I believe the main trouble with your turkeys is lack of exercise. You cannot keep them indefinitely in as small a pen as you are using without bad results. Turkeys must exercise or they cannot be healthy, and a pen 30 by 15 gives little room for exercise. You do not say what grain you are feeding. If it is corn that may explain the trouble in part. Barley and wheat are the best grains for turkeys except when they are being fattened for market. Potassium permanganate in the drinking water is of no use for either cholera, blackhead or indigestion. The ipecac, if properly given, might relieve blackhead, but I do not believe your turkeys had anything but plain indigestion. Let them out if you can, cut down their supply of grain for a few days, and be sure they have an abundant supply of shell or grit as well as of green feed. There is no rule for amount of grain to feed to turkeys. Some breeders keep grain and mash before them constantly. If the birds have free access to growing green feed they will not eat too much grain. Directions for making the 1-4000 solution are on the bottle in which the ordinary bichloride tablets (1.82 grains) come. One tablet in a pint of water makes the 1-4000 solution. To make 1-5000 add one-fourth pint (half a teacup) of water to the 1-4000 solution.

Flavor of Eggs

Although I am feeding just as I have always fed, the eggs from my hens even when perfectly fresh have a taste which spoils everything. Is

Try the Coulson System of Feeding

Our free book "Chickens from Shell to Market" gives full particulars. Coulson Co., Petaluma, Cal.

is from kafir corn? If not, what causes it?—Subscriber, Upland.

Kafir corn could not flavor the eggs, but beef scrap, if fed in large quantities, has been known to affect the flavor decidedly. Is it possible that our mash contains more scrap than in former years or scrap of poorer quality? You can easily find out whether the trouble is in the beef scrap by changing your mash if you are using one commercially prepared, or by purchasing a different kind of beef scrap if you mix the mash yourself. You know, of course, that onions or any other food with strong flavor will affect the eggs if fed heavily. Lack of green feed sometimes forces the hens to eat too heavily of mash and consequently of scrap.

Sore Eyes

About a dozen out of my flock of 250 White Leghorns have an affection of the eye. This is similar to roup in that they all wheeze more or less but is different from the cases I have seen. Some of the hens have a swelling under the eye, some a sore right in the eye which runs water and pus, while others have a cankerous growth in the mouth on the swollen side. I have removed this and painted with vasoline. The hens do not seem very sick but none are laying. Houses are clean and well ventilated and flock on free range.—Subscriber, Santa Rosa.

The hens that have the sore in the eye may have gotten something in the eye or nasal passage that is causing irritation, but all the symptoms you mention are those of roup, which has more than one form. Something must be wrong with your housing or management. Are you sure the hens are not crowded in their house or that there is not some dampness in or about the house which is causing this condition? Hens are peculiarly sensitive to dampness. All the sore eyes should be washed with boric acid solution. You can drop it in with an eye dropper or from a bit of absorbent cotton. Wash eyes twice a day and at night anoint with white vasoline. If there is pus in the swelling under eye, open and cleanse cavity with peroxide of hydrogen, full strength. The canker in throat may be swabbed out with peroxide, mixed with water, half and half. Dipping heads in solution of potassium permanganate is sometimes effective but it loses its strength too quickly when exposed to air in drinking water to be of any use there.

Four Dollar Flock

May I ask one or two questions about the feeding program outlined in our article, "A Four Dollar Flock?" Are the layers fed scratch at 6 a. m.? What amount of mash is fed daily? Does the 30 pounds of scratch mentioned constitute the entire scratch ration for the day? How much green stuff is fed per hen? What is feed meal?—Subscriber, Upland.

No scratch is given in the morning. If any is left from the night before the hens have that. If not they are obliged to eat mash, the supply of which is unlimited and fed fresh each morning on top of that in the hopper, which has been picked over the day before. Thirty pounds of scratch to 400 hens is the entire ration for the day. In this Mr. Horswill follows Professor Dougherty's theory that the amount of scratch can be considerably reduced and the birds still remain healthy. The less scratch they are given the more mash the birds are obliged to consume, and it is mash that produces eggs. The amount of green feed is limited only by supply. If fresh greens can be kept before the hens all day so that they can eat as they would on range, the better for them. Feed meal is a coarsely ground cornmeal which is commonly used for poultry.

What Ails Her?

One of my hens eats heartily but is very thin and weak. Every few seconds she slings her head to one side or the other as if she were trying to throw something from her bill.—Subscriber, Altadena.

Have you looked in her throat? The trouble may be there or the movement of her head may be the result of a nervous affection. As she is thin and weak I would not waste much time doctoring her. If you find any growth in the throat swab it out with peroxide if possible. Otherwise the best remedy is the ax.

Mating Leghorns

I would like to know how to mate and line breed my White Leghorns so as to secure a high egg yield and still not have them related. I have 20 blue ribbon pullets mated to a male from a 260 egg hen. How shall I mate next year's pullets? — Subscriber, Arroyo Grande.

Mating for high egg production is one thing and line breeding to secure exhibition birds is another. Which do you want? You cannot mate for both eggs and feathers at the same time. The best cockerels from this mating should be kept to head your breeding pens next year. If this year's male is unrelated to his hens you can mate next year's cockerels back to their mothers (1) and the best pullets to their sire (2). The next year mate cockerels from (2) to pullets from (1) and to their mothers or such of them as are good enough to keep over. Cockerels from the above matings (3) can be mated the year following to the hens used in (2). In this way you keep two separate groups, distantly related, but growing more distant each year. Of course you will use only the best birds each year, hens that have proved to be heavy layers in their pullet year and cockerels of strong vigor and the best type. If any prove to be of exhibition quality you will have to separate them from the others and breed for the characters you want. Show them to a judge or other expert and ask him to tell you which birds should be mated for best results. No one can tell you how to mate for type and color without seeing the birds.

Keeping Chickens Healthy

Is there anything to put in the drinking water to keep old and young stock healthy?—Subscriber, Fresno.

Clean water in clean fountains, clean houses, clean yards or range, clean food with plenty of green, pure, clean air at night, and room to grow in is the best rule for keeping chickens healthy. There is no short cut.

Roosts

How far apart should roosts be?—Subscriber, Arroyo Grande.

It depends on the size of the birds. For Leghorns the roosts are about 18 inches apart and about one foot is allowed on the roost for each hen.

Selecting the Male

I should like to know how to select a good breeding rooster. How should the pelvic bones be for finger measurement?—Subscriber, Fresno.

If you are really anxious about pelvic measurements, consult Walter Hogan's book, "The Call of the Hen." The main thing in a breeding male is vigor. He should be an upstanding bird, with good, firm comb, large wattles, legs far apart, long back, blocky in head and build, up to standard in weight, inclined to walk with legs far apart, beak not too long, chivalrous to his harem, a good crower, and above all things, a fighter. If you have a bird that picks your feet whenever you enter the pen and wants to tear you to pieces if you pick up a hen, put him in the breeding pen.

Black Down

Our chicks this year have some little spots of black down. We have raised White Leghorns a number of years but never had this happen before. Our roosters this year are all new, bought from good stock. Have we been stung or is it liable to happen this way?—Subscriber, Bakersfield.

I believe it sometimes happens that pure bred Leghorns show these little black specks, which disappear when the feathers come, but it sometimes happens, too, that Leghorns apparently pure, throw back to Black Minorca crossings. In either case you have not been stung, for these Leghorns with Minorca blood are fine layers, but you will not wish to use any birds with black spots in the breeding pen.

Black Spanish

I am unable to find White Faced Black Spanish listed in the Cultivator. Can you tell me where I can buy pure bred stock of this breed?—Subscriber, Los Altos.

I have no names of Black Spanish breeders. Can some one send us the name of a California breeder of these birds?

"Half-Fare" Trips to Town

FOR those rush trips to railroad station or store—or when your neighbor wants you to come over and lend a hand—or when you want to get to the far end of the farm in a hurry—a Harley-Davidson will get you there quicker and cheaper than any other way.

50 miles for a dollar—gasoline, oil, tires and all! Compare that with the cost of other kinds of travel and you'll see why a Harley-Davidson is a good investment for a farmer.

Save wear and tear on your automobile. Save it for family use. Ride a Harley-Davidson on business errands. It's easy to handle—comfortable—carries a good load—wonderfully durable—and the worst roads can't stop it. You can use it every day of the year, and you'll wonder how you ever got along without it.

Write for free, illustrated literature and reduced prices. No obligation to you.

Dealers wanted for unassigned territories. Write for attractive proposition.

Breaking Construction Records

Since 1920, faced with the greatest demand for service in telephone history, the Bell System has surpassed all previous records for the installation of new telephone equipment. In the last two years more than 1,000,000 additional stations have been added to the system by construction. This is equal to the entire number of telephones in Great Britain.

In 1921 alone, 450,000 new poles were placed—enough to make a telephone line from New York to Hong Kong. The aerial wire put into service in the same year, 835,000 miles in all, is enough to string 60 wires on such a telephone line.

1,875,000 miles of wire, enclosed in 1,500 miles of cable, were added to underground and submarine lines in 1921. New underground duct totaling 11,000,000 feet was constructed, this representing approximately 300 miles of subway. 69 new central office buildings and important additions were completed or in progress, and new switchboards with a capacity of many thousands of connections were installed.

This equipment added to the Bell System, great though it is in volume and value, represents but a small part of the vast property which enables the telephone on your desk to give the service to which you are accustomed. And to meet the increasing demands for new service, the work of construction goes on.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

Some of the painstaking work performed by the bureau of plant quarantine of the state department of agriculture is shown in the chart or map given on the Cultivator's cover of this issue. The various indicators make plain some of the effectiveness of state quarantine regulation. At one time California stood almost alone in plant quarantine. Even yet there is lack in this respect in nearly all of the Atlantic entry ports, which has made California's work more difficult. Note in the lower left hand corner of the map under legend "Citrus canker, (all states except Arizona)." California found in preventing the entrance of citrus canker that states other than Florida often shipped citrus fruits or other carriers of the canker into California. Illinois, for instance, proved a good shipping point for Florida grapefruit destined for California consumers. Hence, the general quarantine, excepting only Arizona which is working in harmony with California in the citrus canker quarantine.

As general as is the recognition of the necessity for protecting California's great citrus industry, it is strange there is so little understanding as to the menace of introduced diseases. Only during the last few weeks the president of a great railway system, which profits to the extent of millions each year because of the citrus shipments, visited this state in his own private car. State quarantine officials made the discovery that his car was stocked, amongst other things, with a supply of Florida grapefruit brought into the state in violation of quarantine regulations. Still worse, the confiscation and destruction of the fruit by the state department met with strong protest.

All quarantine regulations are liable to affect the comfort or desires of some of us, but he who would gratify his own selfish desires at the expense of one of the state's greatest producing industries should be appealed to to let a more enlightened selfishness dictate.

Observe the great extent of the map of the United States covered by the parallel diagonal lines running downward to the right. Nearly all this district is east of the Mississippi. Arkansas only is on the west bank, then there is a great jump across some four or five states clear to Nevada. These lines indicate the dreaded peach yellows. Years ago Nevada did not care; she knew nothing of quarantine and peach trees with peach yellows from some enterprising nurseryman east of the Mississippi were shipped and planted there. While Nevada is our nearest neighbor and we regret the quarantine, yet these shipments may endanger our peach growing industry so we are compelled to stand at the border of the state and stop them.

Note the fine checker board effect with which Mr. Strong indicates the alfalfa infested states and portions of states. Washington, California and Arizona are still free. We are all holding our breaths and asking "How long will we be free from the pest?" The efficiency of the quarantine service of our state department of agriculture is our only protection.

All told that map is wonderfully interesting "reading." Director Hecke and the entire plant quarantine service are to be congratulated on presenting at a glance such a fund of information as to the state's service to the producing industry.

One of the farmer's everlasting and always present uncertainties is the weather. This has been a year of "some weather." The rains have been abundant; they are worth millions. Drying winds have come occasionally and taken away some of the moisture. The January frosts came and injured some of our fruits. Even the longer days and warmer sunshine of April have not entirely taken the crispness out of the atmosphere, and the information comes from some of our richest valleys that blossoms and embryo fruits are injured. How serious this will be we do not yet know. We still hope the entire state production will be nearly up to normal.

The Cultivator is asking its subscribers to send in estimates as to injury and as to probable percentage of normal production. We wish every reader would report as to his county or community prospects. It is early, and mistakes will be made, yet to all

of the producing interests early information is vital. The first of a batch of returns from our request are given on third page of this issue. There will be a vastly greater number next week.

Hoover is speeding up the Boulder Dam movement. Traffic regulations may control Hoover's speed somewhat but strength to his arm—or weight to his foot as it rests on the throttle. The next meeting of the Colorado River commission will be in Santa Fe, New Mexico. At that time a pact between the seven states will be formulated and submitted to the legislators of those states for ratification. The work on the dam will begin immediately after ratification.

Almonds, citrus fruits, raisins, dates, olives and some other California products received favorable attention in the administration's tariff bill. The new bill is now before congress but will not be called up till April 20.

The other day we saw it stated: "The trouble with cheap things is that they cost too much. This applies to everything from harnesses to thoughts." We carried it along as far as the harness perfectly easily, but, as to cheap thoughts—well, really, we don't know that there is anything cheaper than cheap thoughts. We can see where they cost too much.

THE FIGHT ON JACK

A large number of California fruit growers are standing ready to remark to Jack Frost: "Here's your hat, what's your hurry?" In fact we do not think there was ever such a general desire for vengeance, but as yet Jack Frost still hangs around. One manifestation of displeasure was made at Covina last week when orange growers gathered and discussed windmills, electric fans, centralized heating plants, tall stack heaters and even old time "lard bucket" smudge pots. No united action was determined upon excepting that there must be another more general meeting to discuss and, if possible, join in an effort to secure the effective frost fighting methods. To this end the larger meeting will be called at Covina late in this month.

The Fruit Growers Supply committee is still in action and has confined its work entirely to securing the nearly - as - possible - perfect orchard heater somewhat along the line of the present down draft short smokestack heater. It is fairly definite that the tall smokestack is now down and out because of its partial failure this season.

The Claremont Pomological Club will discuss frost prevention at its next meeting. Especially will it consider a central compressed air heating plant. The inventor of this plan recommends the use of compressed air which at a high temperature is admitted to a series of pipes which will deliver the air under pressure to practically every tree in the orchard. He estimates the plant may be of sufficient capacity to handle a 20 acre orchard.

Others are discussing tents over the trees, canopy covering the entire orchard, boilers creating steam for delivery over the orchard, coal and other forms of heaters, some of which have been tried out years ago and found wanting. But these investigators are searching for some modification or change in minor plans which will make for efficient frost fighting.

"You can't farm against climate."

Neither do Californians propose to make over their climate. At the same time they do propose to discourage some of the idiosyncrasies which our weather men have been showing.

TOO BUSY

Some of us are so busy doing trivial things that we "haven't time" to do some of the really worth while big things, opportunity for which sometimes comes our way. Sometimes we have to choose between the really worth while and the duties which may become secondary.

When we were kids and got our lickin's on our birthday the one last lick, "one to grow on," was the one we dreaded most of all. But we had to grow and still have to no matter how old in years and we can only grow as we should through the proper use of time. Let us not be so busy at any time that we do not use our odd moments in improving and fitting ourselves for higher duties.

CALIFORNIA VALENCIA ORANGE SHOW

The growth of the Valencia orange industry in northern Orange County led to the establishment at Anaheim last year of the California Valencia Orange Show. The second annual will be held May 23-30 of this year.

In two decades Valencia orange culture has grown until now it absorbs four-fifths of the citrus shipments from Orange County. This is shown by figures recently compiled by the horticultural commissioner of Orange County. Out of a total citrus valuation of more than \$20,000,000, the Valencia crop totaled \$16,000,000; Lemons, \$3,000,000; Navels slightly under the \$1,000,000 mark. The Valencia crop fills the vacant period in Navel production during the late spring and early summer and serves to make the citrus crop of California a continuous one.

The chamber of commerce of Anaheim last year recognized the value of exploiting their major crop and the First Annual California Valencia Orange Show resulted. It met with instant approval of all of the municipalities, civic organizations and Valencia distributing associations in the district. This year the show will be housed in three tents instead of one, the number of feature exhibits has been more than doubled, and the space reserved in the rack exhibit multiplied many times over last year.

APRICOT GROWERS TO CONVENT

The apricot growers of Southern California are to meet at Santa Paula, Ventura County, on April 28 at 10 a. m. in the high school auditorium. Special problems which are Southern California's alone will be dealt with as well as the industry's problem from a national standpoint.

Program for this first apricot institute held under the auspices of the farm bureau:

Address of welcome, Chairman A. L. Shively; Need of an Institute, Farm Adviser C. C. Staunton; Apricot Industry as a Whole, D. Coleman, Santa Jose; The Apricot Grower, the Farm Bureau and the Extension Service, President W. S. Rosecrans; Los Angeles County Farm Bureau. Luncheon served by domestic science class of the high school. Marketing Conditions, Foreign and Domestic, H. G. Coykendall; Better Drying Methods, A. W. Christie, University of California; Irrigation and Soil Moisture Control, Professor J. W. Nelson, U. of C. Constructive Cooperative Marketing Studies, C. C. Teague.

Vol. LVIII, No. 15

Los Angeles, April 15, 1922

One Dollar Yearly

THIS nation is rich in money, in goods and credit, but its potential wealth is far greater in undeveloped land, minerals and water power. The pessimist who bets against our finding the way toward a better economic distribution of profit and consequent prosperity will surely lose. We suffer now from a culmination of a modern development, following a great war, a distinct overbalance through the power existing in control of sources originally designed to be subordinate and helpful to production.

Our banks are bulging with money, but the three essential producing industries of agriculture, mining and livestock are operating at present loss, and consequently there are millions of idle men. A further complication exists in the wide spread between what the producer receives and the consumer pays. This aggravates labor unrest because living costs have not declined in proportion to wage reductions.

A few years after Watt discovered the use of steam as motive power in 1765 on the threshold of new industrial methods, the father of modern economics, Adam Smith, wrote with emphasis that production was the wealth of nations and that agrarian well-being brought national prosperity. This simple conclusion, forgotten in recent years, is now affirmed in a period of national depression by a few thinkers in the citadels of finance and in political forums.

Steam power was applied to ships and railroads; electricity brought the telegraph, the telephone, and recent facilities in lighting, communication and motive power. Watts' discovery brought the steam auto, and the steam auto developed into the gas engine with an exploding electric spark. These evolutions developed new methods of production and economic usage, with a resulting change in rural life, in the distribution of population and in volume of possible production. The modern tractor that in one day can plow as much land as 40 primitive ox teams has had much to do with bringing into farming new problems of surplus grain production and soil fertilization. Greater production is but one phase, for the tractor, in addition to facilitating the cultivation of vast acreage, annihilates the grain and feed demand for those 40 ox teams. Fertilization of the land farmed by the ox team was self-maintained.

Without doubt the tractor has had much to do with forcing a crisis in agricultural effort through surplus, although the present lack of stability of profit margin is the direct result of the middle marketer's efficiency and producer's neglect of that part of their business. The present financial trust combines have been formed within the business career of our present captains of industry. Watered stock and the relation of value to interest return rather than actual investment cost became general practice during the last 25 years. Gigantic combinations of capital in steel, oil and other commodities were met by equal organization of employed union labor. Middle marketing applied an efficiency to increase and protect profits. Meat packers took on poultry, cheese, fruit and canning. Wholesalers of food organized, brokers organized, and retailers had powerful associations. Organized self protection took the farmer's product frequently through money advance even before a matured crop, but the farmer remained free—and helpless.

After the war the organized middle marketers were loath to forego profit, and power bled the agrarian producers for billions by lowering prices to producers while maintaining them to consumers. For a period this kept up a fictitious city prosperity. The inevitable happened when the agrarian industries, bled white from

Organized Effort Wins

By A. L. Spellmeyer

loss, quit purchasing the city products, for factories in a hundred lines closed and 5,000,000 men lacked employment.

In 1820 people engaged in agriculture comprised 87 per cent of this nation's population. Today, through modern facilities, there is a greater production proportionately from 30 per cent so engaged. The greatest shift in population was in the period from 1840 to 1870, when the agricultural population declined from 77.5 to 47.5 per cent.

An impartial analysis clearly proves that our present economic ills are the result of progress in production and a progress that gives an unequal profit distribution because agrarians have not balanced the 2½ city control and middle marketing efficiency with associated self protection. It is known that every new colonist to Australia or New Zealand who goes into farming or livestock permits 2½ more city men to live in the manufacture and marketing of products.

A just economic distribution may be secured either by the producers completing their operation and product control to the consumer or by the retailer extending his interests in a direct production. A diversified farm, producing meat, butter, eggs, cheese and vegetables, may be owned by a large hotel or restaurant, or the diversified farm may own a restaurant, hotel or retail market. The hotel taking on a production burden assumes a loss in the consequent higher product cost than the present low market affords in open purchase, but the diversified farms that have taken on a marketing connection have proven profitable.

The complete control of a product from the ore to the consumer has brought enormous profit to Henry Ford. Identical procedure in Europe on the part of Hugo Stinnes in control of raw product, transport and marketing has enabled a tremendous

expansion when general business is chaotic. Repeated examples prove this a fact where a complete control of a product is maintained. Tobacco is sold at a slight margin and no profiteering occurred in its retailing, though it was often handled at a loss, and invariably other commodities sold by the merchant must help to pay the deficit in business sales overhead. A thousand great firms are today operating profitably where they control and complete their operation. The realization of this is so keen that there is in this time of national depression a great advertising increase in papers and magazines aimed at the consumer for a market and freedom from middle control, and it may apply to paint, canned milk, shoes, wall board or auto tires.

Examples of achieved success exist in agriculture where a cooperative effort has been extended to the marketing and handling of a product. The citrus association of California is a pioneer in applied cooperation, although it uses the present wholesale and retail facilities and the auction system of price. The walnut, and raisin and prune associations prove that the citrus plan is no fluke, but a consistent fact, by their success in maintaining quality pack, price and consumer's good will and by making profits in hard times on what many consider food luxuries. The difficulties faced by livestock men or by grain farmers are small to what have been overcome by these associations. There exist in some states successful examples of cooperative success applied to dairies, alfalfa and other products. Secretary of Agriculture Wallace has realized the existing necessity of applied cooperation.

The present situation in agriculture is loaded with dynamite, and its pos-

sibilities are menacing with concealed threat from several angles. It is a pertinent question for political parties, and one that may disturb the apex of power that finance has reached in the last few years. The farming and livestock industries of the nation have paid heavily for several years, and they comprise but a third of the population, but there exists a chance to collect with heavy interest those payments from the two-thirds of the population who must consume. Restricted output is no chimera, and the desire for a fair profit is prevalent, even though it must mean a coalition with former enemies, the middle marketers, to force the public to pay that profit. The orange crop cost \$125,000,000 to transport and market, whereas the producers secured \$75,000,000. Many products stand a double, triple or greater price to the consumer than the producer pays. Several cooperative producer efforts are today halting through a divided opinion as to the wisdom of completing a market operation or forcing price profit through present facility alliance.

Ruinous market prices and heavy taxation have forced a measure of group association in all farming lines, though the present upward tendency may divert agrarians from scheduled plans. A close knit cooperation and association standard of pack, quality and price should interest the public as it insures fair dealing and prevents an uneven power being held by middlemen or producers. The citrus, walnut, prune and raisin associations guarantee to the consuming public both quality and standard, and further, a price based not on the power to demand but on cost and fair profit due.

The same sources that built up with complete accord with modern tendencies in finance are those sources which hold the land mortgages and bonds. They are the ones which control the big bank which controls the bank groups which control the multitude of loans on livestock and farms. All the government money is loaned through some established bank or loan source and backed by them. A partial instance: Seventy-five per cent of the western cattle and sheep, and that means over half our total of the latter, are under the direct dictation of banks, bond houses and loan companies. Three banks in New York's different groups extend their affiliations to these loan sources that hold the cattle and sheep paper and mortgages on the lands they graze or leases they range. When the banker owns a cattle outfit he becomes a livestock man in his viewpoint. When a million men in farming and livestock, or five million, owe heavy bank loans, their creditors are interested in their business success. These same powers did not hesitate to make 1000 per cent in an industrial combination, and neither will they hesitate at any profit their power can obtain after they become livestock men and farmers in direct or indirect ownership.

The consumer is vitally interested in the agricultural situation for the price of his food, for the fertile soil of a nation, and for the national production and independence raw material production gives to any country in peace or in war. One thing is certain for the public need, and that is it is far better to promote and encourage reliable, fair dealing and restrained producer associations than to permit the foreclosure and change in ownership that must result from a continuance of the low farm product prices and heavy taxation.

What Will the 1922 Harvest Be?

CALIFORNIA'S fruit production for the year 1921 was slightly under that of 1920.

As reported by the cooperating service of the United States and state departments of agriculture the tonnage was: Peaches, 320,000, as against 360,000 and 430,000 for the years 1920 and 1919 respectively. The return in dollars for peaches was about half that of 1919 or about \$13,000,000 as against \$25,000,000 in 1919. In apricots the 1921 tonnage was 105,000, value \$5,250,000, as against 175,000 in 1919 which was valued at \$14,000,000. In apples the 1921 production was 6,500,000 bushels; pears, 78,000 tons; prunes, 90,000 tons; oranges, 22,500,000 boxes; lemons, 5,300,000 boxes; raisins, 130,000 tons; grapes (wine), 310,000 tons; grapes (table), 125,000; cherries, 13,000; plums, 40,000; olives, 8,200; figs, 8,000; almonds, 5,500; walnuts, 19,500 tons.

What will the production of 1922 be? Nobody on earth can answer that question this early in the season. There are yet possible storms of wind or rain or there may be frosts which will affect any estimate given this early in the season. For instance we may refer to the fact that Monday morning's paper contained items as to severe frost in Santa Clara Valley and in the northern end of San Joaquin Valley. One report stated: "Between 4:30 o'clock and sunrise the temperature dropped from 29 to 26

degrees Fahrenheit above zero." "Many orchardists report apricot crop a total loss while some of the more fortunate think their losses will amount to at least 25 per cent of the crop. Smudge pots were resorted to." "Apricot buds had in most cases been replaced by the embryo fruit crop especially susceptible to the cold." The normal apricot yield for the Santa Clara Valley is about \$4,500,000, and it is to be hoped that the early estimates of damage are greatly exaggerated.

A far greater number of the early estimates will be given next week. So far as they have begun to come in this week they are as follows:

A. E. Bottel, Horticultural Commissioner, Riverside County

In regard to fruit conditions in Riverside County the following estimate is given: Almonds, 100 per cent. Apples, 100 per cent. Apricots, 75 per cent. Cherries, 75 per cent. Peaches, 75 per cent. Pears, 85 per cent. Prunes, 85 per cent. Grapes, 85 per cent.

A. L. Shively, Santa Paula, Ventura County

Apricots are two weeks late; a heavy bloom is set, during which a light freeze has occurred, but it is thought little damage is done.

(Continued on Page 423.)

Agricultural News Notes of the Pacific Coast

Northern California

Colusa County fair will be held at Colusa instead of Arbuckle as in the past.

The Lassen national park bill has passed the house and is now before the public lands committee of the senate.

Twenty-three carloads of dried fruit left Winters during January and February. Stocks are practically cleaned up.

The section from Red Bluff to Arbuckle in Colusa County will raise 100,000 turkeys this year according to a poultry dealer at Willows.

A public auction sale of state scrip will be held by Surveyor General Kingsbury at the state capitol, Sacramento, Monday, May 1, 1922, at 10 a. m.

The state board of control has authorized plan of State Forester Pratt and Surveyor General Kingsbury for exchange of school lands within federal forest reserves.

Orchard accounting will be discussed April 17; orchard spraying, fruit growing as a business, April 21; closing days of farm bureau short course at Newcastle, Placer County.

Farm bureau meetings in Shasta County: Directors, Redding, April 15; Cottonwood, 17; Bella Vista, 19; Hat Creek, 21; Fall River, 22; Mountain, 23; Millville, 25; Palo Cedro, 26.

The Fruit Growers Supply Company has contracted with the government for one billion feet of lumber in Lassen national forest at a net price of \$3,314,000, the cutting to extend over 31 years.

The Wyandotte Olive Growers Association has been processing fruit of members for two seasons, last season putting out 15,000 cases of canned ripe olives; 50 per cent of the crop was made into oil.

The University of California has signed a five year contract with the California Almond Growers' Exchange for the marketing of crops from almond acreage at the Davis farm school in Yolo County.

The North Side Water Users' Association has protested applications of Sacramento for waters in Eldorado County which it is claimed belong to irrigators of Cool, Pilot Hill, Georgetown, Garden Valley and Greenwood sections.

The Mills Orchard Company has planted at Hamilton and Maxwell 3050 Bartlett and Nelis Pears, 1364 French, Robe, and Imperial prunes, 2576 Royal, Tilton and Blenheim apricots, 1200 Muir peaches, 500 Nonpareil and Drake almonds.

The California Farm Bureau Exchange announces that a contract had been signed with George Wills & Sons, Ltd., of London to handle all of the California grain passing through the exchange and intended for consumption in Europe and the United Kingdom.

According to the reports of the United States bureau of markets total egg receipts at San Francisco, January 1 to March 24, 1922, 190,607 cases; same period last year, 231,570; 219 cars shipped from Petaluma to points other than San Francisco; last year 206 cars. Stored at Petaluma 18,433 cases, last year 13,730. Comparison indicates egg production in Central California about 8.3 per cent less than last year.

Central California

Valencia picking will soon begin in the Porterville district.

The 1922 Raisin Day celebration will be held this year on Thursday, April 27.

Directors Merced irrigation district are receiving hundreds of applications for extension of canals.

A field meet and basket picnic of the state Grange will be held in Monterey County May 27, place to be announced.

Estimate of land planted this year in Turlock irrigation district shows increase of 204 acres over last year.

The California Peach and Fig Growers is building a \$100,000 plant at Dinuba. It will be ready for the coming season.

The California Peach and Fig Growers will this year handle Kadotas of its members, refusing to release this variety for sale outside the association.

Fruit growers of Hilmar have been conferring with the cannery people to see if sufficient acreage can be secured to warrant opening of the local plant this year.

The farm home department of Kings County is planning meeting at Hanford, April 18, to be addressed by Mrs. Max West of Berkeley on child nutrition.

The board of directors of the California Dairy Council meets today, April 15, at Tulare. Managers of dairies in Kern, Kings and Tulare Counties also meet with them.

The Fresno bureau of state employment agencies placed 1,293 persons on jobs during March, the greatest numbers being with agricultural industries, transportation and public utilities.

County Horticultural Commissioner Brann of Tulare is making plans for clean-up campaign against rodents this summer. Especial attention will be given to the Alpaugh section, which was passed over last year.

Kings County supervisors have passed meat inspection ordinance providing that no beef, veal, pork or mutton may be sold in the county without state inspection. This inspection will allow shipment to any point where city inspection is now enforced or similar county ordinances.

Clovis will hold its annual spring festival April 22. The program will include open house at the grammar and high schools 9 to 10 a. m., parade at 10:30 a. m., track meet at 1 p. m., rodeo at 2:30 p. m., and dancing in the evening. The prize winning floats will be entered in the Raisin Festival parade at Fresno.

At a meeting of the San Joaquin River Conservation Association at Newman it was resolved to ask all "concerned with the use of the waters of the San Joaquin River to join in a prompt and mutually considerate study and settlement of controversies" and to secure comprehensive survey by qualified engineers.

Fresno figs and grapes have been preserved for period of six months by cold storage experiment of the University of California. Ripe figs were placed in syrup and frozen solid, keeping the juice and flavor intact. Emperor grapes were packed in redwood sawdust with the result that the color and flavor were unimpaired.

Southern California

Santa Ana and Anaheim will join in construction of an outfall sewer.

Ventura County fair directors are actively preparing for the fall show.

Imperial will send out 29 carloads of grapefruit in addition to many express shipments.

A demonstration of date pollinating was given at the Swann place near El Centro last week.

The annual meeting of the Hemet Valley chamber of commerce was held at Hemet, April 7.

Farm home department meetings in Imperial Valley: Westmoreland, April 18; Lantana, 19; Meloland, 20.

Permits to seine for carp in Lake Elsinore have been granted by the fish and game commissioners.

Lettuce growers of the Imperial Valley report offers of more than \$1,000 an acre for their crops of lettuce.

Two avocado meetings are planned for May in Los Angeles County to discuss top-working to more profitable varieties.

The San Fernando Mission Park committee is planning a two day fiesta to obtain funds for restoration of the Old Mission.

Field station will be maintained at Brawley by the United States crop reporting service to keep cantaloupe growers informed of daily changes in markets.

Cotton growing interests of the state headed by A. W. Morrill are petitioning for early hearing of complaints against present quarantine regulations.

State Viticulturist Nougaret suggests that Coachella Valley grape growers experiment to find an early maturing grape better adapted to their conditions than either Thompson or Malaga.

Palo Verde Valley Produce Association is the new marketing organization of the cantaloupe growers of that valley. Directors are: E. A. MacDonald, L. E. Speer, A. E. Bente, Herman Bahls and O. F. Rudd.

The Imperial Valley Vegetable and Melon Growers' Association on March 30 shipped the first carlot of peas from the Imperial Valley. It was sent by express to New York City and contained 492 crates.

Bloomington and Colton are demanding that the supervisors of San Bernardino County take action on the nuisance of the Fontana garbage farm. It is claimed that Los Angeles garbage not only is fed to hogs but spread as fertilizer.

C. E. Jordan, former supervisor of the Inyo County forest reserve, has been appointed supervisor of the Santa Barbara forest, succeeding Thomas Sloane, who has been made assistant supervisor of the Angeles reserve.

The agricultural extension service is arranging with about 25 citrus growers throughout Los Angeles County to conduct citrus fertilizer tests on the use of quickly available nitrogen fertilizers in the spring, application of gypsum and lime, and organic fertilizers.

The San Bernardino County Beekeepers Club has placed its cooperative purchasing of supplies in the hand of a committee composed of Frank Bedell of Redlands, L. E. Alfred for Ontario and Upland, E. J. Miller for Colton, Rialto and San Bernardino; T. O. Hatter of Highland.

The Coast and General

Arizona is shipping asparagus.

Arizona pioneers held their second reunion at Phoenix, April 11-12.

Brazil's 1922 coffee crop will be short from present indications.

Arizona reports early planted cotton coming on nicely and growing rapidly.

Ten carloads of lettuce are being shipped daily from Eloy, 50 miles west of Tucson, Arizona.

Owners of 1550 cows have signed up with the Yakima, Washington Dairymen's Association.

California is the second largest producer of tomatoes in the United States; Maryland ranks first.

Live steam blown on the water hyacinth infesting streams of Louisiana and Florida is said to be an effective killer.

An international grain and hay show will be held at the Union Stockyards Chicago, during the Livestock Exposition.

The National Livestock Producers Association has established a commission association at the Union Stockyards, Chicago.

Because of cool weather first cuttings of alfalfa in the Salt River Valley of Arizona delayed to last of April or first of May.

Guernsey breeders of Thurston County, Washington, have formed an association, electing as president C. H. Bergstrom of Olympia.

J. L. Smith of Spokane, Washington, has been selected as superintendent of the livestock department for the next Spokane Interstate Fair.

Range in the Fort Apache Indian reservation and White Mountain section is in excellent condition. Snow has disappeared; water supply adequate.

The grain pool of the Maricopa County farm bureau has sold 1,250 tons of Salt River Valley wheat to Arizona mills. The price was \$2.40 per hundredweight.

The Cochise-Graham Cattle Growers' Association will meet at Douglas, Arizona, April 10. President Boice of the Arizona Cattle Growers will be one of the speakers.

Advices from Sonora, Mexico, are received that 11 successive frosts have destroyed practically half of the season's Garbanzo crop. The crop last year was valued at \$3,000,000.

April 24-29, United States Good Roads Week, United States Good Roads Show, United States Good Roads Association and Bankhead National Highway Association meet at Phoenix.

The Black Hills Cattle Growers Association in its annual meeting at Camp Verde, Arizona, elected R. E. Perkins, president; Ralph Monroe, vice president; David Wingfield, secretary and treasurer. A committee was appointed to secure salt for the members.

Announcement was made recently that as result of the Columbia River being made a port of entry for the import of livestock, E. L. Westover, representative of the American Guernsey Cattle Association, is perfecting arrangements for the importation of no less than 200 head of Guernsey cattle from the Isle of Guernsey this summer. The animals will be brought direct to Astoria.

THE septic tank is an unventilated, water tight compartment into which all raw sewage from the household is discharged in order that the more solid materials may be liquified, largely deodorized and rendered less dangerous preparatory to final disposition. It is not a so-called cesspool, neither is it a panacea for all sewage disposal ills. It should not be relied upon to purify the sewage; that is, the effluent from a septic tank is not much less dangerous than when the sewage

The Septic Tank

By William B. Herms and H. L. Belton,
University of California

years. A tight fitting cover (to allow access in case of trouble or possible cleaning) is necessary in order to permit the formation of a certain amount of pressure from gas in the dead space

six or eight inches above ground level so that drainage nearer the surface may be obtained. If soil conditions are good for drainage there is no objection to having the top of the tank 12 to 15 inches below the ground.

Style of Tank

The tendency in septic tank plans is in the direction of simplicity. Many different types have been recommended from time to time, commonly multiple chambered. For all practical purposes, based on about 10 years' experience in California, we recommend a single chamber septic tank provided with baffle boards with outlet about one inch lower than inlet (Figs. 1 and 3), or in the absence of these baffle boards the inlet and outlet elbows

portion of fine and coarse materials. The inner surface if rough and porous may be finished with a cement mortar consisting of one part cement to 1½ to 2 parts sand, brushed or troweled on the wet concrete immediately after removing the forms. The tank is usually built so that the top is either flush with the ground or slightly lower. If drainage nearer the surface is desired or abrupt surface contours are involved the tank may be placed partly above ground. The tank cover, consisting of four concrete slabs, should be reinforced with bars or heavy fencing (see Fig. 1).

A fairly satisfactory tank may be constructed of two-inch redwood if made waterproof in creosote and the crevices properly calked. However, concrete is much more durable, is far more satisfactory, easily handled, comparatively inexpensive, and is recommended.

Final Distribution of Effluent

The effluent from the septic tank is ordinarily discharged through four-inch (sometimes six-inch) distribution

LONGITUDINAL SECTION 1

2 INSIDE FORM

MATERIAL

One part Portland cement; two parts sand, fine to 1/4 inch in size; four parts rock, 1/2 to 3/4 inch in size. Amounts: For smallest size tank, 10 people, two single branch Y's, vitrified tile; 1 1/2 cu. yds. 1/2 to 3/4 inch crushed rock, 3/4 cu. yds. sand, 12 bags cement. Reinforcements: Use woven wire or bars.

SIZES

No. of People	Inside Width	Inside Length	Depth	Sides	Thickness of Ends	Thickness of Floor	Thickness of Top
10	3 ft.	7 ft.	4 ft.	4 in.	4 in.	4 in.	3 in.
16	3 1/2 ft.	9 ft.	4 ft.	5 in.	5 in.	4 in.	3 1/2 in.
20	4 ft.	10 ft.	4 ft.	6 in.	6 in.	4 in.	4 in.

Purifying tile: A minimum of 100 ft. of tile is suggested, more to be added if soil does not readily absorb the effluent.

enters the tank, but it can be much more readily disposed of and that in a thoroughly safe manner.

The useful bacteria which cause liquefaction are already present in the sewage and require only proper conditions—namely, excluding air from the sewage—to carry on their good work. This condition is secured by the dark, unventilated tank, which is provided with baffle boards (or with deep elbow inlet and outlet) to prevent agitation and to allow the entering sewage to settle quietly to the bottom where the bacteria are at work. The products of liquefaction are to a large extent dissolved in the water of the sewage, giving a liquid which may be readily disposed of and leaving behind in the tank a small portion of the solid organic matter reduced to a comparatively inoffensive substance known as sludge and forming sooner or later a scum on the surface. Cleaning out the tank is usually unnecessary for several

above the level of the contents, thus further excluding outside air.

Typhoid stools and other infectious matter should be disinfected, preferably by boiling, before being discharged into the toilets. Disinfectants must not be added in quantities to the sewage, as this may destroy the useful bacteria in the tank.

Location

The septic tank if properly constructed of concrete may be placed as near the house as circumstances permit, even beneath the porch if necessary, thus allowing for an adequate final disposal system even with very limited yard space. Ordinarily the tank should be buried in the ground and covered with earth. It must be kept in mind that a leaky septic tank near a well or spring is dangerous. A high water table at certain seasons of the year, heavy clay loam, or hardpan near the surface may make it advisable to keep the top of the tank

must reach to within about 18 inches of the bottom of the tank, the outlet slightly shorter than the inlet.

Size of Tank

The size of the septic tank depends, of course, upon the number of persons contributing to the sewage. For a household of 10 persons or less the inside dimensions of the tank should be approximately three feet wide, seven feet long and four feet deep. A smaller tank than this for smaller families is not recommended.

Construction

The pipe leading from the house to the septic tank should be of vitrified four inch sewer pipe with cemented joints laid at a grade of not less than nine inches per 100 feet. The tank should be constructed of concrete with four to six-inch sides and floor according to size of tank; the roof must be reinforced and three to four inches thick. A 1:2:4 mixture of concrete materials is recommended; i. e., one cubic foot or sack of cement, two cubic feet of sand, four cubic feet of crushed rock. Both the sand and the rock should be clean and free from foreign matter. The sand should vary from fine to one-quarter inch in size, the rock from one-half to three-quarters inch in size. Enough water should be added to give the entire mixture a jelly like consistency. Too much water is harmful, as the strength of the mixture is reduced by adding more water than is necessary for a workable mixture. Creek gravel should not be used unless it is clean and screened and remixed to the pro-

tile, the first eight or ten feet of which may have tight (cemented) joints; the rest should have open joints covered on top with burlap, tar paper or other material to keep out loose earth. The arrangement of the disposal tile after the first eight or ten feet of the line may be in the form of a three or four-tined pitchfork, herring bone or grid-iron in order to conserve space and to assist if desirable in subsurface irrigation. The disposal lines should have a fall of not to exceed one inch in 50 feet in order to prevent the water from rushing to the end and there waterlogging the soil.

The length of the disposal lines depends upon the nature of the soil, except that generally not more than 100 feet of tile should be used in any one line. A minimum of 100 feet of tile is suggested if soil conditions permit, more tile to be added in case the soil does not readily absorb the effluent. When drainage conditions are very poor, or if the tile must be laid close to the surface for other reasons, it is recommended that the drain tile be laid upon 12 to 18 inches of rock or loose gravel in a ditch about 12 inches wide.

The effluent may be utilized for the subirrigation of alfalfa, berries or trees, or possibly certain surface vegetables, such as squashes and beans, but certainly not for vegetables which may be eaten raw.

Where room is not available for the above described drain tile system, or where there is no natural fall to insure proper drainage from the tank,

house at Stockton

It becomes necessary to connect the tank with a dug cesspool into which the liquid sewage is discharged, connection being made as for drain disposal system described in plans.

Under such conditions the sewer well should be located (as in the draught method) as far away from the source of drinking water as possible to prevent contamination by seepage. No fixed rule can be given for distance, since local conditions must be considered.

Dug wells for this purpose are commonly made from 16 to 18 feet depth. These, if drainage is inadequate, must be regularly pumped out, a simple matter owing to the fact that only liquids are involved.

Directions for Building:

Excavate a hole in the ground eight inches longer and wider than the dimensions, and four inches deeper to allow for four inch walls and floor. If the soil cannot be used as an outside form one must be made of lumber to dimensions given above for hole.

Make form of smooth lumber, to outside dimensions to correspond inside dimensions of the tank when finished, and the corner studding extending some distance above frame (Fig. 2).

Nail 1/4 by 2 inch cleats on outside of form (Fig. 2) to form grooves to receive baffle boards. These cleats should be slightly beveled to be easily removed from the concrete.

Place boxes 6 by 6 by 4 inches in form at exact location of inlet and outlet pipes (Fig. 2).

Suspend form in hole four inches from bottom, using 1 by 6 inch piece nailed firmly to four corner studding and anchored to stakes driven in ground a distance from each corner.

Pour concrete evenly about the form so as not to push it out of place. This method forms bottom and walls at one process and prevents leakage joints. Tamp and smooth the floor before concrete hardens.

Level off ground nearby and cast slabs for cover in frames four inches deep. Four slabs for the average tank is a convenient number. Reinforce slabs with bars or fencing and insert wire loop for lifting. Covers of rough wood plank have been used in many cases.

After concrete has set, chip box from walls and remove form. Cement inlet and outlet pipes into place, using a rich mixture of cement and sand. Plaster or brush tank surface if necessary.

Cut and insert baffle boards. Connect tank with sewer pipe and drainage system. Place cover slabs in position, using a lean cement mortar bed them firmly to the tank walls. After the cement joints in the sewer line and inlet and outlet pipes have set firmly, the tank is ready for use. If the tank top is below the surface of the ground, cover it to ground level.

GOVERNMENT PEACH GRADE ISSUED

United States grades for peaches have been reissued by the United States department of agriculture. The grades contain only minor changes from those recommended in 1921.

In past years peaches have been graded chiefly with regard to size. The United States grades are based upon market quality. Under this system are included such factors as color, maturity, general appearance and freedom from insect and fungous injury. Minimum sizes have not been specified for the various grades but numerical count and minimum size or style of pack must be stamped on each package. This is a well established practice in handling box apples and citrus fruits.

The No. 1 grade is designed to meet the normal commercial needs of the trade and consuming public by eliminating damaged stock which might cause loss in transit. It also provides that the peaches shall be of one variety, firm, mature and well formed and free from growth cracks, cuts, skin breaks, worm holes, and from damage caused by dirt, scab, scale, hail, disease, insects or mechanical other means.

The No. 2 grade includes peaches of one variety which are firm, mature and free from worm holes or serious damage caused by disease, insects or any other means.

A Fancy No. 1 grade is also provided for those who desire to pack an

pecially fine product. In this grade will be packed only peaches which are free from all damage by insects or diseases and which in addition have a specified amount of red color. This amount has been fixed at 50 per cent for such varieties as Carman and Hiley and at 25 per cent for Elberta and J. H. Hale and other similar varieties.

The department's action in reissuing the grades is the result of the favorable acceptance and use of the grades last year by growers associations, state marketing officials, and the trade generally. During the early investigations by the department there was considerable skepticism as to the practicability of formulating grades which would be uniformly acceptable to both Northern and Southern districts, but actual use of the grades on a large scale under the supervision of specialists of the bureau of markets and crop estimates has won over many of even the most conservative operators.

In addition to the recommended grades for peaches, the bureau of markets and crop estimates has prepared grades for 13 other important fruit and vegetable crops; asparagus, barreled apples, strawberries, cabbage, celery, cauliflower, cucumbers, lettuce, Bermuda onions, Northern grown onions, white potatoes, sweet potatoes and tomatoes. Copies of any of these grades may be secured without charge on application to Bureau of Markets and Crop Estimates, Washington, D. C.

RAISIN WEEK

When the California raisin industry set aside the week of April 23 to 29 to be nationally recognized as "Raisin Week" it established but another milestone in the romantic and progressive history of this delicious fruit.

The grapes from which California raisins are made were first grown in southwestern Asia and the bordering countries of the European continent. Today their largest field of production is in the beautiful San Joaquin Valley, a sunspot in the very heart of California, and the thousands of growers who have interested themselves in the development of the California raisin are today enjoying a prosperity seldom accorded any such industry. Entire success of this business is attributed to the painstaking care with which the vineyards were planted and cared for and the consequent merit of the product when it reached the people.

California raisins are today marketed throughout the country and exported to several of the foreign nations with the same success they are enjoying here. The successful institution known as the Sun-Maid Raisin Growers, and formerly the California Associated Raisin Company, will probably achieve greater things as time goes on, but its success in putting so much effort behind the industry in general will stand forever as a worthwhile achievement among the co-operative growers associations.

Tracing the romantic history of the fruit, historians state that the raisin grapes grown in California, constituting 90 per cent of the raisin grapes of the world, are of the same species planted by Noah after the flood and those discovered in the Promised Land by the scouts sent out by Moses.

These raisin grapes contain about 75 per cent of pure fruit sugar in practically predigested form. Is it any wonder, then, that the California raisin is so full of energizing nutriment and blessed with such a delicious flavor?

Step by step, as this industry has developed, the raisin has become more and more popular with the American public. Now it is seemingly at the acme of its popularity, yet the men associated with it in the Golden State believe that a Raisin Week will serve to introduce raisins into households where hitherto they have been regarded as tid-bits of luxury, instead of a healthful fruit food which should have a place in every home and which should be served often in the various, but simple, ways in which they can be prepared.

Broccoli handling investigations in the Willamette Valley and southern Oregon this season will be made by R. R. Palthrop of the federal bureau of markets, who will direct the work of a small corps of men in an effort to determine what causes discoloration of the "jacket."

FIRE PREVENTION WEEK

Governor Stephens has issued a proclamation, urging the observance of "Forest Protection and Fire Prevention Week," April 16 to 22, in which he says: "The forests of California, with proper care and protection from fire, will supply by their recurring growth for generation after generation the needs for timber of all of our citizens. During the summer of 1921, forest brush, grass, hay and grain fires devastated 698,357 acres in California, causing a direct monetary loss estimated at \$942,977; killing young trees, the value of which 50 years hence can not be estimated; destroying pasture that should have fed hundreds of cattle, sheep and horses; denuding watershed areas of growth needed to conserve water from winter storms for summer irrigation and electric power purposes; leaving barren waste in place of sylvan beauty. With our growing population our forests are becoming more valuable, both for timber and for the enjoyment and recreation of our populace and tourists from other states. By reasonable care and protection this great loss can be greatly reduced, our forests preserved, our hay, grain and pasture conserved.

"Therefore, I do proclaim the week April 16 to 22, 1922, Forest Protection and Fire Prevention Week, and call upon all of the citizens of California to pledge themselves to exercise

watchful care against the starting of fires, either in forest, pasture or grain areas, and to extinguish them promptly, when by mischance they do occur, knowing that so to do is to perform one of the most important services that can be rendered to the present and future welfare of our state."

KROYER BUILT

For the Toughest Jobs on Farms or Roads

WIZARD 4-PULL TRACTOR

Because of its outstanding advantages of tremendous traction and durability, the Wizard 4-Pull Tractor tackles the most gruelling jobs, and makes good.

The 4-Wheel Drive principle, with the power delivered first to the front wheels, then to the rear wheels, gives the Wizard all the traction of the track machine—and under some conditions **more**—at exceptionally low up-keep cost.

Enormous Traction Plus Durability

Super-strength, super-power and super-life are built into the Wizard by making it 35% more stalwart than it needs to be for its listed drawbar pull. This means that it works harder, faster and steadier—more hours a day—more days a year—and more years during its long life.

The Wizard is admirably fitted for road work, logging, hauling, stationary work, orchard work, vineyard work and general farming—or any other job where a tractor of exceptional stamina is needed.

For specifications, price and other particulars, write your name and address on this advertisement and mail it to us.

Son Signed Father's Note

A note was signed by father and son some ten years ago. The father died. The son gave his share of the property to the mother. Can either the son or the mother be required to pay the note?—Subscriber, Escalon.

It probably would be the case that the note is outlawed by this time unless the son acknowledged the indebtedness in writing within the past four years or unless the note has matured within the four years. The note should have been presented during administration of the estate in order to hold any of the property of the father, so that the mother is in nowise liable.

Heir Paying Taxes on Estate

Heirs do not agree with respect to certain real property. Taxes are becoming delinquent. May one pay these taxes and obtain reimbursement?—Subscriber, Los Angeles.

Any heir is fully entitled to pay taxes on the property, and he is invested with a lien upon the whole property for the shares of the other tenants in common, which must be repaid to him whenever there is any partition of the property. This also applies to other necessary expenses as to the upkeep of the property.

(In this statement it is assumed that one who pays the expense or tax is one of the heirs).

Selling Lot Bought Under Contract

A house and two city lots were sold upon contract, payable in monthly installments. Can the vendee sell one of the vacant lots?—Subscriber, Owensmouth.

The only thing that he can sell is his interest in the lot, whatever that may be. He could not convey title because that is in the name of original owner. It would require the act of the original owner, together with the vendee to transfer a clear title to any party.

Note Drawing No Interest

Is a note or a contract lawful that does not provide for payment of interest?—Subscriber, Owensmouth.

There is no requirement with respect to a matter of interest in this state, and such note is entirely valid.

Poison Out

If a person puts out poison for squirrels and rabbits, and if domestic animals eat it, is the person liable in any way?—Subscriber, Owensmouth.

A person has a right to put poison on his own premises for the protection of his property, having due regard for the safety of human life, and will not be liable for damages to one whose animals eat the poison while trespassing; but if he places poison not to protect his property, but with the intent to kill the animals, then he will be liable. The penal code provides that every person who wilfully administers any poison to an animal, the property of another, or maliciously exposes any poisonous substance with the intent that the same shall be swallowed or taken by any such animal, is punishable by imprisonment in the state prison not exceeding three years, in the county jail not exceeding one year or by a fine not exceeding \$500. There are many provisions throughout the game laws with respect to the killing by poison of various wild game; otherwise it is perfectly proper.

One Not an Officer Making Arrest

If I should see a person steal property, have I, not being an officer, the right to interfere? Have I a right to go so far as to do bodily injury or shoot the thief?—Subscriber, Turlock.

It is a rather delicate proposition for a private person to make an arrest. He is, however, entitled to make arrests in the following ways: For a public offense committed or attempted

in his presence; when the person rested has committed a felony, though not in his presence, and has reasonable cause for believing person arrested to have committed. He may orally summon as many persons as he deems necessary to him in making the arrest. In making the arrest he must inform the person to be arrested of his intention to rest him, the cause of the arrest and his authority therefor, except when the arrest is made of a person actually engaged in the committing attempt to commit an offense, or pursuit immediately after its commission, or after an escape. He must do without unnecessary delay take the person arrested before a magistrate or deliver him to a peace officer. It has been held that a private person making an arrest in case of a felony or breach of peace may overcome such resistance as is offered with such force as is reasonable to accomplish his purpose. It has also been held that in arresting for a felony a private person may, if necessary, kill a felon who resists or flees so that he cannot otherwise be taken; but there is justification for killing a person upon mere suspicion of felony. The matter of the extent of the force to be used in making any such arrest is always a question of fact to be determined by a jury.

Animals Trespass

I have 80 acres of mountain land in the center of which I maintain orchard and garden. There is fence. Stock as well as other animals have made serious depredation. Have I any remedy?—Subscriber, Owensmouth.

There is one old act which applies to the following counties or parts thereof: San Bernardino, Alpine, Dorado, Colusa, Tehama, Humboldt, Merced, Solano, Santa Barbara, San Joaquin, San Luis Obispo, Sacramento and Los Angeles. Under this act it is unlawful for any animal, the property of another person, to enter upon any land owned by or lawfully in the possession of any person other than the owner of such animal. For a violation of this act the owner of the person in lawful possession of the land is entitled to recover from the owner of the person in possession of or chargeable with the care of the animal, the damage sustained by reason of the trespass, with costs of suit. This act does not require that the property be fenced, and it has been held that trespass acts which do require that the property be fenced, do not apply to the counties or parts of the counties to which the above named act does apply. Therefore, you would undoubtedly be entitled to recover damages in the case stated.

Right of Way for Drainage

In 1913 three land owners belonging to an irrigation district made a verbal agreement to drain flood water through a natural draw on the land of one of the parties. A ditch was made to better effect this agreement and the parties all drained their water up to the present year. A new party has now purchased the land over which the drain runs and he has plowed up this ditch. Would he have a right to do so?—Subscriber, Clovis.

It is quite apparent that the three parties made an agreement whereby easement was given for the drainage of this water and have continued the practice thereof more than five years. It is very probable that the two parties whose water drains through this ditch would have a right to have the ditch maintained for the use for which it was given.

Homestead

Land has been set aside to a widow as a homestead. How can she secure a farm loan?—Subscriber, Hughson.

If you are unacquainted with the location of any farm loan association in your neighborhood you can write to Federal Farm Loan Bank, Berkeley, California, and they will either inform you of such association or give you full information.

Cows Not as Represented

In November I purchased two cows guaranteed to calve in December. They did not do so. I told the vendor and wanted my money back, but he has not given it yet. What would be

the best way to collect damages?—Subscriber, El Monte.

Your best action probably would be to bring suit for the difference between the value of the animals as represented and the value which they now have.

Queries Answered

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Poisoning Rabbits

How best to dispose of the rabbit pest is one long question. The orchardist usually prefers fencing with rabbit tight wire, but so often this is impossible that rabbit drives and poisoning campaigns are resorted to. Answering queries from several localities we would suggest first neighborhood drives if possible. However, poison grain at this time of the year is fairly effective. Later as the green grass disappears the rabbits are very fond of watermelon rinds, pieces of apple or other bait, which may be poisoned by the use of strychnine. The formula for the poison grain, especially recommended for squirrels, also recommended for rabbits, as given in the California Cultivator of September 24, 1921, is: Barley (clean grain), 16 quarts; strychnine (powdered alkalioid), 1 ounce; bicarbonate of soda (baking soda), 1 ounce; thin starch paste, 3/4 pint; heavy corn syrup, 1/4 pint; glycerin, 1 tablespoon; saccharin, 1-10 ounce. Mix thoroughly 1 ounce of powdered strychnine and 1 ounce of common baking soda. Sift this into 3/4 pint of thin, hot starch paste and stir to a smooth, creamy mass. (The starch paste is made by dissolving 1 heaping tablespoon of dry gloss starch in a little cold water which is then added to 3/4 pint of boiling water; boil and stir constantly until a clear thin paste is formed.) Add 1/4 pint of heavy corn syrup and 1 tablespoon of glycerin and stir thoroughly. Add 1-10 ounce of saccharin and stir thoroughly. Pour this mixture over 16 quarts of clean barley and mix well so that each grain is coated.

Twig Budding for Navels

Is twig budding practical for Navel oranges? When and how is it done? Is it as successful as single budding? I wish to bud over a few lemons to Thompson Navels. —Subscriber, Visalia.

Twig budding is no longer used commercially for top-working citrus. A much simpler and better method is to insert the buds directly under the bark on the larger branches, using well cured bud wood and large buds. It is still a little early for budding, the best months being May and June. In the hands of an expert twig budding is successful, but the average person secures much better results using a single bud. As to the supply company not being able to furnish buds, I would suggest taking the matter up directly with C. S. Milliken, Manager Bud Selection Department, Fruit Growers Supply Co. I know of no reason why the supply company cannot furnish buds, as there is still plenty of citrus which was not frosted.—R. W. H.

Lettuce Seed

I intend to plant 15 acres to lettuce next November. Would you advise raising my own seed, planting now? How much seed is required per acre for drilling in?—Subscriber, Carlsbad.

It cannot be done, as insufficient time is allowed. Planting should be done in August and September and seed harvested in May and June. This seed will not germinate until November or December, even though planted in August. It must have time for proper curing. It is not advisable for one to raise his own lettuce seed unless he "knows the game." It would be necessary to "rogue" or weed out all but the best types, select closely, and even then, unless the very best seed was originally planted, the risk is great. Why risk a valuable crop on 15 acres unless you well understand the seed growing game? The amount needed is two and a half pounds to the acre.

"73-Year Paint"

The Least Expensive We Know

ONLY the best paint can give you satisfactory service. It spreads easily—saving labor cost. It covers more area per gallon than "cheap" paint. Two worth while savings.

But more than that, it lasts many years longer than "cheap" paint and prevents depreciation, saves repairs, and enhances values.

We have been making best paints for 73 years—to meet the weather conditions of the West.

We use PIONEER WHITE LEAD which is super-purified and ground so fine that it will pass through a silk screen which has 40,000 meshes to the square inch.

All other materials—pure linseed oil, pure zinc and pure colors—are of the same high quality—the quality which is essential to the making of best paints.

The use of Fuller's Paints whenever your buildings and equipment need them—without delay—assures the lowest paint cost we know.

House Paint: Fuller's Pure Prepared Paint, Phoenix Pure Paint, for painting houses. The purest, best protective and most durable paint manufactured—32 colors.

Barn and Roof Paint: A protective coating for barns, roofs, fences. Dries with a good gloss and wears. Economical in cost and dependable in quality—6 colors.

Floor Paint: Fuller's Rubber Cement Floor Paint—a sanitary, waterproof and durable paint for floors of kitchens, closets, etc. Attractive in color and gloss. Dries hard over night—12 colors.

Implement Paints: Fuller's Pacific Wagon Paint, adapted for repainting agricultural implements, farm wagons, farm machinery, wind mills. A glossy, durable finish—7 colors.

Also makers of Fullerwear, an all-purpose Varnish, Silkenwhite Enamel, Fifteen-for-Floors Varnish, Decorative Washable Wall Finish, Auto Enamel, Fuller's Hot Water Wall Finish (kalsomine), Poreh and Step Paint, Silo Paint, Milk Can Enamel, PIONEER WHITE LEAD, Tractor Paint, and Fuller's Oil Stains.

Advice on Painting FREE

If you want to do your own work and get the best results, ask our Specification Department for free advice.

We'll tell you how to treat old paint, how many coats to use, what kind of brush, etc.

Use Fuller Service as well as Fuller Paints and Varnishes to insure good work.

Two Mowers at the Price of One

Is Virtually what You Get When You Buy a

Thomas Crown Two-Speed Mower

The Thomas Crown Mower differs from all others in that, by means of changeable speed gears, the knife can be driven slow when cutting alfalfa, weeds or light grass and fast when working in tough or heavy grass. Everybody knows that machinery operated at high speed wears out quicker than the same machinery run at slow speed, because the higher the speed the greater the vibration—and the greater the vibration the more "racking" there is. When a mower knife is driven faster than

necessary to do the work, an extra burden is placed on the team, with no corresponding benefit. Again, the higher the speed the greater is the tendency to heat; hence more oil must be used—and oil costs money.

The change from regular gear to slow, or from slow to regular requires no tools and only five seconds' time.

Come in and let us show you other reasons why the Thomas does the best work, does it easier, and does it for the longest time.

CALCO Bins

Save
wasted grain

You market your *whole* crop when you handle your grain in CALCO METAL GRAIN BINS. None of it leaks away; none of it goes for free lunches for squirrels and mice; none of it is destroyed by fire or exposure to early rains.

You save all by the use of CALCO BINS. That is more than you can say for the costly, wasteful method of handling grain in sacks.

Many grain farmers are cutting down their losses and reducing their operating expenses by substituting CALCO GRAIN BINS for sacks.

Order one of these money savers at once. It will be shipped ready for immediate erection.

Write for detailed information.

Cauliflower Seed

How can one raise good cauliflower seed? If I keep just the choice heads will they mix with cabbage or other vegetables? Is it necessary to cover them?—Subscriber, El Monte.

Would not advise growing cauliflower seed by anyone who does not thoroughly understand the work. It is technical work, very exacting, and we know of none who has made much money at it, even over a term of years. Planting for commercial crop is done in July, but for seed crop the planting time is September. The July planting would have blossoms and seeds caught by frosts, while September planting throws the crop into late spring after frosts are past.

Hot spells may then come and seed are "cooked," especially inland, for cauliflower does best in cool weather. Cauliflower runs 7,000 or 8,000 heads to the acre, but one would have to choose but a few of the best and choose knowingly. Birds also swoop down in flocks and practically eat the entire crop. Good growers often get but 25 pounds to the acre. Among frosts, heat and birds, the risk is great. There is so much to tell that should be known, and so technical in detail, that subscriber is advised against such seed growing until he visits and consults at length some one already in the business.

Dying Fern

What can we do for Boston fern which seems to be dying? It was badly infested with brown apricot scale and we were advised to put soapsuds on it, which we did, but afraid we got them too strong. Is there any help for it?—Subscriber, Sebastopol.

In such case would advise cutting off entire top, watering well once, and no more until new top has started. If you poured the strong soapsuds on the soil the fern is probably dead, at least not worthy of attempted resuscitation. If leaves only were saved proceed as advised and get a new set of leaves.

Buds and Grafts

Is it best to bud or graft seedling carob trees, and at what age and time of the year should the work be done? Should rose bushes be budded or grafted to change to other varieties? What good variety of plum blossoming from two to four weeks later than Satsuma, would be a good pollenizer for another plum?—Subscriber, San Diego.

Both budding and grafting is practiced on carobs, but grafting is the more general and more successful. Right now, in the month of April, is an ideal time, and when seedlings are as thick as lead pencils is the best stage of growth. It is better to bud than to graft rose bushes. Burbank, Wickson and Abundance are three good varieties that generally blossom in the relative season you mention.

Pruning Thompson Seedless—Mildew

How long should a high standard grape vine like the Thompson Seedless be left from the main stock—third year—and how many canes also short and medium varieties? Many grapes last year split open and soured about the time they began to color. There were bugs on them that looked just like bean weevil. Can you tell me the cause and cure?—Subscriber, San Diego.

In pruning young Thompson Seedless grape vines it has come to be the common practice to establish a comparatively high head. This is done by leaving a single cane 30 inches or more in height, and forming a head at or near that point. The number of canes which may be left on a three year old vine depends on its vigor, which is not usually so great that more than two canes will be required.

It is very probable that mildew was the cause of your grapes splitting and souring. I doubt very much if the bugs mentioned had anything to do with the condition of the fruit. This could not be told, however, by the examination of a specimen. To prevent recurrence of this condition, providing, of course, it is mildew, your vines should be very thoroughly sprayed at frequent intervals throughout the season, beginning when the shoots are six to eight inches in length.—F. K. H.

Household Department

CHRIST IS RISEN!

By Ruth P. Dougherty

"Christ is risen! Christ is risen!"
Happy voices join His praise,
"Christ is risen! Christ is risen!"
Lord of Life through endless days.

Clouds of greed and hate are riven,
Fading creatures of the night;
Mists of fear and doubting scattered—
Lo, where streams His glorious light!

Love that came to Bethlehem's cradle
On that Holy Christmas Day
In the risen Christ now speaketh,
"I am with you all the way."

Loving Christ, our risen Saviour,
We as children turn to Thee,
Longing hearts and hands uplifted;
Pure and holy we would be.

Risen Christ, in love triumphant,
Healeth now the sad world's need.
Weary heart, look up, rejoicing.
He is risen, is risen indeed.

NEEDLE NADDLE'S EASTER GIFT

By Annette Squire

ONE MORNING not long before Easter, Peggy Weggy and Jerry Dumppling discovered Needle Naddle, the Redbreast, chirping and singing on the tip-top of their father's garden spade. And below him, grinning at him, was Pussy Cat.

"Pussy Cat makes me laugh," sang the robin, "I am not afraid of cats! I am not afraid of dogs either! That is, usually I am not. But I don't like

"Mother Goose had a house; it was built in the wood," answered Jerry quickly.

"An owl at the door for a sentinel stood," added Peggy.

"Right! You can tell it by the owl. Are you afraid of dogs?"

"Not a bit," said Jerry.

"Then will you carry my precious Easter gift to Mother Goose? Look, here it is at the foot of the lilac. Carry carefully what is so beautiful."

The children looked, and saw only an ugly ball of dry grasses—grasses wrapped round and round, and round and round.

"Take it," said the robin and flew away.

"We'll have to take it," declared Peggy, "if we can. But do you think it is beautiful, Jerry? I think it is a queer, ugly thing for an Easter gift."

"Could something be inside of it?" wondered Jerry. "What could be inside of it? Carry it carefully, Peggy Weggy."

Very carefully they carried, first one and then the other. They had never gone so far into the wood before. But deep, deep in the wood they found a little house that they knew must be Mother Goose's house, because an owl sat over the door. And there was the fussy little dog, too. Out he ran, barking fierce and fast.

CHRIST IS RISEN!

In the end of the Sabbath as it began to dawn toward the first day of the week came Mary Magdalene and the other Mary to see the sepulcher. And, behold, there was a great earthquake; for the angel of the Lord descended from heaven and came and rolled back the stone from the door and sat upon it. His countenance was like lightning and his raiment white as snow * * * And the angel * * * said unto the women, "Fear not ye, for I know ye seek Jesus which was crucified. He is not here, for he is risen as he said." * * * And as they went to tell his disciples, behold, Jesus met them, saying, "All hail." And they came and held him by the feet and worshipped him. Then said Jesus unto them, "Be not afraid; go tell my brethren that they go into Galilee and there shall they see me." * * * Then the eleven disciples went away into Galilee, into a mountain where Jesus appointed them. And when they saw him they worshipped him; but some doubted. And Jesus came and spake unto them, saying: "All power is given unto me in heaven and in earth. Go ye, therefore, and teach all nations, baptizing them in the name of the Father and of the Son and of the Holy Ghost, teaching them to observe all things whatsoever I have commanded you; and, lo, I am with you alway, even unto the end of the world."

fussy dogs. There is a very fussy dog down in the woods near Mother Goose's house. He barks at every little bird that comes near. He seems to think that she ought to have only owls and geese. Do you know where her house is?"

"Bow, wow, wow," mocked Peggy, "whose dog art thou?"

And he barked back, "Little Tommy Tucker's dog, bow, wow, wow!"

"Well, then," scolded Jerry, "why don't you go home?"

And that took the little dog so by surprise that he turned tail and ran yelping away—toward Tommy Tucker's house.

The funny old owl blinked, looked rather pleased, and nodded his head. "Who-oo, who-oo?" he inquired.

"Just Peggy and Jerry Dumppling," they told him, "and we have brought an Easter gift to Mother Goose from a robin."

"A robin," cried a gay old voice, and out of the door came Mother Goose, settling a pink bonnet on her gray curls and smiling.

"An Easter gift!" she said, taking the ugly ball, "then there is in it something of life and beauty. Look!"

Mother Goose took off the dried grasses that were wrapped round and round. One by one they fell down until at last she held in her hand—did you guess it?—four beautiful blue robin eggs!

"I shall care for them," she said, "I shall find the Mother Robin to keep them warm, and at Easter they will blossom into four new little Robin Redbreasts for my woods!"

HOUSEHOLD QUERIES

Yellow Dye Stain

I wish to know how to remove yellow dye from white clothes caused by a lingerie ribbon inadvertently left in the laundry.—Subscriber, Waitsburg, Washington.

Put lemon juice on stained spot, then apply javelle water, let stand a moment then rinse with hot water and soap. This procedure may be repeated if stain does not come out the first time. Javelle water is made of 1 pound washing powder, 1 quart boiling

When Will There Be A Disarmament Of Dining Tables?

Suppose everybody would recognize the fact that there's no gain but much loss in keeping up hostilities with the stomach!

Suppose the ancient aggravation of improper food on indignant digestive organs should be settled with guarantees of sensible diet and tranquil digestion!

The saving would be beyond all possibility of counting.

Yet millions go on declaring war on the stomach and accepting war in return—loading up on starchy, heavy, unbalanced and highly-seasoned food at breakfast or lunch—and wondering why comfort and happiness and efficiency are out of reach.

Grape-Nuts makes a friend of the taste and an ally of the stomach.

There's a charm and satisfaction to this delicious food which prompts appetite to say, "There's a meal!" and digestion to answer, "Thank goodness, here's peace at last!"

Grape-Nuts is the perfected nutriment of wheat and malted barley—sweet, crisp, and wonderfully nourishing. It digests quickly and provides the necessary elements, including the vital mineral salts, for body, nerve and brain.

Order Grape-Nuts from your grocer today, and let a delighted taste pass a treaty of peace along to an enthusiastic digestion and assimilation.

water, ½ pound chloride of lime, 2 quarts cold water. Put soda in agate pan and add boiling water. Mix lime in the cold water and pour into the dissolved soda. When settled, pour clear liquid into a bottle and keep in dark place. The sediment is a good disinfectant for sinks and flush closets.

Light Corn Bread

Looking through the Cultivator I find several recipes of all kinds, but I have never seen any for light corn bread. I would like very much to have a recipe for it, if you could get it for me.—Subscriber, Johnstonville.

If our inquirer means corn bread made with baking powder, here is the most delicious, fluffy quick bread we know of:

One cup (scant) yellow corn meal (finely ground), 1 cup milk, 1 egg, 1 tablespoon sugar, 1 teaspoon (heaping) baking powder, 1 tablespoon shortening, pinch of salt. (If drippings are used, omit salt.) Put lard in pan in which bread is to be baked and slip in oven to melt. Put all other ingredients into mixing bowl; beat up quickly with split spoon; pour in melted shortening, folding in quickly; pour out batter in the hot pan; bake in quick oven. If oven is a little slow the egg will settle to bottom of pan, leaving delicious layer of egg, with lighter bread above. I often cook it this way (by mistake—on purpose). This bread is very light and tender, and, of course, crumbly, because of having no flour in it and small amount of corn meal in proportion to liquid.

If yeast bread is what is wanted, here is recipe sent out during war conservation times:

Eight cups white flour, 1½ cups corn meal, 5 teaspoons salt, 2 tablespoons corn syrup, 1 or 2 cakes compressed yeast, 5 cups water. Make same as other yeast bread, but because of less amount of gluten it must be molded and handled with care.

PRESSURE COOKER — FIRELESS COOKER

In the Cultivator of April 1 a subscriber asks as to value and use of pressure cookers and fireless cookers. We are glad to be able to present this week letters from housekeepers who make daily use of them. One point brought out in the following letter from Chatsworth we wish to emphasize, and that is that the steam pressure cooker may be used on coal oil, gasoline or wood stove; it is not necessary to have gas or electricity as many housekeepers have thought. The pressure cooker is valuable in the gas or electrically equipped kitchen; it is invaluable where slower fuel is used.

Invaluable for Canning

I have a pressure cooker and use it for practically all my cooking and canning. We are four at the table and I put cooker on at 11:15 and serve dinner at 12 o'clock. Have meat in bottom on trivet, potatoes in wire basket, vegetables in pan next and pudding in pan on top—all cooked on one burner of Perfection oil stove. The actual cooking takes about 20 minutes and 20 minutes to register 20 pounds pressure, counting cooking time from the time pressure is 20 pounds, or desired pressure according to what is being cooked, a little longer time at lower pressure, etc.

We settled last summer on a small ranch and our garden at times gives more than we can use fresh, so I can up the string beans, tomatoes, peas, etc., for days when there is a shortage of green things for the table. Pack the jars (after blanching) with vegetables or fruit and set in pressure cooker on trivet and put on lid and fasten, then run pressure to desired number of pounds and cook. Time tables for cooking come with the cooker. I have the Sechrist cooker, bought at \$28.75. Fruit canned by steam tastes more natural, retains color and shape.

One need not worry as to overcooking a meat if family does not arrive on time, just turn off the fire and cooker will stay hot for two or three hours with pet cock closed. One can wrap a blanket around the pressure

cooker and take out on trips Sundays. The hot dinner will be acceptable to all.

Strong odors of onions or cabbage do not taint the other food in cooker. We had a goat a couple of weeks ago and could not use all the fresh meat, so I cold-packed and put in the cooker—now have meat canned for emergency.

In these ways I consider the cooker very economical and a saver of work. I hope this information will be helpful to others.—Reader, Chatsworth.

Pressure Cooker Saves Time

The pressure cooker is especially good for cooking foods which take a long time to cook in the ordinary way, such as beef roasts or any other kinds of meats, beans, prunes, vegetables, etc. I take a roast of beef, brown a little in the frying pan, season to taste, put in cooker, screw lid down tight (which is easy to do), run up to 20 degrees and hold there by turning down gas or coal oil very low, and cook about 25 minutes (of course, it would depend upon size of roast and kind), then let steam out, put in my potatoes, run up to 20 again and cook five minutes, when the potatoes will be done. If you have some kind of vegetables to put in put pan on top of roast and cook at same time. Most vegetables take about five minutes. When the roast comes out it is nice and juicy and the same size you put in, which does not always happen in cooking in oven. Another thing, cheaper cuts of meat can be cooked and made to taste delicious. There is nothing dangerous about the cooker and it is very easy to learn, but it cannot be left alone as it might run over 20 degrees and do damage to cooker. But it is needless to leave it as one can be preparing the rest of the meal and setting the table.

In the selection of a pressure cooker there are a number of kinds. Be sure to buy one that screws the lid down tight, for if it leaks it will take much longer to cook and be unsatisfactory in more than one way. Mine has about five places to screw down; there are some that only have two or three, and they leak.

The pressure cooker, like a new stove, is learned by experience. It is certainly worth the money. Mine is a Sechrist cooker and very good. Pressure cookers are certainly fine things to have.

Yes, a Pressure Cooker

We have had a pressure cooker nearly a year, and use it constantly. I find it saves time, fuel and food. The only trouble I ever had with it was when I did not follow the directions that came with the cooker. I was canning string beans in a six pound Crisco can and being in a hurry I opened the cooker before the pressure was quite down—result, string beans all over the kitchen and a can only half full. The next time I wasn't in a hurry, and when I opened the can this winter all said, "the best ever." Another time I was cooking a very old hen and I thought I had better give it a little more time than called for—result, the meat was all off the bones. Since then I have followed directions. I have canned fruit and vegetables in glass and tin with good results. It is remarkable how sweet and tender old beets are when cooked in the pressure cooker.

We had sickness this winter and I made the best soup by cooking a shank bone and rice about 40 minutes. The bones were as white as though they had been boiled three days, and the rice never stuck or burned. The toughest meat is tender and never stringy. Steel cut oats can be cooked for breakfast in a short time.

I do not bother with it for potatoes and food that cooks quickly, as it takes time to get up to pressure and to cool off before opening. I never tried bread but once and that was like a stone. The pressure keeps it from rising and it will get up to pressure before you know it—it takes so little fire.

Baked beans—well, I am from Boston and I knew beans must be baked all day to be fit to eat. At last the good man persuaded me to try the cooker—result, we have not baked beans since. My husband has promised to make a fireless box to put the cooker in so we can take our dinner out on picnics this summer, then I

shall have both; but that is another story.

My advice is get a pressure cooker, use it according to directions and you will be satisfied that it is a wise investment.—Mrs. Ruth Watson, Sunnyvale.

Need Both

In the Cultivator for April 1, I notice you would like to hear from some who have had experience in using fireless or pressure cookers. As I have had both, I thought I might be able to give a little information.

We had a three compartment Rapid Fireless Cooker and found it very satisfactory. I would fix my mush at night and put it in the cooker, and in the morning it would take but a few minutes to get it reheated for breakfast. Then I have put beets and soup in it in the morning, have gone away from home for hours. On returning I could have my meal ready in a few minutes.

For almost two years we have been using a Denver Pressure Cooker and we find it very satisfactory. We would not want to be without it. With it, food can be cooked thoroughly in a short time, and the flavor is delicious. We find it unnecessary to use any seasoning but salt in beans (dried or green), cabbage, cauliflower and turnips. This is quite a saving. Mush cooked in pressure cooker has much better flavor than when cooked otherwise, and can be cooked in a short time.

One advantage the fireless has over the pressure is that you can bake in it; another is that you may go away and leave your food cooking in the fireless. I never feel like leaving my pressure cooker for long, but food can be cooked in such a short time in it that it is not necessary to do so.

Personally I would like a one compartment fireless cooker of good make and a good pressure cooker in large size. If I could have but one would take the pressure cooker.

While the first cost seems high we find that these cookers will pay for themselves by the saving in time, fuel, and the seasoning. Then the food is much more palatable.

Couldn't Keep House Without Fireless

I could not or would not like to keep house without my Domestic Science Fireless Cooker. First, it saves fuel, which is very important in California, and prevents heat in the kitchen. Second, it saves labor. I can put my dinner in fireless cooker, go away from home if I so desire and return at meal time with dinner perfectly cooked ready to serve.

It excels in preserve making, as it cooks your fruit whole, never burning or scorching food, and you never have the odor of food cooking in house.

When we go on picnics I put my dinner in fireless cooker, put cooker in car and when we reach our destination we have our hot dinner ready to serve.—Mrs. Franklin Bell, Redlands.

Better Methods in Home Making

I have used a fireless cooker for one and a half years and would not be without it. Meat or beans are by far best cooked in a fireless. Pie or cake baked in one is excellent. I have canned fruit and vegetables by using the fireless and found it highly satisfactory. Last Sunday I put my dinner in the fireless and went to Sunday school and church and found on my return a most excellent dinner ready to be served hot when taken from the fireless cooker. I am not familiar with the pressure cooker. Yours for better methods in home making.—Mrs. L. Bostwick, Paso Robles.

HINTS FROM HOUSEKEEPERS

Freshening Pickled Pork

In reply to "Subscriber, Sonoma County," you recommend parboiling to reduce the saltiness of pickled pork. I find it is much nicer with salt soaked out. For boiling, soak the piece over night in plenty of water, and in the morning put to boil in cold water.

For frying, slice and soak over night or for several hours. If part sweet skimmilk is used it makes it very much nicer, as it browns nicely. When ready to cook, drain and wipe the pieces with a soft cloth and fry over a hot fire, with a spoonful or two of fat in the pan.—Mrs. W. H. Currell, King City.

DISPERSAL SALE

161—Registered Holsteins—161

112 Females—49 Bulls

F. H. Harvey Herd, Galt, Calif.

Selling on the Farm—about Three Miles West of Galt

April 26-27

At 10 A.M. Each Day

In order to devote his time to his many other interests, Mr. F. H. Harvey has decided to make a complete dispersal of his big herd of registered Holsteins. The herd represents many of the highest producing blood lines of the breed and is of high average type.

A LARGE NUMBER OF THE FEMALES HAVE OFFICIAL RECORDS UP TO OVER 26 LBS. BUTTER IN 7 DAYS. MOST OF RECORDS MADE AS 2, 3 AND 4 YEAR OLDS.

The herd contains a considerable group of the daughters of the 32 lb. bull SUPREME GLISTA PIETJE, whose daughters have consistently shown a high percentage of butter fat.

Many of the females sell bred to KING PONTIAC SEGIS INKA, a splendidly bred son of King of the Pontiacs, and the bull himself will sell.

DAIRYMEN SHOULD NOT OVERLOOK THE OPPORTUNITY TO BUY A PURE BRED REGISTERED BULL IN THIS SALE. THERE ARE FORTY-NINE BULLS TO SELL, MANY OF SERVICE AGE, AND THERE ARE BOUND TO BE A GREAT LOT OF BARGAINS.

TERMS OF SALE: Responsible parties may arrange before sale, with sale managers, for credit on the basis of one-third cash, balance in three, six and nine months, with notes bearing eight per cent interest.

Guaranteed Breeders—No Tuberculin Test Certificates

Viewing Holstein Farms by Automobile

By Jack Klein

THE two days following the guaranty sale were spent by the Southern California Holstein-Friesian Association in entertaining the breeders from a distance with automobile trips, which included visits to the most prominent Holstein breeding farms in and about Los Angeles.

The first day a crowd of 50 started on the trip, and their number was augmented at each stop, until at the

pounds of butter in a year. It was the consensus of opinion that very few herds of pure bred are headed by such bulls. The Pellissiers have been purchasing a few pure bred females lately and have been making some fine records.

The last stop of the day was at the Baldwin ranch, where the famous bull King Korndyke Pontiac Acme, and his calves were the principal objects of interest.

HARTSOOK COW BREAKS SECOND WORLD'S RECORD

Miss Aaggie Ormsby Segis, who recently dropped a fine helper calf and thus assured the acceptance of her world's record for ten months at 2½ years of age, has just finished a seven day record of 40.954 pounds of butter from 644.9 pounds of milk at 3½ years of age. Earl Sturgis has managed the test on a lot of cows, but this is his first 40 pounder. You can imagine how happy he is!

end nearly 100 people were in attendance.

The first stop was at the Burr Farm, where a wonderful herd of producing females with high yearly records has been assembled. The principal feature of the Burr Farm, however, is the great herd bull, King Korndyke Pontiac 20th, and his progeny on the farm. This bull has been in service here for nearly two years, and his daughters on the farm are still young but they are beauties. It is no question that they will be high producers, as paternal half sisters in other herds are constantly making high records. From Burr Farm a quick trip took the crowd to Earl Graham's, near Compton, where Earl proudly exhibited Princess Malda Veeman, his world's record three year old, who made 1154.7 pounds of butter in a year and whose combined two and three year old records total 49,905.3 pounds of milk and 1915.2 pounds of butter.

Everyone was in a hurry to get to the Los Angeles County Farm and an excellent lunch provided by the Southern Association. During lunch the visitors were given a chance to see the methods of keeping the herd records and other data connected with the business. Everyone was amazed at the thoroughness with which Superintendent W. R. Harriman has arranged the dairy department of the farm. Starting with a small herd of grade Holsteins and a couple of good registered bulls, the herd has grown under Mr. Harriman's supervision to the world's highest producing herd of over 100 cows. It now includes a number of very choice pure breeds and the best bulls obtainable. The visitors were as delighted with the extremely sanitary conditions of the barns and corrals as with the animals.

The next stop was at Agee Brothers' farm at Rivera. Agee Brothers for a number of years maintained a very good herd of milking cows. These were of varying types, as a herd purchased here and there is bound to be. At the head of this herd was placed the young bull, Toyon Fayne Valdessa, a grandson of the first 40 pound cow, Valdessa Scott II. The remarkable thing is that practically every one of the 40 daughters of this bull out of these various type cows has a perfectly straight top line and the most perfect udder imaginable. This is an asset to Agee Brothers that cannot be counted, and in another year or so they are bound to be famous on account of this bull.

The next call was on the Pellissiers, where hundreds of excellent Holstein grades are milked. Mr. Pellissier has always used the best herd bulls he could get and he has a wonderful herd of producers. In the bull corrals the crowd was amazed to see a son of King Segis Alcartra Prilly, the great Bridgford bull, out of a cow that made 950 pounds of butter as a four year old from three quarters. In the next pen is a son of King Mead of Riverside, out of a 900 pound four year old, and next to him is Prince Walker Cornucopia, the former herd header at the Santa Anita Ranch. He is a son of Prince Gelsche Walker and out of a 36 pound dam who made 866 pounds of butter in 342 days. The other bull is Sir Acme De Kol Acme 7th, whose three nearest dams average 1115

The second day began at the Anderson Ranch at Burbank, where the great son of Pontiac Korndyke now resides. Mr. Anderson is an old established breeder and is generally conceded to be one of the best judges of dairy cattle in the state. His herds bears out this contention.

The second stop was at the Hartsook ranch. Fred Hartsook has provided Earl Sturgis with so many great cows that it is impossible for one to

STOP ABORTION

It spreads rapidly; is often caused by the same infections that cause barrenness, garget and calf scours. It cuts the quantity of your milk—also contaminates it. B-K is your safest, surest weapon to defend your pocketbook against these losses. It has the strength to kill on contact, the germs causing abortion, garget, calf scours, also those of bad odors. Easy and cheap to use; safe, clean—contains no poison, acid or oil. Farm packages 1-gal. and 5-gal. boxed—all dealers—get a package—money back if not satisfied. Ask for bulletins.

HALF A CAN SAVED HIS COW

Trouble After Calving Quickly Cleared Up

So many cow ailments have their origin at the calving period simply because cows are left to shift for themselves during this critical time, when the simplest kind of medicinal care would insure health and safety. E. A. Hale of Chatham, Mass., writes us:

"Please send me a copy of 'The Home Cow Doctor.' I had one cow this spring that did not do well after calving. I tried everything and she grew worse all the time. Her milk about stopped. A friend of mine gave me about half of a small can of Kow-Kare. I gave her that and she began to pick up and eat before that half box was gone, and gave ten quarts a day. I got more Kow-Kare and now she is giving fifteen quarts a day, and is hungry as a wolf."

Kow-Kare has carried thousands of valuable cows safely through calving. The best plan is to use it for two weeks before and after. Barrenness, Abortion, Retained Afterbirth, Scouring, Bunches, Milk Fever, Loss of Appetite and all similar disorders that arise from weakened digestive or genital organs are quickly cleared up by Kow-Kare, because it is these organs that are toned up and strengthened by this great cow medicine.

General stores, feed dealers and druggists sell Kow-Kare at the new reduced prices, 65¢ and \$1.25

CALIFORNIA BREEDERS SALES
AND PEDIGREE CO.

C. L. Hughes, Sales Manager.
Sacramento, Calif.

grasp the true greatness of the herd in a short visit. There are nearly 20 cows in the herd who have made over 1000 pounds of butter in a year and innumerable ones with 30 pound records. At the head of the herd stands Sir Aaggie De Kol Mead, five of whose seven nearest dams average 1130.68 pounds of butter in a year. This is one of the most richly bred bulls of the breed and he is getting some excellent calves for Mr. Hartsook.

Across the road a stop was made at Carl Ray's ranch, where he is assembling a herd of very good animals. Mr. Ray has been a prominent figure in Holstein sales for the past couple of years and the soundness of his judgment is to be seen in the herd he has gotten together.

From here the crowd whirled to the Maxwell Farm, "the fountainhead of the Ormsbys," where they were shown a number of daughters of Sir Ormsby Skylark, the sire of Duchess Skylark Ormsby, whose record of 1506 pounds of butter in a year was the world's record for so long a time. The daughters of Sir Ormsby Skylark have made and are making some exceptionally fine records for the Maxwell Farms. Considerable interest was taken in the famous Silky, who has never been defeated in the show ring, either in the East or West. This heifer is just fresh and made a wonderful picture, as she thoroughly enjoys visitors and is always on her best behavior while they are there.

The next point of interest was the new plant of the Los Angeles Creamery near Van Nuys, where it is expected shortly to be milking 1200 cows. This is going to be a great plant, and it is the hope of the Holstein fraternity that eventually these cows will be pure bred Holsteins.

The last stop was the Sunshine Ranch, San Fernando, where a small herd, principally of pure bred, is being assembled, very largely to provide fertilizer for the 1000 acres of oranges now growing there.

The value of two days spent in a trip like this cannot be estimated. It is only in this way that any great number of farms can be visited and the herds looked over. Many of the Southern California men who went along have never visited all of these places and very few get around often. The northern men were delighted with their entertainment and went home strong for Southern California and its Holstein breeders.

The total number of milk cows in the United States on January 1, 1922, was estimated to be 24,028,000 as compared with 23,594,000 on January 1, 1921 and 23,722,000 on January 1, 1920. The average value per head in 1920 was \$85.86; in 1921, \$64.22, and in 1922, \$50.97. The percentage of decrease when compared with the preceding year was 25.3 per cent in 1921 and 21.7 per cent in 1922. The total number of all other cattle in the United States on January 1, 1922, was estimated to be 41,324,000 as compared with 41,993,000 on January 1, 1921, and 43,398,000 on January 1, 1920. The average value per head in 1920 was \$43.21; in 1921, \$31.36, and in 1922, \$23.78. The percentage of decrease when compared with the preceding year was 27.5 per cent in 1921 and 24.2 per cent in 1922.

The Yolo, Colusa, Solano Woolgrowers Association was organized April 1 at Woodland, when about 40 sheepmen met for that purpose. F. N. Bullard, of the firm of Bullard Brothers, prominent Rambouillet breeders of Yolo County, was elected president. An executive committee was elected, consisting of Elwood Peters, Dr. E. E. Brownell and H. G. Brown from Solano County, W. F. Stephens, J. B. Merritt and G. M. Chapman from Yolo County, and S. A. Mendosa, Edgar Mitchell and G. W. Hougland from Colusa County. Fred A. Ellenwood, president, and W. P. Wing, secretary of the California Woolgrowers Association, were present and addressed the meeting.

The Western Berkshire Congress is awarding a silver trophy and a silver and bronze watch fob, all suitably engraved, as first, second and third prizes in the students' fitting contest to be held in connection with the students' annual picnic at University farm, Davis, on April 29.

40---Serviceable Bulls---40

The
Rangeman's
Opportunity

The
Better
the Bull—
the Better
the Steers.

Herefords
are:
Thick-fleshed,
Hardy,
Rustlers,
Early Maturing,
Profitable.

This offering of bulls should prove a real opportunity for the range man. They are the right kind—short legs, blocky, mountain raised and range fed. The kind that produces real steers and makes money for the buyer. This sale will be the last opportunity for California cattlemen to buy Hereford bulls at auction this spring.

10—Cows and Bred Heifers—10

The females have been selected with care and are just the sort for the beginner or the man wanting to establish a herd for the production of registered cattle. They are a splendid lot.

I have recently located in Stockton and this will be my first annual sale in the San Joaquin Valley. Come and get acquainted with my cattle.

H. M. BARNGROVER

Bank of Italy Building Stockton, Calif.

Jno. A. Marconi, Auctioneer

ANNOUNCING FIRST PUBLIC SALE Innisfail Milking Shorthorns Friday, May 5, Davis, Calif.

Why Milking Shorthorns?

Milking Shorthorns are the most practical cattle for the farmer.
Milking Shorthorns will produce profitably at the pail (many cows average 8,000 to 12,000 pounds of milk a year).
Milking Shorthorns are hardy, adapted to dairying in the foothill and mountain sections.
Milking Shorthorns will produce profitable beef steers (the best Shorthorn carcass at the 1920 International was from a steer whose dam was record of merit cow).

There is a wide and active demand in California for cattle of this breed.

Why INNISFAIL Milking Shorthorns?

Innisfail herd was founded in 1914 with purchases from the best American herds.
Innisfail Milking Shorthorns are milked and this herd probably has more record of merit records than any Western herd.
Innisfail Milking Shorthorns have a showing record second to none.
Innisfail Milking Shorthorns are healthy.
Innisfail Milking Shorthorns are backed by sincere purpose, honest effort and a reliable guarantee.

Collins Farm Queen, Hello De Kol, Kansas
State Champion Butter Producer

Why Great Dairymen use Empire Milkers

AT Maaikenshof, Bedford Hills, New York, the Empire Milker is used on pure bred Holsteins, making test records. Supt. R. E. Buell reports that although these cows are milked four times a day, teats have never been injured in any way.

Collins Farm Company, Sabetha, Kansas, milk their prize cows including a State Champion with Empire Milkers to save money and to increase production. The Cotati Company, Cotati, California, reports that the Empire saves \$3600 per year.

Thus from coast to coast, the great dairymen have approved the Empire as most efficient method of milk production. And the same results are obtained from a grade herd of six or more cows.

The Empire reduces labor costs, makes cleaner milk, increases production and benefits cows.

The 1922 Guaranty Sale

By Jack Klein

THE fifth annual guaranty sale of the California Holstein-Friesian Association was held at Hynes near Los Angeles last Wednesday, April 5. This was the first guaranty sale that has been held outside of Sacramento. Tulare has been a candidate for the sale for the past two years but the hotel accommodations are not yet adequate in that city for crowds the size of the ones that attend these sales. Los Angeles is in a way the logical place to hold a sale of the caliber of a guaranty sale as for the past two years at least more than two-thirds of the offering has come south of the Tehachepi.

Breeders of Holstein cattle throughout the state have come to watch the guaranty sale each spring as a means of determining the standard by which to set the values on their own animals. They know that these animals are the best obtainable and the prices they bring are a good barometer of the conditions. All of the breeders who are used to following the above methods of inventorying their herds will have to do some cutting if they use this year's sale as a basis of value, because the prices were nowhere near the ones heretofore obtained. This is no sign though that the price of good Holsteins is weakening very much. The average animal in this sale was considerable below the average of the previous sales. You cannot blame the breeders in a way as the conditions are very unsettled and cattle are down along with everything else. Most of the animals on the farms today were bought in a period of good times and cost the man more than he can hope to get at present. Most of them were bought as a foundation for a future herd and there is no reason for one to sacrifice such animals just in order to help out a sale. However the guaranty sale is a point of honor with most of the breeders and they consigned animals that could not have been bought off their ranches for many times what they hoped to get. Some of the men failed to consign animals that brought tears to their eyes when they were sold and so the average was not so good as in former years. Another thing the sale emphasized is the value the breeders place on the 305 or 365 day test. Many of the animals had made splendid seven and 30 day tests but they were not nearly so eagerly sought as the ones with only moderate long time records.

A total of 64 head was cataloged but for one reason and another some were dropped out and 58 went through the ring. These brought a total of \$26,555 or an average of a few cents over \$457 each. The top animal of the sale was the outstanding cow Norma Korndyke Cornucopia who has a seven day record of 38.42 pounds butter and is the highest record cow ever offered at auction in the state. This cow also has a 30 day record of 155.75 pounds butter which won first place in the entire United States in 1920-21, giving her first place in both the seven and 30 day divisions. A number of the big breeders have been watching this cow and at the Crawford-Spires sale last summer she brought \$2300. She was purchased by Mrs. Annie Donders and J. M. Blenkiron and J. F. Phillips of Fresno. At that time the cow was open and the owners of good bulls were keen for her. She sold in the guaranty sale bred to Sir Aaggie Mead who formerly headed the Toyon Farm herd and is now owned by W. J. Higdon and F. S. Borror and Son. There was considerable competition for the cow and she could have brought \$1000 more than she did and still been well within her value. She is a wonderful individual and is bred to a bull that stands in the first rank in this state, but the money market has been tight and after considerable time Col. Rhoades was forced to sell her to Fred Hartsook for \$1700. When the gavel dropped Hartsook mentally credited his bank account with about \$1500 because he has previously stated that he would give \$3000 for the cow. She is a great cow and is in the hands of one of the few men in the state who can give her a real opportunity to prove her further worth.

Heading the heifers was a youngster

that some people thought might out-sell the 38 pound cow, but she did not make the grade. This was Fay Tritomia Hengerveld 2d who was consigned by W. J. Higdon. She was the sweetest thing in the sale and was purchased by Burr Farm for \$975. Sired by King Korndyke Pontiac 20th and out of Fay Tritomia Hengerveld, this heifer had one of the richest pedigrees in the sale and she is backed up everywhere by high records. Another thing in her favor is that practically every dam in her pedigree has one or more high record daughters. She was a find at the price she brought.

Mr. Higdon also had the honor of topping the males in the sale with a son of King Korndyke Pontiac 20th. This bull is out of the famous 30 pound cow, Mona Fobes who has been a consistent winner in the show ring. He is a great individual and his pedigree is a real one. He was a bargain to Frampton Brothers at \$1300.

One of the sensations of the sale was a little heifer consigned by the McCloud River Lumber Company. She was a thing of beauty and had a junior two year old record of 21.38 in seven days. This was a pretty good record but the thing that the breeders liked was that she had made 620 pounds of butter in 305 days. She brought \$660 while 30 pound cows were bringing under \$600.

SEMI - DISPERSAL SALE 50 REGISTERED JERSEYS HYNES, CALIF.

at Rhoades & Rhoades Sale Pavilion
Tuesday, May 9, at 10 a.m.

Here is the opportunity registered Jersey buyers have been hoping for for months past—to find available for purchase a high class lot of Jersey females.

This sale includes every cow and bred heifer in the well known herd of GEO. W. THOMAS & SONS, Arlington, Calif., also the two herd sires. Mr. Thomas and his sons are retaining only their unbred heifers and heifer calves as foundation for their future herd.

THIS IS A HERD OF SPLENDID INDIVIDUALS, IN EXCELLENT PHYSICAL CONDITION, THE ENTIRE HERD IN MILK AVERAGING 38 LBS. BUTTER FAT PER MONTH AT THE PRESENT TIME.

The entire herd was recently tested by a Deputy State Veterinarian, and not a single animal responded to the test. Every animal guaranteed to be a breeder and sold subject to tuberculin test by the buyer.

TERMS OF SALE: Responsible parties may arrange for credit on basis of one-third cash, balance in three, six and nine months before sale with California Breeders Sales and Pedigree Company.

SWINE FUTURITIES AT SOUTHERN CALIFORNIA FAIR

Much interest is being taken in the swine futurities for the next Southern California fair. Secretary W. W. Van Pelt has arranged with each of the national associations of the four leading breeds and has announced very attractive classifications.

The National Duroc-Jersey Association offers a classification for both junior and senior litters. The senior show is for pigs farrowed after September 1 and before March 1. The junior show provides for pigs farrowed after March 1. It is hoped that both the senior and junior shows will fill this year. Last year only the junior filled.

The National Poland China Promotion Show will be the center of much interest this year to Poland China breeders. The secretary has notified these breeders of the character and rules of the 1922 show, and already several herds have been nominated. While there are few large breeders of Poland Chinas in Southern California, there are a large number of small ones who are showing a live interest in the promotion of the breed. There are quite a number of these in Riverside County and they have formed a Poland China Breeders Association.

The national associations of the Berkshires or Hampshires do not provide for futurity shows, but the Southern California fair has been able to make special arrangement with each of these associations for special futurities. Secretary Van Pelt has sent notices to all Hampshire and Berkshire breeders, and already responses are coming in which indicate that both will fill.

The swine show this fall at Riverside will only be limited by the space available. There is a notable increase in the number of swine breeders in the south, and Riverside is looking for the biggest show in the history of the fair.

HOG AUCTION DATES

Farm bureau hog auction sales will be held at Bakersfield, April 15; Merced, 18; Turlock, 19; Madera, 20; Fresno, 21; Tulare, 25; Visalia, 26; Hanford, 27; McFarland, 28.

Following a directors' meeting at the home of the president, Francis T. Underhill, Santa Barbara, on April 3, the California Hampshire Swine Association held an enthusiastic meeting at Ojai on the 4th. After spending the morning at Cheery Acres looking over the herd of the secretary-treasurer, Carl G. Meiners, the members enjoyed an excellent luncheon at the El Roblar Hotel, at which one of Mr. Meiners' small pigs, roasted, was the star attraction. Matters of importance were discussed at a live business meeting following the meal.

Any one of these Reasons puts the De Laval in a class by itself—

1. Over 2,500,000 De Laval Separators in use—about as many as all the rest combined.

2. Won 1,091 grand and first prizes at all important expositions and fairs in the world during the past 40 years.

3. De Laval butter has won first prize at every meeting of the National Buttermakers Association, with but one exception.

4. 62% of the separators in Minnesota, the largest butter state, are De Laval. (Based on investigation by prominent farm paper.)

5. Practically all creameries use De Laval Power Separators.

6. Endorsed, recommended and used by Government experiment stations, colleges, dairy authorities and leading dairymen everywhere.

7. Thousands in use from 15 to 20 years, and still doing good work.

8. De Laval Separators have led in every important separator improvement since Dr. De Laval invented the Separator over forty years ago.

9. Made in the world's largest and best-equipped separator factory.

10. Backed by the most thorough system of service—over 50,000 agents the world over.

Go over a De Laval point by point. Compare it with any other separator made, and you too will decide that it is the best in every way, and in the end the least expensive.

DISPERSAL SALE

Ormondale Shorthorns

60 REGISTERED COWS 60
HEIFERS and BULLS

Ormondale Ranch, Redwood City, Calif.
Thursday, May 4, at 12 o'clock Noon

The dispersal of this splendid collection of Shorthorns under the auctioneer's hammer will provide one of the most attractive opportunities for purchase yet afforded by the breed in the West.

The female offering will include both Scotch and Scotch topped sorts, ranging from great matrons with calves at foot, to open heifers. Many of the heifers are sired by Imp. Boquhan Guinea Stamp, and the bred females are in calf, either to THE CALEDONIAN, an outstanding prize winning son of Imp. Caledonia, or to COUNT KINGWOOD, a splendid son of Imp. Kingwood.

A female group that attracts particular attention is that of the great producing cow SWEETHEART and her three daughters. She is the dam of the International Grand Champion LITTLE SWEETHEART, and two of her heifers in this sale are full sisters to Little Sweetheart, sired by Golden Goods, Jr., while the third is by Ormondale Radium.

THE CALEDONIAN and COUNT KINGWOOD both sell, and from every standpoint they command the attention of the buyer who requires a high class herd header. There is also a choice group of younger bulls.

GUARANTEED BREEDERS—TUBERCULIN TESTED

TERMS OF SALE: Responsible parties may arrange for credit before sale with the sale managers on the basis of one-half cash, balance in six months.

ORMONDALE RANCH is about 9 miles southwest of Redwood City; about 36 miles south of San Francisco. Morning trains will be met at Redwood City morning of sale.

POULTRY

A POULTRY RANCH OR COUNTRY HOME

If you have a few hundred dollars, pep, perseverance, integrity and good character; if you are not afraid of work, are willing to work a few hours a day developing your own property, after or before earning a day's wages;

If you want a small poultry ranch, fruit ranch, a vineyard, a vegetable and produce, alfalfa or grain ranch, or a home in the country that you can develop and pay for on exceptionally easy terms—

THIS IS YOUR OPPORTUNITY.

Only those who want to develop a home wanted.

Exceptional opportunity for work and a market for poultry, vegetables or other produce right at your door.

Land with water, on boulevard, railroad and bus line, seven miles from one of the finest cities in California, in lots of from two to forty acres at from \$200 to \$350 per acre; or grain or grape land without water stock at from \$75 per acre up—one-fifth cash, balance in monthly or eight semi-annual payments; or, if you will place on the property improvements equal to the value of the land, we will take a mortgage, due in five years, for the entire purchase price.

We will furnish you baby chicks, ducks, turkeys, hens, chickens, guineas, or fruit trees, at wholesale cost price to help you get started.

We will give you the benefit of our experience on one of the largest and best equipped poultry plants in the South and cooperate with you in every way.

Exceptionally favorable opportunity at the present time for a—

NURSERYMAN VEGETABLE RAISER GRAIN FARMER BROILER RAISER SQUAB RAISER POTATO RAISER TURKEY RAISER ALFALFA RAISER or a gasoline station, with a poultry, egg and vegetable stand in connection.

If you have a family, so much the better. Plenty of opportunity for the boys and girls to make some money raising poultry of all kinds, squabs, pigs, rabbits, vegetables, etc.

No market problems. Your produce taken right at your door every day.

SMALL CAPITAL REQUIRED

You must have a few hundred dollars, all of which can be put into improvements on the property, if you desire; or be in position to make monthly payments at the rate of at least Five Dollars per acre per month on land with water and at the rate of \$1.50 per acre per month on land without water.

We expect to develop here the largest, best equipped and most attractive poultry, fruit and produce community in the South.

Profitable Poultry News—Capacity, 200,000 Chicks, hence prices surprisingly low for quality. Customers say: "March 22, 1922. Your last year (200 Ancona) chicks remained in depot over night, yet I raised every one. They have laid 83%. Have never had sick bird. Want 200 more; 3000 White Leghorns are keeping up standard in production, are beautiful birds. One County Agent has already bought this spring 12,450 chicks. For years his people have tested them. These strains are 180-290-egg Leghorns—Reds, Rocks, Anconas, Minorcas, Wyandottes, Andalusians, Brahmas, Orpingtons, Ducks, Turkeys (21 varieties, each under specialist)—lead many egg-laying contests; build foundation flocks, fill repeat orders for hundreds. Why? **ELECTRIC HATCHED**, vigor, growth, winter laying, profit, guarantee; booking for immediate, future delivery, below pre-war prices. Smallest, largest orders welcomed. Write Profitable Poultry, 13 North Fair Oaks, Pasadena.

Baby Chicks: When you buy baby chicks the big thing for you to remember is **QUALITY**, in both the chick itself and the parent stock. By investigating you will find that our chicks are in a class by themselves, for we have absolutely the best equipment obtainable to produce them and very high class stock from which we get our eggs, and then, too, we know how to handle and deliver chicks. We are hatching every week White Leghorns and Anconas that will lay; R. I. Reds and Barred Rocks that are well bred and will produce. Send for our circular and prices and order immediately for 1922 delivery **ORANGE COUNTY HATCHERY**, Santa Ana, California.

Have you
had satisfaction
with your

BABY CHICKS?

Light Brahma Eggs for Hatching, \$2.50 per 15, large stock. J. M. Sigler, Puente.

SEEDS AND PLANTS

SUDAN GRASS SEED
(The Great New Hay Crop)
First introduced in the United States 1909 from Sudan, Africa.
Culture. Strictly an annual, may be drilled or broadcasted, 15 to 25 lbs. per acre, it grows 8 to 10 ft. high, yields 3 to 10 tons per acre, two to four cuttings.
Pasturage. It will yield food for six times as much stock as any other forage without irrigation. For milk cows and hogs there is no better and more abundant pasture than Sudan. It will solve the hay proposition as nothing else can or will do in this climate. This seed is grown on our farm and is free from Johnson Grass.
Price—5 lbs. \$1, 10 lbs. \$1.50; 50 lbs. \$5; 100 lbs. \$8; 500 lbs. \$35; 1000 lbs. \$50.
BOWMAN'S HDWE & IMP. CO.
721 J St. Sacramento, Calif.

USE CARBOLA in your hen houses as well as in your stables. Thousands of expert poultry farmers who have used it for years would not do without it. Carbola is a white paint and disinfectant combined in powder form that is ready to use as soon as mixed with water. Applied with brush or spray pump. Will not clog sprayer, and doesn't flake, blister or peel off. Can be applied to wood, brick, stone, cement or over whitewash. Destroys disease germs, lice and mites and helps prevent their development.

System of Feeding

Our free book "Chickens from Shell to Market" gives full particulars.
Coulson Co., Petaluma, Cal.

Feeding With Gumption

By Jean A. Koethen

WE have been told that the five essentials in poultry feeding are grit, grain, greens, grubs and gumption, and that the one which matters most is gumption. You may feed more grain or less, little meat or none at all, sour milk or sweet, but if your hens have greens and are fed with plenty of gumption they will be healthy and productive. On my recent trip to Escondido I visited a poultryman whose feeding, though extremely simple, is so systematic that it answers the above description admirably. This is H. C. High, whose 2,000 White Leghorns are as thrifty looking as any I have seen.

Mr. High feeds his hens a grain mixture consisting of equal parts by weight of wheat and barley. Milo is sometimes added. Twelve pounds or six quarts to 100 hens is the rule, but the amount is regulated by the apparent hunger of the birds. If they have eaten heartily of mash during the afternoon they will eat less grain at supper time. If the mash hopper has been neglected they will eat more grain. A buttermilk mash is kept be-

have one in the flock now," said Mr. High, "that I know is six years old, but she doesn't look over two, and is still producing."

Escondido poultry farmers, like many others, find themselves working against heavy odds this year, but they are determined to stick even if they lose money. Mr. High made \$3,000 from 900 hens in 1918, and he doesn't hesitate to say that this is the poorest year for chickens in ten years. Like other farmers all over the country he is pocketing his losses bravely. He has ten acres in fruit in addition to his chickens, consoling himself with the reflection that the farmer is never paid for his time, anyway. If he gets a living, that is about all he can expect.

Poultry Queries

Conducted by Jean A. Koethen

Roup

My hens' eyes swell, the birds go blind and ultimately die. Is this

Long House on High Ranch

This is one of the best equipped poultry ranches in the Escondido district.

fore them, and they are given green feed twice a day, cut alfalfa in the morning and alfalfa and kale in the evening. A half acre of alfalfa keeps the 2,000 hens and the cow.

Feeding the Chicks

The baby chicks are started on commercial chick feed. After a few days mash is added to their ration, not one of the fancy chick mashes, but the egg mash that the layers receive, mixed with an equal amount of bran. The chick feed is continued for about six weeks and then the chicks are gradually worked onto wheat, which Mr. High considers the best of all grains for chicks, and which they eat more readily than any other grain.

The amount of bran in the mash is gradually diminished after the first six weeks until by the end of the fourth month the pullets are eating egg mash alone. By this time some of them are beginning to lay.

Mr. High has been raising chicks for ten years, and he does not believe in either conditioning the pullets or in holding them back from early laying. "Keep them growing," he says, "and let them lay when they want to."

Perhaps one reason why Mr. High's pullets do so well is that he hatches in winter. This spring he hatched 500 April pullets, but his rule is to be all through hatching by the middle of March. The pullets molt in the fall, to be sure, but they pay for their feed first. April pullets, he has found, do not lay as well as the earlier hatched birds. "I had one exception to this rule, a bunch hatched the 13th of April that laid as well in the fall as any I ever had, but as a rule April pullets are not reliable fall layers."

Culling

On this ranch the hens are culled in July. Every hen is handled and tested by the Hogan system as well as by color of shanks, beak and ear lobes. All hens that molt before the first of July are eliminated.

Age is no criterion of usefulness. Sometimes an old hen is kept because she has proved her value. "I

little larger. They seem to have diarrhoea before dying. Last year I found the same thing and was told it came from feeding too soon, but do

not think that can be the cause this year. We got them on Friday when they were said to be 36 hours old and they were given nothing but water and grit till Sunday. They have had plenty of sour milk. Mortality is less than at first, but I would like to know what causes those lumps and how we can save our chicks next time. Some people suggest a fault in incubation.—Subscriber, Porterville.

Certainly you did not feed too soon this time. Ninety hours is a long time to keep little chicks without food, even if the doctors do say it is all right. Sixty to 72 hours seems to me the very limit. However, I don't believe it was keeping the chicks hungry too long that killed them. My explanation is that they were chilled somewhere,—whether before they reached the brooder house or afterward I cannot say. Chilling a baby chick checks digestion and causes diarrhoea, and that lump like the yolk of an egg was probably the undigested yolk which was taken into the intestines the last day of incubation. I have heard it said that the chicks are not as vigorous as usual this year because of the long cold season and lack of greens in the ration of the parent stock but do not know how general the complaint is. I believe if you will make sure that your next lot of chicks is kept perfectly warm and comfortable from the time it leaves the incubator till it has been four days in the brooder house you will find your losses greatly lessened.

Depluming Mites

Will you please tell me how to destroy depluming mites? Nearly half of my 40 hens have bare spots on the head just back of the comb, and the trouble seems to be increasing.—Subscriber, Chino.

Those bare spots on the head, if they are the only bare spots on the hens' bodies, may be due to too much attention on the part of the rooster. Depluming mites more frequently begin their work at the tail and work toward the head. You can tell whether this bareness is due to mites by running your finger over the spots. If you feel the sharp ends of eaten-off feathers you may be sure mites have been at work. If the feathers are merely missing watch and see if they have not been destroyed by the rooster's beak. To rid the hens of this troublesome mite rub the affected places with one of the following: Oil of caraway mixed into an ointment with white vaseline, 1 part caraway to 5 of vaseline; or Balsam of Peru, full strength; or an ointment made of 1 dram sulphur, 20 grains carbonate of potash and ½ ounce lard or vaseline.

Mites and Other Things

Some of my hens are troubled with depluming mites which work first on the tail feathers, then on the wings. Two others suddenly went blind. Those I killed had rather soft livers.—Subscriber, Santa Cruz.

For remedy for depluming mites note reply to Chino subscriber. Your hens have evidently a real case of these mites, and you may have to use the ointment daily for a week or so to get rid of them. Either one of the remedies suggested is good for the purpose.

The hens that went blind may have had roup and they may have gotten something into their eyes which caused inflammation. Whenever you see any soreness in the eyes, wash them twice a day with boric acid solution, made by dissolving half a teaspoon of boric acid in a cup of warm water. You can drop the solution in their eyes with a bit of absorbent cotton or a very clean piece of old muslin, or use an eye dropper. When you have washed the eyes well, rub a little white vaseline on them. I hardly think the soft livers had anything to do with the blindness. Maybe the hens were overfat.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, March 28, 1922. Report for the twenty-first week ending March 27. The hens in the contest have laid a grand total of more than 50,000 eggs. The interesting part of this announcement is that this score has been reached eight days earlier than was expected. The Plymouth Rocks are still going strong and would have made a

clean sweep for two consecutive weeks except for a pen of Leghorns from Hollywood, Washington. This pen made two perfect individual scores and three perfect daily scores of 10 each and succeeded in tying a pen of Barred Rocks for third place. With this single exception the Plymouth Rocks are ahead of all outstanding Wyandottes, Reds and the rest of the Leghorns.

The four leading pens in each of the principal breeds are:

Plymouth Rocks

Seven Hills Farm (Barred), 757; S. Bradford Allyn (White), 743; Harry G. Culver (Barred), 636; H. E. Dennison (Barred), 677.

White Wyandottes

Frank P. Matteson, 875; Woodbridge Orchards, 872; Walter Bradbury, 788; Clemens J. Diemand, 785.

Rhode Island Reds

The Orchards, 770; Applecrest Farm, 759; F. S. Chapin, 731; F. H. Sampson, 719.

White Leghorns

Goshen Poultry Club, 754; J. Frank

Dubois, 691; Hollywood Farm, 686; Small's Poultry Farm, 668.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

Report for the eleven days ending the month of March:

Twenty-one entries laid 70 per cent and better, three pens tying for first place with a production of a fraction under 80 per cent.

High pens for the eleven days: Hanson's Poultry Farm, 87 eggs; Boehm & Noel, 87; Alex Stewart, 87; L. A. Thornehill, 86; Boling's Poultry Farm, 84; R. H. Young, 83; D. C. Berry, 82; E. D. Crewdson, 81; W. A. Ford, 81; Geo. Gray, 81; C. E. Hyde, 80; D. B. Walls, 80; Sea Breeze Poultry Farm, 80; Thos. Stewart, 79; J. J. Shore, 79; C. P. Brooks, 78; Geo. Wood, 77; Hollywood Farm, 77; Sunrise Poultry Farm, 77; U. Komatsu, 77; Aromas Hatchery, 77.

Following Colusa County's road bond vote on March 28 the supervisors are making preparations to rush construction work with all speed possible.

The Appian Way, extending 350 miles from Rome to Drumsium, was begun in the year 312 B. C. by Caesar Appius Claudius. It has carried traffic for over 2000 years and is still a good road. They say it was built without a bond issue.

You can have Running Water Without a Storage Tank

ANY FARMER within serving distance of power lines operated by the Pacific Gas and Electric Company can have running water in his house and corral without using a storage tank.

An electrically driven pump, controlled by a pressure gauge, can be installed for less than the cost of a storage tank and tank house. The cost to operate such a pump is very nominal.

Running water is really essential in every modern home, and it is a great convenience around any corral. During the hot summer months, you will appreciate an automatic pump that raises water at frequent intervals from the cool depths of your well.

Before you start your spring improvements and repairs, *investigate automatically-controlled, electrically-driven pumping outfits.* If your hardware dealer is not familiar with them, ask the local P G and E man.

If Really Pleased Would You Buy

If you could find 3 to 15 acre small farms of fine red sandy soil, with full water rights, good for peaches, walnuts, pears, figs, grapes, poultry and general farming, at \$225 per acre up on very easy terms, WOULD YOU BUY?

If it were within or near the city limits of Corona, with city school, churches, banks, libraries, in a beautiful scenic location, with a first healthful climate, WOULD YOU BUY?

If you drove among peach, apple and pear orchards, now in full bloom, and bearing; if you found 250 people now living on the tract; if you found flourishing, successful poultry yards, apiaries, vineyards, deciduous orchards, orange groves there, WOULD YOU BUY?

If the contract allowed you for years to pay, and agreed to extend a payments one full year more, provided you made the first year certain easy permanent improvements, WOULD YOU BUY?

If you thought 10 acres put into walnuts, grapes, peaches or apricots, 5 acres devoted to poultry would give you not only a home, but a permanent income, WOULD YOU BUY?

If you are in the market for an irrigated farm of from 3 to 20 acres and would buy if thoroughly pleased, the call on, telephone or write me. The lowest-priced, best all-around soil of the easiest and fairest terms, especially adapted for small farm home, and for permanent incomes from poultry, vineyards or orchards.

ANCHOR BRAND SUBLIMED VELVET FLOWERS OF SULPHUR, also EAGLE BRAND and FLEUR DE SOUFRE, packed in double sacks, are the FLUFFIEST and PUREST sulphurs that money can buy.

The fine light SNOW-FLAKE-LIKE particles float to every surface and crevice of the plant.

Do not adulterate these sulphurs with any inert material such as lime or kaolin, etc. Coating the sulphur particles with an inert material PREVENTS the FUMING ACTION caused by the sun's rays. Send for Circulars 6, 8 and 10 about our "Toro" Brand Agricultural Compound and booklet, "The Truth About Sublimed Sulphur," also price list.

Citrus Markets
Los Angeles, April 12, 1922.
Heavy shipments of strawberries from
the Gulf states are reaching big Eastern
markets and meeting instant favor. An
unusually large crop is in sight. Early
loss of Florida citrus shipments, short
California crop and poor reception of Cal-
ifornia Valencias makes slow citrus
market.
Heavy arrivals of foreign lemons affect
market for California fruit, but foreigners
are showing decay, which will probably
react in California's favor.

Shipments
Shipment of citrus fruits to date since
November 1, 1921. Southern California:
Oranges, 11,694 cars; lemons, 3,298; total,
4,992. To same date last season: Or-
anges, 15,944; lemons, 3,250; total, 19,194.
From Central California to date this sea-
son: Oranges, 4,447; lemons, 103; total,
4,550. To same date last season: Or-
anges, 4,448; lemons, 127; total, 5,575.
From Northern California to date this
season: Oranges, 372; lemons, 8; total,
380. To same date last season: Oranges,
95; lemons, 5; total, 310.

MOST IMPORTANT OF WEALTH PRODUCERS
Agricultural payroll figures are be-
ing gathered by the Porterville cham-
ber of commerce as evidence of their
belief that this item to most Califor-
nia cities is more important than the
factory payroll about which so many
commercial organizations agitate. Fig-
ures are being compiled from the rec-
ords of carlot shipments of agricul-
tural products last year and so far as
completed show 1406 carloads of or-
anges worth \$1,687,200; lemons, 81
cars, worth \$105,300; 73 cars of grape-
fruit worth \$80,300, while the livestock

so far tabulated shows 164 carloads of
cattle valued at \$218,880 and 31 cars
of hogs valued at \$47,030.

COAST EGGS TO BE POOLED IN THE EAST

Surplus eggs from the Pacific Coast
will be marketed in the East by a
single agency instead of the five asso-
ciations at present acting independ-
ently. This was announced by J. B.
Barber, general manager for the Poul-
try Producers of Central California,
Inc., in his weekly letter to members
of the association.

A new association, the Pacific Egg
Producers, has been organized, but not
yet incorporated, he said, following an
agreement between the Washington
Cooperative Egg and Poultry Associa-
tion of Seattle, Pacific Cooperative
Poultry Producers of Portland, Poul-
try Producers of Central California,
Inc., Poultry Producers of Southern
California, Inc., and the Poultry Pro-
ducers of San Diego, Inc. It will act
as a general selling agency for the
above named associations.

The business of the association will
be conducted by a board of represen-
tatives composed of one representa-
tive from each district. The repre-
sentatives will have equal voting
power. J. H. Guffey of Washington
is chairman; U. L. Upson of Oregon,
secretary; H. W. Stanley, Los Ange-
les; G. C. Keeney of San Diego, vice
chairman, and J. H. Barber of San
Francisco, general manager.

Manager Barber says: "In the last
two years there has been a large in-
crease in the production of eggs on
the Pacific Coast, and therefore a con-
stantly increasing surplus which has
had to be shipped out to Eastern mar-
kets, because it could not be consumed
here at any price that would enable
the producer to stay in the business.
This increase is still going on and it
means that there will be a larger and
larger surplus to be marketed in the
East.

"At the present time the greater
portion of this surplus is being mar-
keted through the five big producers'
egg marketing associations of the
Pacific Coast. Each of these associa-
tions has been marketing its own sur-
plus separately and through separate
channels in the Eastern markets.

"This general selling agency is to
handle the carlot export business of
the several associations composing it;
that is, the eggs which are shipped
by each association outside of the dis-
trict occupied by its own members.
Sales by each association in its home
market will be handled by the respec-
tive associations individually, and not
by the general agency. The purpose,
as stated above, is to secure a better
distribution of the surplus product
marketed by these associations for
their members, thus rendering a bet-
ter service to both the producer and
the consumer; also to effect certain
economies in the marketing opera-
tions by handling this export business
by joint action through one agency
rather than through five, as at pres-
ent."

THE MODERN GAS TRACTOR

"The Modern Gas Tractor, Its Con-
struction, Operation, Application and
Repair," a practical treatise by Victor
W. Page, published by Norman W.
Henley Publishing Company, 2 W.
45th Street, New York, at \$3.

This is the fourth edition issued
since the Cultivator gave it notice
some three or four years ago. It is a
600 page book and contains a large
chart, showing important parts of trac-
tor, with uses fully explained, and
many other drawings, charts and half-
tones, some of which appear a bit
technical and yet at closer inspection
give an excellent idea to the layman
as well as the machinist of tractor
repair and handling. There are 13
chapters touching upon the scope,
advantages and applications of power
traction, review of tractor designing,
design and construction of gas tractor
power plants, gas tractor power plant
components, making and exploding
the gas, cooling and lubricating, func-
tions and construction of clutch, gear-
set and differential, frame, wheels and
axles, driving and housing, troubles
and their elimination, late tractor de-
signs, operation and miscellaneous
rules and formulae. All types and
phases of gasoline, kerosene and oil
tractors are described and every
phase of traction engineering practice

fully covered. Even the '22 types of
tractors are fully described. It is a
book which should be in the reference
library of every power farmer.

Misfortunes are big or little, accord-
ing to how soon you forget them.

Beware of taking on more dignity
than you know what to do with.

Quantity Plus Quality

"Do you see those, Dave? That is *real*
fruit and the trees are heavy with 'em.

"Hercules Farm Dynamite did that. Of
course, planting them with dynamite helped
but I blasted between the rows as well.
Look at that box of fruit and you can see
whether it was worth it or not."

HERCULES FARM DYNAMITE

The Hercules Powder Co. has published
a 75-page book about dynamite on the
farm called "Land Development". It
will be sent you upon request if you are
interested in tree-planting, blasting be-
tween the rows, ditching, or stumping.

Speed and Dependability in the Hay Harvest

McCormick - Deering - International

HAY machines that bear the above names may always be relied on to put your hay where you want it, the way you want it, in the quickest, most economical manner. McCormick and Deering mowers can be depended on to cut hay every minute. International tedders hasten, and insure, better curing. McCormick and Deering self-dump rakes are known the whole world over for their quick, clean work and light draft. The International combined side-delivery rake and tedder is also a popular time and labor saver.

Look at the farmer in this picture, pulling two wagons and two International loaders with the Titan tractor. He is sure to get his hay out of the way for grain harvest.

International sweep rakes and stackers provide a quick method of getting your hay to the stack.

International power hay presses put the hay in neat tight bales that keep better, are easier to handle, store and feed, and that bring the top price on the market.

Perforated Tree Protectors

Are you planting GRAPE CUTTINGS this season? We can save every one of them from rabbits, also every fruit tree from pest, hot sun and sand storms. We make a number of kinds. Tell us your pest. We will tell you what to use.

Collapsible Planting Pots

These pots are bottomless. This allows you to plant pot and plant, never disturbing the roots of the plant or stopping its growth a single hour in transplanting. For starting early vegetables, such as Tomatoes, Cabbage, Eggplant, Cucumbers, Cauliflower, Cantaloupes and Squash; also for Avocado, Carob Tree, Eucalyptus and Olive Cuttings. It's the most practical pot in use today for propagating work of any kind. Write us for samples and prices of both pots and protectors. Tell us which you are interested in.

A Patriarch of the Avocado Family

This avocado tree, now dying (probably of old age), stands in a small orchard in the Patate Valley of Ecuador. It is believed to have been planted by the Jesuit missionaries more than 150 years ago. The seed may have come from Mexico, since the tree belongs to the well known Mexican race of avocados. (Photographed near Ambato, Ecuador, by Wilson Popenoe of the U. S. D. A.)

THOMAS

Side Delivery Rake

\$80⁰⁰ List

Take advantage of this price now. We can supply you with this latest model Thomas Side Delivery Rake, fully up to date and designed for either hay or beans, at a saving of more than \$50.00 over current prices.

The Thomas Side Delivery Rake is well made, noiseless, strong and efficient. It has more clearance on delivery side than any other. Works equally well in hay or beans. Rakes 8 to 9 feet wide. Cylinder is 10 feet long; heavy steel wheels of large size; two Castor wheels, which are raised or lowered from the seat by a single lever. Steel throughout.

We are exclusive agents for Thomas Hay Tools and carry a full line of repairs at all times.

What Will the 1922 Harvest Be?

SCARCELY an apricot growing section of the state reports 100 per cent apricot crop. Nippy frosts visiting the state between April 8 and April 15 have caused many a report to come in: "75 per cent of a crop" to as low as "25 per cent of a crop." However, growers in sections where the frost was light sometimes express themselves as hopeful that the frost injury will simply result in a thinning of the overload until the tonnage will be nearly normal and probably command a higher price and greater profit than a full crop.

The response has been so liberal to our request for information that only a portion of the reports received during the last week can be used in this issue. The remainder will be given next week.

R. R. Gorton, Horticultural Commissioner, San Diego County

We estimate the almond crop to be about 90 per cent of a normal crop with a production of approximately 95 tons. Apples, about 40 per cent of a normal crop and a production of 76,675 boxes. Apricots, 50 per cent and a production of 11,098 tons, fresh weight. Cherry crop practically a failure. Peach crop about 75 per cent of normal, production 56,025 tons, fresh weight. Pears show 25 per cent of normal, production 895 tons. Prunes, 60 per cent crop, 606 dry tons production. Grapes, all varieties, about 5 per cent of normal, 13,088 tons, fresh weight.

H. H. Call, Horticultural Commissioner, Ventura County

Apricots, very good crop judging by recent indications, some brown rot showing in some sections.

W. M. Moulton, Horticultural Commissioner, San Francisco County

No fruit grown in our county.

M. M. Gould, Horticultural Commissioner, Yolo County

Almonds, 150 per cent. Apples, too early to make estimate. Apricots, 100 per cent. Pears 90 per cent, some thrips injury; crop may go lighter than 90 per cent here. Prunes, 100 per cent. Grapes, too early to tell.

Mr. Gould's estimate last year was: Almonds, 50 per cent. Apples, 75 per cent. Apricots, 40 per cent. Cherries, 10 per cent. Peaches, 75 per cent. Pears, 80 per cent. Grapes, 70 per cent.

H. H. Flournoy, Horticultural Commissioner, Tehama County

Almonds, good. Apples, good. Apricots, good. Cherries, good. Peaches, good. Pears, good. Prunes, good. Grapes, good.

John A. Winkelman, Horticultural Commissioner, El Dorado County

Everything is looking good, but it is a bit too early to give a correct estimate.

J. Sharpe, Vacaville, Solano County

Almonds, 100 per cent. Apples, 100 per cent. Apricots, 100 per cent. Cherries, 120 per cent. Peaches, 100 per cent. Pears, 90 per cent, some thrips injury; crop may go lighter than 90 per cent here. Prunes, 100 per cent. Grapes, too early to tell.

Mr. Sharpe's last year's estimate was: Almonds, 60 per cent. Apples, 100 per cent. Apricots, 35 per cent. Cherries, 100 per cent. Peaches, 75 per cent. Pears, dropping badly; cannot estimate yet. Prunes, 100 per cent. Plums, 100 per cent. Grapes, 100 per cent.

California Fruit Distributors, Wilmer Sieg, Secretary-Manager, Sacramento

Owing to the peculiar weather conditions it is impossible to give definite estimates as to crop conditions; however, I never saw a better condition exist at the present time on our main

crops, subject, of course, to any weather conditions that might arise, but we feel that the very late maturities this year have put our fruit in good condition to withstand any minor changes of temperature. We hear of occasional light frosts, but can locate no damage of any character.

We suggest that it will probably be better to wait until about April 20 for definite information.

J. O. McKinney, Horticultural Commissioner, San Benito County

As near as I can estimate the crops they are as follows: Almonds, 75 per cent crop; some frost injury, more may follow. Apples, normal to date. Apricots, about 30 per cent crop; 25 per cent brown rot, rest rain and frost. Cherries, may have been injured by frost; not apparent yet. Peaches, look like normal crop; frost injury slight, if any. Pears, some thrips injury, some frost; about 90 per cent crop. Prunes, normal to date. Grapes, too early to state. These figures will naturally change somewhat, but are as close as can be figured at present.

George P. Weldon, Ontario, San Bernardino County

The deciduous fruits grown commercially in this county are: Apples, apricots, peaches, pears, plums, grapes and walnuts. At the present time the condition is normal with all. Of course, it is too early to make any predictions that mean very much in the case of walnuts or grapes. We have a heavy bloom on the peaches, apricots and plums, and if the fruit sets as it should there will undoubtedly be a bumper crop. For several nights past the weather has been rather cool, with white frost, but so far no reports have come in of damage and everyone is optimistic.

Yucaipa News, San Bernardino County

Almonds, only few acres in valley; slight frost injury indicated. Apples, no bloom yet, with over 30 inches of rainfall for season indications are for another bumper crop; buds very plentiful and strong. Apricots, no cot injury, heavy bloom, few grown. Cherries, buds turning white and will be out in few days; heavy bloom. Peaches just dropping petals of an exceptionally heavy bloom in all varieties; no indication frost injury. Pears same as apples. All bloom several weeks late. Trees made good growth past year and fruit buds are generally strong and vigorous and indicate a very heavy bloom.

L. O. Haupt, Horticultural Commissioner, Kings County

Almonds, not grown commercially. Apples, not grown commercially. Apricots, 100 per cent of normal. Cherries, not grown commercially. Peaches, 100 per cent of normal. Pears, not grown commercially. Prunes, 85 per cent of normal. Grapes, 100 per cent of normal.

Arthur E. Beers, Horticultural Commissioner, Merced County

Almonds, very spotted, slight bloom and frost injury 50 per cent. Apples, no commercial. Apricots, very poor set; considerable frost injury, 50 per cent. Cherries, no commercial. Peaches, very heavy bloom, 100 per cent. Pears, no commercial. Prunes, not large acreage, but promise of a good crop. Grapes, promise heavy crop.

J. P. Dargitz, Soulsbyville, Tuolumne County

Almonds, not grown here. Apples, should be full crop; season late, no bloom yet. Apricots, only few grown, good condition, blooming. Cherries, only few grown, good condition, no bloom yet. Peaches, bloom just opening, promise good. Pears, bloom just opening, promise good. Prunes not grown here. Grapes have not started yet. Our season is very late, which

means we should escape losses by late frosts, and it looks like a bumper crop year.

Earle Mills, Horticultural Commissioner, Butte County

The fruit trees here are nearly four weeks behind their normal blossoming time, so of most of them it is quite impossible to say what the crop will be. The almonds are the only ones that have gone out of blossom; indications for these are a full crop but, of course, one night of frost may completely change this condition. Prunes are just beginning to blossom, as are cherries, so I will not venture to guess at this time their crop conditions.

A. A. Brock, Horticultural Commissioner, Orange County

We have only a small acreage of apples, apricots and peaches. I believe it is too early to estimate these crops. Thus far the apricot crop outlook is good for 100 per cent.

W. D. Butler, Horticultural Commissioner, Napa County

Apples, cherries, peaches, pears, prunes and grapes are all 100 per cent as they stand today. Apricots are going bad again with brown rot and to date there is only one-half a crop. If the rot continues as last year there will be practically nothing. Everything is 15 days late this year. There is plenty of moisture in the soil and prospects were never better as a whole.

E. T. Reynolds & Son., Chico, Butte County

Almonds, present prospect, April 10, 100 per cent crop. Apples not yet in blossom. Apricots, very few grown here. Cherries, present prospect 100 per cent. Peaches, present prospect is for 100 per cent. Pears, prospect is for 100 per cent. Prunes, present prospect is for 100 per cent.

John F. Benton, Horticultural Commissioner, Humboldt County

Almonds not grown commercially. Apple trees in good condition, season backward, considerable cold weather, rain and snow; no damage thus far from frosts; indications good but too early to give definite information. Apricots not grown commercially. Cherries, trees just coming into bud, indications good, season late. Peaches, prospects good, just budding, season late, no damage by frost. Pears, indications good, no damage from frost, cold weather holding back bloom. Prunes not grown commercially. Grapes not grown commercially.

H. J. Baade, Farm Adviser, Napa County

Almonds not grown commercially. Apples, 100 per cent. Apricots, 40 per cent, brown rot has destroyed over half of our possible crop. Cherries, 100 per cent. Peaches, 100 per cent. Pears, 100 per cent. Prunes, 100 per cent. Grapes, 100 per cent.

Frank W. Curtis, Farm Adviser, Tehama County

Almonds, indications for good crop though not as heavy as 1921; heavy crop of 1921 kept trees from setting heavy crop of buds. Apples not grown commercially except in hill sections and to date have not blossomed. Apricots, same as for almonds. Cherries, very few commercial orchards, blossoming good, too early to make crop prediction. Peaches, prospects good, heavy set of blossoms, too early to predict set of fruit. Pears, blossoming late, too early to predict crop. Prunes, red spider did considerable damage in 1921 and in many orchards the French prunes are not blossoming; Robes and Imperials blossoming heavily; too early to predict crop; generally prunes are blossoming heavily where there was no spider damage in 1921. Grapes, many new vineyards being planted but bearing vineyards few, no frost damage noted. The season has been abnormally cold and the

blossoming of fruit trees has been held back from six weeks to two months. This has been a good thing in that the danger of loss from frost has been lessened.

Harry P. Stabler, Horticultural Commissioner, Sutter County

Almonds, apples, apricots, cherries, peaches, pears, prunes, grapes, full crop promised at this time.

L. M. Harrison, Agricultural Statistician, Arizona Cooperative Crop Reporting Service

The cantaloupe acreage in Arizona is estimated at 4,500 as against 3,800 acres in 1921. The watermelon acreage is placed at 700 acres, compared with 1,000 acres last year.

The alfalfa crop is late, but harvesting of the first crop will soon begin in the southern valleys. With an increased acreage, the total production will probably exceed that of last season.

Fruit conditions in the state on April 1 were satisfactory, but it is feared that the recent frosts may have caused some injury in the higher altitudes.

Thos. P. Redmayne, Horticultural Commissioner, Marin County

Almonds, selling of fruit average. Apples, only partly in bloom. Apricots, indications are for very light crop, probably not over 10 per cent. Cherries, in full bloom and looking well. Peaches, indications not very good; light crop indicated.

Pears, thrips made early invasion in some localities and killed buds before clusters separated; other localities look very favorable. Prunes, bloomed well; too early to determine setting. Grapes, backward, fruiting shoots not yet in evidence; cold weather has held back all fruit crops.

California Peach & Fig Growers, by I. J. Condit, Department of Horticulture

Reports from our field men from the San Joaquin Valley show that the peach trees are mostly in excellent condition and setting normal crop. Muir peaches in scattered sections have dropped their blossoms and the trees are practically bare of fruit. Young fig trees in practically all parts of the valley have suffered severely from cold weather, starting with the heavy frost of November 19 and continuing until the extremely low temperatures of the middle of January. In a few localities the spring crop of Capri figs as well as the terminal buds of other varieties have been killed by the frost of April 9. While the winter crop of Capri figs suffered severely in some sections, the crop is unusually good in most sections and a plentiful supply seems to be assured. Bearing fig trees are in good condition and a normal crop is expected, providing weather conditions are suitable for good caprification of the Calimyrnas.

Donald D. Penny, Horticultural Commissioner, Santa Cruz County

Apples, bloom very even and abundant. There is apparently a great reduction in the normal amount of insect pests and diseases which generally make their appearance at this time. General crop conditions are quite favorable. Apricots, brown rot very severe except in some of the young orchards. Pears, bloom excellent, with very little scab showing. Grapes, normal.

Sydney J. Stokes, Horticultural Commissioner, Lake County

As to report of the fruit conditions I am holding off for a few days as we are at present having some very unsatisfactory weather. You will hear again from me shortly. Up to the present time the fruit crops look very encouraging, the frosts of the last few days not having done any serious damage excepting to a few peaches and apricots.

(Continued on Page 438.)

Agricultural News Notes of the Pacific Coast

Northern California

Brown rot is severe in many apricot orchards.

Colusa County has voted a \$795,000 road bond issue.

The Eden Township Farm Products Show will be held again this year.

Butte County's annual farm bureau picnic will be held May 20 at Paradise.

Hand shearers are being paid eight cents in the Livermore Valley this spring.

Colusa County Fair Association has been organized with J. J. O'Rourke as president.

Plans are going forward for the new plant of the Sun Maid Growers at Yuba City.

Tractor short course in Butte County, week beginning May 22, probably at Richvale.

Livermore Valley reports Eastern buyers active. Lambs are selling at \$8; wool at 33 cents.

In preparation for the Easter sun-rise services a large cross has been erected in Sutter buttes.

Apple growers of Sebastopol are planning to hold "Gravenstein Apple Day" some time in August.

The state welfare commission announces reduction of minimum wage for women from \$16 to \$15.

The Thermalito, Butte County, farm center reports favorable progress in formation of irrigation district.

Berry growers of Sisson, Siskiyou County, are talking of forming a co-operative marketing association.

The Durham Almond Growers Association has endorsed the new five year contract of the state association.

The Marin County Federation of Women's Clubs will plant along state highways 170 tanbark oak trees.

The state highway between Redding and Anderson has been completed and will soon be open to traffic.

Hundreds of thousands of strawberry vines are being shipped from the vicinity of Antler, Shasta County.

The California Cherry Growers Association has established offices in San Francisco. F. W. Maddox is president and manager of the association.

The Northern California Counties Association has started campaign for location of a state land settlement in each of the five northern counties.

Many apricot growers of the Santa Clara Valley lit smudge pots last week in effort to counteract low temperatures. Some loss of fruit is reported.

Committee from Sacramento Federated Trades Council will attempt to place on the ballot next November an initiative measure modifying minimum wage law and abolishing industrial welfare commission.

The Shasta County Producers Association has been incorporated to succeed the Happy Valley Berry and Fruit Association. Directors are C. E. Kooser, G. F. Fowler, Philip Martin, H. E. McCrea and J. B. Woods.

Secretary Barnes of the Utah-Nevada-California Highway Association and President O'Brien of the Tahoe-Ukiah Highway Association were the speakers at a chamber of commerce luncheon at Colusa recently. The route of the Victory highway through Nevada and Northern California was the topic of discussion.

Central California

The Hume cannery at Turlock has opened on spinach.

The Riverdale section has signed up 1,500 cows for testing.

Exeter last year shipped 543 carloads of citrus fruits, 610 of grapes.

The campaign to eradicate squirrels in Tulare County has already started.

Tulare County alfalfa growers are cutting their first crop. It is unusually heavy.

Mariposa reports that warm rains of the past month have assured a good hay crop.

The Langdonville district of Madera County has organized a unit of the farm bureau.

The Hughson farm center wants a farmers' telephone line and a second rural mail route.

A weed eradication campaign is being waged by farm bureau centers of Stanislaus County.

The Turlock Melon Growers Association now has well over a majority of the growers signed up.

The California Automobile Association offers \$50 reward for conviction of each destroyer of a road sign.

The Shafter Potato Growers' Association is making plans for handling this year's crop, purchasing supplies, etc.

Frosts of last week did some damage in Kern County to cantaloupe and potato plantings and young vine rootings.

The Stanislaus County farm bureau is planning a celebration for the Fourth of July that will include everybody in the county.

Horticultural Commissioner McKinney of San Benito County reports over 12,000 acres set to fruit trees this season. Prunes lead, apricots second.

The Sun-Maid Growers will ship 12 cars of raisins to Bristol and Liverpool this month on cable order from Sales Manager Brady, who is now in England.

Stockton city council will call for bond issue of \$1,200,000 to build dam on the Calaveras to protect city from floods and to impound water for municipal use.

Revival of the "Apple Annual" held every fall several years ago in Watsonville, the center of the Pajaro Valley apple country, is being discussed by local merchants and club people.

Organizers of the state olive growers' association report great success in the campaign in the valley. Acting Chairman McKelvy says he hopes to mail contracts to growers within 30 days.

It is planned to have President Giffen of the Sun-Maid Growers send address by radio to the meeting of the California Manufacturing and Marketing Association at San Francisco on Raisin Day, April 27.

The Milk Producers' Association of Central California at its annual meeting held in Modesto April 7 elected J. E. Thorp of Lockeford as president, C. P. Hageman vice president and W. H. Fowle secretary and treasurer.

Sunland, Strathmore, Grand View, Terra Bella, Plano and Porterville packing houses are operating on Valencias. Porterville chamber of commerce employment bureau reports calls for pickers and packers exceed applications.

Southern California

Cutting of barley hay has started at West Riverside.

Thirty-one packing houses in Los Angeles County are now handling Navels.

Ninety-three carloads of lettuce were shipped from Imperial Valley on April 7.

The first carload of cabbage from Ventura was shipped last week to Sacramento.

The first shipment of onions from Thermal sold at 17 cents wholesale in Los Angeles.

Contract has been let for building of Banning-Whitewater stretch of the state highway.

Partition of Santa Cruz Island off the Ventura coast has been ordered by court decision.

Grapes and grapefruit are favorites in the planting about Westmoreland, Imperial County.

New onions from Imperial Valley are retailing in coast markets at 12 and 13 cents a pound.

Ventura County will hold its fall fair October 4 to 8. Adolfo Camarillo has been elected president of the association.

The state highway commission authorizes statement that the Rincon causeway will not be closed for repair this season.

Horticultural Commissioner Waite of Imperial estimates cantaloupe planting in the valley at close to 28,000 acres.

The California Bean Growers' Association has opened a Los Angeles office at 418 Central Building, in charge of R. C. Jensen.

California cauliflower shipments for week ending April 7 reported at 287 cars as compared with 12 cars for corresponding week last season.

Pasadena has voted by a large majority to continue activated sludge treatment of its sewage. Large extensions to the existing plant are authorized.

In the study of citrus red spider the agricultural extension service in Los Angeles County is now cooperating in field plot work with Prof. H. J. Quayle of the citrus experiment station.

Bruce Drummond, for years in charge of the government date gardens at Indio, has asked for investigation of his work because of continued friction with some of the date growers.

Grain growers of Orange, Riverside, San Diego and Los Angeles Counties met at San Juan Capistrano on April 14 to discuss bulk handling of grain with Grant W. Kenney of the California Farm Bureau Elevator Corporation.

Farm centers of Orange County, meeting recently at Santa Ana, it was declared the sense of the meeting that any adequate water conservation project should include the entire county. The supervisors will be asked to appropriate \$25,000 to conduct thorough investigation.

The loose pack of strawberries has stood shipping so well that southern berry growers this season are unanimous in endorsing. Three grades are used: No. 1 mature well colored, uniform size, fine quality, free from defects, about one inch in diameter. No. 2 about same quality, except about one-half to three-quarters the diameter. No. 3 smaller berries of fair quality.

The Coast and General

Bellingham, Washington, holds its Tulip Festival May 4-6.

Oregon agricultural college has the largest enrollment in its history, 3,818 students.

Oregon celebrates 60th anniversary of the discovery of gold at Canyon City June 8-10.

An increased acreage will be planted to hops in the Moxee district of Washington.

Cotton acreage in Arizona will be about 105,000, 85,000 of Pima. Practically the entire acreage of Pima is in the Salt River Valley.

Secretary of the Interior Fall is on an extended trip through Western states to investigate reclamation projects, Indian reservations, etc.

Poisoned oats for squirrels is being distributed in Pend Oreille County Washington. A half mill levy was made by commissioners last fall for its purchase.

Columbia River salmon packers are offering 10 cents a pound flat for Chinook salmon. The season opens May 1. Fishermen pay state poundage tax of \$5 per ton.

An active war on Canadian thistle in Linn County, Oregon, is planned by the farm bureau. An anti-thistle campaign is organized in all communities of the county.

Washoe, Ormsby, Storey, Lyon and Douglas Counties, Nevada, are under temporary embargo as to cattle shipments into California pending investigation of cattle scab situation.

Farmers meeting at Colfax, Washington, set wage scale at \$1.50 a day and board for common labor, \$25 month and board for cooks, \$65 month and board for man and wife.

In the Yuma Valley of Arizona the acreage of short staple is estimated at 17,000 compared with 14,000 last year. Planting is well under way but the weather has been too cool for satisfactory growth.

Dispatch from Salem, Oregon, reports world's championship record for mature Jerseys now held by Lady Iota owned by S. J. McKee of Independence, Oregon, for year's production of 1,047.94 pounds butter fat.

A meeting of the Colorado River Commission is announced for some date in July or August, possibly Santa Fe, New Mexico, where Secretary of Commerce Hoover will present a states' pact for development of the Colorado.

Four carloads of dried prunes from one orchard, valued at \$32,000, have just been shipped out of Eugene to the Oregon Growers Cooperative Association. The shipment is billed to New York and will cross the water to Europe.

The Pacific Coast Wool Growers Association, with headquarters at Portland, is making plans to extend the organization. There are now 190 members in Washington, Oregon and Idaho. Recently this association distributed \$175,000 in return from last year's wool clip.

The United States has 64 per cent of the telephones of the world, with 16 per cent of the population. In 189 there were 500,000 telephones in the country. Now there are 1,000,000. This statement is made by P. S. van, vice president of the New York Telephone Company.

Treatment of Young Frosted Citrus Trees

By Vincent F. Blanchard, Agricultural Extension Service,
Los Angeles County

MANY thousands of acres of young citrus trees were severely injured by the heavy freeze recently experienced.

The owners of those groves are and have been endeavoring to acquire the best information possible for methods of procedure to save the trees. Advice given for their treatment has been varied to a great degree, and many growers are in a quandary to know just what way is best.

After the 1913 freeze the citrus experiment station at Riverside made a survey of the best practices, and this was published in the form of a bulletin. That information, combined with practical field observation, was given to the growers just as quickly as possible by the agricultural extension service, but there are still many questions that must be answered.

Large acreages of young trees were so severely injured that the tops are killed back entirely, leaving only the stock and bud union alive, and in some instances are dead to the stock. Still other trees have the bark on the trunks split open, leaving great wounds. The questions which have come to the minds of owners of such trees are whether it pays to care for those trees and, if so, what is the best way of handling them.

All knowledge which we have for the treatment of frost injured citrus trees must have been acquired from the past freezes. It is unfortunate that there were not many growers who kept accurate records of the various treatments and followed up for results. It is probable that there are more who did so than one would realize. Surely it would be well for the citrus industry if a detailed study could be made of such trees. There were, however, some growers who did keep accurate records and made observations over a period of years as to results. The work reported on by Mr. Culbertson, assistant manager of the Limoneira Company at Santa Paula, has been of great value.

From the year 1911 to August of 1919 the writer was employed on the Rancho Sespe, a large citrus property in Ventura County, owned by Keith Spaulding and managed by the late W. H. Fleet, and now managed by Howard F. Pressey, former assistant manager. When the devastating freeze of 1913 came the Rancho Sespe was just coming into bearing with about one-half its planting in five year old trees and the other half in three year old trees. Like many other groves of that time the ranch was inadequately protected with heaters, with the result that about 150 acres

of trees were frozen down. That ranch was in the same predicament that many others are today. To save the trees or to replant was the question to be answered. It was decided to try and save the trees.

It was not a question of cost of new trees for there were 50,000 first class trees in the Rancho Sespe, but it was thought that with a root system established three years in the grove, and five in some instances, the trees would surpass newly planted trees. This is the same reasoning many growers are using today.

The greatest percentage of the 150 acres of frost injured trees was so severely injured that it was necessary to cut the tops off entirely, leaving just the trunk. All stages of severity, however, were experienced and the less the severity of injury the less cutting was necessary. It was expected to grow new heads on the trunks left for the bark was apparently healthy on the trunk when the cuts were made, but the bark and wood kept dying back until most of the trees had only a few inches of live bark above the bud union, some being killed below the bud union.

In the spring numerous shoots began to grow from above and below the bud union. One on each tree was tied to the old trunk to grow a new trunk, and the others were left to be taken off after the tree had recovered sufficiently from the effects of the freeze injury. Every effort possible was made to treat all wounds with disinfectants and to paint with wound dressing. In spite of all the pains taken 90 per cent of the entire 150 acres showed it was not satisfactory before the year was over. The ten per cent saved was the very best, and it was considered would make good trees.

As soon as the new trunks became sufficiently mature the old trunks were sawed off close up and on a level to permit healing over. The wounds were disinfected and sealed over with wax. Stakes were placed at each tree and the new trunks tied to them for safety. Much duplication of work was necessary in chiseling out the stumps where heart rot had developed, which added to the cost materially. The sour stock shoots which grew from below the bud unions were permitted to grow and form a head at a height of 32 inches and later on were top-worked to Eureka lemons. The buds

were inserted in the framework limbs.

From the standpoint of cost the trees which were saved cost far more than new trees. It was hoped, however, that the larger root systems would more than make up the difference. In the places where trees were dug up new trees were planted. This was done in 1914.

In 1916 I made an individual tree record on the Rancho Sespe for the entire acreage. This included the year planted, health and general remarks to describe past treatment. Records were made of just how each tree was treated following the 1913 freeze. Some of the records are as follows: "Cut off above the bud union after 1913 freeze"; "Cut off below bud union after 1913 freeze"; "Reheaded after 1913 freeze"; "Cut off below bud union—sour stock shoot"; "Tops cut back severely after 1913 freeze"; "Small frost cracks" and "Large frost cracks." Those abbreviations enabled the ranch to keep an accurate record of the progress of trees under various treatments.

With others on the ranch I made observations from time to time in regard to the condition of the frosted trees. It always seemed that even though many of the trees were vigorous those which were cut off above and below the bud union with a new trunk formed were usually behind the resets planted next to them. In fact, trees which had undergone such treatment were constantly being removed and replaced with resets.

When the freeze of January of this year came it occurred to me that the experiences on groves in the 1913 freeze would assist growers in properly handling their trees. After writing to Howard F. Pressey, manager of the Rancho Sespe, in regard to whether it had not been his opinion that the Rancho Sespe would have been far better off financially if every tree which was frozen so severely that the tops had to be cut off and a new tree formed, had been pulled out and replaced, a letter came from him stating that it was his opinion that such was the case, but in order not to make a snap judgment he would prefer to go over the trees again.

In March two other members of the agricultural extension service, Mr. Pressey and myself went over a considerable portion of the trees on the Rancho Sespe which were injured in

1913. The records were examined and trees were noted in regard to how they had responded. A summary of the observations made is that of the original ten per cent saved only about six per cent is alive today. Those which were cut off above or below the bud union and a new trunk formed are as a whole not any larger than those resets planted in 1914 and 1915, and in many instances are not as good. Some are beginning to show decadence. Those which were not injured so severely are poorer than those which were cut off completely. It seemed that the large frost cracks made it practically impossible to keep out heart rot fungi and they are now suffering from its attack. Apparently it would have been better to have cut them off and formed a new trunk rather than not cut so severely.

An interesting observation was made of two rows of trees planted in 1914 which were taken from one of the Rancho Sespe's nurseries. Those trees were slightly injured by the frost with small cracks on the trunks. It was thought since the cracks were so small and appeared to be healing that they might recover. However, rather than take any chances with many of these trees only the two rows were planted. Those two rows are between trees planted at the same time which were not injured by frost. We observed that the frost injured trees were much below the size of the other trees and many of them appear stunted. It was a clear cut demonstration of the effect of frost on nursery trees.

The conclusions drawn are that it is better not to try to save a frosted lemon tree when it is so severely injured that the top is entirely killed. The expense of handling is far greater than the value received.

Since growing citrus trees is a long time business and it is essential to have good trees, it is not advisable to try to save such trees for they cannot regain their original vitality and they become decadent early in life. Mr. Pressey stated that the Rancho Sespe will never bother with such trees if their trees are again injured by frost.

Of course it must be remembered that the trees injured on the Rancho Sespe were lemons. It might possibly be that orange trees are less susceptible to injury from the freeze effects when the tops are killed back entirely. Perhaps there are orange growers who have kept just as accurate records as were kept in the Rancho Sespe who can throw some light on that phase.

How to Properly Celebrate Raisin Week, April 23-29

THIS is Raisin Week, recognized the nation over and set aside by the California raisin industry as the week in which raisins shall be introduced into the homes with a view to increasing their popularity with every member of the household. And on Raisin Day, April 27, all the great valley will join in special celebration at Fresno, headquarters of the raisin association.

Within the past few years raisins have become widely known and recognized as food of real health value. It is the aim of the industry that this delicious California fruit food shall become known and used in not the majority of homes, but in every home. Raisins can be served in perhaps a greater variety of ways than any other similar food and no matter how prepared they retain their health building qualities and their wonderful flavor, another thing that many other foods do not do.

In addition raisins have a distinct health value because of their heavy content of organic iron. They aid digestion, revitalize anemic blood, and lately have become the delicious way to satisfy a between meal craving for an energizing food.

California raisins are prepared in three varieties. They are the seeded, from which the seeds are removed; seedless raisins, which are grown

without seeds, and the cluster raisins, served on the stem, just as they are dried in the vineyard. The seeded and seedless varieties are cooking raisins, although since the introduction of the now famous five cent package of seedless raisins this brand has become popular as a confection, too. Clusters are also served uncooked and when placed on the table with a bowl of nuts are invariably an attractive dish. One of the most popular dishes, which is destined to become ever more popular during this week, is stewed raisins served at breakfast. With or in place of the usual cereal, stewed raisins add to the first meal of the day a new and delicious flavor.

Serve raisins in your household this week. Note some of the following ways to prepare them; just a few suggestions to help you get better acquainted with the variety of ways to serve, and to introduce to you this delicious fruit food containing all the necessary elements for health building:

Ten Delicious Ways

Whole Wheat Buns

2 cups scalded milk, ¼ cup sugar or ½ cup molasses, 2 teaspoons salt, 1 yeast cake dissolved in ¼ cup lukewarm water, 4 ½ cups coarse whole wheat flour, 1 cup seeded Sun-Maid raisins.

Add sweetening and salt to milk;

cool, and when lukewarm add dissolved yeast cake and flour; beat well, cover, and let rise to double its bulk. Beat again, and turn into greased baking tins having pans one-half full; let rise, and bake. Whole wheat bread or buns should not quite double their bulk in the last rising.

Soft Gingerbread

½ cup butter, ½ cup sugar, 1 cup molasses, 1 cup boiling water, 2-½ cups flour, 1 teaspoon baking powder, 1 teaspoon soda, ½ teaspoon salt, 1 teaspoon ginger, ½ teaspoon cloves, 1 teaspoon cinnamon, 2 eggs, ½ cup Sun-Maid raisins.

Cream butter and add sugar slowly, creaming them together. Add molasses and water and mix thoroughly. Sift flour, baking powder, salt, soda and spices together. Add to the butter mixture slowly, stirring constantly. Beat vigorously and add well beaten eggs and plumped raisins. Mix and pour into greased shallow pan. Bake in a moderate oven 30 to 35 minutes.

Raisin Date Sandwiches

2 cups Sun-Maid raisins, 1 cup dates, lemon juice, slices of buttered bread.

Mix the finely chopped raisins and dates. Moisten with the lemon juice and spread between the slices of buttered bread.

Hungarian Salad

Mix equal parts shredded fresh pineapple, bananas cut in pieces, and sections of tangerines, and marinate with French dressing. Fill banana skins with mixture, sprinkle generously with paprika, and arrange on lettuce leaves. Garnish with one-fourth cup plumped Sun-Maid seedless raisins.

Raisin Pie

½ cup sugar, 2 cups seeded Sun-Maid raisins, 1-½ cups boiling water, ½ teaspoon salt, 1 tablespoon grated orange rind, 3 tablespoons orange juice, 2 tablespoons lemon juice, 1 tablespoon grated lemon rind, 2 tablespoons corn starch, ½ cup walnuts.

Cook raisins in boiling water for 5 minutes; pour into sugar and corn starch which have been mixed. Cook until thick, about 5 minutes. Remove from fire and add other ingredients. Bake between two crusts. Walnuts may be omitted if desired.

Baked Apples with Raisins

5 apples, 5 tablespoons brown sugar, ½ cup Sun-Maid seedless raisins, ½ teaspoon cinnamon.

Cut around the apples just through the skin half way between the blossom and stem ends. Remove the skin from the upper half and core the apples. Mix sugar, raisins, cinnamon and fill the centers. Put apples in a baking dish and pour water around

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

California has some large avocado trees; some so large that the outstretched arms of two men are barely able to circle the trunk, but we have none equal in girth to that South American tree which is shown on this week's cover. If avocados generally are to grow to such a size, 20 feet apart will scarcely suffice. However, but few of us are worrying over the size of avocado trees 150 years hence.

* * *

By the way, Mr. Popenoe who took this photograph has promised to be present at the banquet and convention of the California Avocado Association to be held in Pasadena in May.

* * *

The wisdom of President Harding in refraining from participation in the Genoa conference is shown in the action of Germany and Russia in signing a separate treaty. The United States must be big enough to shoulder her share of the burden of reconstruction but also wise enough not to enter too closely into alliances with nations which dishonor their agreements and boast of it.

EAT RAISINS

All of next week is Raisin Week. Its observance will be more or less general from the Pacific to the Atlantic. The consumption of California raisins—of all California fruit—will be increased because of this observance. Therein does California exemplify "service," for as we secure greater consumption of California fruits we secure better health, greater efficiency and longer life on the part of our patrons.

SALES TAX

The effort to push through the sales tax as a means of providing funds for the soldiers bonus will doubtless bring a roar from the rural districts which will be heard even to the banks of the Potomac. Clear thinkers seem to be settled in their conviction that the sales tax will result in putting practically the whole burden of the bonus on the farmer. The national grange asserts that the present sales tax agitation is an attempt by this same bunch of high surtax payers to fasten upon the plain people of this country a sales tax. It is an un-American plan and the American people will never submit to it.

COVINA CONVENTION

Citrus growers are asked to meet at Covina Saturday, April 29, to spend the entire day in discussion of frost fighting equipment. There will be practical demonstrations by frost fighters and much discussion as to best methods in protecting fruit from injury and preserving for the tree its vitality. Secretary Calkins of the Covina chamber of commerce writes in effect that Covina producers believe there are better methods of frost fighting than through the use of oil smudge. In any case there is a big question mark after every question at issue. It will be a meeting open to all.

APRICOT GROWERS TO MEET

The Ventura County farm bureau is planning a one day apricot institute to be held at Santa Paula April 28. The Ventura farm bureau folks are being aided by a committee from Santa Barbara and Los Angeles Counties. The convention will discuss matters of general interest to 'cot growers. Principal attention, however, will be given to pooling orders for trays, boxes, props, spray materials and matters pertaining to the practical cultural side of the production. It is also hoped that at this meeting there may be organized a series of field meetings to work out better methods of thinning, drying and cultural practices. C. C. Staunton of Ventura has the matter in charge.

IT WAS NIPPY

Beginning April 8 and extending for one week at various points in the state there were mornings when white frost appeared, and some apricots, the bloom of which was passed and the small fruits already formed, were injured. It may result in a slight reduction of tonnage. There still may be almost normal return of dollars. As to other fruits it is reported: "Prunes not damaged at all by frosts anywhere in California;" "Smudging in cherry orchards, hoping frost warded off, and full crop"; "In San Joaquin Valley some damage to raisin grapes, not over five per cent;" "No damage in Sacramento Valley but

everyone worried;" "Some truck crops suffered but damage light." Even as to apricots some sections report frost damage not equal to the brown rot injury which occurred prior to the frost.

JOHN KILLEFER

One of the earth's quiet workers has passed as quietly as he worked. For many years John Killefer has studied the needs of the soil tillers of California and has worked to produce implements which would meet those needs. The term "light draft" never appealed to him and from the beginning he insisted that the two prime factors in implements for use in California were strength and dependability. In his younger days much of his time was put in at the forge or in front of the lathe working almost alone on the job. Later he became associated with Mr. Griffith and still later with many other practical workers, and the Killefer Manufacturing Company was organized. The past few years age has prevented the intense activities of earlier life but almost to the last moment he continued in "service." California has lost a loyal worker.

VACUUM FUMIGATION

We recently touched upon vacuum fumigation and referred to the fact that "It succeeds in killing the bug in the center of a bale of cotton and destroying other insect life in the center of cured fruit," then added: "It has succeeded in making safe the planting of trees, the roots of which are infested with nematodes, etc." To this latter statement Entomologist D. B. Mackie makes correction:

"I note with interest your item on utilization of vacuum fumigation for treating nursery stock. I think you are going a little too strong in saying that it kills nematodes, as such is not the case. There are also certain lines of insects which cannot be reached by this method. We hope some day to be able to develop a method whereby we can treat nursery stock for various pests, but as yet we have discovered no panacea and, frankly speaking, do not believe we will be able to find any one method that will treat all different kinds of stock for all different kinds of pests."

ROT

The average voter of California must be of desperately low intelligence in the eyes of those who are opposing the California water and power

act. One day an appeal is made to rural sections that the supporters of the act are working to put the cities into a position to hog it all and that its passage will result in the big cities securing control of the power and making rates to their patrons so exceedingly low that the country will be unable to compete and in the end the cities will become vastly more attractive to the great detriment of the country. Now comes another piece of copy dated San Francisco, April 12, without other responsibility than the signature of Edward P. Troy. The writer starts out with "The startling news, etc." Here is one of the startling statements:

'All the manufacturing industries of California would locate in the mountains 'near the source of supply' of water and power developed by the board, and the railroads would control the freight. Hundreds of millions of dollars invested in manufacturing plants would have to be abandoned, and new plants built. Existing cities would be depopulated, and new ones established in the mountains, 'near the source of supply.'

"Should any 'remote' city, like those about the Bay region, or in the South, desire water or power, a few land speculators in the mountains need only organize an irrigation district or a town, and then the board would be compelled to deprive the coast cities of the water and power and give it to those 'near' the source of supply, because of this unauthorized language, added after the adjournment of the conference that drafted the measure. Cities, large and small, 'remote' would be in darkness, in case of another water power shortage, while factories 'near the source of supply' could use all the power they desired."

As between the two stories we will let Cultivator readers take their choice. Other favorite "charges":

"This act if adopted would create a board of five men and provide for the issuance of \$500,000,000 in bonds, backed by the full faith and credit of California. The board would be beyond control of the people, the legislature or the governor and would have unlimited powers in spending the enormous amount of money when, where and how it pleased. This tremendous bond issue would, in effect, be a mortgage on every piece and parcel of property in the state as well as upon every security."

What is California credit and faith for if not to preserve and make available for the people of the state their own resources? The immensity of the wealth at stake and the high charges which it would be necessary for corporations to make to the farmers of the state render it imperative that we preserve our wealth for ourselves and our children.

AVOCADO GROWERS TO MEET

The seventh annual meeting, dinner and exhibit of fruit of the California Avocado Association will be held at Vista Del Arroyo Hotel, Pasadena, Friday and Saturday, May 12 and 13.

The avocado growers seem to be as virile and life-giving as is their fruit for after the unpleasantness of mid-January it takes a hardy pioneer to grow an almost tropical fruit in a semi-tropical country. During the nipping days of that cold spell many an avocado orchard was severely tested, so were the growers, but they are still standing pat, and at the gathering one of the principal discussions will have to do with the lessons of the frost. So they will gather at one of the prettiest little hotels in California to discuss their trials and their victories.

From the program we note that there will be a discussion of planting and cultural questions followed by "The Effect of the Recent Cold Weather on Varieties of Avocados in Different Localities." This is by Wm. Hertrich of the Huntington Estate and will be on Friday afternoon. On Friday evening will be the annual banquet at which Wilson Popenoe, tropical fruit investigator of the U. S. D. A., will deliver an address on the "Trails and Trials of an Agricultural Explorer," illustrated with beautifully colored lantern slides. The officers of the association are: W. L. Hardin, president; A. F. Yaggy, vice-president; J. M. Elliott, treasurer; K. M. Wagner, secretary.

The Program:

Saturday—President's address, W. L. Hardin. Avocados of the Chota Valley Ecuador, Wilson Popenoe, U. S. D. A. A Comparison of the Composition of Standard Varieties of Avocados Grown in the Same Orchard, C. G. Church, assistant chemist, Laboratory of Fruit and Vegetable Chemistry, U. S. D. A. Notes on the Enzymes of the Avocados, E. M. Chace, chemist in charge, Laboratory of Fruit and Vegetable Chemistry, U. S. D. A. The Danger of Transmitting Insects and Other Maladies on Avocado Budwood, G. F. Mozzette, entomologist, U. S. D. A., Florida. Saturday, 2 p. m.—Business meeting. Report of the committee on varieties. Election of three directors.

IRRIGATION EQUIPMENT ASSOCIATION

The Western Equipment Irrigation Association recently met in Fresno. There were delegates from many points on the Pacific Coast. D. J. Conant of San Jose presided, owing to the resignation of James A. Woods, former president. For the coming year C. A. Utley of Sacramento was elected president and P. H. Marlette of Los Angeles, secretary. This association was organized nearly a year ago in order to gather a greater fund of information regarding pumping machinery and general irrigation equipment and other data of value to the members and irrigation interests. Doubtless there was much talking shop during the convention. There were new members elected and matters of importance to irrigation people discussed. The meeting was participated in by many who are vitally interested in irrigation and the aid these equipment people could give to the irrigators. One of the principal events of the meeting was the banquet, though we are told there was no "irrigation" discussed.

The association expects to be state wide in its operation. It is divided into various district associations.

SUTTER COUNTY PEACH GROWERS' CONTEST

"According to available statistics 60 per cent of the canning peaches of the world are produced within a radius of some 25 miles of Yuba City, Sutter County," writes County Agent C. E. Sullivan. He adds: "Our work in the annual peach growers' contest, and with the peach industry of this section, has developed a number of interesting facts."

The following figures have been compiled from data gathered in this county:

Cost of producing one acre of peaches—Soil fertility, \$1; pruning, \$30; culture, \$30; water, \$50; pest control, \$10; harvesting, \$40; overhead, \$50; interest on investment,

\$72; propping and thinning, \$40; miscellaneous, \$10. Total, \$333.

Cost of production per acre, \$333; average for county per acre, eight tons at \$35, \$280; loss per acre, \$57. Ten tons to acre, at \$35 per ton, \$350; cost of production, \$333; gain per acre, \$17. If \$50 per ton be taken as average price, eight tons at \$50 per ton, \$400 per acre; gain per acre, \$63; profit on investment, 2.1 per cent. Ten tons at \$50, \$500. Gain per acre, \$163; profit on investment, 9.8 per cent. Ten tons per acre shows profit of 160 per cent greater than the acreage producing eight tons.

CITRUS FROST INJURY

Owing to absence of authentic temperature records in the orchard it is a hard matter to determine just what degree of cold citrus trees will endure without serious injury. Knowing the thoroughness with which William Hertrich, superintendent of H. E. Huntington's large San Marino ranch, does all things, the writer recently visited that ranch and thoroughly examined

an orchard in which the best self registering thermometers are kept.

The tract is an upland one, on a high bench, well away from low ground. It consists of ten acres of Valencia trees which will be five years old in July. The trees are large, in fine vigor, and extremely uniform in size, having always received the best of care—an ideal orchard. The December rains had thoroughly wet down through a fine soil in good tith. The cold weather came late in January. Mr. Hertrich said: "The lowest temperatures were on three consecutive nights and ranged 22, 24, and 26 degrees. The low point of 22 was reached on the morning of January 20, at 2:30 and thermometer remained close to this point until 7:30 a. m., or five hours."

The trees were loaded with fruit, most of which is worthless, and none will be marketed. The foliage and twigs are not badly injured and trees will not suffer thereby. About 25 per cent of the trunks were split a few inches above the soil, but none of them

apparently beyond condition of rapid recovery. These have been tightly wound, spirally, with stout twine, and wounds and area for about three inches on all sides painted with asphalt. Mr. Hertrich ascribes the trunk injury to the fact that the trees were trimmed rather high from the ground and are therefore too much exposed to both cold and sun.

WEEDS OF CALIFORNIA

After several months of preparation the manual "Weeds of California," published as the February-March number of the Monthly Bulletin of the California Department of Agriculture has been received from the printer. This is a book of 330 pages and is a ready reference to the identification and control of noxious weeds, and of especial interest as the new weed laws enacted by the last legislature will now be enforced against weeds as against insects and rodent pests.

Goodrich "55"

The Tire for Small Cars

The Last Word in Tire Economy

If you drive a Ford, Chevrolet, Willys Overland, or any other car using 30 x 3½ or 30 x 3 clincher fabrics, *see and feel* the Goodrich "55."

New qualities of durability, of strength and of safety added to that half-century old Goodrich quality make the Goodrich "55" a most remarkable value.

Its scientifically designed tread grips like a tractor. It unerringly holds your car to the road. It checks skidding and sliding. It makes driving easier.

And further—

The sidewalls are specially fortified—extra resistant to rut wear. Tread extends around under sidewall to the bead.

The Goodrich "55" is low priced. The quality and construction is on a par with its appearance—you have Goodrich's word for it.

The Goodrich "55" is all on the side of increased tire economy—*see and feel* it at your nearest Goodrich Dealer's, and you'll quickly understand why.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Sweet Butter

In reply to the subscriber who is having trouble with her butter will try and help her out. She does not mean unsalted butter, but butter that does not get rancid. I had the same trouble until an Englishwoman told me to sterilize my cream. I let the milk set 24 hours then put it on the stove and let it begin to bubble but not break through the cream, then let it stand 24 hours longer and skim, but am careful not to put in any cream that has not been scalded, as the least bit will turn the whole lot rancid. This cream is called Devonshire or clotted cream, is very sweet and the butter will keep as long as you want it. I also cook this butter slowly and drain off the oil and keep for months for cooking when butter is high. It will keep sweet indefinitely. Hope this will help some one.—Mrs. J. W. Seawill, Healdsburg.

Concrete for Engine Base

I want to make a base for a 40-horsepower gas engine and would like to know what proportion to mix the concrete. Should I use sand and cement, or should it have some coarse gravel in it?—Subscriber, Perris.

The proportion usually recommended is cement, one sack; sharp, clean sand, two sacks; clean, coarse gravel, or better, selected broken rock, four sacks. If greater strength is desired the proportions could be on the 1:2:3 basis.

Bluestone for Root Knot

If subscriber, Clovis, will sow about one-half pound bluestone on top of the ground around his trees affected with root knot it will do wonders. I had two almond trees that had fallen down and had only one root left. I cut part of the top off and staked them up. They are the best bearing trees in orchard today; also put a weak solution on trees when dormant as a wash on the trunks and use Bordeaux any time on cuts.—L. L. Guss.

(We hope our subscriber's suggestion will prove helpful, but we would suggest care in making large applications of sulphate of copper to the soil around trees. It is of course deadly to fungous spores and at the same time not acceptable to the tiny rootlets of the tree. If applied in sufficient quantity to control root knot it appeals to us it would endanger the life of the tree. We appreciate the suggestion.—Edit.)

Grafting Plum

Will you tell me if a Wickson plum about ten years old can support a Climax graft and keep it alive and growing with the rest of the tree bearing fruit? Our Wicksons have not been bearing lately and we were advised to put in a Climax graft, and now some say that the graft cannot live with the rest of the tree growing blossoms for fruit.—Subscriber, Lodi.

We believe the more satisfactory way would be to interplant with the desirable pollenizing tree. However, the expert might get a graft to "take" and there is no reason why it should not grow if properly set at the right time. We fear it would be too late for this season.

Iron for Blight

About a year ago I wrote you asking a remedy for pear blight. A gentleman answered, advising me to bury some old iron about the roots and requesting me to report, which I now do. I did as he advised and it evidently had the desired effect as our tree had quite a crop on last fall and the limbs seemed green and healthy and it looks all right now. I surely am very grateful to him and also to you for the courteous service your paper renders its subscribers.—Subscriber, Lodi.

(This is a case for close observation. The present season is an excellent one to aid in reaching definite conclusion. It has been a year of great rainfall, which will induce lux-

uriant growth which is usually friendly to blight. In order to form definite conclusions more than one year's observations are necessary.—Edit.)

Sterilizing Milk Utensils

Will you please give me a simple formula for a solution that will be good to rinse the milking equipment and cans with?—Subscriber, Artesia.

Boiling lime water is the best of disinfectants. Slake limestone as usual and thoroughly mix with hot water, allow to settle, use the clear liquid, then if used in sufficient quantity so it will retain its heat for a moment after being poured into the utensils or forced through tubes of the milking machine its action should be perfect.

Agricultural Laws

Where can I get a copy of the laws governing the production and sale of cream? Am selling to a creamery for manufacture of butter.—Subscriber, Hanford.

Write George H. Hecke, Director State Department of Agriculture, Sacramento, and ask for "Agricultural Statutes of the State of California."

Paint on Iron

Can you or any of your readers tell me how to make paint stick to galvanized iron. Good lead and oil will not stick but peels off.—Subscriber, Thermal.

All paint houses carry paints especially prepared for metal. These are probably superior to any which can be mixed by the amateur.

Waterproofing Concrete

I wish to construct a cellar which shall be water tight. How should I mix the concrete?—Subscriber, Dinuba.

Professionals give the proper mixture for water tight concrete as what is known as the 1:2:3 mixture. This means one sack (which is about one cubic foot) of Portland cement, two of well graded sand and three cubic feet of well graded gravel or broken stone. If the mixture is thorough it is possible four cubic feet of gravel could be used. Also where watertightness is desired it is necessary to have all forms ready, use fresh cement, proceed continuously in the pouring, thus preventing any seam or construction joint. If suspension of work becomes necessary then leave surface very rough so as to secure perfect contact with next pouring. Then, if possible, both sides should be washed or brushed with pure cement and water mixture applied of consistency of thick cream. This wash of pure cement should also be used over any joints which may be necessary in the pouring. There are also proprietary waterproofing mixtures which may be had from cement dealers.

Where to Raise Hogs

Where is the best part of California to raise hogs and raise your own feed?—Subscriber, Delano.

Hogs are consistent lovers of all the hills and valleys of California. We do not think there is any one locality which stands supreme. It is a matter of securing good soil and irrigation water to cover at least part of the farm, then a good strain of pure bred hogs.

Best of Citizens

Two friends had an argument as to which was more American. A says his mother is American born, his father born in Italy, and he himself in the United States. B says his father was naturalized, his mother foreign born, and he was born in the United States. Is either more American than the other? Also B says A cannot have more privileges than B.—Subscriber, Concord.

Both boys are perfectly good Americans and on an equality as to citizenship. However, the mother who was born in this country but married a foreigner, if he has not been naturalized, lost her citizenship.

Coloring of Fur

THEY CONQUER THE MUDDIEST ROADS

Copyright 1922, by The Goodyear Tire & Rubber Co., Inc.

"The roads between Anoka and Minneapolis test the strength and construction of the strongest tires. After a heavy rain, the truck runs for miles at a stretch through heavy ruts. Our Goodyear Cords carry through on schedule, in all weather, saving time and money. Our Minneapolis Goodyear Dealer gives us good service on them."—SIMON KRUSE, Owner of Radisson Farm, Anoka, Minnesota, and President, Radisson Hotel, Minneapolis.

ON rain-soaked roads, Goodyear Cord Truck Tires find sure footing and make steady speed from farm to town. The wide, thick blocks of their All-Weather Tread take hold with a tractive grip that carries the truck forward full distance with every turn of the wheel.

Their buoyant resilience protects the truck, reducing operation and repair costs; cushions

the load against road shocks that injure the perishable cargo; saves the driver, and is easy on the surfaces of improved roads.

Goodyear Cord Truck Tires are strong and durable. They are designed to wear a long, long time. Detailed records of their performance in farm hauling on the road and in the fields are furnished on request to Goodyear, Akron, Ohio, or Los Angeles, California.

When Writing Advertisers Please Mention the Cultivator.

for coloring the fur of a coyote skin, in either dark brown or black or both.—Subscriber, San Dimas.

We are unable to give any help to our inquirer so we pass the question on to our subscribers. We imagine the coloring of fur calls for the work of a specialist.

Trapping Hawks

To discourage hawks erect in the poultry yard a pole that extends above the chicken house or any nearby building or tree. Place on top a very small steel trap, set but not necessarily baited. Of course the pole must be a stout one with spikes in the sides so that the poultry man may take out the captive and reset the trap. A ladder may be substituted for spikes. This scheme has been tried and found effective.—H. H. Williams.

(But if the hawks are not too big a menace to the poultry yard, bear in mind they devour great numbers of squirrels, rabbits, mice and other pests.—Ed.).

Balanced Ration for Dairy Cow

Will you kindly tell me in what proportion to mix the following feeds for balanced ration: beet pulp, bran, ground barley, alfalfa-molasses and copra? How much should be fed for each gallon of milk produced? Cows have all the alfalfa they can eat.—Subscriber, Los Angeles County.

This is answered by Prof. F. W. Woll: "The best proportion will depend on cost. Considering intrinsic feeding values and market prices, they may be assumed to range about as follows in cheapness, fed to dairy cows supplementary to alfalfa hay: Coconut meal (cheapest), dried beet pulp, barley, bran and alfalfa-molasses. It follows, therefore, that coconut meal and beet pulp should make up a large proportion of the grain ration in order to make this most effective per dollar expended. I would suggest equal parts by weight of coconut meal, beet pulp and barley (why not rolled, which is just as good as ground barley for dairy cows, and cheaper?), or one-fourth of each of these three feeds and of wheat bran. One pound per four to five pounds milk makes a medium grain ration, or about two pounds per gallon of milk. The quality of the hay and the milk production of the cows may make it desirable to vary this ratio somewhat, but two pounds per gallon milk is, generally speaking, a fair amount of grain to feed to good cows under practical dairy conditions in this state. I would suggest that the subscriber and others interested send to Director of Experiment Station, Berkeley, California, for copies of the following publications by the writer on subjects relating to feeding dairy cows: Bulletin 323, Heavy vs. Light Grain Feeding for Dairy Cows; Bulletin 335, Coconut Meal as a Feed for Dairy Cows and Other Livestock; and Circular 215, Feeding Dairy Cows in California. These and other publications of the station are sent free of charge to those requesting them so long as the supply lasts.

"Another question raised is, as to the best ration for veal calf. This will likewise depend on available feeds and their cost. The best calf ration must include skimmilk, which may be fed in increasing amounts until 14 to 18 pounds is fed daily at three to four months old. The grain mixture fed from the time the calf is two to three weeks old may consist of grain feeds like barley, corn, oats and milo, with some coconut meal and bran or middlings, say two parts mixed grain and one part of each of the latter two feeds, gradually increasing the feed from a quarter of a pound to two to three pounds daily at three to four months old. This with skimmilk and the best quality of hay available will make an excellent calf ration. Calves fed in this manner will gain from one and one-half to three pounds per day on an average, depending on the breed, individuality and age of the calf, and will be at from five to eight months of age almost as sleek and fat as if fed on whole milk."

Lichens or Fungus

This growth is on apricot and peach trees. Please let us know what to do so it will go no farther.—Subscriber, Riverside.

This is a shelf or bracket fungus

often taken for one of the lichens which grow upon rocks, trunks of trees, fences, etc. They derive their nourishment from the air and are an indication of diseased bark or at least tree out of condition. Scraping or mechanically removing is best first treatment and spraying with Bordeaux or other fungicide may be helpful.

Weevil in Beans

Can you tell me through your paper how to keep beans free from weevils?—Subscriber, Arcadia.

Keep in insect tight room or container. If already infested fumigate in tight room or bin with carbon bisulphide, using at the rate of five to ten pounds for each 1,000 cubic feet of space in the room. Expose to the gas for 48 hours. This gas is very explosive. Use care with lights or fire.

Gypsum-Kainit

Kindly advise me as to use of gypsum or kainit in connection with a

manure pit. Which is preferable?—Subscriber, El Cajon.

Regarding gypsum Van Slyke's "Fertilizers and Crops" says: "Its chief value is not because it possesses unusual power as a mechanical absorbent of liquid or of ammonia, a common belief, but because by chemical action it changes the easily volatile ammonia into a more stable form." If gypsum is used, use liberally, say at least 100 pounds for each ton of manure. "Kainit sprinkled on manure tends to attract and hold moisture. The potassium and magnesium compounds in kainit tend, as in case of calcium in land plaster, to change ammonium carbonate into more stable compounds, such as ammonium chloride and sulphate. Kainit has the advantage of being easily soluble and is therefore more readily distributed through the manure and more completely utilized than land plaster. The application is recommended of 50 pounds of kainit for one ton of manure. One precaution should be observed in the use of kainit or any similar material;

it should be kept from direct contact with the feet of animals, since it is injurious. It is therefore best applied to fresh manure and covered with bedding or it may be applied and carefully mixed with manure daily when the stable is cleaned."

Spray Material

Is there any supervision of sale of spray materials in this state? If there has been injury to a crop because of spraying can one collect from the manufacturers of the spray material?—Subscriber.

Write George P. Gray, Division of Chemistry, Department of Agriculture, Sacramento, for copy of the "California Economic Act of 1921," which controls insecticides offered for sale in this state.

Sulphate of Iron for Nematodes

At one time Dr. Snowden referred to control of nematodes by the use of sulphate of iron. An inquirer wishes to know as to quantity and method. The question was referred

REO

SPEED WAGON

Cab Express
\$1435

Stock Rack
\$1460

A Truly Marvelous Motor!

If there is any one unit that, more than any other, accounts for the stamina and the long life of the Reo Speed Wagon, it is the power plant.

Of course the other units—transmission, axles, driving shafts and gears—must be strong enough to sustain the full thrust of the motor.

But in the final analysis, it is the motor that must withstand the grief—must do the work.

That four cylinder motor was designed and built in the Reo shops for precisely this work.

Crank shaft is "50 per cent oversize," and all bearings, connecting rods, camshaft, valves and other parts, conform to the same Reo standard.

This isn't a "carriage horse," hitched to a heavy truck—this is a big, powerful

"drafter"—bred for this special work.

"Bred" is right—for this motor was the result of long years of development.

It is an evolution—not an inspiration.

We maintain that no other motor—and certainly none of lighter construction—can stand up beside this great Reo engine.

Experienced users—owners of individual trucks and of fleets—endorse our contention by standardizing on Reo Speed Wagons.

A matchless combination of brutal ruggedness in design, and of watch-work fineness in construction, this Reo motor has proven equal to the most strenuous work over a long period of years.

Until you have found an equal for this motor, it is futile to look for a truck that will stand up beside a Reo Speed Wagon.

Besides those here illustrated, there are several other standard body types for all kinds of hauling. Get particulars from your Reo dealer. Prices shown are f.o.b. factory, plus Federal Tax

The boy who started to town with \$100.00

THE advice they gave him for getting on in the world was simple and familiar enough: "Keep what you have, and build on it. Be careful what you do and it will grow into more."

It's a safe rule—with money or health, but a good many overlook the rule with health, until they have lost what they had. Then it's hard to get a new supply.

Postum is a splendid help in saving health from the very common losses through the drug elements of tea and coffee—whose effects on the nervous system any doctor can tell you.

Thousands of people who think it wise to be as careful of their health as they are of their dollars are users of Postum. They find this famous cereal beverage a delightful drink with meals, and it is free from any disturbing element.

You can begin with Postum today, with an order to your grocer. The road to health is a good road for anybody to follow. "Save what you have, and build on it," is sound policy for anybody.

Postum comes in two forms: Instant Postum (in tins) made instantly in the cup by the addition of boiling water. Postum Cereal (in packages of larger bulk, for those who prefer to make the drink while the meal is being prepared) made by boiling for 20 minutes. Sold by all grocers.

Postum for Health

"There's a Reason"

Made by Postum Cereal Co., Inc., Battle Creek, Mich.

to Dr. Snowden, who answers: "Regarding the destruction of nematodes with ferric sulphate I would suggest 500 pounds per acre scattered broadcast and mixed with the upper four or five inches of soil. The rain will take it down. An application then of 1,000 pounds of freshly slaked lime will convert this into sulphate of lime and ferric oxide, both very beneficial to the soil. The best procedure with this object in view is to sow iron salt in the fall and the lime in the early spring. I would like to point out, too, that in soils poisoned with arsenic, the ferric sulphate and lime would prove an effective antidote. I should have said also in my original article that on soils where fruit trees are growing this ferric sulphate which has an acid reaction may have a temporary unwholesome influence on the thrift of the trees. Not over 100 pounds should be used where trees and crops are growing."

Floor Paint

Please give formula for mixing a good floor paint which is inexpensive.—Subscriber.

We fear that is a physical impossibility. With the amount of wear usually given to painted floor only a thoroughly dependable paint will hold up. These are now prepared by paint companies which manufacture a thoroughly dependable paint of any shade one may desire. As to cost this paint is as cheap as one can buy the separate materials and mix.

Wire Worms

I am writing you in regard to artichoke plants set out this spring. They didn't seem to be thriving so I dug around the roots and found them a crawling mass of small yellowish brown worms, and the ground around seems to be infested with them. I put sulphur around the roots of each of them but it had no effect. Can you tell me what kind of worms they are and what will eradicate them? The information given through the Cultivator can always be relied upon.—Subscriber, Modesto.

This is a case of serious infestation of wire worms. We fear there is no saving these plants though it is possible by taking pieces of potatoes and burying near the roots of the artichokes that the pests will leave the roots of the plant and feed upon the cut surface of the potatoes. After they have been buried near the plant over night or for a few hours carefully lift and if found to be covered with wire worms destroy them by jarring off into kerosene or boiling water. Place the potatoes immediately again near the roots and repeat day by day. Lima

bean growers of Ventura County have followed this course over large acreage and after a little practice the work has been found quickly accomplished and at a cost which is not prohibitive. If the plant is past saving remove and rid the soil of the pest by use of carbon bisulphide poured into the holes every few inches apart. The use of this gas is not economically possible on a large acreage.

THE 1922 HARVEST

(Continued from Page 431.)

Sebastopol Apple Growers' Association, Sonoma County

Apples, present indications are for a good crop of Gravensteins and a light crop of late apples. Too early to make a dependable estimate.

E. R. Beeton, Beaumont, San Bernardino County

The 1922 deciduous fruit crop to date has been handicapped by low temperature and lack of sunshine. Almonds and apricots were quite severely injured by frost, April 5 and again on the 9th. In some groves the damage to cots would amount to fully 60 per cent; in other localities considerably less. The loss to almonds may average 35 per cent. Peaches slightly damaged. The precipitation to date for the season is 31.60 inches. Fruit development is late from two to four weeks. The season is not far enough advanced to determine what the harvest may be. A later report will follow.

R. F. McKinney, San Jose

Brown rot damaged many apricot orchards; few were entirely free. Spraying just before the blossoms opened up seemed to control to a certain extent on some trees. Sunday morning, April 9, a very heavy frost occurred. In many orchards where no effort was made to smudge a 100 per cent loss was experienced. One of my neighbors who does his smudging thoroughly saved 70 per cent of his apricots. Some growers report a 100 per cent loss regardless of smudging. Many orchards regarded as out of the frost belts report 80 to 90 per cent loss. The crop in this valley appears at present to be about 20 per cent of normal. Almonds are not grown extensively here but the few trees growing appear to have a heavy crop. The sugar prune trees appear to have suffered about a 60 per cent loss from frost. French prunes, cherries, pears, peaches and apples are not far enough advanced to make any estimate. These varieties of trees are in a very vigorous condition, blooming profusely and at the present time have every indication of setting a heavy crop. The grain, except in the low lands that were flooded, is in excellent condition. Tomato plants growing slowly on account of cool weather. Large acreage to be planted. Some canners now offering \$20 per ton.

Santa Paula Chronicle, Ventura County, by Edith Bristol

The 13th of April proved itself an unlucky day for the apricot growers of the Santa Paula and Ojai district, for the thermometer dropped suddenly and sharply on the morning of that date and the result was destructive to the heavy crop of young fruit, well formed and promising well. At two o'clock on the morning of the 13th the mercury was at 26 in the western end of this valley and is reported as low as 24 degrees toward the eastern end. At the Limoneira Ranch the smudge pots were fired at that hour and continued till well after it was light. Other ranches equipped with firing apparatus lighted their pots, and this lessened the possible damage, but many ranches that grow apricots exclusively have no equipment for firing and the loss reported in these is in some places as high as 50 per cent, although many of the orchards in the western end of the valley report a much smaller loss. Some orchardists claim that because the crop was so large the damage from this frost will do hardly more than thin the fruit out to the desired amount.

The tender young growth of the walnuts was nipped in many orchards. In the upper Ojai the young fruit was badly damaged, all except late bloom fruit still in the blossom stage. The young almonds in this locality were nipped as well.

THE MAN BEHIND THE HOE

By O. S. Pinckney

I asked a wise old sage one day to give me his opinion, Who is the most important man in this world-wide dominion? Said he, "My friend, you'll surely see, if you will look around, The most important man of all's the one who tills the ground.

"He gives to us the lowly bean to satisfy our hunger And grows a thousand other things that make the old feel younger. He gathers in the golden wheat to make our daily bread, And on his geese the feathers grow to fill our feather bed.

"You'll find wherever you may go, wherever you may wander, The farmer is a busy man, he has no time to squander. He's many, many things to do, and many more to know; So don't turn up your nose at him and call him crude and slow.

"For should the farmer go on strike, we all would hungry go. Without that sturdy workingman, the man behind the hoe, We'd go without our daily bread, or butter to put on it. Is he important? 'Twan't for him we couldn't live, dog-gone it!"

HOW TO PROPERLY CELEBRATE RAISIN WEEK, APRIL 23-29

(Continued from Page 433.)

them to the depth of ¾ inch and if there is more than enough of the sugar mixture to fill the centers add it to the water. Bake in a moderate oven 35 to 40 minutes or until apples are tender. Serve hot or cold, plain or with cream.

Sun-Maid Macaroons

1 egg white, ¼ cup fine granulated sugar, ½ cup Sun-Maid seeded raisins, 1 teaspoon vanilla.

Beat white of egg until stiff; add sugar slowly, beating constantly; then add raisins and vanilla. Drop from the tip of a spoon on buttered sheet one and one-half inches apart. Garnish each with one-half raisin and bake in a slow oven from 12 to 15 minutes.

Apple Pudding with Raisin Sauce

2 cups flour, 4 teaspoons baking powder, ½ teaspoon salt, ½ cup chopped Sun-Maid raisins, 1 egg, ¾ cup milk, 3 tablespoons butter or shortening, 1 cup sliced apples, 1 tablespoon brown sugar, ¼ teaspoon cinnamon.

Sift flour, baking powder and salt together. Add raisins and mix well. Stir in beaten egg, milk and melted butter. Beat thoroughly and spread in greased shallow pan. Place sliced apples over the top and sprinkle with sugar and cinnamon. Bake in moderate oven until apples are tender. Cut in squares and serve hot with raisin sauce.

Raisin Sauce for Apple Pudding

1 cup chopped Sun-Maid raisins, ½ cups boiling water, ½ cup sugar, 1 tablespoon flour, ¼ teaspoon grated lemon rind, 1 tablespoon lemon juice.

Cook raisins and water slowly 10 minutes. Mix sugar, flour and lemon rind and add raisins, stirring constantly. Bring to boiling point, stirring, and keep hot in double boiler until ready to serve. Add lemon juice just before serving.

Prune and Raisin Conserve

1 cup prunes, 1 cup Sun-Maid raisins, 2 cups cold water, 1 cup brown sugar, ½ cup vinegar, 1 teaspoon cinnamon, ½ teaspoon cloves, ½ teaspoon allspice, ½ cup chopped blanched almonds.

Soak prunes and raisins over night in cold water. In the morning cook in same water until prunes are tender. Discard pits from prunes and put in pieces. Add sugar, vinegar and spices. Cook until thick—about 45 minutes. Add almonds and cook 5 minutes. Pour into sterilized glasses and seal with paraffin. This makes about six glasses.

The golden poppy is God's gold, the gold that lifts nor weighs us down—the gold that knows no miser's hold, the gold that banks not in the town, but singing, laughing, freely spills its hoard far up the happy hills. Far up, far down, at every turn, what beggar has not gold to burn? —Joaquin Miller.

HOUSEHOLD QUERIES

Kumquat Marmalade

How do you make kumquat marmalade?—Subscriber, Pasadena.

Here is recipe combining kumquats with lemon: One quart kumquats, two lemons, sugar, water. Quarter kumquats and remove seeds. Slice lemons, rejecting seeds. Combine the fruits and let stand for 24 hours in twice their quantity of water. Place over a low heat in the same water and boil gently for one hour. Cool, add two cups of sugar to each pint of fruit and juice and boil gently till clear and thick. This amount will fill nine medium sized glasses.

This one uses kumquats only and grinds them fine: Wash and remove seeds. Slice very thin or put through the food chopper. (I do the latter, as it is quicker and just as good.) Weigh and add same weight of water. Set away until next day. Then boil until tender in same water. Set away again. The following day boil 30 minutes. Weigh again and add same weight of sugar. Boil 20 minutes. Put in glass cans or jelly glasses.

Loquat Jelly

How is loquat jelly made? They will soon be ripe now.—Subscriber, Anaheim.

Gather the loquats while still firm and only partially colored as they will jelly much easier at this stage.

Wash and remove blossom ends. Cover with water and cook till soft. Strain through cloth. Boil juice down till thick and cherry colored, when add heated sugar, pint for pint, gradually. When sugar is thoroughly dissolved, boil a few minutes and test by letting small quantity cool in small dish.

Salad Vegetables

Please tell me how to cook or fix chicory, leeks and endive. I sowed some of these in the garden, as they were recommended to me.—Subscriber, Visalia.

Chicory and endive are salad greens and may be used alone or in combination as is lettuce or as garnish for meat or similar dishes. Leeks may be used raw or cooked just as onions are. They are not as strong as onions.

Ginger Snaps

Will you give me recipe for ginger snaps such as we buy at the stores?—Subscriber, Visalia.

One cup molasses, ¼ to ½ cup butter, suet or chicken fat, 2 teaspoons salt, 3 cups flour, ½ teaspoon soda, 1 tablespoon ginger. Boil shortening and molasses 2 minutes. Add remaining ingredients, mixed and sifted. Beat well; chill over night. Roll very thin. Shape with knife or cutter. Bake on buttered pan in quick oven 8 to 10 minutes.

Cobbler with Batter

Please give a recipe for a cobbler pie in which a batter is used.—Mrs. R. E. Main.

Place fruit in deep baking pan. Dot with sugar and butter according to taste. Sift 1 cup flour with 2 teaspoons baking powder and ¼ teaspoon salt. Add about ½ cup milk or enough to make stiff batter. Spread lightly over top of fruit. Put cover on baking pan and put in moderate oven 20 minutes. This is practically the same as stewed dumplings. The cover should be left on for the batter to steam until done, otherwise it will be soggy. If pan is not covered the batter, having no shortening in it, is liable to bake hard and dry.

Banana Pie

Please give recipe for banana pie.—Subscriber, Colton.

Remove strings from bananas, cut in dice or rub through sieve sufficient bananas to measure one cup. Place in mixing bowl and add ½ cup sugar, juice of one lemon, ¼ teaspoon grated rind of lemon. Stir to mix, then add slowly, beating to mix, one cup milk, yolk one egg, one whole egg, ¼ teaspoon nutmeg. Pour slowly in pie plate lined with plain pastry. Bake in slow oven 25 minutes, then cool. Meringue may be made with the leftover white.

Noodles

Please tell me how to make old fashioned noodles like my mother made. How long should they be dried?—Subscriber, Arcata.

One egg, 1 tablespoon water, ½ teaspoon salt. Beat together till well mixed, then add sufficient flour to make stiff dough. Knead till elastic, about

Culling

UNPROFITABLE hens or "boarder-cows" are now-a-days culled out. The scrub passes—the purebred remains. Likewise in selecting a dentifrice for family use you have to choose between the "culls" and the really worth while tooth cleansers.

"Cull" tooth pastes may contain drugs for which impossible claims are made. Or they may contain harsh grit which scratches or scours the precious, protective enamel of the teeth.

COLGATE'S Cleans Teeth the Right Way

"Washes" and Polishes—Doesn't Scratch or Scour

Colgate's is a good, honest, common sense dentifrice without drugs or harsh grit. Colgate's Ribbon Dental Cream loosens clinging particles from the teeth and "washes" them away without scratching or scouring. No dentifrice can do more. And the flavor of Colgate's is delicious—it leaves the mouth clean, cool and refreshed.

More dentists recommend Colgate's Ribbon Dental Cream than any other dentifrice—they know it's not a passing fad—but a "true-to-type" dental cream. A LARGE tube of Colgate's costs only 25 cents—why pay more?

Good Teeth, - Good Health

Children

NEED A "BALANCED RATION" TOO

A "balanced ration" is more essential to children on the go and grow than it is to grown-ups. So important are prunes to the well-being of every child that a famous health writer said recently: "For your own health and the health of your children it is important to know that prunes should be eaten the year 'round and at least once every day. The American mother does not know how to take care of her children unless she teaches them to eat prunes regularly."

Good prunes—such as this State-wide, co-operative association packs and markets—are Nature's finest fruit-food. They are rich in fruit sugar. And this sugar is quickly turned into energy—for study or play. Also, they are rich in tonic iron and other mineral and "vitamine" elements. The body needs these for body "tone" and body "balance." Search where you may, you will not find a better energy-food for lively, romping folk than these sugar-laden prunes.

Many children, too, love to eat 'em raw. Good! Let them eat prunes to their fill. It is a natural sweetmeat—food and confection in one. It means unspoiled teeth and unspoiled stomachs—and better health in the bargain.

We have received so many requests for prune dishes for children that our Domestic Science Director has prepared this special recipe folder—"For a healthier today and tomorrow." The dishes are wholesome, tasteful and novel enough to appeal to children. Send for it today—it's free!

two minutes, then roll out on pastry board until as thin as paper, dusting board lightly to prevent sticking. Let stand 15 minutes to dry, dust flour lightly over top, roll up like jelly roll and cut in width desired with very sharp knife. Lightly shake out strings and let dry at least over night.

Chicken Pates

Please tell me how to make chicken pates.—Subscriber, Eureka.

1 cup dried cooked chicken, 2 tablespoons butter, 2 tablespoons flour, ½ cup cream, ¼ cup chicken stock, 1 tablespoon lemon juice, few drops onion juice, 1 teaspoon Worcestershire or walnut catsup, salt and cayenne to taste. Melt butter, add flour, seasonings and stock, boil one minute, add chicken, when heated through serve in hot pate shells made on regular pate irons, or shells may be made of puff paste as follows:

Puff paste may be made in proportion of 1 pound butter, 1 pound flour. Flatten butter into round cake, chill. Sift flour several times till very light. Add cold water to form dough a little stiffer than for baking powder biscuit. Chill. Roll dough on floured molding board into rectangular shape. Place shaped and chilled butter on middle of one side of paste dough, fold over other side, press edges together. Now fold one end of this over, one under, making six layers of dough. Roll again into rectangular fold as before and so continue seven times. If butter begins to soften, roll paste dough in cheese cloth and place on ice till hard enough to roll easily. Be careful not to wet cheese cloth. Roll paste finally ½ inch thick. Cut with round cutter. Cut rings from half the rounds. Place rings on rounds, holding together with cold water. Chill until stiff before baking. Lay small rounds lightly on top. Bake in hot oven 15 minutes, then decrease heat and bake nine minutes more.

Fill chicken into shells, place small rounds on top and serve.

MORE ABOUT PRESSURE COOKERS AND FIRELESS COOKERS

Pressure Canning

Seeing your request for actual experience with a steam pressure cooker I will say I have used a National Steam Cooker, 25 quart size, for over a year and could not do without it. It does all that is claimed for it and more. I use it nearly all day, put meat, beans or vegetables in it to cook and go on about other work as it will blow off automatically when it reaches the right degree to cook as I set it for the particular cooking on hand. The toughest meat will cook in 45 minutes at 15 pounds pressure. I canned 50 cans of corn and 300 cans of meat which kept perfectly. It does not take over one-third the time that the old method did and is much safer and better for canning. In canning meat and vegetables I use a Burpee Sealer and tin cans. It is no trouble to learn to use for a child could use one easily.

The first cost of a cooker is all, as it will last permanently, being made of such heavy aluminum.—Mrs. A. A. Winters, Grizzly Bluff.

Pressure Cooker

In regard to the pressure cooker, I have used one of them for four years and would not keep house without it. I have had good success with everything I have made. I have canned corn, made apple butter, canned meat, made carrot and suet puddings and all similar dishes. Boston baked beans will cook in 25 minutes.

Full directions will be found in each kettle.—Mrs. John Koch, Covina.

Fireless Fine in Summer

I have fireless that has been in use for two years and would find it impossible to do without it, especially in the summer. I never cook meat any other way than in the cooker.

Remember when you cook meat in the cooker it goes so much farther than when it is boiled on the stove, and it retains all the fine flavor of the meat.

I can't begin to tell all the splendid things about the cooker, but if you live on an orchard ranch and have lots to do outside in summer you will find

HAROLD SOMERS, 150 De Kalb Ave., Brooklyn, N.Y.

the fireless cooker the best saver of time and fuel.

You asked the question, does it pay to buy a fireless cooker? Yes, by all means.—Mrs. J. M. White, Gilroy.

Fireless, One of the Family

Indeed a fireless cooker is worth buying. I have used one for four years, a 16 quart size, a Rapid, and it has become one of the family. We could not do without it. It bakes, boils, roasts and fries, browns food deliciously and never burns. It is very simple to use. I am always very glad to tell the value of a fireless cooker.—Mrs. H. G. Webb, Turlock.

Whole Dinner in Pressure Cooker

I have owned and used a pressure cooker for more than a year and simply would not be without one. I cook all our meats in it as they cook quickly and retain all their juices. I put my roast for Sunday's dinner on, and it will cook while I prepare salad and set table.

Chicken stuffed with dressing and cooked 50 minutes was so tender and had the most delicious flavor I have ever tasted. Vegetables which so often lose their flavor in boiling are steamed in the inner pans and taste much better than when boiled. Corned Beef cooks nicely in less than one hour and will be "done."

Cereal cooks in 20 minutes and one may always be sure it is well cooked.

I have also steamed carrots and plum puddings an hour, leaving pet-cock and safety valve open, then put on pressure for 10 minutes to ripen. These were delicious.

One point which I would call attention to is the fact that a whole dinner may be cooked in it and the flavors not mix.

One should be careful to keep the cooker always clean and open when not in use.—Mrs. B. L. Lamb, Taft.

Pressure for Canning Meats and Vegetables

I have had a pressure cooker several years and think it just great. Aside from cooking things so quickly it keeps the flavor right in the cooker instead of letting it go off in steam as in an ordinary kettle.

And it is certainly the only safe way to can vegetables and meats as you must have a very high temperature to be perfectly safe.—Mrs. Geo. H. Clark, Madera.

OUR BABY COLUMN—DIET FOR NORMAL CHILD

By Mrs. M. S. Sirdevan

AT nine months one can start to give fruit juices and beef broth. Orange juice should be given at 8 A.M. but only ½ ounce, with water (1 or 2 ounces). At the two o'clock feeding give beef juice ½ ounce or broth 1 ounce.

Feed every four hours; 6 A.M., 10 A.M., 2 P.M., 6 P.M. and 10 P.M.

Lamb or Beef broth.—½ pound of lamb or beef from neck or shoulder with bone, cut in squares, 1 tablespoon celery or peas and 1 tablespoon carrots or spinach, 16 ounces water. Boil 5 hours in double boiler or all night in fireless cooker. Boil down to 8 ounces. Strain, remove fat and add salt. Feed from a spoon.

Beef juice.—A small piece of lean round steak cut thick, slightly broiled, and the juice pressed out with potato ricer or meat press. This seasoned with salt, may be given cold or warmed by placing the cup which holds it in warm water.

At Ten Months

At ten months the following foods may be given gradually:

Cereals.—Use any of the following: Cream of wheat, farina, oat meal, barley. Prepare as follows: 2 tablespoons cereal to 1 pint water. Cook in double boiler for three hours or all night in fireless cooker. Add salt and strain through fine wire sieve. Feed from a spoon at 10 A.M. and 6 P.M. without sugar. Begin with one teaspoon, gradually working up to 1½ or 2 tablespoons.

Cottage cheese.—1 dessert spoon once or twice a week.

Eggs, coddled, twice a week, ½ of whole egg. Begin with 1 teaspoon.

Green vegetables.—Spinach, cooked lettuce, celery, peas, or carrots. Begin with 1 teaspoon and gradually in-

crease the amount to 1 tablespoon daily. Be sure and put them through a sieve.

Beef juice, one ounce with rice three or four times a week. Alternate with broth, 2 or 3 ounces three or four times a week. Bread, crisp dry toast or zwieback. Fruits, orange or prune juice with strained pulp; baked apple or apple sauce 1 or 2 teaspoons. If the child is constipated give 2 or 3 ounces of prune juice with water at 4 P.M.

Feeding Rules

In order to get a child on this diet begin cautiously with a small amount of one new food at a time and very slowly increase to amount specified. Do not begin two new foods on the same day, and place the new food at the beginning of the meal with nothing else in sight. If the new food is

refused try again the following day, with smaller quantity, until child acquires the taste. After the cereal, beef juice broth and green vegetables have been added to diet the cottage cheese and coddled egg may be added, and so on, until all the foods mentioned are given.

Do not force food.

THE EGOTIST

"There's no denying that Bill has a pretty high opinion of himself. He thinks he is one man in a thousand."

"Not if I know him, he doesn't—he thinks he's the other 999."

"What are you doin' of, James?"

"Sharpenin' a bit o' pencil."

"You'll 'ave the union after you, me lad. That's a carpenter's job."

WAS IT ADOBE?

An Irishman, when asked a number of years ago if he had ever been in California, replied:

"Oh, sure! Oi walked across the whole dom state one winter and niver left a track."

"How in heck was that?" he was asked.

"Well, wmin Oi put me foot down in the mud, I just picked up thot mud and carried it along with me."

SLIPPERY

An officer was showing an old lady over the battleship.

"This," said he, pointing to an inscribed plate on the deck, "is where our gallant captain fell."

"No wonder," replied the old lady; "I nearly slipped on it myself."

A Gas Well to Light, Cook and Iron for You

FROM that simple out-of-the-way tank you see pictured in the backyard comes the most remarkable servant you can employ—carbide gas; the wonder gas of the age. An artificial, non-poisonous gas.

Produces wherever you want it—in your home, outbuildings and barn—a clear, flickerless light so mellow, radiant and restful as to rival sunlight. No constant replacement of chimneys or bulbs. *You don't even use matches in lighting!* With this light one user increased egg laying from 10 to 100 eggs a day. That plants grow under carbide light has been conclusively established by Cornell University.

Makes Cooking Easy—the Kitchen Cool

To the kitchen it brings you the hottest cooking flame. Clean and orderless—you can draw a white cloth across the bottom of a pan after usage and not soil it. Boils, broils or fries the meal in one-third the time. When carbide gas is used no coal, wood and ash carrying. Your wife can work in shade tree coolness on the hottest day. No fussing, priming or adjusting—fuel at the fingers' touch. Quickly heats water for dish washing, shaving and bathing. Gives you an even, sustained heat for ironing—a time saver. All these wonderful city conveniences from that simple, out-of-the-way tank—**THE COLT LIGHTING and COOKING PLANT.**

Simplest and Most Economical Automatic System

Don't put money into any system until you have thoroughly investigated the COLT. See how simple it works. Just run water into the water chambers and pour carbide (a gas-filled compound) into the hopper of the COLT. The machine does all the rest—mixes the carbide automatically with water, releasing this marvelous gas. *No expensive parts to replace in a short time—maintenance practically nothing.* Nothing to adjust. The only attention required is some carbide and water once in a while. Gas is generated when you need it, and only as you need it. No waste.

From Factory to Farm

Sold direct to you by COLT solicitors—no distributors or dealers to take a profit. This applies everywhere, from coast to coast, from Canada to the Gulf. A lighting and cooking plant tested and proven by many years of service, and sold by a responsible concern doing business with the farmer for a generation.

Send Postal Card Today for Full Story

More than 341,000 farmers own carbide gas systems—you should hear them praise it. No more wick trimming, lamp filling and cleaning; no more stuffy, stifling kitchens and burdens—*gas on tap.* Get the full COLT story—send a postal today, now.

LIVESTOCK ASSOCIATION HOLDS INITIAL SALE

The Southern California Purebred Livestock Association which was formed to promote the interests of purebred livestock throughout Southern California and bring the breeders into closer touch with one another, held a consignment sale at Imperial on April 15.

Formerly one of the principal livestock sections of California, Imperial Valley has during the past few years almost turned away from that industry. During the war high prices boomed cotton to such an extent that nearly everyone plowed up his alfalfa and sold his dairy stock. Last year the bottom dropped out of the cotton market and today there are again thousands of acres in alfalfa. A long way from the market, the Imperial Valley alfalfa cannot compete with the local product owing to the high freight rates, and dairy stock is again coming to the front. The people of the valley have very little ready money but the banks are coming to their rescue and were behind the sale

held April 15. It was largely due to the interest taken by the banks that the Purebred Association was invited to make this sale as heretofore most of the stock taken into the valley was in the hands of speculators and was of inferior quality. In this sale the animals were consigned by the biggest breeders of the southland and many of them were present to guarantee the health and breeding qualities of the animals.

Following the sale a local purebred association was formed which will be affiliated with the Southern California Breeders. One of the duties of this local will be to pass upon all stock offered for sale in the valley, and it is hoped in this way to discourage the introduction of stock by speculators. Since this local numbers among its members the bankers of the valley it should be able to accomplish its purpose easily.

The sale was attended by about 500 of the local people, and while the prices were not high they were satisfactory considering the fact that the breeders expected to realize only

about 50 per cent of the value of the animals as it was purely and simply a promotion proposition. Two of the largest auctioneering firms donated their services and the newspapers contributed a large amount of valuable space.

Fred Hartsook topped the cattle sale with a fine Holstein cow bred to his great bull, Sir Aaggie De Kol Mead, and just ready to freshen. The Italian Vineyard Company topped the males with a Guernsey bull, Reuben Langdon of Hollow Hill Farm, and also had the top Guernsey female, J. E. Wherrell of Riverside was the principal consignor of Jerseys and got the top for both sexes.

The hog sale was brisk, and the different breeds seemed to be about equally in demand. The top of the sale was a bred Berkshire gilt consigned by the Italian Vineyard Company of Guasti.

Bred cow, Burr Farm, \$340.
Bred heifer, Maxwell Farms, \$305.
Bull calf, Santa Monica Dairy Co., \$115.

PRINCE AAGGIE OF BERYLWOOD

We Bought This Great Young Holstein Bull Because:

He is an exceptionally fine individual.

He is the highest record bull on the Pacific Coast.

His dam made 21.62 pounds of butter in 7 days and 851.01 pounds in 365 days as a two-year-old: 32.03 pounds in 7 days and 886.16 pounds in 305 days at four years of age. During her present lactation period she has made 37.12 pounds in 7 days and gives every indication of making close to 1100 pounds for the year.

When his dam finishes her present record he will have a yearly average for his seven nearest dams considerably above that of any other bull in the world.

His seven nearest dams now average 1120 pounds for the year.

Five of his seven nearest dams have produced over 2000 pounds of butter in two consecutive years and the sixth has made 1862.88 pounds in two years.

Five of his seven nearest dams have proven their transmitting qualities by producing 1000-pound daughters, and the sixth one has a daughter who is making over 1000 pounds this year. His own dam is still young, but has three daughters who give every indication of easily being 1000-pound cows.

He is the 100% blood brother of Sir Aaggie Mead De Kol, whose seven nearest dams have a higher average for yearly production than those of any other bull in the world.

His sire is Sir Aaggie De Kol Acme, who has been at the head of two of the largest herds in California and who has over 100 daughters, nearly all in the hands of men who will give them official records. At present he has 16 A. R. O. daughters, seven of which have over 20 pounds in seven days.

He carries a double cross of King Segis, King Mead of Riverside and Aralia De Kol.

We have assembled an excellent herd of high record foundation females, and we expect wonderful results from the use of this bull.

We have on hand a number of very typey young bulls out of high record show cows. Some are ready for service. They carry the blood of many of the greatest Holsteins and are backed up by high production. They are priced from \$100 up. Every animal is tuberculin tested and guaranteed a breeder.

Visitors are always welcome.

RIVERSIDE'S DAIRY DAY
Dairy days and cattle judging are not at all unusual but Riverside put over the biggest one that has ever been held in the South on April 8. A whole souled interest in the affair was displayed by the dairymen of the county, the merchants, the University of California and the members of the Southern California Purebred Livestock Association which held its regular monthly meeting there that day. The merchants donated the use of their windows for all sorts of displays boosting the value of dairy products. Many of these were furnished by the university and were arranged under the direction of A. W. Folger of Davis. Others were prepared by the high schools of Riverside and by the different breed organizations. One of the interesting places was the Guernsey booth where one of W. H. Dupee's beautiful cows was on exhibition and Guernsey milk donated by the breeders of the county was served free of charge. The Jersey breeders also dispensed free milk from an exhibit in one of the big stores. A dairy parade in the morning, a milk boosting fairy play given by one of the grammar schools, judging and milking contests open to all comers and a demonstration of judging by Professor Thomson of Davis were among the interesting features which entertained and educated the big crowd which had gathered from all parts of the southland.

Another Oregon Jersey cow has broken a world record and now holds the championship for all mature animals. She is Lad's Iota, owned by S. McKee of Independence, Oregon. The cow's record for the year ending last Friday night was 1,047.94 pounds utter fat. This beats by 7.86 pounds the previous record held by Plain Mary, a Maine cow. In the Jersey list are eight classifications, beginning with cows under two years old and ending with mature cows, those above five years old. Oregon now holds the records for seven of the eight classifications.

Pending further investigation of the cattle scab situation in parts of Nevada Dr. J. P. Iverson, head of the division of animal industry of the state department of agriculture, has announced that he has served notice on the transportation companies, including the Southern Pacific and Western Pacific Railroads, not to accept for shipment into California any cattle from five counties in Nevada without first obtaining a special permit from this department. The five counties included in the temporary embargo are Washoe, Ormsby, Storey, Lyon and Douglas.

Among other features of the animal husbandry division exhibit on Picnic Day, April 29, at the university farm, will be a rice feeding demonstration of particular interest to pork producers. Rice as a hog feed is assuming an important place in California due to the large plantings in recent years in the northern part of the state. The university has been carrying on a series of experiments in feeding rice and rice by-products during the last few months and by Picnic Day will have enough data on hand to show the farmers just how much of several of these rice products is required to produce a pound of pork.

H. M. Barngrover, Stockton, reports sale of three extra good young Hereford bulls to J. W. Stanford of Warm Springs. They are sons of Beau Blanford 76th and Patrician 5th.

COMPLETE DISPERSAL

ORMONDALE SHORTHORNS

49 Females--2 Herd Bulls

Ormondale Ranch, Redwood City, Calif. Thursday, May 4, at 12 o'clock, Noon

RARE OPPORTUNITY FOR BUYERS

Not for many years, if ever, has such a herd of registered Shorthorns as this been dispersed at public sale in California. There is positively no reason to doubt that the owners who are founding new Shorthorn breeding herds today, or strengthening already established herds, are the ones who will reap the rich returns in the next high price cycle only a few short years in the future.

CORRECT FOUNDATION MATERIAL

The owners spared no expense in securing the foundation for this great herd, and in its dispersal new owners may well feel confident that they have secured breeding animals of superior merit.

49 FEMALES SELL

Forty-nine females sell as single lots in the offering, representing most approved Scotch families and some of the best American sorts, those that are bred carrying the services of The Caledonian or Count Kingwood.

15 COWS WITH CALVES AT FOOT

Fifteen of the great matrons in the sale have calves at foot, all of them sired by the \$12,000.00 imported bull, Boquhan's Guinea Stamp, and those that are rebred are in calf to one or the other of the present herd sires, The Caledonian and Count Kingwood.

9 DAUGHTERS OF IMP. BOQUHAN GUINEA STAMP

Nine of the daughters of Imp. Boquhan Guinea Stamp sell as single lots, out of richly bred dams, and a most attractive and uniform lot of heifers.

A REMARKABLE GROUP

The famous breeding cow Sweetheart and three of her daughters sell in this offering.

She is the dam of Little Sweetheart, the Chicago International Grand Champion in 1919, and two of her daughters in this sale are full sisters to Little Sweetheart, the third being sired by a son of Radium.

11 DAUGHTERS OF GOLDEN GOODS JR.

Golden Goods Jr. is the sire of the International Grand Champion Little Sweetheart, and his eleven daughters in this sale are an impressive group, including the two full sisters to Little Sweetheart noted above.

ONLY TWO BULLS IN SALE

Ormondale Ranch has sold every bull of weaning age from the herd except the two great herd sires which will go in this sale.

THE CALEDONIAN

This young sire is an outstanding son of Imp. Caledonia, and out of a royally bred Rosa Hope dam. He would be a top attraction in any sale of the breed and in every respect merits a place at the head of a top notch herd.

COUNT KINGWOOD

This splendidly bred son of Imp. Kingwood was brought into the herd to share herd heading honors with Imp. Boquhan Guinea Stamp, and while no calves have yet been dropped to his service he has every promise to justify the long price which he commanded.

This sale is an event of outstanding importance to everyone who contemplates the purchase of high class Shorthorns, and there are bound to be many splendid bargains in the sale. Every animal selling as a single lot positively guaranteed to be a breeder; every animal over six months old tuberculin tested and individual certificates furnished the buyer.

TERMS OF SALE: Responsible parties may arrange for credit, before sale, with the sale manager, on the basis of one-half cash, balance in six months with approved note bearing eight per cent interest.

ORMONDALE RANCH is nine miles southwest of Redwood City, 34 miles south of San Francisco. Trains will be met only at Palo Alto morning of sale.

Paint Without Oil

Remarkable Discovery That Cuts Down the Cost of Paint Seventy-Five Per Cent

A Free Trial Package is Mailed to Everyone Who Writes

A. L. Rice, a prominent manufacturer of Adams, N. Y., discovered a process of making a new kind of paint without the use of oil. He named it Powder-paint. It comes in the form of a dry powder and all that is required is cold water to make a paint water proof, fire proof, sanitary and durable for outside or inside painting. It is the cement principle applied to paint. It adheres to any surface, wood, stone or brick, spreads and looks like oil paint and costs about one-fourth as much.

Write to A. L. Rice, Inc., Manufacturers, 400 North St., Adams, N. Y., and a free trial package will be mailed to you, also color card and full information showing you how you can save a good many dollars. Write today.

Registered Oregon-Bred JERSEYS

To be Offered at Public Auction on the Fair Grounds at
STOCKTON, THURSDAY, MAY 4

**39 CHOICE FEMALES
1 RARE YOUNG BULL**

These cattle should appeal to the most discriminating. They are from representative herds, carefully selected by a competent, practical Jersey breeder, who had no personal interest aside from seeing that the cattle were of a character to properly represent the Oregon Jersey breeders. Every hoof comes from Clean Herds; the offering as a whole and individually is as nearly right as human skill and care can present it, as is attested by the following official letters voluntarily offered:

TO WHOM IT MAY CONCERN:

I have seen many of the cattle that Mr. C. R. Thomas has purchased for shipment to California and have inspected the pedigrees of all of them and can recommend them as entirely worthy to represent Oregon in any state to which they may go. The blood lines are among the best in the State.

(Signed) O. O. HEWITT.
President, Oregon Jersey Cattle Club.
Independence, Oregon,
April 7, 1922.

TO WHOM IT MAY CONCERN:

I have not only seen, but I personally inspected the 40 Jersey cows and heifers that Mr. C. R. Thomas has purchased for shipment to California, and take pleasure in saying that it is a splendid lot of cattle, and represents some of the very best and most popular blood in Oregon, and every animal is worthy to represent Oregon, no matter into what state it may be sent.

(Signed) W. O. MORROW.
Independence, Oregon,
April 7, 1922.

Catalogs will give details as to breeding and performance of ancestry. It will show special strength in ST. MAWES and GOLDEN GLOW blood, the two blood lines that have enabled Oregon Jerseys to annex seven out of eight possible world's championships. It is this breeding that produced VIVE LA FRANCE, rightly called the Wonder Dairy Cow; in 5 years she produced averagely more than her own weight in butter per year, and produced 5 calves before she was 7 years old. The pedigrees will be found full of persistent producers, many the get of Gold Medal bulls. Catalogs ready now. Send for one and verify to your own satisfaction statements made.

The breeding is Right; the cattle are Right individually, and the time is Right for getting them at your own price. For catalogs address

COL. CY N. CLARK & SONS, Auctioneers.

ANNOUNCING FIRST PUBLIC SALE Innisfail Milking Shorthorns Friday, May 5, Davis, Calif.

Why Milking Shorthorns?

Milking Shorthorns are the most practical cattle for the farmer.

Milking Shorthorns will produce profitably at the pail (many cows average 8,000 to 12,000 pounds of milk a year).

Milking Shorthorns are hardy, adapted to dairying in the foothill and mountain sections.

Milking Shorthorns will produce profitable beef steers (the best Shorthorn carcass at the 1920 International was from a steer whose dam was record of merit cow).

There is a wide and active demand in California for cattle of this breed.

Why INNISFAIL Milking Shorthorns?

Innisfail herd was founded in 1914 with purchases from the best American herds.

Innisfail Milking Shorthorns are milked and this herd probably has more record of merit records than any Western herd.

Innisfail Milking Shorthorns have a showing record second to none.

Innisfail Milking Shorthorns are healthy.

Innisfail Milking Shorthorns are backed by sincere purpose, honest effort and a reliable guarantee.

GETTING MORE FOR THE WOOL CLIP

By Fred A. Ellenwood, President California Woolgrowers Association

As the quotations on wool are nearly always given on the scoured basis a little explanation of terms may be appreciated by woolgrowers. In the first place "staple" or "combing" wools are those that are long enough to comb into a top, and this top is then used in the manufacturing of worsted goods. "Clothing wools" are short wools and are not combed into a top but are used in the carded or woollen process of manufacturing and are made into woollen clothing. These are the kind of wools with which shoddy is often mixed and made into clothing, blankets, etc. Shoddy cannot well be used in worsted clothing because in that process wool must have a long staple. This kind of clothing can only be adulterated successfully by substituting cotton.

There is also another term sometimes used for fine wools that for length of staple are about half way between a real combing wool and a clothing wool which is known as a "French combing." These wools are too short to comb in the ordinary comb that has been used for many years. In late years we have a machine known as the French comb, which combs a wool shorter in length than formerly, and these wools are sometimes used and known as French combings.

At this time "fine" and "fine medium" combing wools are quoted at \$1.00 to \$1.05, scoured basis. To ascertain what that means on the grease pound in Boston it is necessary to know what the shrinkage of our wools is, and by shrinkage is meant the amount lost in the process of scouring. Manufacturers always refer to this as the yield that a wool will produce, and means the amount of wool left after scouring. If the shrinkage in scouring is 60 per cent, then the yield is 40 per cent.

Clothing wools always shrink slightly more than combing or staple wools, and as a general rule the finer the wool the heavier the shrinkage. The average shrinkage on our fine staple wools is from 60 to 64 per cent, and on clothing wool a little more. Assuming that these wools are worth \$1.00, as quoted today in Boston, if the shrinkage is 60 per cent, then the grease value of that wool in Boston is 40 per cent of the scoured price or 40 per cent of \$1.00, which is 40 cents. If the shrinkage is 62 per cent the yield would then be 38 per cent or 38 per cent of the scoured price, which is 38 cents, and if the shrinkage is 64 per cent, with a yield of 36 per cent, the grease value would be 36 per cent of \$1.00 or 36 cents per grease pound in Boston.

With scoured wool quotations at \$1.00 per pound it will be noted that 1 per cent difference in shrinkage on your wool means about 1 cent per pound difference in its grease price. For that reason it is quite important that the producer should know not only the value of his wool in Boston, but he should also know what his wool shrinks in order to determine its value. You will also notice from quotations that clothing wools or short wools are worth from 15 to 20 cents per scoured pound less than combing wools or staple wools. Take one-half-blood wools with a quotation of about 95 cents per scoured pound, if the shrinkage on these is about 58 per cent the grease price is 39.9 cents per cent and the yield is 42 per cent, then pound. If the shrinkage is 60 per cent, with a yield of 40 per cent, the grease price in Boston would be 38 cents. If three-eighths blood combing is worth 75 cents and the shrinkage is 50 per cent and the yield is also 50 per cent it makes the grease price in Boston 37½ cents per pound.

When we figure the cost of transportation, selling charges, a dealer's margin for handling and other charges, it is necessary to deduct at least 4 cents, and if one wishes to be liberal deduct 5 cents from Boston quotations, and you have the value of your wool at home. The only way that we, as sheepmen, can ever know just what grade of wool we have, and what the shrinkage is, in other words, to really know wool values, is for us to have a warehouse, where we can have our wool stored and graded and sold upon its merits.

For the Prevention of

ANTHRAX

Of all livestock diseases, anthrax is one of the most fatal.

For the preventive and curative treatment of anthrax we offer

ANTHRAXOIDS

(Spore Vaccine)

For immunizing cattle, horses, sheep and mules.

Anthraxoids are Anthrax Spore Vaccine in pill form. Each Anthraxoid is a dose ready to be injected under the skin of the animal.

Antianthrax Serum

A serum to be used when animals show symptoms of anthrax.

Anthraxoids-Antianthrax Serum

(Simultaneous Treatment)

Double vaccination with serum and vaccine. Used when anthrax is established or suspected to be in a herd.

I. H. Gable Esparto, Cal.

should also brand your sheep after shearing with branding ink, and if your dealer does not carry this branding fluid write to the secretary of the California Woolgrowers Association and he will tell you how to procure it. Paint and tar brands will not wash out in the process of scouring and that makes considerable amount of the very best part of your fleeces damaged by these brands, whereas branding ink does come out in the process of scouring and no harm is done to the wool.

When you note the difference in value between staple wools and clothing wools you will readily see the importance of striving to produce all staple wools. Here, again, is an important thing at the time of shearing, either with hand shears or with machine shears. You may have a fleece of wool on the sheep's back that if properly taken off all would be graded as a staple wool, but if the shearer is careless in shearing and cuts the wool too high and then goes back and smooths it up to make it look better, he will make a lot of second cuts or "summer fallow." When this is done your staple wool has been cut in two and the fleece may be thrown into the clothing, where it is worth 15 or 20 cents per pound less than it would have been if it had been carefully sheared. It is very important for all of us to urge upon the shearers the importance of eliminating these second cuts in shearing.

It is also important to be careful to keep the wool clean and free from tags or dirt. Let us work to a clean standard and make a reputation for putting up an honest package. You can see what standardization has done for the fruit men and it will do the same thing for the woolgrowers if followed. You may, if you are so inclined, slip something over on the wool buyer once, but it will cost you money for many years afterward.

If we are to succeed in the future in the sheep business we must know more about the market value of our product when it is ready to sell. Put up an honest package and become more efficient in every way.

TRUTH-IN-FABRIC BILL

The Truth-in-Fabric bill introduced by Senator Capper, which is now resting with the senate interstate commerce committee, shows no signs of life, for the committee, it is reported, is having some tests made to ascertain whether woolen garments can be manufactured with a label attached which would show the composition of the garment so far as fabrics are concerned, and the farmers are also writing to this committee urging action. The members of the senate committee are: Albert Cummins, Iowa; Charles E. Townsend, Michigan; Robert M. La Follette, Wisconsin; Miles Poindexter, Washington; George P. McLean, Connecticut; James E. Watson, Indiana; Frank B. Kellogg, Minnesota; Bert M. Fernald, Maine; Joseph S. Frelinghuysen, New Jersey; Davis Elkins, West Virginia; Ellison D. Smith, South Carolina; Atlee Pomerene, Ohio; Henry L. Myers, Montana; Oscar W. Underwood, Alabama; Josiah O. Wolcott, Delaware; A. Owsley Stanley, Kentucky.

INCREASED CONSUMPTION OF WOOL IN 1921

Consumption of wool in the United States in 1921 was 72,000,000 pounds more than in 1920, according to a statement issued by the United States department of agriculture today. Consumption of wool in 1921 totaled 572,724,000 pounds as compared with 500,744,000 pounds in 1920. These totals are made up as follows: Grease wool 477,473,000 pounds in 1921 as compared with 410,666,000 pounds in 1920. Scoured wool 68,698,000 pounds in 1921 compared with 72,102,000 pounds in 1920. Pulled wool 26,553,000 pounds in 1921 compared with 17,976,000 pounds in 1920.

Consumption of wool in the United States in 1921 was 72,000,000 pounds more than in 1920, according to a statement issued by the United States department of agriculture. Consumption of wool in 1921 totaled 572,724,000 pounds as compared with 500,744,000 pounds in 1920.

Sir Aaggie DeKol Mead

Bred in the richest Aaggie Acme-De Kol of Valley Mead cross, he should be one of the greatest young sires of the breed.

Five of his seven nearest dams average:

Butter	2 Years.....	2,040.97 Pounds
Milk	2 Years.....	41,547.20 Pounds
Butter	1 Year.....	1,130.66 Pounds
Milk	1 Year.....	23,096.60 Pounds

His seven nearest dams average:

Butter	7 Days.....	30.47 Pounds
Milk	7 Days.....	627.60 Pounds

His calves are just what we could expect from a long succession of great sires and dams, and in their present state of development fulfill every promise in the pedigree of their great sire.

Good business judgment will eventually prompt you to place at the head of your herd a bull of Aaggie Acme-De Kol of Valley Mead breeding

DISPERSAL SALE

161—Registered Holsteins—161

112 Females—49 Bulls

F. H. Harvey Herd, Galt, Calif.

Selling on the Farm—about Three Miles West of Galt

April 26-27

At 10 A.M. Each Day

In order to devote his time to his many other interests, Mr. F. H. Harvey has decided to make a complete dispersal of his big herd of registered Holsteins. The herd represents many of the highest producing blood lines of the breed and is of high average type.

A LARGE NUMBER OF THE FEMALES HAVE OFFICIAL RECORDS UP TO OVER 26 LBS. BUTTER IN 7 DAYS, MOST OF RECORDS MADE AS 2, 3 AND 4 YEAR OLDS.

The herd contains a considerable group of the daughters of the 32 lb. bull SUPREME GLISTA PIETJE, whose daughters have consistently shown a high percentage of butter fat.

Many of the females sell bred to KING PONTIAC SEGIS INKA, a splendidly bred son of King of the Pontiacs, and the bull himself will sell.

DAIRYMEN SHOULD NOT OVERLOOK THE OPPORTUNITY TO BUY A PURE BRED REGISTERED BULL IN THIS SALE. THERE ARE FORTY-NINE BULLS TO SELL, MANY OF SERVICE AGE, AND THERE ARE BOUND TO BE A GREAT LOT OF BARGAINS.

TERMS OF SALE: Responsible parties may arrange before sale, with sale managers, for credit on the basis of one-third cash, balance in three, six and nine months, with notes bearing eight per cent interest.

POULTRY

Profitable Poultry News—Capacity 200,000 chicks, hence prices surprisingly low for quality. To date one County Agent has ordered 7,400 White Leghorns, 3,000 Brown Leghorns, 1,250 Reds, 200 Rocks, 200 Minorcas, 12 Breeding Males. His orders are coming after years extensive trial throughout his county. "Your Barred Rock Chicks bought May 1919, proved great winter layers." "Your White Leghorn, Ancona pullets are great." "My Reds laid at 5 months, Leghorns at 4 1/2; cleared per pullet \$2.50 first six months." "Get more winter eggs from 60 year Leghorns than from 200 formerly." These strains 180-290 egg Leghorns, Reds, Rocks, Anconas, Minorcas, Wyandottes, Andalusians, Brahmas, Orpingtons, Ducks, Turkeys lead many egg-laying contests; build foundation flocks, fill repeat orders for hundreds. Why? **ELECTRIC HATCHED**, vigor, growth, winter-laying, profit, guarantee; booking for immediate future delivery, below pre-war prices. Smallest, largest orders welcomed. Write Profitable Poultry, 13 North Fair Oaks, Pasadena.

Baby Chicks: When you buy baby chicks the big thing for you to remember is **QUALITY**, in both the chick itself and the parent stock. By investigating you will find that our chicks are in a class by themselves, for we have absolutely the best equipment obtainable to produce them and very high class stock from which we get our eggs, and then, too, we know how to handle and deliver chicks. We are hatching every week White Leghorns and Anconas that will lay; R. I. Reds and Barred Rocks that are well bred and will produce. Send for our circular and prices and order immediately for 1922 delivery. **ORANGE COUNTY HATCHERY, Santa Ana, California.**

Better Baby Chicks—Assuming you are anxious to get the Best Chicks for your money we are offering you our "BETTER CHICKS" from thoroughly hoganized stock and hatched by electricity in a scientific manner. Why not get the best when they cost you no more. Let an order prove our claim. Quality our motto. Rhode Island Reds, Barred Rocks, White Rocks, White Wyandottes, Anconas, Black Minorcas, Brown Leghorns, White Leghorns, Single Comb White Leghorns, Turkeys and White Pekin Ducklings. Artesia Hatchery (Electric), Artesia, California. Phone A422. Capacity 125,000 eggs. (World's original electric hatchery.)

HORTICULTURAL PRINTING

Catalogues and Booklets, office forms and correspondence stationery for the nursery, seed and florist trade; half-tone cuts of many standard plants. Correspondence invited. The Kruckeberg Press, 236 Court St., Los Angeles.

SEEDS AND PLANTS

SUDAN GRASS SEED

(The Great New Hay Crop)

First introduced in the United States 1909 from Sudan, Africa.

Culture. Strictly an annual, may be drill or broadcasted, 15 to 25 lbs. per acre, grows 8 to 10 ft. high, yields 3 to 10 to per acre, two to four cuttings.

Pasture. It will yield food for six times as much stock as any other forage with out irrigation. For milk cows and horses there is no better and more abundant pasture than Sudan. It will solve the hay proposition as nothing else can will do in this climate. This seed grown on our farm and is free from Johnson Grass.

Price—5 lbs. \$1, 10 lbs. \$1.50; 50 lbs. \$100 lbs. \$8; 500 lbs. \$35; 1000 lbs. \$50.

Goat Trouble

I have a large doe two years old, first kidding three weeks ago, two healthy kids. She had trouble passing the afterbirth and passed blood for two weeks. She has started passing blood again, and there is at times a bloody residue in the milk. Her appetite is very good, she has a large milk flow and otherwise appears healthy. The kids are allowed to run with her but she is milked twice a day. What is the cause and remedy?—Subscriber, Inglewood.

This should have been taken care of at first, but the parts are so contracted now that it would be cruel to wash out. Get a pint of raw linseed oil and add two ounces of turpentine. Shake and divide into four parts. Give one part as a drench every other day. After that if there are any signs of bleeding get one ounce tincture of iron and give 15 drops in half cup of water once a day for two weeks. Better wean the kids.

Cow Vomiting

Have owned Holstein cow two years, now nine years old. Last summer she had two spells of vomiting and lately she had another. Looks like her food ground up or partly digested and is of a yellow color. She does not seem to remain sick, but will eat heartily immediately afterwards. We feed her a gallon of ground barley, mixed with two gallons of alfalfa meal, twice a day. She is on wild pasture. Had I better dispose of her?—Subscriber, Red Bluff.

No, she will be all right when you feed her right. Her trouble is indigestion from eating too much ground feed. She must have more coarse feed that will make a cud. The yellow color of what she vomits shows that she is bilious. Get one quart of raw linseed oil and add half ounce powdered nux vomica, half ounce aloin and two ounces turpentine. Shake well and divide into four doses. Give one dose once a day as a drench. In place of the alfalfa meal give alfalfa hay; will do her much more good. The gallon of ground barley is all she can stand. Remember, a cow must have something to make a cud or she will get sick.

SWEET POTATO SHIPMENTS

California is increasing its output of sweet potatoes. However, we sometimes get a bit optimistic in reporting from various sections. From figures gathered in local papers we recently stated that Merced County had shipped 725 carloads of sweet potatoes. This, it seems, was a slight overestimate, and we are now per-

mitted to make correction because of statement submitted to us by Homer A. Harris, investigator of market news of the bureau of markets and crop estimates of Los Angeles. However, we may add that some sections, in making up their total of production or output of the community, include car shipments which may be all carefully secured and reported by the state and federal reporters but in addition include small express and truckload shipments and sometimes even home consumption. However, Mr. Harris reports as to figures secured from railroad agents as follows:

"According to records which we have on file in our office, information obtained from railroad agents, the following is a list of sweet potato shipments out of Merced County, listed by billing stations: Atwater, 210 cars; Livingston, 224; Merced, 28; Winton, 4; total, 466. Our records further show that the total number of cars of this commodity shipped out of the entire state was 898 carloads."

STRAWBERRIES SOLD IN PINT BASKETS

The strawberry season will soon be under way and under the terms of section 7 of the fruit and vegetable standardization act, the standard basket for strawberries shall be the dry pint. Half pint baskets cannot be used under any conditions for strawberries.

POTATO VARIETIES IMMUNE TO WART DISEASE

In a report on potato wart, Weiss and Orton list 34 immunes out of 103 varieties tested, these are all confined to already known types however. The potato alone has been found infected by the wart disease in America of many species of Solanaceae tried.

POINTS THE WAY—FOR OTHERS

We are not disparaging idealism, but an "idealist" is too frequently a man who has high notions of what the other fellow ought to do.—Boston Transcript.

Here is the Greatest Motor Car Value in America

Overland is a wonderfully dependable motor car for the American farm. All-steel construction in a chassis that represents the experience of 14 years of successful engineering assures you of a reliability of per-

formance that saves your time and saves your money.

The abundance of quality in the Overland establishes Overland as the greatest automobile value in America.

All-steel body, baked enamel finish, Triplex Springs—real riding comfort, 27 brake h. p. motor, U. S. L. Battery, Auto-Lite Electric Starter, Real One Man top, Demountable rims, Tire carrier. Every driving and riding convenience.

Poultry Queries

Conducted by Jean A. Koethen

Bag of Water?

One of my little turkeys has a bag of water hanging down under the beak. Is it a disease which spreads, and how may I cure it?—Subscriber, Los Olivos.

If this is really a bag of water it is probably a sort of blister or wind puff due to some injury and may be cured by pricking and letting out the contents and painting with tincture of iodine. The question is, are you sure your little turkey has not an enlarged or pendulous crop, due to irregular feeding? Pendulous crop is sometimes cured by a bandage, not too tight but tight enough to hold the crop in place and keep the poul from stuffing it to the limit. If this does not succeed the only cure is to cut a piece out, and I cannot advise an amateur to try this operation. Better leave it alone and eat the bird as soon as it is large enough.

Cyphers Incubator

I am writing to ask the address of some dealers who handle Cyphers incubators, either in San Francisco or Los Angeles.—Subscriber, Merced.

The former Los Angeles agents for the Cyphers incubator inform me that it is no longer manufactured. Your only chance to get that make of machine is to find a second hand one.

Dead in the Shell

A large part of the chicks in my last hatch failed to get out of the shell. I broke the unhatched eggs and found the chicks swollen and wet, which points toward excessive moisture, yet the glass of the incubator was dry while hatching was in process, which indicates lack of moisture. The basement in which the incubator is kept is rather damp. The temperature was kept steadily at 103 during incubation. Shortly before pipping time the egg tray got a severe jolt. Would this have injured the chicks?—Subscriber, Alpine.

It looks as if those chicks were drowned by too much moisture, and I am not enough of a physicist to say why the glass was dry. Perhaps the heat was a little low at hatching time and the excess of moisture so long continued that it did not show at the last. You know temperature is apt to rise while the hatch is coming off and no harm is done, if it does not go over 104. Again, that jar you gave the tray may have killed some of the chicks. It is always hard to tell in these cases just how many complications there were. I am not familiar with the incubator you used and do not know just how it supplies moisture, but the season has been unusually moist, and if your basement was also damp it is easy to see that a moisture supply which would be right under other conditions might have been excessive. I should certainly try to run my next hatch with less moisture.

White Diarrhea

When my chicks, now three weeks old, were ten days old they began to droop and gradually die. I opened the dead chicks and found in every one the unabsorbed yolk on the intestine, some as large as a sparrow's egg, some as small as a poppy seed. Is this the cause of death? I am told it comes from overfeeding.—Subscriber, Norwalk.

That unabsorbed yolk in the intestines is one of the surest symptoms of white diarrhea, which is caused, according to Dr. Morse, by improper feeding, too much or too little heat, too early feeding or the feeding of improper food. Other causes sometimes given are debilitated breeding stock, improper incubation, improper brooding, overheating, chilling, poor ventilation and overcrowding. In most cases these errors in management permit the development of the germ which is the underlying cause of the disease and encourage its spread among the flock. As I do not know how you have fed and brooded I cannot say just what mistakes you have made. Chilling and feeding too soon are the most common causes of the disease. If you fed your chicks before they were 48 hours old or let the heat in the brooder drop so low that

they huddled together for warmth either cause would suffice. Some experts do not feed till the chicks are 6 to 72 hours old.

Trapnest Bulletin

I note in Cultivator of April 1 you mention mailing an inquirer a bulletin giving plans of trapnests. Would it be possible for you to send me one? Subscriber, Sunnyvale.

I have just one copy of that bulletin which seems to be out of print, and have loaned it to one or two parties. If it is returned I shall be glad to loan it to you if you will send postage.

Cannibalism

Can you tell me how to prevent sitting hens from eating the eggs placed under them? Is it some lack in the ration?—Subscriber, Sebastopol.

Eating eggs is a vice and is usually caused not by any lack in the ration but by too small nests or lack of nesting material. The hen finds the egg cracked or broken before her, and once she has tasted it soon develops the egg eating habit. Keeping the nests dark and well provided with litter and making them so roomy that several hens may occupy one at once without breaking the eggs are the best means of prevention. Some poultry men build their nests like long boxes with room for half a dozen hens at once. I have never heard of a sitte eating the eggs she was hatching, but I should not give a confirmed egg eater the chance.

Emden Geese

I should like the address of some one who has Emden goose eggs for sale.—Subscriber, Fallon, Nevada.

Can any reader give us such an address?

White Faced Black Spanish

A subscriber sends us the name of Mr. Newbower, the Ingleside Hatchery, San Francisco, as a breeder of White Faced Black Spanish stock.

THE EGG MARKET

Regarding the eastern market the Poultry Producers of Central California writes:

"While the eastern market has continued to decline and will probably go lower yet before reaching a storage basis, it is not at all likely that another big break will come before next winter. It is the sudden, severe breaks that cause the heavy losses of shipments, the loss to the association arising simply from the fact that we have paid the members more for the eggs than they finally sell for in New York. A gradual decline in the eastern market in line with the general increase in production throughout the country is usually more or less anticipated by the markets at production points, so that any losses that may occur on some shipments are relatively small and are overbalanced by profits on other shipments. In support of this, we may say that on 1921 shipments sold and returned for up to the date of this writing we have accumulated a net gain of \$25,801.06."

KANSAS CITY CONVENTION

Of all the spring conventions which are regularly held by the egg and poultry shippers' associations in the big egg producing states of the Central West and South, the biggest is always the Missouri convention which is held alternately at St. Louis and Kansas City. At this convention the egg shippers of the West and South meet with the egg dealers of the Eastern markets to discuss production conditions, consumptive requirements and probable prices, especially with reference to the spring storing of eggs for fall use. A good deal of trading usually goes on at the conventions and this tends to establish something of a basis for storage eggs.

The Inyokern farm center, Kern County, has organized a poultry department for the purpose of promoting the poultry industry in Indian Wells Valley. The raising and marketing of turkeys will be one of the features of this department. The officers of this department are: W. C. Barber, chairman; J. D. Calloway, vice chairman; and Horace Ulery, secretary-treasurer.

Fig. 970

Make Your Poultry House Complete

Equip your poultry house with a Star Poultry House Litter Carrier and save a lot of time and work. Once you have installed it you will wonder how you ever got along without it.

The tub of this carrier is 72 inches long. It can be held at the level of the dropping board in the laying houses, and a hoe or scraper used to clean the dropping board directly into the tub. Of great assistance also in cleaning floor of poultry house, and for conveying litter or feed into the building. The tub can be unhooked from the conveyor when desired.

You need this Star Litter Carrier, and you may need other Star Barn Equipment. Our beautiful catalog will tell the story and will be an addition to your library. Write for it.

SOUTHERN CALIFORNIA EGG LAYING CONTEST

Egg production for March, nearly 65 per cent. Some of the high producing birds had to be disqualified because of laying 50 per cent or more of eggs weighing less than 22 ounces to the dozen. First ribbon for individual production goes to Mr. Heying's R. I. Red hen, which laid an egg a day for the 31 days of the month.

Highest birds: Ferd Heying (R. I. R.), 31; M. & M. Ranch (R. I. R.), 28; Ferd Heying (R. I. R.), 28; Ferd Heying (R. I. R.), 28; Geo. C. England, 28.

Highest pens: Geo. C. England, 256; M. L. Frick, 247 3-8; Ferd Heying (R. I. R.), 245 3/4; J. L. Miller, 243 3/4; H. M. Stone, 238 3/4; E. E. Rogers, 237; Chas. G. Weaver, 237; Flinian & Furstenfeld, 229 3/4; A. M. Harrison, 228 3/4; Mrs. Pearl Wilcox, 227 3/4.

Highest birds to date: B. S. Smallwood, 132; Geo. C. England, 129; E. E. Eisenberg, 127; M. A. Schofield, 127; E. E. Rogers, 125; E. E. Eisenberg, 122; M. L. Frick, 121; California Leghorn Breeders, 117; M. A. Schofield, 116; Geo. B. Wilken, 113.

CALIFORNIA EGG LAYING CONTEST

High pen production in the California Egg Laying Contest for the ten day period from March 10 to 21: R. H. Young, 81 eggs; Alex Stewart, 80; Boling's Poultry Ranch, 78; Boehm & Noel, 78; D. C. E. Siefert, 70; Kinmont Poultry Farm, 70.—Max Kortum, Manager.

PRESERVING EGGS IN WATER GLASS

Water glass is a substance used in glass making. It is made by melting together quartz, sand and soda ash, and looks like thick white syrup. It can be bought at drug stores, feed and poultry supply stores.

How to use water glass: Wooden kegs, candy pails or stone jars are usually used for holding the eggs. Prepare the vessels by cleaning thoroughly; boil 14 quarts water, and while the water is still warm add one quart water glass and mix well. Some recipes call for one part water glass to nine parts water, but the above has been found very satisfactory and much cheaper. If the vessel is about half filled with this solution the eggs may be put in from day to day as they are gathered, and this amount of solution will usually cover the eggs when the vessel is full. There should be sufficient solution to cover the eggs so that none are exposed to the air. Covering the vessel with oiled or greased paper will prevent evaporation. The eggs should be kept in the same way as are canned fruits or vegetables.

Eggs may be placed in the vessel in any position. Boiled water is quite sure to be pure. Only clean, fresh eggs should be used.

A big poultry plant at Bloomington, Riverside County, reports: "When feathery flakes of snow began falling during our recent 'unusual' weather, the ever alert White Leghorn chickens rushed out of their pens to partake of what they believed to be a feast. There was a hurrying and scurrying over the chicken yards in their attempt to grab snowflakes and the disappointment to the feathered tribe was shown when after many futile attempts to pick up the flakes, they dropped their feathers and trailed back to the pens disgusted. This was the first fall of snow these inhabitants of the Sunny South had ever experienced, and like everything else that falls to the ground it looked like food to them."

Some poultrymen use sandpaper or steel wool to remove dirt from the eggs. This is undesirable, as the appearance of eggs so treated tends to create suspicion in the minds of the buyers. The best thing to do is to send in the eggs just as they are. If you have any mud balls, we suggest that you consume them at home, as such rarely have any keeping quality.

Albers

CHICK FEEDS CHICK MASHES

STANDARDIZED QUALITY UNIFORMLY HIGH

BIG FACTS BRIEFLY TOLD

Albers Chick Mash is a balanced, soft feed made by the Pacific Coast's largest cereal Mills.

Being balanced, Albers Chick Mash needs nothing added to it. Feed it dry. Naturally you will supply hard grain in the form of chick feed, with proper succulents, grit, charcoal and clean water.

Albers Chick Mash comes in new sacks of various sizes, 100 lbs. for the big poultryman and 25 lb. sacks for the backyarder. Always see that the Premium trade mark is on each sack.

You can buy Albers Chick Mash from nearly any feed dealer. Most grocery stores will order it if they do not already carry it in stock.

For quality, established reputation.

Tangerines: Market firm, 8@10 lb.

HONEY

Continued heavy rains have practically assured a heavy crop of honey, although there is some uncertainty as to how large the orange blossom yield will be. Sage outlook is especially promising. Both Northern and Southern California report colonies in normal condition. Supplies of best white honey reported as very limited, but supplies of lower grades said to be still fairly abundant. Movement very light during recent weeks. Demand limited and market largely nominal. Few sales in carload lots reported at 11 cents for white sage and white orange and 8½ cents for light amber, f. o. b. California points.

A GENTLE PROTEST
"I say, Nell, I was reading that there are 60 different ways of cooking potatoes."
"I've heard so, but boiled——"
"Well, don't you think it would be exciting to try one of the other 59 ways once, just as an experiment?"

SEMI - DISPERSAL SALE
50 REGISTERED
JERSEYS
HYNES, CALIF.
at Rhoades & Rhoades Sale Pavilion
Tuesday, May 9, at 10 a.m.
Here is the opportunity registered Jersey buyers have been hoping for for months past—to find available for purchase a high class lot of Jersey females.
This sale includes every cow and bred heifer in the well known herd of GEO. W. THOMAS & SONS, Arlington, Calif., also the two herd sires. Mr. Thomas and his sons are retaining only their unbred heifers and heifer calves as foundation for their future herd.
THIS IS A HERD OF SPLENDID INDIVIDUALS, IN EXCELLENT PHYSICAL CONDITION, THE ENTIRE HERD IN MILK AVERAGING 38 LBS. BUTTER FAT PER MONTH AT THE PRESENT TIME.
The entire herd was recently tested by a Deputy State Veterinarian, and not a single animal responded to the test. Every animal guaranteed to be a breeder and sold subject to tuberculin test by the buyer.
TERMS OF SALE: Responsible parties may arrange for credit on basis of one-third cash, balance in three, six and nine months before sale with California Breeders Sales and Pedigree Company.
Write for catalog now.

LARGE PLANTING NEAR TERRA BELLA
A large acreage has been planted this season in the Terra Bella district in Tulare County to various varieties of fruits and grapes. Among the largest of these plantings is that of the Deer Creek Orchard Company which has planted several hundred acres to plums and prunes, and judging from the way their tracts are showing up there certainly is no question about the quality of the Terra Bella soil. In addition to furnishing the nursery stock for the Deer Creek Orchard Company's plant, the Fresno Nursery Company reports having furnished several thousand trees for other plantings in this same district.
The April issue of the state department of agriculture monthly bulletin has an article on the potato as one of the chief agents in the distribution of the root knot nematode. It is written by D. G. Milbrath. In addition G. R. Horton of the U. S. bureau of entomology writes on Swallow-tail butterfly injurious to California orange trees. Other subjects touched upon are ripening of plums, cherry fruit sawfly (this article is also issued as a separate), European red mite, "mara-bou," a menace to cattle ranges.
"A Connecticut preacher declares that the hen is temperamental and that her routine must be varied if she is to lay eggs. We don't grasp his meaning fully, but we presume that he means in cases where it is impossible to take the hens to a moving picture show it will do just as well to take them into the parlor and treat them to a little music on the Victrola. Poultry fanciers can use their own judgment. — Fulton County Tribune.

COW TESTING IN STANISLAUS
During March 1,194 cows were tested. The average butter fat production was 29.1 pounds per cow and 791 pounds milk per cow. Of this large number, 205 produced over 40 pounds fat per cow, which is a little better than a sixth of the number of cows of the association now tested. The high cow of the association was a registered Jersey, Lady Kate Allie, owned by D. F. Conant of Modesto, which produced 1,578 pounds milk and 85.1 pounds butter fat. The herd having the highest butter fat average for the month was a grade and registered Jersey herd composed of 25 cows, which is owned by Peter Meier of Hickman. This herd had a butter fat average of 43 pounds per cow and a milk production of 789 pounds per cow.
During the month the butter fat average of the testing association was four pounds higher than in February. Doubtless this average will become higher as the dairymen are putting their cows on green feed and others are introducing the feeding of concentrates. During the past month 280 additional cows were signed up and some 20 cows culled from different herds.
On March 30 a dairymen's meeting was held at Patterson. In the near future we hope to hold another meeting at that place to actually sign up the dairymen in the testing association.—M. L. Gorow, Testing Supervisor.

MAKING SURE OF VIRGIN WOOL
J. B. Wilson, vice president of the National Sheep and Wool Bureau of America is receiving many inquiries from various parts of the United States, asking where virgin wool cloth and clothes may be purchased, and how proof of virgin wool can be had. Although the National Sheep and Wool Bureau has made diligent inquiry it has been able to learn of but very few manufacturers, either manufacturers of fabrics for outer apparel, underwear manufacturers, or blanket manufacturers, who are known to manufacture only virgin wool cloth, or who will provide the proof of virgin wool. In consequence, in some eighteen states, the farm and wool growers' organizations are making and marketing their own virgin wool cloth and blankets. The Capper-French truth in fabric bill makes it compulsory to stamp wool cloth and to identify contents in clear and unmistakable terms, and would right the wrong that now results from shoddy's counterfeiting virgin wool.

ARGENTINE WOOL CLIP BELOW AVERAGE
The 1921-22 wool clip of Argentina will be below average and will hardly reach 220,000,000 pounds, according to information received by the United States department of agriculture. The exports of wool from Argentina during the past commercial year (Oct. 1, 1920, to Sept 30, 1921) amounted to 291,565,000 pounds, compared with 279,349,000 pounds during 1919-20 and 262,100,000 during 1918-19.
ORMONDALE SHORTHORN DISPERSAL
Lovers of the Shorthorn who plan to attend the Ormondale Ranch dispersal on May 4 will be met at the train at Palo Alto and from there motored to the ranch where sale will be held. Former notice stated morning trains would be met at Redwood City. Remember, Palo Alto is the station.

Reports from the lower San Joaquin Valley state that 16,000 head of lambs have been contracted in the valley to go to San Francisco market between April 10 and May 10 at 12½ cents per pound weighed at country points. This approximates \$8.75 per head. San Joaquin County reports 4000 lambs contracted at \$8 to be shipped after April 20. These lambs probably will go to an eastern market, either Omaha or Chicago.
Sam H. Greene, secretary-manager of the California Dairy Council, has been elected one of the nine vice-presidents of the World's Dairy Congress Association, in recognition of the fact that California Dairy Council was the first Dairy Council to subscribe a membership in the Dairy Congress Association.

J. S. GIBSON HERD WILL NOT BE SOLD
Holstein breeders generally will be glad to know that the J. S. Gibson Company of Williams has reconsidered its decision to disperse its large herd of registered Holsteins, sale of which had already been announced for May 23-24. This decision was reached after a careful survey of the big 1,800 acre Gigson ranch and its possibilities had been made, and the present plan is to continue the herd on possibly a somewhat smaller scale. A limited number of cows and heifers is being offered at private sale, and it is expected that this will make the slight reduction in the herd contemplated at present.

STOCKTON JERSEY SALE
C. R. Thomas, manager of the Pacific Purebred Sales Company, announces its initial sale of Jerseys at Stockton, May 4. With the exception of four or five mature cows, all are under three years old. Each of the two year olds has had one calf and each is bred again. Every animal has been bred with the exception of one heifer that is yet too young to breed. She is of most excellent breeding and her dam is one of the best young cows to be offered in the sale.

Dispersal Extraordinary
71 Registered Guernseys

Edgemoor Farm, Santee, Calif.
Owned by G. L. Strobeck
Selling at
HYNES, CALIF.
(Rhoades & Rhoades Pavilion)
Wednesday, May 17
at 10 A.M.

The decision of Mr. G. L. Strobeck, owner of Edgemoor Farm, Santee, Calif., to disperse the splendid herd of registered Guernseys owned by him, places at the disposal of buyers a herd that has gained international fame both in the show ring and production lists.

19 Females of Milking Age
The females of milking age include imported cows of fashionable blood lines, some with good A. R. records, part of them now fresh, and those that are bred are in calf to the great MASTERPIECE OF EDGEMOOR, or to DEANIE'S MAROSE OF APPLETREE POINT.

39 Bred and Open Heifers
This great group of heifers presents a rare opportunity for selection for foundation purposes, representing most substantial and popular breeding, and the bred heifers carrying the service of such bulls as MASTERPIECE OF EDGEMOOR, DEANIE'S MAROSE OF APPLETREE POINT, and others of sound worth. The open heifers are nearly all close to breeding age.

14 Bulls of Service Age
Every bull in the sale is of service age, mostly old enough for heavy service, and the group affords a most attractive occasion for selection at a time when there is a strong demand for high class Guernsey bulls in California.

Every Animal Positively Guaranteed to Be a Breeder; Every Animal Tuberculin Tested and Sold Subject to Retest by the Buyer.

TERMS OF SALE: Responsible parties may arrange with sale manager, before sale, for credit on the basis of one-third cash, balance in three, six and nine months, with approved note bearing eight per cent interest.

Coast Tires

WEAR DEFIERS

COAST TIRES are making good on their SERVICE

Every day we receive enthusiastic letters from users who find that Coast Tires are money-savers because they give more mileage.

As one dealer expressed it: "They are made right; the quality is there, and they stand up better than any tire I know of. Every Coast Tire I sell makes a friend for my business."

You may be interested in reading what some of our customers say about them:

A Record Made on the Lava Roads of Hawaii

ROYAL HAWAIIAN SALES CO.
Limited

AUTOMOBILES, TRACTORS AND
ACCESSORIES

Honolulu, T. H., Sept. 13, 1921.

Coast Tire & Rubber Company,
Syndicate Building,
Oakland, Calif.

Gentlemen:

The information given below may be of interest to you, and it may possibly help your advertising campaign:

"Up to the morning of September 10th, a 34x4½ Coast Cord had traveled exactly 7,319 miles, on the rear wheel of a Hudson Super-Six Rent Car, which travels daily between Lahaina and Wailuku on the Island of Maui, T. H., a distance of some 22 miles each way, over one of the roughest roads on the Island. (When we say 'roughest' we mean that the tire had to travel over seven miles of mountainous road, which is nothing better than loose rock.)

"Two weeks before this tire was applied to said Hudson car, another brand of Cord tire was put on the opposite wheel, and blew out at 5,177 miles. The tire was completely worn out. From the latest reports the Coast Cords should see better than 9,000 miles, as the tread and carcass are in perfect condition. No stone cuts appear on tread."

One might say that this is an official test made under the auspices of the Royal Hawaiian Sales Co., Ltd., Territorial Agents for Coast Cords.

Very truly yours,

ROYAL HAWAIIAN SALES CO., LTD.

By E. W. Burgess, Tire Department.

Stand Mountain Roads

Oakland, California, Oct. 14, 1921.

Coast Tire & Rubber Company,
Oakland, California.

Gentlemen:

I have used Coast Tires on my Chalmers car for more than a year and have found them the most satisfactory tires that I have ever used in every respect.

Last March I placed two "Coast Cord" tires on the rear wheels which have gone over 5,000 miles, and which includes two trips across the Sierra Nevada Mountains as well as over some of the worst roads in the State, yet they show very little wear and have never been off the car.

For long wear and service I do not think there is a better tire made than your product.

Very truly yours,

NBC:MN

N. B. CAMPBELL.

Non-Skid Qualities

City of Portland, Oregon
Department of Public Safety
Geo. L. Baker, Commissioner
Bureau of Police

May 24, 1921.

Coast Tire and Rubber Company,
Oakland, California.

Gentlemen:

In response to your inquiry regarding the service we are getting from the Coast Tires which are being used on my official car, I am glad to say that I think this tire has wonderful non-skid qualities, and is therefore of special value to us.

We have had an opportunity to give these tires a good trial during the recent bad weather conditions when the streets were very wet much of the time, and I feel that I can conscientiously recommend the Coast Tire.

Yours very truly,

L. V. JENKINS,
Chief of Police.

Mayor of Oakland Likes Them

CITY OF OAKLAND
California

JOHN L. DAVIE

Mayor

September 8, 1921.

Mr. Holmes Ives, President,
Coast Tire and Rubber Company,
52nd Avenue and E. 12th Street,
Oakland, California.

Dear Sir:

I am sending you these few lines in appreciation of the splendid service which I am receiving from the Coast Tires.

Early in this year my official car was equipped all round with your tires. They have given and are giving splendid service. My car is subjected to difficult strain and covers territory of every description—highways and mountain roads.

I am highly pleased with the record of performance made by your tires and wish to congratulate you on the fact that a home industry produces a product of such excellence.

With my best wishes for the development of a very successful business, I am

Very truly yours,

JOHN L. DAVIE,
Mayor of the City of Oakland.

It will pay you to give Coast Tires a trial. There are hundreds of Coast Tire dealers on the Pacific Coast, but if there should be no dealer in your vicinity, we will be pleased to send you prices and complete description of our tires. Write to

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

A well kept pear orchard in Sacramento County as it appears on the cover looks like a wonderfully attractive holding. Apparently there is not a leaf which the fire blight has touched. Plainly there is not a weed but the cultivator has touched. The home, like a watch tower, on the hill beyond gives an impression that it is filled with comforts and even luxuries because of the fruits of the orchard.

* * *

Such an orchard in such a condition in such a valley has meant lots of work. It has meant work for today in keeping down the weeds and for a part of tonight in planning for tomorrow's work for the blight or for other manifestation of nature which was decreed some years ago when it was said, "In the sweat of thy face thou shalt eat bread." But the end has justified the price. Occasionally some of us are not willing to pay the "price" which such an orchard demands.

* * *

Speaking of Sacramento, we are re-

mindful of its enterprise by a bit of publicity work being sent out by Secretary Dudley. It is publicity for the entire state of California. It contains showing of "California's Resort Wonderland." In addition to giving list of many of these resorts with illustrations there are maps showing roads from San Diego to Siskiyou. Another feature is a list of the auto camping facilities in various towns of the state.

* * *

Sacramento is particularly alive at this moment because of her work to make ready for the "Days of '49." It is only a step back into the hills of Sacramento to where Marshall picked up the first nugget. We will all expect to find them in abundance in the streets of Sacramento when the days of '49 again pass in review.

* * *

The state of Illinois is conducting a campaign with the slogan, "Plan to Plant Another Tree." One feature of the suggestion is that farmers pick up the business of growing Christmas trees. Millions of little Christmas trees are needed every year. Why not grow them in the home acre?

* * *

It has been suggested that a farmer's national "bloc" be organized. There certainly is need of some organization to father and encourage legislation which shall be at least just to agriculture. Class legislation has been deprecated and endured almost since congress began, but since the agricultural bloc secured a measure of relief for agriculture there has been suggestion that the time has come for termination of class legislation. The bloc has been materially reduced in power to do things, but we believe the country will be well served if the organization is continued.

* * *

Grape growers who have read with profit and pleasure the "Planning and Planting a Vineyard" written for the Cultivator by Fred K. Howard, who has been at the head of the field department of the raisin association, will be glad to know of Mr. Howard's advancement. He will, after May first, have charge of the publicity of that great organization. The publicity has been handled during the past year by Al Joy.

* * *

Crime never seemed so rampant as at present. There is debauchery in cities and sometimes in the country a crude and brutal effort to secure justice by direct action. This direct action or mob law is condoned by some, ordinarily law abiding citizens because of the assertion that if our courts are helpless to secure justice some means must be provided by the common people. This feeling has been more general than it should be ever since the prompt disposal of criminals in Santa Rosa something like a year ago. The most recent manifestation was that at Inglewood, Los Angeles County, this week. There seems to have been no provocation similar to that at Santa Rosa. It seems more like a practice stunt on the part of the Ku Klux Klan. It resulted in the death of one and wounding of two others, all, we believe, members of the mob. Los Angeles County has taken a strong hand, and it is rumored the members of the mob will be severely dealt with, and doubtless there will be discouragement of further effort at mob law enforcement. Meantime here is hoping that technicalities may have less consideration in our courts.

IGNORANCE OF LAW

Wm. Mulholland, chief engineer of the Los Angeles water department, remarked the other day that if he were asked as to the exact content of the proposed California Water and Power Act he would have to confess that he has never as yet read it; further, if he did read it, he would be compelled to ask some attorney as to the meaning of certain phrases. Likewise, he has never read all of the criminal code—and still remains out of jail. There is much of legal phraseology in bills and enactments that adds to bulk and gives little real information to the casual reader. Hence it is easy to make assertions regarding results when a proposed act becomes an act.

For instance, it has been said that the Water and Power Act will result in confiscation of properties now held by public utility corporations. We believe a careful reading of the act will show that it will change procedure in that particular in no way whatever. The general laws of the state permit the people to acquire these great public utilities, as was done recently in taking over the distributing system of the Edison Company within the city limits of Los Angeles. The new law will in no way change that procedure.

"It favors the cities." Possibly, but not to the extent that it favors the rural districts. There are three or four of the larger cities of the state which have sufficient wealth to develop their own power systems. There is no rural district which can do this without state aid and direction.

One large hydroelectric power company stands ready to invest one billion dollars in the development of the Southwest. To secure a part, at least, of this billion dollars the company offered preferred stock drawing eight per cent interest at 94. The state of California can secure far cheaper money. Besides, if one corporation, with possibly 30,000 or 40,000 stockholders, can secure a billion dollars for the development of the hydroelectric power of the Southwest, why may not three and one-half million stockholders in the state of California afford to spend half a billion in developing and retaining as their own power from the waters which God has showered upon their mountains?

GETTING READY TO FIGHT

Orchardists propose to knock out Jack Frost. Committees are studying and investigating as to improvements possible on heaters. They are reaching into the air and asking how it can be made to protect citrus fruits and, in fact, all other fruits. The low stack heater with imperfect combustion is dreaded by people living in sections where frost fighting is a feature every two or three years. The smudge is not only disagreeable but destructive or at least injurious to many fine fabrics and certainly to comfort. But the golden fruit means too much of wealth to California to let even the occasional smudge discourage or put it out of commission.

The growers not only have appointed committees, which are at work, but there are many self appointed committees, or rather investigators, giving of their time and ability to help solve the problem. Saturday of this week there are held two meetings, one at Claremont and one at Covina, to discuss and inspect different frost fighting methods. The Covina people are centering on the air circulation plan, rather plans, for there are many ways suggested. These vary from the large windmill on a tower down to the electrically operated fan. In a year like the present the upper strata of air seem to have been as cold as that close to the earth, and mere agitation makes little change in temperature.

The Covina chamber has no ax to grind other than it is anxious to secure protection for the citrus orchard, and at the same time, if possible, elimination of the smudges. The Covina meeting will be extended through the entire day.

The Claremont idea contemplates one central plant for, say, each 20 acres of orchard, with a pump similar to those established for compressed air in filling stations. The air is to be

distributed through pressure pipes after passing through a heater at the central plant. It is claimed it can be installed at a much less price than the pots, and as to labor—"just light one match, turn the electric current on the pump and go to bed."

Assuming that there may be some installations which will not be so easily solved—as to the labor problem—we have one suggestion which appeals to us as having merit for sections where the small orchardist with limited command of labor can be relieved or, rather, assured of a labor supply. This was secured in Colorado apple orchards by the organization of volunteer frost fighters. Each volunteer company was made up of bankers, storekeepers, clerks, high school boys and others who would respond to the alarm, as to a fire alarm, by going at once to the orchard or field and joining the frost fighters. These volunteer companies were prepared by going through regular drills until they fully understood the handling of the equipment. For many orchardists this would have no value, but we know that in California orange and lemon producing sections there are small orchardists unable to pay the large wages demanded and even unable to give of their time to go out and organize a corps of frost fighters.

FLORIDA COMING TO CALIFORNIA

Edgar A. Wright, editor of the Florida Grower and at one time a resident of California, is working up an excursion of Florida fruit growers to California. They expect to arrive in Los Angeles early in June and propose to "do" the citrus sections of the state. Mr. Wright says:

"My object in encouraging such a trip and the consequent effort to see it were not possible to get together a party of Florida folks to visit California this summer was to show them what had been accomplished in citrus building, believing that every one who participated would come back with ideas that could be utilized for the good of this state. My plan would be to keep such a party intact until the sightseeing in California was over, say a week, and then let each one choose his, or her, own time of departure and route home.

"To this time we are assured of enough members to secure a special car, and I have no reason to doubt but that we can get together 125, which will assure a special train, with dining attached. I believe that a visit to California by such a delegation will result in untold good for the individual member and for his or her community and for all Florida. California is a beautifully attractive country, though her hills will be brown by the time we arrive. You know California has no rainfall from May to October; every thing that grows must be irrigated, so that her natural grasses have dried up and her hills will be bare. You will not need umbrellas, overshoes or rain coats. Heavy underclothing and overcoats will be a necessity at times, for her summer evenings are chilly, especially near the ocean front.

"You will be interested in the beautiful cities, especially Los Angeles, which has grown faster than any city in the United States in the past 25 years, and you will want to know why this growth has been possible. You will soon know that Los Angeles owes much of her growth to her attractiveness, her parks, wonderful street railways, splendid homes. You will see many developments that could be duplicated in Florida, and perhaps you will find out how to bring such development about and thus make your trip worth while for yourself and for your home state. You will see her fine beach towns built on beaches that have not the attractiveness of Florida beaches—beaches where the waters are never as warm as off our Florida shores and that run off into deep water very quickly.

"You will want to see their packing houses; they pack Valencia oranges all summer long out there, you know, and their packing houses are seldom idle, the season for one variety running closely into the season of another. You will want to see their roads. They probably have the finest and most complete system of roads, ways of any section of the world. Possibly you will want to climb the mountains; you can do it by train or on the back of a burro—take your choice."

California Cultivator

Vol. LVIII, No. 17

Los Angeles, April 29, 1922

One Dollar Yearly

What Will the 1922 Harvest Be?

THERE is still uncertainty as to the full effect of the frosts. These manifestations of nature have been most partial in the manner of distribution. They covered a period of two weeks. As time passes more hope is expressed that the damage was overestimated. Reports which have come in since those given in the issue of April 22 are:

Fred Seulberger, Horticultural Commissioner, Alameda County

(News Dispatch)—Damage to crops along the east side of San Francisco Bay by the frosts of April 8, 9 and 10 totaled probably \$2,000,000. The loss of apricots probably will be 95 per cent, peas for the early market 40 per cent, new potatoes 50 to 60 per cent, and currants about 50 per cent. New growth on ornamental trees also severely injured.

J. K. Turner, Horticultural Commissioner, Placer County

It is impossible to make any estimate of the Placer County fruit crop at present; the season is about three weeks late. Nearly all varieties of

plums and peaches have bloomed heavily. Cherries are also showing lots of bloom and pears will do the same. We have had several cold nights lately but so far I have had no reports of killing frosts. What effect the cold will have on the fruit remains to be seen. Under this year's conditions I do not believe that we can make an intelligent estimate of the crop before May 1 at the earliest.

Sun-Maid Raisin Growers, by Karl B. Clark, Growers' Service Department

Conditions are generally quite favorable for a large crop this year. The rainfall has been above normal and the ground is in most sections well soaked. The heaviest mountain snowfall for years gives promise of an abundant irrigation supply. The season is two or three weeks later this year than last. Some frost damage was done to the grape crop on the night of April 8. The frost is spotted and in no way so severe as the freeze of last year. For the most part Muscats and most table grape varieties were not out far enough to be seriously injured. The Thompson crop was

damaged probably as much as 25 per cent in some districts. The districts caught by the frost this year are, for the most part, different from those caught last year. Estimates that have been made so far seem to indicate that the loss was five to ten per cent of last year's loss, which would mean that probably not over three per cent of the total crop has been destroyed. There was some injury to figs and other fruits in the frosted districts.

Clifford G. Tanner, Horticultural Commissioner, San Luis Obispo County

Almonds, heavy set of fruit. Apples, prospects good for heavy crop as the fruit buds are looking fine. Apricots, brown rot and weather conditions caused considerable damage, 50 per cent crop. Cherries, favorable at present. Peaches, impossible to state as spraying was done too late, due to weather, and the recent frost killed some. Pears, prospects very favorable for the largest crop ever in this county. Prunes looking good. Grapes, heavy planting of young stock, table and wine; older plantings look good.

Geo. Marchbank, Horticultural Commissioner, Madera County.

Apricots, 40 per cent. Peaches, 100 per cent. Plums, in full bloom; looks like 100 per cent. Grapes, 85 per cent. The weather may modify this estimate to some extent. About two weeks from now I would be better able to give a more accurate report of the crop conditions, but this is how it looks now. I am unable to report on almonds and apples as yet. The apple growers are mostly in the mountains and I haven't had a report from any of them. I have not been able to inspect the almonds so far this year on account of other business. There are no pears and cherries grown commercially in this county, only a few in family orchards.

F. W. Waite, Horticultural Commissioner, Imperial County

Almonds not grown commercially. Apples not grown commercially. Apricots, small acreage, 90 per cent. Cherries not grown commercially. Peaches not grown commercially. Pears, Winter Bartlett, 100 per cent. Prunes not grown commercially. Grapes, 90 per cent, winds damaging early grapes. Cool weather delays tomatoes and cantaloupes.

E. E. Kaufman, California Cooperative Crop Reporting Service

Just at this time I haven't any official knowledge to pass along. Our regular inquiry regarding the condition of various fruit crops will not be made until May 1. Unofficially I might say that prospects seem pretty good. Saturday and Sunday night last it was pretty chilly in a few spots, and there is some report of frost damage to apricots in the Santa Clara Valley, how serious, I don't know. Also heard a little about how cool it was Saturday night in Fresno and possibly a slight injury to some grapes. This, however, is not official as I have had no direct advices. I have not figured on apricots to any great extent as they have been afflicted with brown rot to such an extent around the Bay counties for a couple of years that it is doubtful whether there would have been much fruit anyway. The blooming period of all fruits is undoubtedly two to four weeks late, all of which has been of some benefit under our present weather conditions as the danger from killing frosts has been materially decreased by the lateness of the blossom.

H. M. Kingwill, Horticultural Commissioner, Glenn County

It is a little bit early to report on any of our crops as yet, but I believe that so far as we know to date, almonds will show about a 90 per cent crop and apricots about 85 per cent. So far as the other products are concerned, it will be inadvisable at this time to make a report as they are not far enough along to give the figures any value.

J. C. Metzgar, Secretary Santa Ana Chamber of Commerce, Santa Ana, Orange County

Almonds not grown commercially. Apples and apricots, too early to judge by buds, etc., but we have had an extra good year as to rain. The trees

(Continued on Page 459.)

It Harnesses the San Joaquin

Here is shown the great Kerckhoff Dam on the San Joaquin River. It is the property of the Joaquin Light & Power Corporation. Completed in 1920, it stands as one of the several big engineering accomplishments which tend to make the past two years notable for intensive electrical development in central California. The dam is 400 feet across and 110 feet high. The piers on it are men, and they afford a means of gauging its proportions. The intake to the canal is shown in the picture—the boxlike structure at the water's edge. The Sierra Nevada is rich in thousands of similar hydroelectric possibilities. Unlike oil coal which may be exhausted in a score or a few score years, hydroelectric development is all time to come. Hence the intense interest in the vote which will be taken next November on the California Water and Power Act.—Engraving through courtesy of Standard Oil

Agricultural News Notes of the Pacific Coast

Northern California

Farm picnic today, April 29, at University Farm, Davis.

Sheepmen have begun to come into Red Bluff with the 1922 wool clip.

Rice sale in Sacramento last week at \$2.80 for No. 1 paddy, the best of the season.

Shasta County sheepmen have begun to come into Red Bluff with the 1922 wool clip.

Red Bluff and Eureka chambers of commerce confer on improvements of Bee Gum road.

Colusa County fair date has been changed to September 14-17. Fair will be held at Colusa.

San Francisco's eighth annual exhibit of wild flowers was held at the St. Francis, April 20-22.

Tehama County reports much of the fall sown grain drowned out; winter sown is showing up much better.

There is a movement on foot to organize deciduous fruit growers of Tehama County in a marketing concern.

Twenty-three local exchanges were represented at the annual meeting of the California Almond Growers Exchange.

The state highway commission has advertised for bids on road between Trinidad and Orick in Humboldt County.

Tractor school for Butte County will be held at Chico week beginning May 22. It is in charge of L. J. Fletcher of the state university.

C. J. Koopman and W. C. Smith will represent the Corning district of Tehama County at the Fresno meeting of olive growers of the state.

The Fair Oaks-Orangevale Almond Growers Association at its annual meeting endorsed the reorganization plan of the state exchange.

E. E. Kaufman reports condition of wheat in California on April 1, 94 per cent of normal compared with last year same date 93 per cent.

County Bee Inspector Dickenson of Nevada reports 1,000 stands of bees in the county, with prospect of doubling the number before the end of the season.

Home departments have been organized in Paradise, Fair View, Rio Bonito, Thermalito, Wyandotte, West Gridley and Manzanita in Butte County.

Officers of Jersey Breeders of Humboldt County: President, Dr. H. G. Gross of Eureka; vice-president, W. E. Elliott of Loleta; secretary and treasurer, Ernest Peugh of Elk River.

The Jersey Cattle Club of Orland has elected the following officers: President, M. Fortini; vice-president, C. A. Whitsett; secretary, Kirby Clark; treasurer, W. G. Gurnett. Another calf club is to be started immediately.

Farm Adviser Baade of Napa County estimates number poultry in that county at approximately 85,000, 50,000 of which are in the vicinity of Napa, 20,000 near St. Helena and 15,000 in upper Napa Valley and about Calistoga.

The last three months have made up the coldest first quarter of the year California has experienced in a decade. It was the coldest January since 1913 and the coldest February in 11 years. The temperature during February was three degrees below normal every day, and in March 3.3 degrees below.

Central California

Lockeford community picnic, May 13, is the 23rd annual.

General Grant National Park will be open May 24 to October 10.

Heavy shipments of artichokes are being made from Santa Cruz.

Twenty carloads of "Nickel Sun-Maids" are en route to London.

Tulare hopes to secure the next annual meeting of the California Creamery Operators.

Aromas section of Monterey County reports serious damage to apricots from brown rot.

Trials are being made of black paper "mulch" to keep down weeds and warm up soil in melon fields at Delhi.

San Joaquin Valley counties sent representatives to Hanford last week to outline campaign for encouraging tourists.

The May meeting of the Association of Commercial Secretaries of San Joaquin Valley will be held at Modesto on the 27th.

The city of Stockton has decided to place itself under state meat inspection in accordance with act passed by the last legislature.

The second annual banquet and tour of the dairy department of the Kings County farm bureau was held at Hanford, April 12 and 13.

Richgrove-Jasmine Citrus Association has been incorporated and will build packing house at Richgrove in time to handle next winter's Navels.

The Tulare Cooperative Poultry Association paid 22 cents for No. 1 and 17 cents for No. 2 eggs during March. Total business amounted to \$26,000.

The annual meeting of the Madera branch of the California Cattlemen's Association was held at Coarsegold, April 15. Henry Krohn was elected president.

The California Olive Association (canners) has decided to use four standardized sizes and shapes of can. These will be five ounce, pint, quart and No. 10 packers.

A largely attended meeting of Emperor growers and shippers at Fresno, April 18, adopted recommendations for standard drum pack to serve as guide to the state standardization service.

Olive growers of Terra Bella, Plano, Porterville, Ducor and southern portion of Tulare County met at Terra Bella April 17 to consider the state marketing association now being formed.

The Lodi district of San Joaquin County reports slight damage to Tragedy plums, early apricots and possibly almonds by the frost of April 14; grapes, which are several weeks backward, not injured.

Sunmaid Raisin Growers' headquarters reports indicate damage ranging from 10 to 40 per cent resulted from frost of April 9, heaviest being west of Dinuba. The young Thompson Seedless vines suffered the most. Peaches were unhurt.

Stanislaus County peach growers are staging a contest which will be decided on October 15, Peach Growers' Day. The California Canning Peach Growers and the farm bureau are backing the plan. The purpose is to improve tonnage, quality and orchard conditions.

Southern California

Carload onion shipments from Coachella Valley begin first of May.

Bean planting has started in the Camarillo section of Ventura County.

Recent storms have pounded away nearly 200 feet of the beach at Hueneme.

Riverside County supervisors have appropriated \$8,000 for the Southern California Fair.

Heavy shipments of lettuce are being made from Palo Verde Valley in Riverside County.

First summer squash from Imperial Valley sold in Los Angeles markets at \$3.25@3.50 per crate.

An express train of six carloads of peas left Brawley one day last week. Five cars went to New York, one to Chicago.

Julian, San Diego County, is planning to hold a big celebration this fall on the completion of the road into Imperial County.

One San Diego hay and feed buyer reports shipping from Imperial Valley 300 carloads during 1921 over the new San Diego and Arizona Railway.

Citrus growers met with federal and state departments of agriculture representatives at Riverside last week to discuss the frosted fruit problem.

Three headlight testing stations have been established in Ventura County. Traffic officers are also hard after drivers of overloaded trucks.

During March a daily average of 16,280 inches of waters of the Santa Ana were spread over the debris cone by the Water Conservation Association.

Big floods for the Colorado River the latter part of May or first of June are predicted by government engineers because of heavy snows in the upper basin.

The Automobile Club of Southern California suggests that to avoid accidents pedestrians walk on the left side of highways in order to face approaching traffic.

Speakers for and against the proposed state water and power act were heard at farm bureau meetings in Los Angeles County at Baldwin Park, April 25; Owensmouth, 27.

Grain growers of Los Angeles, Riverside and Orange Counties met at San Juan Capistrano to discuss bulk handling. Success of the community elevator at Murrietta was explained.

The farm bureau travel conference will spend May 9 and 10 in Los Angeles County, 11 in Riverside and San Bernardino Counties, 12 in Orange County, 13 in San Diego County. It is hoped to have 50 automobiles in the tour.

Coachella Valley date growers are considering establishing a packing plant near the coast where packers may be more easily secured and at lower figures. If this plan is followed dates will be placed in cold storage until marketed.

The Lima Bean Bulletin chronicles: "We are sorry to report having seen some very beautiful Madagascar lima beans coming into Baltimore last week. They are 1921 crop, hand picked, free from any imperfection and are being purchased at six cents delivered Baltimore, duty paid."

The Coast and General

Oregon Jersey Jubilee, Willamette Valley, May 25-27.

Northwest Guernsey Breeders' sale at Portland, June 5.

Squirrel poisoning campaign is being prosecuted in Northern Idaho.

Whatcom County, Washington, will hold its annual fair the week of September 25.

Maricopa County, Arizona, has 30,000 acres in wheat; total for the state is 52,000.

A cattle and horse raisers' convention will be held at Enterprise, Oregon, May 24-25.

Vegetable growers of the Kamiah Valley of Idaho have formed a marketing association.

The Hood River Valley Apple Growers' Association does an annual business of \$2,500,000.

Yuma, Arizona, celebrated on April 16 turning of irrigation water on 60,000 acres of mesa land.

The annual jubilee of the Guernsey breeders of Oregon will be held in Tillamook County June 13-15.

Contracts for feeder lambs for next fall are reported being made through the western states at 11 cents.

Seed potato growers of Cassia County, Idaho, have formed a cooperative purchasing and marketing association.

Members of the Ada County, Idaho Lettuce Growers Association are incorporating under the name of Idaho Fruit and Vegetable Exchange.

The Puyallup and Sumner Fruit Growers Association, Washington, has voted to admit no new members; only those marketing with the association in 1921 may work with the association.

The Washington Cooperative Egg and Poultry Association has installed new processing machines in its Lynden and Bellingham plants. The process is a dip that seals the eggs for storage.

Apple growers of Washington, Oregon and Idaho are asked to contribute one cent per box for advertising. A committee appointed at Spokane meeting last December is in charge of the movement which aims at united effort by all apple interests.

A pool for Australian canned fruit has been formed by the commonwealth government. Cooperative companies each state will act as agents in collection of fruit. The marketing commission will include a canning expert and a representative of the fruit growers.

The condition of the Arizona wheat crop on April 1 was 95 per cent of normal, compared with 80 per cent on April 21, 1921. Based on average influences on the crop until harvest, the forecast is for a crop of about 1,482,000 bushels compared with 840,000 bushels one year ago.

Barley acreage in Arizona will be smaller than last year. California reports about the same acreage as on year ago, though the weather has prevented the seeding of heavy soils until too late to insure a good crop. An official report for the entire country will not be made until June.

G. D. Railsback of Medical Lake, Washington, has been selected manager of the Inland Empire Dairy Producers Association. The association has a membership of more than 70 in the territory of eastern Washington and northern Idaho tributary to Spokane, where a by-products plant has been established.

Some Wild Flowering Shrubs of California

By Leonard Coates

 CALIFORNIA abounds in beautiful flowering shrubs, but it is a most difficult part of the propagator's art to grow them from seed or to transplant from the hills and woods. Among the most beautiful, and most rarely met within cultivation, are the madrone (*Arbutus Menziesii*), manzanita in several species, the most common being *Arctostaphylos pungens*, tree poppy (*Dendromecon rigidum*), Western dogwood (*Cornus nuttalli*), and *Styrax Californica*.

I remember that in the nursery we had for years tried to raise a stock of madrone from seed, but without success, until some seven or eight years ago we collected a lot of berries from one tree, which, when sown, germinated like peas, and a fine lot of trees

was raised. In this case lack of fertility was the cause of former failures, the after treatment being the same.

Propagation of the manzanita was still more difficult, either by seed, which sometimes germinated well but failed in the transplanting, or by using small plants taken up and shipped to the nurseries. Getting them established seemed impossible. In Lake County I have found that occasionally on burnt over land where these shrubs grow, thousands of seedlings will spring up, as the wattles do in New Zealand. I moved a lot of plants myself on a wet day and planted them. Nearly all grew and formed a

dense mass of fibrous roots. The next year I transferred them to five gallon cans and sent a whole truck load of beautiful bushes, two to three feet high, to the nurseries in Santa Clara Valley. There are in these hills *dendromecon*, *styrax*, *Cornus nuttalli*, *garrya*, etc., and I understand small plants of these sometimes appear in same manner as manzanita, but not so plentiful.

Dendromecon is a large yellow poppy, the only tree poppy.

Styrax is related to *halesia*, the snowdrop tree of Europe, a most beautiful shrub with pendant snow white blossoms. I have found it up

the Kings River in Fresno County also.

Cornus nuttalli is the Western dogwood, with very large greenish white single blossoms three or four inches in diameter. It grows to quite a large tree.

Garrya has a wide range also. It grows in the hills back of Oakland and in the mountains of Lake: known sometimes as quinine bush, sometimes as silk tassel because of the very long, graceful catkinlike bloom of the male plant.

In the hurry and rush of money making how little is known of the wild growth of California? In the automobile one has a fleeting glimpse of what he is passing: on foot, or horseback is the only way to enjoy nature.

The Turkey Growers Problem

By Jean A. Koethen

 TURKEYS are hard to raise." I wonder how many thousand times every year that remark is made, and yet every fall, when the turkey crop is gathered, there is turkey for everybody, and the grower usually finds his balance on the right side of the ledger. Young turkeys are very hard to raise, no doubt about that, but if every poult lived that is hatched what would we do with them all, and where would the producer's profit be?

To illustrate: Last spring I bought ten turkey eggs for \$2.80, put them under one of my Rhode Island Red hens and hatched six. Four of the six dropped out of the race the first month and the other two, a hen and a gobbler, lived and grew to a fine, husky maturity. We had the hen (she weighed ten pounds dressed) for Thanksgiving dinner, but kept the tom till Christmas, by which time he was too large for us to handle, and we sold him to a market for \$9.60. There was \$15 worth of turkey meat for an outlay of \$2.80 plus cost of raising, which could hardly have been over \$5. Allowing \$7.50 for cost of eggs and feed, my profit was just 100 per cent. And yet I raised only two birds out of six. Probably that is about the average, and the aim of every turkey grower in America is to raise this average and thereby increase the profit.

Turkeys are hard to raise the first two months. After that they are far easier to handle than chickens. They require no shelter, are not troubled by insect pests, and if their constitution and environment are right will almost take care of themselves. My turkeys lived on bran, barley and green feed after the first two months, and roosted on top of the chicken fence. In feeding I followed a Gardena turkey rancher who markets hundreds of turkeys every fall. He feeds them very carefully for two months, then turns them into an open yard where they have a hopper with two compartments, one filled with rolled barley and the other with bran. They have some light shelter until they take to the outdoor roost, which they do naturally when they are ready. A pile of shell always available and young corn to eat completes this man's provision for his young turkeys, but this, remember, is after two months of age. It is those critical two months that discourage so many of us.

Igor First

The first essential to every little tur-

key's equipment for life is a vigorous body, and that comes from its progenitors. If anything is wrong in the parent stock it is sure to come out in the offspring. Like begets like. If the breeders are the leftovers, the late hatched or slow growing turkeys that were not large enough for the Thanksgiving market, they can hardly be expected to produce large and vigorous offspring. If the breeders are from rousy stock or from stock that has been inbred the offspring are quite sure to lack vitality.

I wonder how many persons who go out in the spring to buy turkey eggs ask whether the hens and the tom that produced them were related. I wonder how many who buy toms to mate to their own hens are careful to learn just what is the pedigree of the tom and to satisfy themselves that tom and hens are not from the same stock a generation or so back. Inbreeding is bad enough with chickens but worse with turkeys.

In birds that habitually and preferably roost out of doors rousp is an inexcusable disease. Its only explanation is that there has been rousp at some time among the breeding stock. Rousp is a disease originating in damp or unventilated houses. It has no place in the program of a bird that can roost out in the coldest winter. Birds that ever have a touch of rousp should be sent to market and never allowed to pass on their weakness to the next generation.

Size nearly always goes hand in hand with vigor. The breeding male should be a heavy bird, not the heaviest but well up to standard, and the hen should be plump and firm of flesh. In order to attain a good size at Thanksgiving the young stock must have this stocky ancestry. Skinny turkeys are almost sure to lack vigor.

Climate and Weather

The more I see of turkeys the more convinced I am that weather, climate and drainage play a large part in the success or failure of turkey culture. Dampness is one of the greatest enemies of the little turkey. One who is able to choose the location of his turkey ranch should go well back from the coast. Two or three years ago I had two broods of poult come off in the foggiest, chilliest days in May, and not a single turkey lived over two weeks. Most of them dropped off, with

hardly a sign of illness, before they were a week old. I know now that I did not protect them carefully enough. I had the idea then that the turkey was an outdoor bird and didn't mind the fog if only it was warm at night. Too late I realized that the little turkey with a chicken mother must be more carefully protected than a chick the first week. If the hen is careless about hovering her charges she must be put in a coop where she will be compelled to hover them. I mean a low, dark coop in which she cannot move around. April is a better month for hatching turkeys than May near the coast because there is less fog. Little turkeys like the sun, they like a dry, sandy soil and dry air. If they can be kept on a well drained hillside, so much the better. It seems superfluous to say, "Keep poult out of the rain," but it may be necessary. Not only out of the rain but off wet ground and out of the dewy grass in early morning. Dampness in any form must be avoided while turkeys are small.

Cleanliness

Next to dampness the little turkey's greatest enemy is filth. They must have clean ground to run on and clean coops to sleep in. It seems likely that the old objection to keeping turkeys with chickens is an objection to filth rather than to chickens. The Rhode Island station a few years ago thought it had proved that blackhead originated in the droppings of chickens. Later investigation showed that it was contaminated, filthy soil, and their coops, if they are hovered by hens, must be moved to clean ground or cleaned, if they have board bottoms, every day.

Hovering

How shall I brood my turkeys? This is a question that has given rise to a good deal of discussion. The sensible answer would seem to be "Use what you have," depending of course on the number of poult to be raised. Men and women who hatch with incubators and raise turkeys by the hundreds are finding that they do quite as well in brooders as with hen mothers. Any type of brooder that is successful with chickens may be used. I have seen one man using outdoor brooders with excellent success, another using a large brooder house heated by pipes under the floor, and a very successful

woman is trying out the small unit brooder house. It doesn't matter what method of brooding is used as long as the poult are kept warm and dry and clean.

The turkey hen is generally preferred to the chicken hen as a mother because she is less fussy, but most large turkey ranchers use some chicken hens rather than let the turkey hen stop laying the first time she goes broody. The plan is to break up the turkey hen and make her lay two or three clutches of eggs, letting her hatch the last clutch but giving the others to chicken hens. I have met some turkey people who preferred chicken hens because they are more easily handled. My own experience has been entirely with chicken hens, and I find most of them are excellent mothers, a trifle fussy, perhaps, but dependable if properly managed. Of course, if you let a hen go wandering about with her brood she will tire them out and take them into damp and dangerous places. If she is carefully confined in a comfortable coop and allowed out only when the day is so warm the poult need no hovering she is a good mother.

Green Feed

The providing of green feed is a serious problem in California, and one no turkey breeder dare overlook. Without doubt alfalfa is the best green for turkeys. Little turkeys that can be turned out to run on green alfalfa as soon as their first few days of quiet are over have an easy road to maturity. I heard recently of an Imperial woman who fed her baby turkeys just two weeks, then turned them out on alfalfa and gave them no more attention except a feed of grain at night. She was very successful, of course. The nearer we can get our turkeys to Mother Nature the better, and we must never forget that Mother Nature wears a green dress. Onions and their green tops are considered an absolute necessity for turkeys. Perhaps any green would do just as well. At any rate, green they must have, and provision must be made for it before the birds are hatched. Melilotus, green barley or wheat, young corn, alfalfa, clover, weeds, they like it all, and it is all their staff of life. The ideal turkey ranch is an alfalfa ranch. Lacking this, the grower must provide what he is able. The younger the birds the more their health depends on an abundance of green in their diet.

The Byron Jackson Deepwell Turbine

Standard of the World

Symbol of Efficiency

Always an aggressive leader the Byron Jackson Iron Works did not rest with its presentation of the world's first deepwell turbine. but has continued to make it the recognized leader—the standard for attainment everywhere.

Dependable, economical and efficient in its delivery of the maximum quantity of water for lowest cost, this direct-connected, motor drive turbine is today revolutionizing water development on the farm and in the industries.

Let the Byron Jackson Iron Works solve your pumping problem, without cost or obligation to you. Deepwell turbine booklet for the asking.

Thomas Mowers Save Money and Horse Flesh

It's This Way

Every farmer knows that the pinion at the end of the crank shaft on any mower wears out and must be replaced from time to time and that with most mowers the machine must be taken to a blacksmith shop to insure a good job. Any farmer can replace the pinion on the Thomas because the crank shaft is easily taken off by removing the long box that is bolted to the frame. This box has a long bearing at each end, accurately machined. No re-seating with babbitt or other metal necessary.

All gears are enclosed where dirt can't get at

them. They turn in a bath of oil stored in the bottom of the gear case and thus oil themselves.

That's one reason why the Thomas pulls easily. Another reason is that a malleable wearing lug is fitted in each guard, doing away with wearing plates that cause friction. The heads of rivets that hold the sections are countersunk and ground smooth, preventing grass from packing under the knife clips.

Drop in our store and we will show you a number of other good

points about the Thomas that you'll like.

SPRAYING APPLES AND PEARS

By T. D. Urbahns, Bureau Pest Control, State Department of Agriculture

Growers should be able to protect 95 per cent of their fruit against infestation by worms of codling moth. The spraying should be done with arsenate of lead, using four pounds arsenate of lead paste or two pounds arsenate of lead powder to 100 gallons of water. For best results it is necessary to use a good powder outfit with extensive rods and the proper nozzles. At least 200 pounds pressure should be maintained while the nozzles are spraying.

The first spray (calyx spray) is by far the most important and should be applied while the calyx cups are still open. On both apples and pears the spray should begin when two-thirds of the petals are off; on the apple should be applied within about three days and on the pears within seven days from that time. The calyx cup of the apple closes more rapidly than those of the pear and therefore gives less time for applying the first spray. This application should be driven down from above with an extensive rod and angle nozzle with a one-sixteenth inch disk so that the spray will be deposited in the calyx cups where most of the worms begin feeding. If the bloom is very irregular it may be advisable to repeat the calyx spray to protect the late blossoms.

The second application should be made about three weeks after the first regular spraying. This is necessary to protect the fruit again from worms attempting to enter from the outside. Every effort should be made to thoroughly coat the fruit and leaves with a thin, uniform film of the spray. This result can be secured by using nozzles with disks having one-third second inch opening and high pressure and constantly keeping the nozzle moving so that no excess of spray will collect on the fruit.

The third application should be made about four weeks after the second. A fine mist spray under high pressure uniformly distributed will best protect the fruit against worms and will avoid the deposit of unnecessary spray residue which is very objectionable when the fruit is being marketed. In orchards of late varieties it is necessary to make an additional application about the middle of July for the purpose of destroying worms of the second generation. Equal care should be given at this time to secure a fine, uniform distribution of the spray and every effort should be made to protect the fruit on all parts of the tree.

OLIVE GROWERS ORGANIZING

The olive growers of the state are discouraged, but not down and out. Their situation is serious enough, however, that they are, honestly and earnestly seeking relief through cooperation. A movement started in the central part of the state resulted in the selection of a committee of which T. J. McKelvy of Fresno is chairman and Wm. Glass secretary. The general plan of procedure contemplates dividing the state into three districts. District No. 1—Los Angeles, Riverside, San Diego, San Bernardino, Ventura, Orange, Imperial, Santa Barbara and San Luis Obispo Counties. District No. 2—Tulare, Fresno, Kern, Madera, Merced, Stanislaus, San Joaquin, Mariposa and Santa Clara Counties. District No. 3—Butte, Tehama, Sacramento, Glenn, Shasta, Yuba, Yolo, Placer, Sutter, Napa, Calaveras, Alameda, Contra Costa and Sonoma Counties.

Olive growers in these districts are urged to get together and appoint a board of 25 trustees. At this writing the hope is that these trustees may be named prior to April 30. Then an early meeting of these trustees will be held in Fresno.

Mr. McKelvy's committee has formulated a working agreement which is said to be merely suggestive but it is hoped that from it may be built a plan and form of contract. The plan contemplates a stock corporation to be formed with subscriptions by growers only, each share of stock to have a par value of \$50 per acre owned by the subscriber. The trustees are termed voting trustees, and they are expected to elect the executive committee.

mittee of board of directors which shall have actual charge of the business of the association. A five year contract is provided for but withdrawals are permitted during the years 1923, '25 and '27 during the month of February. The plan of organization is very similar to that of the Sun-Maid Raisin Growers.

APPLE MARKETING COMMITTEE

As an outgrowth of a mass meeting of pear and apple growers representing all parts of Southern California held at Yucaipa, February 7, under the general auspices of the Southern California farm bureaus, the Pear and Apple Marketing Committee of 16 of Southern California has been organized. During the past month this committee has held several meetings resulting in the appointment of special sub-committees on various phases of the apple and pear marketing problem. The personnel of the committee, together with the districts represented is as follows:

H. S. Bissell, central part Los Angeles County; F. H. Gilmore, John Hundley, P. B. Hasbrouck, C. B. Rous, Yucaipa; Henry Mennig and Norman Evans, Antelope Valley; H. B. Woodrough, Orange County; Fred White, Chino; E. H. Richardson and W. A. Foster, Mojave Valley; H. L. Rivers, Oak Glen; R. B. Peters, Devore; C. T. McKenney, Tehachapi; R. L. Wilson, Beaumont; E. W. Allen, Downey. R. B. Peters was chosen chairman and an executive committee was elected as follows: E. H. Richardson, chairman; Bissell, Hasbrouck, Woodrough, Mennig, and Peters. Executive committee selected sub-committees as follows: By-products: Peters, Gilmore, Wilson, White, Mennig. Storage: Hasbrouck, Rivers, Mennig. Marketing: Woodrough, Evans, McKinney, Hundley, White. Market Information: Bissell. Publicity: Peters, Rous, Allen.

In the districts mentioned there are in excess of 15,000 acres of apples and pears in partial bearing. This acreage should soon be able to produce from 1½ to 4 million boxes annually. The local market is not able to consume this production, part will have to be shipped out. At present there are many selling agencies resulting in disorderly marketing.

Large quantities of fruit the past year rotted on the ground for lack of a by-products industry. This has resulted in many cases in very low returns to the producer, yet the consumer has received very little benefit from these low prices. There are certain practices on the part of the cold storage companies which will receive serious consideration.

The Committee of 16, through its sub-committees, will endeavor to study the situation, and suggest ways and means whereby some of the conditions outlined above may be improved and the industry as a whole be developed, so that a fair price may result to the producer and the consumer have the benefit of the fine quality of apples and pears produced here in our midst, and at a fair price to him also.

WHAT WILL HARVEST BE?

(Continued from Page 455.)

It look in excellent condition and good crops should result. Cherries not grown in commercial quantities. Prunes not grown in commercial quantities.

San Fernando Valley

A Cultivator field man reports that careful observation in Owensmouth, San Nuys and other San Fernando Valley points shows material reduction of the apricot crop by frost on April 11 and 12. Peaches likewise lightly affected.

San Joaquin County

The freeze of April 12 got about 90 per cent of the apricots in two-thirds of the valley. The north side is hardly touched. Walnuts also suffered to an extent not yet known but will run to as high as 75 per cent in some orchards. These two crops are grown extensively in the Simi Valley.

San Joaquin County

Almonds, 5 per cent; apricots, 25 per cent; cherries, too early, prospects good; prunes, too early.

Thos. Briles, Horticultural Commissioner, Modoc County

It is yet too early, owing to the extreme lateness of the season, to give you anything definite as to fruit crop conditions. However barring later frosts, prospects are good. Our only commercial fruit crop in Modoc County as yet is apples, and this season the trees will not bloom until the later part of May. Other deciduous fruits such as apricots, pears and cherries grow in this altitude to a high degree of perfection but as yet are little grown commercially.

F. H. Taylor, Horticultural Commissioner, Lassen County

The season is so late that we cannot give figures at this time, but the outlook seems to be very good.

C. E. Sullivan, County Agent, Sutter County

Bumper yields predicted in all crops. No damage of any kind reported as yet to any crops in Sutter County.

Almonds, 100 per cent. Apples, 100 per cent. Apricots, 100 per cent.

Cherries, 100 per cent. Peaches, 10 per cent so far, but danger of frost not completely over, probably will be when paper goes to press. Pears, 100 per cent. Prunes, 100 per cent, frost danger not over, same as peaches. Grapes, 100 per cent, frost danger not over, same as peaches.

California Prune and Apricot Growers, by H. L. Dunlap

Your request for information as to crop prospects comes just a little early for the best information except of

course with reference to apricots. According to reports, apricot crop everywhere damaged. In the coast districts especially damaged by both brown rot and recent frost. Reports just coming in on the frost damage from all districts. Just as a rough estimate at this time it begins to be a little doubtful if the state's crop would exceed last year's light production, but would not attempt definite prediction for a short time. Prune blossoms everywhere good, but critical season still ahead of us.

Turn Your Clods into Dollars

The CUNNINGHAM PULVERIZER

Smashes clods, breaks crust, knocks down ridges, closes cracks, makes perfect seedbed, saves ¼ seed, forms a mulch, stops evaporation, preserves moisture, saves irrigation. Works close to trees, increases crops 30%, makes it easy to procure prune pickers—every farmer, orchardist, vineyardist, nurseryman and seedman should own one. Hundreds in use. Write for circular.

California Plow Co. 140 Polhemus Street SAN JOSE, CALIF.

Cletrac works fast without injuring the trees

Cletrac will speed up your orchard disking and harrowing. Strong, low-set and with power to spare, Cletrac cultivates under the branches and close to the trunks without harming the trees.

When the job is done, it is ready to move the sprayer about and hurry along any work you put it to. Hauling loaded fruit boxes out of the orchard during the rush of picking season is only one of the many extra jobs on which Cletrac saves time and cuts production costs.

The two wide tank-type treads get a firm grip on hilly or soft land. No power is lost through slipping or digging in, and Cletrac travels steadily along—always delivering an abundance of draw-bar pull from its big motor.

Cletrac's short-turn ability makes it mighty handy among the trees. Its heavy-duty motor is unusually flexible—and the governor automatically adjusts the fuel to the load.

In the hot, horse-killing days of dust-heavy summer, the Cletrac user can push his tractor to the limit—twenty-four hours a day if necessary. Dust does not reach Cletrac's motor—the water air-washer prevents that.

Send for a copy of "Selecting Your Tractor"—it gives the whole interesting story. And talk it over with your local Cletrac dealer.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department. Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When queries are wished in Cultivator address query to 317 Central Ave., Los Angeles.

Right of Redemption Sold

A mortgage was foreclosed on certain real property. The property sold for less than the mortgage and a deficiency judgment was given against the mortgagor. The mortgagor sold his right of redemption to a third party with a covenant in the deed to the effect that the third party would pay the amount necessary for redemption and also the total amount of personal judgment. Is the mortgagor and judgment debtor cleared of his obligation? For how long a time can action be taken upon such judgment?—Subscriber, Encinitas.

The sole amount necessary for redemption is the amount for which the property was sold, with one per cent per month interest to date of redemption, but in case such as this where a party agrees to pay additional amounts such agreement could be enforced by an action at law just as any other agreement could be. He would, however, get clear title to the property without paying the personal judgment, if he pays to the sheriff the amount necessary for redemption. The point as to the personal judgment would remain to be enforced against the redemptioner by the mortgagor. Such a transaction, unless made with the consent in writing of the judgment creditor, could not, of course, clear the judgment debtor from his obligation. The sole way that it would affect the judgment creditor would be by probably giving him additional right of action against the redemptioner. Execution may be taken out upon a judgment up to five years from the date of entry and after that time there is no statute of limitations on such judgment, but an affidavit to the effect that the judgment has not been paid must be filed and an order of court secured for the issuance of execution.

Changing Interest Rate

I purchased real property on contract in 1919. For one installment I requested and was granted permission to make a payment before it was due. I have now received a letter stating that the rate of interest will now be seven per cent instead of six per cent. Must I pay this extra money?—Subscriber, Chartiers.

Unless in some manner the terms of the original contract have been altered by an agreement in writing upon your part you are entitled to stand upon the terms as originally drawn. Questions of interest can not be made and enforced by one party without the consent of the other where there is a contract governing the matter.

Wishes to Re-Deed

Two single men purchased a ranch together as tenants in common. Each made a deed to the other of his undivided half, which deeds were placed in escrow to be delivered up at the death of either. One of the parties married and would like to give his share to his wife. What is the best way?—Subscriber, Lodi.

The simplest method would be to make a deed to the wife of all right, title and interest in and to the property and file that deed in escrow with the original deeds, giving the appropriate instructions.

Book Agent's Contract

A year ago a book agent persuaded me to sign a contract for a set of books. He said that if I did not like them I could return them. I paid nothing. I did return them but now I receive a letter that the book people intend to bring action to collect. Can they make me pay?—Subscriber, Downey.

These book contracts are usually very skillfully drawn and provide against any return of books as that is the last thing which the book agent desires to have done. They usually find a very rough course in bringing any action upon such contracts and in view of your return and the accept-

ance of the books it is very probable that any court would find there has been a rescission of contract which has been accepted and that judgment would be for you.

Homestead Sold

Several years ago my father purchased a place, built a house, and filed a homestead declaration. Later I sold the place. My mother tells me that she never signed any deed. Could the place be regained, and is there any limitation of time?—Subscriber, Honolulu.

A homestead of a married person can not be conveyed or encumbered unless the instrument by which it is conveyed or encumbered is executed and acknowledged by both husband and wife. It has been held that even if there are two instruments, each executed by the husband and wife, that this is insufficient. The same instrument must be executed by both. However, if the party purchasing the property, holding as he does the deed from your father, has been in the continued occupation and possession of the property for five years and paid all taxes levied and assessed thereon, he is deemed to have acquired title thereto by adverse possession and could set up such title in defense of any action brought.

Claim of Homestead

A homestead was declared upon property during the lifetime and residence thereof of husband and wife. Seven years after the wife's death suit was brought. In such suit the husband relied upon adverse possession and made no claim as to homestead. If he desired to set up the homestead claim would he be compelled to state another action and could he be kept off the place in the meantime?—Subscriber, Fresno.

It is evident that the party in the instance has had the advice of attorneys and set up in some court action the defense which he may have. It is one of the prime axioms of the law that when a person goes to court he must in such action set up all of the defenses which he may have to the action or be forever barred from asserting them. This rule, of course, does have numerous exceptions depending upon the facts of the individual case. It might be that in some other action some right might be set up to the homestead, but there having been a judgment evidently disposing of the subscriber, such judgment must stand until either reversed or some other judgment taken. Generally speaking, concerning the disposition of the homestead on the death of the spouse, the rule is as follows: "If the selection was made by a married person of community property of the separate property of the spouse making the selection or joining therein the land so selected, on the death of either of the spouses title vests in the survivor. In other cases on the death of the person whose property was selected as a homestead, it would go to the heirs or devisees subject to the right of the court to assign it for a limited period to the family of the decedent."

Not Responsible for Workmen's Tools

A contractor erected a small building wherein carpenters were permitted to place their tool chests at night. The tool house was locked at night by the contractor, but one night thieves broke in and stole all the tools. Can the carpenters hold the contractor for the loss of their personal tools?—Subscriber, Glendora.

This was evidently a deposit of the tools for which the contractor received no consideration. The law binds him, therefore, to use no more than slight care for the preservation of the thing deposited. As he erected the house and placed a lock thereon he certainly has used all the care that it would be required of him to use and therefore would in no wise be liable for theft by breaking in. Of course, if he had received some compensation for the storage of the tools over night, then the case might be different.

Not a Law

I have understood that it is a greater offense to hit a man who wears glasses than one who does not. Is this true?—Subscriber, Glendora.

The question stated is one which

very commonly brought up and seems to be one of the general superstitions in respect to the law. There never has been any such rule and undoubtedly never could be. It probably arose from the fact that the result of the injury in hitting a man in the face, breaking his glasses and forcing them into the eyes would be decidedly greater than if there was no glass about the eyes. If the injury made be greater the punishment might be more, but the law itself is entirely silent upon the subject.

Case for Juvenile Court

I am 16 years of age. My stepfather forces me to work, takes all wages earned and is otherwise very cruel to me. He also brings disreputable people to our home. I ran away and now they threaten to put me in a reform school. What can be done?—Subscriber, Ontario.

You undoubtedly should see the juvenile court officers in your county, and they would probably direct you to file a petition to the effect that you should be declared free from the custody and control of parents. The parents will then be cited into court and the matter be determined. This does not mean that you would be confined to the reform school by any means, but the court would take such measures that you would be given the rights which a child of your age should have.

Marriage in Mexico

May a person cross the border into Mexico, be married and come back again without living there any length of time?—Subscriber, Ontario.

Such marriages have been performed many times and unless it is shown that the trip was made purely to evade some laws of the country of residence, they are undoubtedly valid.

Queries Answered

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Edible Bamboo

Is the edible bamboo grown in California or will any kind do if properly grown and properly cooked? I have been experimenting with a common one grown here.—Subscriber, E. San Diego.

But one species, *Phyllostachys mitis*, is grown for food in Japan; other species are too bitter to be palatable. This species has been grown for food for centuries and is the largest of the sturdy species grown in Japan. It easily grows to 50 feet in height and some of the edible culms or sprouts are six inches or more in diameter. We do not know of any for sale in California nurseries.

Budding Walnuts

Please tell us about budding the black walnut.—Subscriber, Los Angeles.

Budding is not generally practiced enough in the hands of experts occasional successes are secured. It is usually done in the fall, September being preferred. The buds are expected to remain dormant over winter. If, however, one wishes to test out spring budding May and June are the best months. Grafting may be performed in February or early March. It is probably too late to get dormant buds for this work, however, for this season. These buds should have been cut several weeks ago and kept in cold storage or moist sand.

Water for Bees

I am wondering if you could give me some information on how to get rid of bees that are such a nuisance around iceless water cooler and olla which keep out under a tree during summer weather. They were such a nuisance last summer on hot days. The kiddies got several stings. If you know of anything that would be offensive to them I surely would be grateful for knowledge of it.—Subscriber, Hemet.

Keeping a supply of water for the bees is perhaps the best way to avoid this nuisance, a small fountain or,

perhaps easier, a dripping hydrant around which has been made a small basin of cement with sloping sides or even a pan kept filled in which is a shingle or thin board on which the bees may light and secure their water. After this provision is made the locality of the olla may be made offensive to the bees by dusting about a very small quantity of buhac or insect powder.

Sunburn

I enclose a piece of bark from an apple tree about eight years old. Trees on both sides full of blossoms but this one only has about a dozen. Can you tell me what the trouble is and the cure? This bark on the bottom up to 18 inches where it forks is broken, some smaller and others larger, warping on the side or ends, leaving the body of the tree bare. Otherwise it is a vigorous tree.—Subscriber, Bakersfield.

We can see no indications of disease, and it is possible that the injury comes from sunscald or the burning effect of the sun. Of course there is

no saving of the bark where it is already peeled off, but other trees should be protected by low heading or encouraging low growing foliage or else by use of artificial protectors. This protection is required especially in winter time when tree is dormant. Old newspapers wrapped about afford protection and even a coat of whitewash is beneficial.

Pacific Garden

Is there a publication called Pacific Garden and where may it be addressed?—Subscriber, Oakland.

The Pacific Garden ceased publication some years ago.

Plowing Orchards

Can you tell me whether it is injurious to peach trees or fruit to plow orchard when the buds are swelling or just beginning to open? Is it necessary to cut the surface roots off of grapes one year old? Will tying cotton around grape canes near the bottom keep cutworms from injuring buds? I have been told that the

worms cannot cross cotton.—Subscriber, Modesto.

It is injurious to any orchard trees to plow deeply at time of blossoming. If plowing is so shallow that no roots are injured probably no harm will result, but it is not recommended. It is not necessary to cut grape roots. A collar of cotton batting is a very effective deterrent to climbing cutworms. Unroll batting and cut into thin sheets four inches wide. Wrap these around trunks and allow to overlap an inch. Then tie at the bottom with common white twine and roll top of band down over bottom edge. It would be as well, in connection with banding, to put poisoned bait around bottom of trunks unless chickens or domestic animals run among vines.

Squirrels and Crops

How can I get rid of squirrels? I have tried almost everything. Where can I sell walnuts? Where can I sell rhubarb root, not the pieplant grown for stalks?—Subscriber, Elsinore.

Why the \$10.90 USCO is better than just a \$10.90 tire

ON November 10, 1921, the 30x3½ "Usco" was marked to sell for \$10.90.

This odd and closely figured price was the lowest quotation ever made on any tire of known standards.

A genuine pioneering step by the makers of U. S. Tires.

Now comes a lot of different \$10.90 tires being rushed into the market. "Special" tires. "New" treads.

Unfamiliar to look at—with perhaps an atmosphere of having been made to meet the price.

But the "Usco" still occupies a place by itself. A good old standby on millions of cars for years. Better than it ever was.

United States Tires are Good Tires

Copyright 1922 U. S. Tire Co.

Still putting the emphasis on honest quality, even if it does sell for only ten dollars and ninety cents.

The \$10.90 tire with the record of a proven product.

The tire that people still buy for the dignity of its quality regardless of the low amount they pay.

so successful in extermination of squirrels as carbon bisulphide, though poisons are used with success. The horticultural commissioners of many counties keep these materials on hand and supply residents of counties at cost. They will also, in case of sufficient help, send a man to show proper use of materials. Write A. E. Bottel, Court House, Riverside. For large quantities of walnuts would write California Walnut Growers' Association, Los Angeles. Small quantities could be sold to wholesalers. For rhubarb root, ask your local druggist for name of a wholesale firm dealing in such materials.

Asparagus

We have an asparagus bed six years old. Should it be kept clean cut until the end of the cutting season, say the middle of May or first of June, or should a portion of it be allowed to grow up before that time? And is it best to leave the thick winter mulch on after you begin cutting in the spring or rake it off—Subscriber, Santa Barbara.

So long as the cutting season lasts every stalk should be cut, whether large or small, edible or otherwise. After cutting season allow everything to grow until fall, or about August, then cut and burn tops as a protection against rust. It is possible, however, to injure a bed by cutting over too long a season. Allow the mulch to remain; too much seldom accumulates. Asparagus does best in a cool, moist, very rich soil.

TRACTOR REORGANIZATION

The California Tractor and Implement Association held a reorganization meeting at Hotel Bellevue, San Francisco last week. A lengthy financial and operative report was presented by W. V. Freeman, president of the association, and a new constitution was outlined.

Bigger and broader lines of activity for a new organization were discussed and tentative plans made to embrace a larger field of endeavor. It will be the plan of the new organization to embrace farm machinery interests of every class with the aim of rendering the greatest possible cooperation to all users of machinery on the farm. It is hoped to secure a membership of at least 100.

There were in attendance at this meeting representatives of 20 tractor and implement companies, together with representatives of allied interests. After discussion relative to the desirability of discontinuing the old organization and forming a new one along broader lines this decision was finally reached and the old California Tractor and Implement Association was declared no longer to exist. Steps were immediately taken to form a new organization of general farm machinery equipment interests, and a questionnaire is being prepared which will be submitted to the members of the old California Tractor and Implement Association asking their opinion relative to the name and general activities of the proposed new association.

The next meeting of the proposed new association will be held on Monday, May 1, at the Bellevue Hotel, San Francisco.

WALNUT FROST INJURY

In cooperation with Dr. L. D. Batchelor of the citrus experiment station, a frost injury survey of the walnut districts of Los Angeles County has been completed by Farm Adviser Hodgson and has brought out the fact that many of the younger plantings were greatly injured by the November frost. At the time the preliminary report on the survey was made it was stated that no distinct varietal differences had been noted, but since that time it has become apparent that in certain districts the Eureka has suffered considerably more than others, the Placencia and Ehrhardt having escaped practically any injury in many orchards where the Eureka was badly frosted. Arrangements are now being made for a series of field meetings later in the season to demonstrate proper methods of rebuilding damaged trees.

SAN FERNANDO GRAPES

A varietal test plat of grapes has been planted on the place of Norma C. Johnson, San Fernando, and will doubtless prove of great value in indicating varieties which will prove successful under San Fernando Valley conditions. A half acre was selected on which eleven promising varieties recommended by Prof. Bioletti were planted as follows: Kurtelask, Golden Queen, Dattier, Chaouc, Henah, Damas Rose, Hunisa, Moliner, Red Emperor, Cornichon, and Black Monukka.

The Fontana Citrus Association reports a banner price of \$8.15 a box paid for oranges packed 200 in a box. \$6.70 is the lowest price received for the last month. Superintendent Boy reports that the apricots of which there are some 700 acres are setting a bumper crop showing no ill effect from the cold weather; 400 acres of Spanish peanuts are now being planted, 2 acres of potatoes and 50 acres of sweet potatoes are making a good growth and some 300 acres of alfalfa are now being planted.

THE LITTLE TOWN

Great cities are most wonderful;
I love their domes of smoke
And miles and miles of avenues
Crowded full of folk.
And no man looks at mountains
More lovingly than I
When sunset points them sharp and clear
Upon the western sky.

I love the lilac fringe of foam
Along the summer sea,
And every tossing mile of blue
Is beautiful to me;
I love the quiet havens
Where the white looming sails
Slip softly in at twilight
With easks and costly bales.

But best I love the little towns
With leisure to be wise,
Brooding over many things,
With quiet in their eyes.
The little towns are my best friends,
Most innocent and dear—
Oh, these I have loved best of all
For many a happy year.

Even Time is good to them,
Affable and kind,
Weathering and shaping them
Slowly to his mind,
Ripening their beauty
While the seasons run,
Touching them most tenderly
With rain and wind and sun.

Rome, Paris, London,—
Boston, if you will,—
Have a million lovers
Who will love and praise them still.
I shall praise the little towns
While I am given breath—
Concord Town and Stratford
And little Nazareth.—Odell Shephard in
Youth's Companion.

BUTTON! BUTTON! WHO'S GOT THE SAFETY PIN?

By Clara Peterson

CYRUS CIRCLE, the jolly ruler of Pin-Pin City, hadn't smiled for a day and a half. His face was long and sad as he sat in his brown velvet chair before the window and watched the crows hopping around under the cherry trees.

"Only the day before yesterday I was as happy as a baby with a balloon, and now look at me," sighed Cyrus Circle. "To think that a Safety Pin Merchant should find it possible to ruin Pin-Pin City!"

The crows flew away with a great deal of cawing and the ruler turned his tired head so that he found himself gazing straight at his own reflection in the long and shining mirror between the windows.

A dimple arrived in his cheek. His mouth turned up at the corners. Cyrus Circle smiled. Very lovingly he rubbed his fingers over the necklace of buttons which hung over his crimson robe—blue buttons and white ones, pink and black, even green and orange buttons, all strung carefully like some priceless beads.

"Brother Silas was very kind to send a shipload of buttons across the ocean to me," said Cyrus Circle to himself. "I'll never forget how happy all the city babies were, though some of the big boys did look a bit odd."

He smiled again, thinking of that happy day before yesterday. Brother Silas had written that he was sending a shipload of buttons which would prove to be extremely useful to Pin-Pin City. Cyrus Circle had turned red with excitement when the letter came, for he had not an idea in the world as to what buttons were. Perhaps they were a new kind of cookie—or maybe watermelons with a different name; they might even be doll pianos, which would be fine indeed for all the little girls.

The ship arrived almost as soon as the letter, and what do you think! Cyrus Circle found that buttons were nothing but round flat things with two holes in them—beads, of course.

Cyrus had taken all the golden candlesticks from his candlestick safe, which was the largest in the palace, and had filled it to the brim with buttons. All that morning he had sat before the safe and beamed at the boxes of buttons, stopping every servant who passed so that everyone in the building had seen and admired the boxes of red shiny buttons and the racks of green dull ones and all the others, too.

That is, had seen all kinds Cyrus Circle had kept for himself. For no sooner had the ship come in than he had begun to plan a way to share this wonderful treasure his brother had sent—brother Silas, you know, was

very rich and always sent valuable things. And not two minutes after Cyrus had seen the great piles of buttons in the ship he had thought how very, very wonderful it would be to give every child in the city a long, long necklace of these precious beads. So, as I have said, Cyrus sat before his safe all the morning of the day the ship arrived, but all that afternoon he rode around in his coach and gave to every child in the city one long and shining string of buttons. A hundred ladies worked till six o'clock stringing them.

Cyrus Circle went home tired and happy that so many, many children should have such lovely jewelry. His face was completely filled by one large smile as his black and white horses turned in at the palace gates. But the next minute Cyrus Circle had stopped smiling (and his face had crinkled only once since), for there at the upper part of the driveway had stood the purple coach of Samuel Slasher—and Samuel Slasher himself, dread Safety Pin Merchant of Pin-Pin City, was just hobbling through the crystal doors of the palace, frowning and muttering as usual.

The Safety Pin Merchant was spoiling inch by inch the beautiful city of Pin-Pin. Just the moment some spot in the city began to look lovelier than any other, just the moment an orchard grew old enough to bear red cheeked apples, just the moment a happy group of neighbors painted houses and planted rose trees and trained vines over sparkling peeping windows, just then would Samuel Slasher hop in and build one of his hideous stores or a dark and gloomy factory right in the middle of everything. What could the people do? What could Cyrus Circle do? The city had to have safety pins and there wasn't another person anywhere around who knew how to make them. The people used white safety pins to fasten little girls' dresses and little boys' waists, and black safety pins to fasten big people's clothes, and oh, how very many they did use! It was no wonder that Samuel Slasher was richer than anybody. He could have built his factories and stores of marble and silver, but he didn't. He was so stingy and cruel that when he did put up a building (in the most charming spot to be found, of course) he built it of rough black stone and the windows in it were so small that they could hardly be seen.

Cyrus Circle groaned as he sat in the brown velvet chair. Another safety pin factory right in the middle of Arbutus Park! That was what Samuel Slasher had come to see him about. Cyrus could remember his very words. The Safety Pin Merchant always bit off his words and nodded his head fiercely as he talked. "Yes, I've decided on Arbutus Park. I'll leave some of the trees standing so I won't have to put up awnings, and there will be plenty of room to pile my brass wire boxes all over the grass. I'll pay the city just what the park is worth and not a cent more. How's that? What if there isn't any other place for a park! What good is a park—full of nursemaids and children and flowers—not even a potato planted! I tell you the matter's settled, Cyrus Circle."

The trouble was that Samuel covered his safety pins with a kind of paint which wore off very quickly and left them too ugly and tarnished for any use, so every month his carts went around collecting all the pins to be repainted. After that he sold them over again. And this was just the first of the month when nearly every safety pin in the city had been turned in to one of the factories. When kind Cyrus Circle had dared to say that he just couldn't give up the children's park, Samuel had stamped his foot and said very angrily that if they didn't sell him the park within a week he would pack all the safety pins into wagons and leave the city forever and ever.

"What shall we do?" sighed Cyrus Circle. "I'm so worried I can't even enjoy these beautiful button beads. Oh, how do you do, Miss Betsy Elizabeth Circle! How are you today?"

The ruler almost smiled as he said the last words, for his little girl had come hopping into the room. She had on a light green gingham dress and dark green socks and slippers and her

Mr. Jenkins Took a Cracked Club To Tame Lions

The exhibition ended rather badly. It very nearly was a big day for the lions and a sad day for Mr. Jenkins—all for want of proper care in getting ready.

Many a man who has business to do and a living to make and a job to fill is as careless how he feeds his body as Mr. Jenkins was in picking out a club. And an improperly nourished body often fails under a hard test.

Some foods are too heavy, some are too starchy, many lack necessary elements and so starve the body—and many load the system down with fermentation and auto-intoxication.

Grape-Nuts helps build health and strength. It contains the full richness of wheat and malted barley, including the vital mineral elements, without which the body cannot be fully sustained. Grape-Nuts digests quickly and wholesomely. Served with cream or good milk, it is a complete food—crisp and delicious.

Grape-Nuts is just the food for those who care to meet life's situations well prepared in health. Order Grape-Nuts from your grocer today. Try it with cream or milk for breakfast or lunch, or made into a delightful pudding for dinner.

Grape-Nuts—the Body Builder

brown braids were crossed and looped up with middling green ribbons. Even her eyes were green and sparkling and she was pulling quite a large green wagon across the marble floor—clackety bang it went! She began to talk so fast that her lips could hardly keep up with her tongue.

"I'm quite well today, Father Cyrus I've been down to the brook and caught a polliwog and I've made two apple men with cloves and toothpicks, and—and—"

"My child, my child!" cried Cyrus Circle. "Where are your beautiful button beads?"

"I was just going to tell you about that, Father Cyrus. I've had just a terrible time. When the polliwog tried to get away I leaned so far over that the string broke and some of them fell into the water, but I put the rest into my pocket and strung them again. But then, I went down to the pasture to give a cookie to William Billy-Goat, and what do you think! He just grabbed the chain and ate half of the rest of the beads before I could stop him. He had taken only one bite of the cookie so I ate the rest of it myself right before his eyes to punish him."

"Dear, dear me!" said Cyrus Circle. "Now, father, don't be sad. I have the rest of them in a perfectly safe place and it's just the cunningest cunning thing you ever saw. I came to show you."

She drew the wagon up before the brown velvet chair and took off the faded quilt which was spread carefully over it.

Five dolls lay in a beautiful row. Betsy Elizabeth bent over and kissed each one and giggled to herself.

"See, father, all of my doll safety pins were back at the factory so I just used these buttons instead. I sewed the red ones on Polly because she has the reddest cheeks. Molly has the blue buttons because her eyes are blue and Dolly the brown ones because her eyes are brown. The orange buttons just matched my Holly's orange slippers and last I sewed all the shiny green ones on my darling Lolly-pop's dress because I love her best and I want her to match me. Isn't it the cunningest cunning thing!"

The ruler bent over Polly and Molly and Dolly and Holly and Lolly-pop. They were all asleep, of course, because they were lying down, but their china mouths were smiling beautifully. They all wore embroidery kimonas just alike.

And down the front of each kimona was a row of buttons with the holes in the embroidery neatly buttoned over them!

Five doll kimonas fastened without a single safety pin!

Cyrus Circle just stared and stared. He knew now why his brother had said that buttons would be extremely useful to Pin-Pin City.

"Hurrah! Hurrah!" cried Cyrus Circle holding out his string of buttons and dancing happily before the mirror. "Samuel Slasher may load up his wagons and leave the city forever. We'll tear down his ugly stores and factories and build them where they belong and let the people have their parks and their flowers and their orchards! Hurrah!"

And that is just exactly what did happen.

TO SMOKE SMALL AMOUNT OF MEAT

Walter Myers, Phoenix, Oregon, sends to the Oregon Farmer the following recommendation for a device to smoke meat where one has only a small amount to smoke:

Take a box four or five feet long, two or three feet wide and about four feet deep. Drive large nails around inside the box about two inches from the top to hang the meat on. Make a hole in the bottom of the box for a two inch pipe. Dig a hole in the ground about two feet square and 18 inches deep. Cover with two pieces of tin or sheet iron, first making a hole in one piece for the two inch pipe. Set the box on space over this hole so that it will stand about two feet above the ground. Connect the pipe between the piece of sheet iron and the box. Build a fire in the hole and when it is well started cover it with dirt so that the smoke will not get out, but will go through the pipe into the box. Have a hole in the top of the box for the smoke to go out.

Mr. Myers says this will not heat

the meat, as is sometimes done in a smokehouse where the fire is put inside under the meat.

HINTS FROM HOUSEKEEPERS

Lemon Meringue Pie

1 1/4 cups sugar, 1/2 cup flour, little salt, juice one lemon or two, grated rind of one, 3 yolks eggs, 1 cup boiling water, 1 teaspoon butter. Mix sugar and flour, add boiling water, butter, beaten egg yolks, rind and juice. Cook till thick, put in pie crust, bake for few minutes. Beat white of eggs, put on top, put under fire till light brown. Add sugar to beaten white of egg as you beat.

Crust: 1 cup flour, 1/2 teaspoon salt, 1 teaspoon baking powder, 1/3 cup fat, ice water.

HOUSEHOLD QUERIES

Mome Made Mustard

Please give me recipe for home made mustard, the kind sold in groceries.—Subscriber, Eureka.

Equal quantities powdered mustard, wheat or rye flour, brown sugar. Add sufficient hot vinegar to make smooth paste, salt to taste. Use more or less flour according to pungency desired. Omit sugar if not liked. Paste may be cooked in double boiler if to be kept for some time but remember pungency is destroyed by too much heat. Sometimes spices are added, cinnamon, mace, white pepper, cloves, etc.

Meringue Falls

Why does meringue fall after taken from oven?—Subscriber, Eureka.

Use only one tablespoon sugar (level) to one egg white. Beat white, add sugar, beat again to be sure sugar is thoroughly dissolved through egg. If more sugar is added and not thoroughly dissolved it would have a tendency to fall. Also you probably use too hot an oven so that top is browned and meringue removed before thoroughly set all through. Use slower oven.

Whole Wheat Bread

Will you please give me a recipe for whole wheat bread? I have trouble with mine crumbling. I enjoy the Cultivator very much.—Subscriber, Bellflower.

Two cups water, 3 tablespoons corn syrup, 2 tablespoons sugar, 2 teaspoons salt. Mix thoroughly then crumble in one yeast cake and stir until dissolved, then add 7 1/2 cups whole wheat flour. Work to smooth elastic dough and proceed as for white bread. The syrup helps to keep bread moist. Also if bread is kept in ice box it will retain moisture and be softer. I use a small ice box for a bread box, taking care to leave open to air a little while every morning. Bread and cake keep moist and soft, but, of course, one must watch to keep from molding.

GROWING PAINS

When we look out on this world full of unrest, of problems to be solved, of difficulties to be met, of perils and needs everywhere, it is well to remember that many of these troubles are only what our grandmothers used to call "growing pains." If old things would always satisfy, if the old garments of law, conditions, and knowledge would fit the new generations, and no inquiring mind would discover fallacies in past teachings, this would be a much quieter world. But it would also be a world falling into decay.

Humanity cannot stand still. Either it must step forward or stagnate, and it cannot move forward without struggle and conflict. All nations are hungering and thirsting after something higher and better than they have—after righteousness, though they do not know it by that name—and, each in his place, we must bear our share of the burden it brings to belong to a growing world.—Forward.

"MY LOVE TO ALL"

The teacher had been trying to explain to the class how generosity need not be confined to money or concrete objects.

"Suppose," she suggested as an example "that I were to love all mankind with whom I came in contact; then with my love I would be—what?"

A hand shot up.

"Well, Susan?"

"You'd be omniverous!"

The Cultivator Patterns

3964. Misses' Dress.—Cut in 3 sizes: 16, 18 and 20 years. An 18 year size requires 5 yards of 40 inch material. The width of this skirt at the foot is 2 yds. Price 10c.

3958. Girls' Dress.—Cut in 4 sizes: 4, 6, 8 and 10 years. A 6 year size requires 3 yards of 36 inch material. Price 10c.

3970. Ladies' House Dress.—Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size requires 4 1/2 yards of 40 inch material. The width at the foot is about 2 yards. Price 10c.

3954. Child's Romper.—Cut in 5 sizes: 1, 2, 3, 4 and 5 years. A 2 year size requires 2 1/2 yards of 27 inch material. Price 10c.

3972-3822. Ladies' "Knicker" Suit.—Skirt 3972 cut in 6 sizes: 25, 27, 29, 31, 33 and 35 inches waist measure. Blouse and knickers 3822 cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It will require 2 1/2 yards of 36 inch material for the blouse and 2 1/2 yards for the "knickers"; for the skirt 3 1/2 yards of 44 inch material will be required to make this "outfit" for a medium size. The width of the skirt is about 2 1/2 yards. TWO separate patterns, 10c FOR EACH pattern.

3966. Girls' Dress.—Cut in 4 sizes: 6, 8, 10 and 12 years. A 10 year size requires 2 yards for the gulle and 2 1/2 yards for the dress of material 27 inches wide. Price 10c.

3974. Morning Negligee.—Cut in 4 sizes: Small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches bust measure. A medium size requires 3 1/2 yards of 40 inch material. The width at the foot is 2 1/2 yards. Price 10c.

3952. Child's Dress.—Cut in 4 sizes: 1, 2, 4 and 5 years. A 2 year size requires 2 1/2 yards of 27 inch material. Price 10c.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Do not expect patterns under **Two Weeks** from date of order.

CATALOGUE NOTICE

Send 12c in silver or stamps for our Up To Date Spring and Summer 1922 Catalogue, containing over 500 designs of Ladies', Misses' and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker. Also colored plates.

PATTERN DEPARTMENT

California Cultivator Los Angeles

OUR BABY COLUMN

By Mrs. M. S. Sirdevan

In my last article I gave the diet for a child of nine months to one year, and although this varies little to 18 months yet there are a few changes. At 16 months a child should be drinking 1½ pints of milk daily. His eggs may be coddled, soft boiled or poached and a whole egg given, but not more than three times a week. Occasionally it may be given in custards. A broiled lamb chop or steak that is scraped or finely minced may be added, starting with one teaspoon and slowly increasing to one dessert spoon. Crisp bacon (one or two small slices twice a week). Cottage cheese is a wonderful substitute for meat, and if the child refuses it try to mix it with apple sauce or prune juice.

The vegetables need not be put through a strainer at this age, but should be mashed well. Never use canned vegetables if it is possible to get fresh.

The beef juice, broth and creamed soups are continued.

Pea or Bean Puree

Soak beans over night. Drain off water and put to cook in enough water to cover. Add one medium size carrot and half an onion. Cook slowly until tender. Mash through a sieve, using the water they were cooked in. To one tablespoon bean pulp add enough milk or cream to make five ounces. Add a small amount of water and cook several minutes. Add salt.

At 18 or 19 months it is advisable to put the child on a three meal schedule. Give a lunch of milk and crackers at 10 o'clock if necessary. Keep the diet varied and do not allow the child to make an entire meal of any one or two articles. If you give an egg in the morning do not give any meat at noon but substitute beef juice, pea puree or cottage cheese. Insist on slow eating and thorough chewing.

Never force food.

Normal Weight

Please tell me how much a child should weigh who is five years, three months, 20 days old and three feet, nine inches tall. Is there a place where I could have her examined for protruding shoulder blades?—H. P. S., Fillmore.

The child should weigh between 40 and 46 pounds. In most large cities there is a mothers' educational center where one can take a child and have it examined free. This is located in the Chamber of Commerce Building, Los Angeles. Inquire at Ventura; there may be a clinic there.

THE SEASON IN NATIONAL PARKS

Those who are planning auto trips for the vacation season will be interested in the schedule of opening and closing dates for the national parks, just announced by Secretary Fall.

Crater Lake National Park, Oregon, July 1 to September 20; General Grant National Park, California, May 24 to October 10; Glacier National Park, Montana, June 15 to September 15; Grand Canyon National Park, Arizona, open all year; Hawaiian National Park, Hawaiian Islands, open all year; Hot Springs National Park, Arkansas, open all year; La Fayette National Park, Maine, June 1 to November 1; Lassen Volcanic National Park, California, June 15 to September 1; Mesa Verde National Park, Colorado, May 15 to November 1; Mount McKinley National Park, Alaska, no official season (summer only); Mount Rainier National Park, Washington, June 15 to September 15; Rocky Mountain National Park, Colorado, June 15 to October 1; Sequoia National Park, California, May 24 to October 10; Wind Cave National Park, South Dakota, June 1 to September 30; Yellowstone National Park, Wyoming, June 20 to September 15; Yosemite National Park, California, open all year; Zion National Park, Utah, May 15 to October 15.

FIFTY-FIFTY

A sausage maker had won great fame for his wonderful rabbit sausage. However, a pure food slough-foot became suspicious.

"Are you sure there's no horse meat in this rabbit sausage?" he inquired. "Well—yes," the manufacturer finally admitted, "about 50 per cent. One horse to one rabbit."

TRIED AND TRUE RECIPES

By A. M. H.

A good way to fix cheap cuts of beef is to grind in food chopper, add salt and pepper to suit taste, and add some dampened bread crusts, thoroughly mix and make out in cakes to fry.

To make a fine breakfast food use home ground graham flour and make mush the same as corn meal. Have water boiling and salted before stirring in graham flour, and cook well on back of stove while preparing breakfast. Serve with sugar and cream. This is fine for infants over four months old, for children and grown people and especially good for delicate people.

To make good brown sugar syrup use three cups sugar and one cup water. Put sugar in skillet, let half of it melt and brown a little, then add the water. If there are any lumps, mash them with the spoon while boiling; let boil about five minutes and it is done.

If troubled with eczema use a plentiful supply of olive oil to which has been added dry sulphur. If used regularly it will cure some of the worst cases. For delicate children mothers will find a free use of the nutritious olive oil invaluable, as they will a saturated solution of boric acid.

One can easily prepare this by dissolving a heaping teaspoon of granulated boric acid in one pint of either distilled or boiled water. This will be found most useful as a wash for eyes, ears, mouth, little abrasions, small cuts and for chafing and all skin eruptions. For earache it is warmed and dropped in the ear as hot as can be borne, and toothache often yields to a bit of cotton saturated with the solution and placed around the tooth. The best way to treat feet that perspire freely is to wipe them off with the solution and use dry boric powder in the shoes.

To relieve rheumatism melt several tablespoons of lard and stir in 20 drops of laudanum and rub well on parts affected. Melted lard thickened with flour till as thick as salve, put on a wound or swelling or warm as can be borne is excellent. For a chronic sore take a hard stump or heart of a cabbage and let it simmer on the back of the stove with a tablespoon of pure lard and use this for an ointment.

HUSTLE AND GRIN

Smile and the world smiles with you;
"Knock" and you do it alone;
For the cheerful grin
Will let you in
Where the kicker is never known.

Growl and the world looks dreary;
Laugh and the path is bright;
For a welcome smile
Brings sunshine, while
A frown shuts out the light.

Sigh, and you "rake-in" nothing,
Work, and the prize is won;
For the nifty man
With backbone can
By nothing be outdone.

Hustle, and fortune awaits you,
Shirk, and defeat is sure;
For there's no chance
Of deliverance
For the chap who can't endure.

Sing, and the world's harmonious;
Grumble, and things go wrong;
And all the time
You are out of rhyme
With the busy, hustling throng.

Kick, and there's trouble brewing,
Whistle and life is gay
And the world's in tune
Like a day in June,
And the clouds all melt away.
Author Unknown.

DRIVING OR DRIVEN?

Bill—I saw you out driving in your car yesterday.
Will—No, my wife was out driving.
Bill—But she was on the back seat.
Will—Just the same, I insist my wife was out driving.

POOR FINDERS

"Johnny: "Say, paw, I can't get these 'rithmetic examples. Teacher said somethin' 'bout findin' the great common divisor."

Paw (in disgust): "Great Scott Haven't they found that thing yet? Why, they were huntin' for it when I was a boy."

A chuckle a day will keep a man gay.

A lazy man is no worse than a dead one, but he takes up more room.

JELL-O
America's Most Famous Dessert

THE AUTO-OILED AERMOTOR
A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

An Important Milking Shorthorn Event

One of the most interesting features of the livestock industry of this state is found in the development of the herds of Milking Shorthorns that has been under way for several years past.

It is a matter of record that the first improved cattle brought to this state were Shorthorns of Bates breeding—the bloodlines that furnish the foundation of the best milking families. Those early importations, many direct from England, were made by the pioneer breeder, Robt. Ashburner. Later, Glide, Gibson, Rush, Howard and others brought in high class cattle

During the early history of the herd few females were ever offered for sale and it has taken almost eight years to reach a point where the owners felt justified in making a draft for a public sale.

The coming event will therefore prove of interest to others than established breeders. Indeed Messrs Rowe say that they could have sold all that they care to spare at private treaty, but it is their plan to hold an annual sale and the present seemed an opportune time to make the start.

Bellevue Daisy
Weight 1,700 pounds, age 12 years. Undefeated during 1921-1922 show circuits. Won eight grand championships. Her daughter, Innisfail Daisy, produced 10,026.3 pounds milk and 402.64 pounds fat as a senior two year old. Her son, Innisfail Perfecter, weighed 1,150 pounds at 14 months. He won three junior championships, five firsts and one third at 1921 shows. Cows of this type are real "double deckers."

of the same bloodlines. These early Shorthorns, mostly red in color, while primarily beef cattle were usually heavy milkers. Many found their way to the ranges and many others were used in grading up small herds that until the introduction of the Holstein and Jersey furnished the bulk of milk and butter produced locally. It can therefore be said that the first improvement of our native cattle stocks was largely through the use of Bates bred Shorthorns, and today the general structure of our cattle industry rests on such a foundation.

When came the almost universal switch to Shorthorns of Scotch extraction those old Bates families were quite neglected by California breeders as well as breeders throughout the country. But as time went on a growing number of breeders had borne in upon them the fact that there was a lot of real merit in old style red and roan Shorthorns that swung big udders and had their ample frames upholstered with a thick covering of flesh. Here and there a few breeders began conserving the old families and developing them along modern lines. This rather scattered work continued until a comparatively short time ago when a definite and well organized effort to develop milking Shorthorns got under way. Of recent years the progress made toward the dual goal of milk and beef has been quite outstanding.

As this new-old strain developed in the East there developed in California a demand for cattle of similar type and in the past eight years some very high class herds have been assembled.

Doubtless the most distinguished herd is the Innisfail herd which was established in 1914 by Alexander and Kellogg. The foundation for this herd was drawn from the leading American herds, and on several occasions imported animals were added at long prices. Almost from its inception this herd has been a dominating factor in the show rings of the West, and more recently, since the herd came under the management of J. D. Rowe and Sons, the regularity with which creditable production records have been announced has served to give the herd a high place among the better American herds.

CALIFORNIA BREEDING FARMS BERYLWOOD STOCK FARM

By Jack Klein

TRANSFORMING a 450 acre beet and bean ranch into an up-to-date stock farm, fully equipped in every detail and stocked with the best animals to be had, is a big job, but to do the trick in a little more than two years has kept J. W. Snodgrass, the manager of the Berylwood Stock Farm at Hueneme in Ventura County, on the job night and day.

Foresight into the probable precarious future of the beet and bean industry in the Hueneme valley prompted Mrs. Bard, widow of the late U. S. Senator Thos. R. Bard, to back Mr. Snodgrass to the fullest extent, and in consequence the Berylwood Stock Farm is one to which all Californians can point with pride for although only in its infancy it has taken its place among the leading breeding farms of the state.

Speaking in terms of pure bred livestock Ventura County, although one of the oldest settled sections of the coast, is still practically virgin territory. The hills have long been full of grade beef

stock but the valleys where the pure bred thrives have yielded so plentifully of beets and beans under the methods of extensive cultivation that vogue on immense ranches that livestock has not been welcome. It is a well known fact however that land cannot go on forever without crop rotation and fertilization and the people of Ventura County are awakening to the fact that there is nothing like livestock to provide a steady and persistent income and at the same time build up the land. At the present price of sugar there can be no very great margin of profit for the grower of beets, and hundreds of acres that were formerly used for that commodity are in grain or alfalfa this year. The bean

business has not been very profitable for the past two or three years and the bean men also are drifting into other lines in many instances.

The first venture into pure bred livestock at the Berylwood place was with a herd of Duroc hogs. This herd was of the Orion Cherry King strain and has produced some very nice individuals. It has acted as a market where the neighbors could get what they wanted in the way of breeding stock at a reasonable figure. At present there are about 150 hogs on the place and Mr. Snodgrass has the satisfaction of being able to say that the herd has never shown a loss since its beginning. A very careful system of bookkeeping allows a check on every department at any time and there is no guesswork as to the amount invested, the daily, weekly or monthly running expense nor of the income. It is Mr. Snodgrass' opinion that most of the failures and disappointments in the livestock business are due to the slipshod methods many breeders have of keeping their accounts. A careful check on operations and a study of costs and returns is the most profitable way an owner can spend his time. By this method and this

If You Have a Barn You Need a Star Litter Carrier

No matter what size or shape barn, no matter how complicated the layout, there's a Star Litter Carrier adapted to your needs.

These carriers are simple, serviceable, and durable—built to stand hard knocks and the wear and tear of heavy service. Yet they save their cost in a few months.

The Star Litter Carrier is a good investment and is needed on every farm. We know you'll say so when you get one because in all our experience we never heard of a farmer who would take a Star Litter Carrier out of his barn for the price he paid for it. Send for our catalog. It's the finest thing of its kind ever published.

DR. HESS DIP and DISINFECTANT

Use the sprinkling can about your premises—the dipping tank where the occasion demands. For your hogs, a wallow is the most convenient, and quite effective. To every 70 to 100 gallons of water add one gallon of Dr. Hess Dip and Disinfectant. Then your premises—the cow barn, the stables, the pig pen, the poultry house, the sink, drains, closets, cesspools—everything, everywhere, will be pure and healthful.

You can dip, or you can spray or sprinkle, or apply with a sponge or brush. Dr. Hess Dip and Disinfectant to the animal body. There's scarcely an animal parasite, skin disease, or infection that Dr. Hess D. and D. will not remedy. *Guaranteed.*

DR. HESS & CLARK Ashland, Ohio

hen chicken plant has been put into successful operation. The best quality of White Leghorn stock was obtained, and under the most scientific methods of feeding combined with an abundance of skimmilk this department made a return of a few cents over \$2 a hen last year. Mr. Snodgrass attributes this large profit to the skimmilk, and his experience bears out the contention that there is no better combination than the White Leghorn hen and the Holstein cow. Wherever these two have worked together there has always been a fine profit, and chicken men should wake up to this fact and have a few cows along with their flocks. The sweet cream will pay for the feed and care of the cows and the skimmilk is ideal feed for the hens.

From the beginning the ultimate aim of the Berylwood Stock Farm has been to have a fine herd of Holsteins. Previous experience had taught Mr. Snodgrass to avoid the common mistake of getting together a herd without a place to put them, so his first duty was the building of the barns. Being an engineer and architect as well as lover of livestock, he has accomplished a set of barns and other buildings equal to any in the West. Everything is well built and arranged so that the necessary work can be done with the least amount of effort. Above all everything is kept scrupulously clean. The buildings adjoin the beautiful Bard estate and everything is in keeping with it.

The first notable purchase of cattle by the Berylwood Stock Farm was of three head from W. J. Higdon of Tulare. One of these animals, Fay Tritomia Hengerveld Walker, has achieved considerable fame by making the 305 day state record for 3½ year olds. She dropped twin calves to start with and then made 794.5 pounds butter in 305 days and dropped a third calf, all within 11 months. She is a remarkably fine heifer out of the great 30 pound cow Fay Tritomia Hengerveld and was sired by Prince Riverside Walker. Her last year's bull calf was junior champion at Riverside last fall and was sold for \$1000 when seven months old.

Later purchases of cattle have brought the herd up to nearly 100 head and practically all are top notchers. Systematic testing was begun only recently with the completion of an excellent though inexpensive test barn and the acquisition of Dick Ulken as herdsman. Mr. Ulken is well known throughout California for the fine work he has done in various herds, and under his direction the Berylwood cows will be given every chance to prove their worth. As a producer of records Mr. Snodgrass is no slouch himself. With only a limited knowledge of feeding, but with a large fund of common sense to draw upon, in one of his first attempts at testing he made a 30 pound record with the three year old, Queen Sadie Vale Veeman Karlay. He also made a 29 pound record with Hartwood Netherland Segis which he bought in the Clapp sale last October.

One of the interesting animals on the place is the senior yearling heifer, Queen Pietertje Hengerveld Fobes, who made 20.85 pounds butter in seven days six months after calving. She also made 84 pounds from 2300 pounds milk in 30 days. If nothing happens to her she is a candidate to

FIRST PUBLIC SALE INNISFAIL HERD Davis, Cal., Friday, May 5

10 Bulls—Every one a good one and every one from a dam with a proven record of milk and butter production. Heading the list is the crack three year old, Innisfail Favorite, sired by Westward Ho and out of an imported dam with over 10,000 pounds of milk.

13 Cows—This group of cows is undoubtedly the most satisfactory lot ever offered in a western sale. Most of them have records from 5000 pounds to above 8300 pounds of milk. From the standpoint of type and breeding there is little to be desired. These cows are real double deckers by inheritance.

4 Bred Heifers—Two by Westward Ho, a grand champion, and two by Imp. Kelmscott Viscount 19th., a sire of distinction. No better will be offered this year.

15 Open Heifers—The sweetest lot of calves to sell in any sale. All have been bred in this herd and represent the results of a constructive plan of breeding. The best producing lines of the breed will be found in these heifers.

A WORD PERSONAL

Innisfail stands for constructive breeding and integrity. No money has been spared in purchasing foundation material and no effort has been overlooked to develop the herd. The showing records and the production records of the herd are matters of pride. You will find the cattle in proper condition. Every animal offered will be sold and sold on a guarantee. Come, visit the herd and get acquainted.

BURR FARM HERD

LOS ANGELES, CALIF.

June 1-2, 1922

140—Registered Holsteins—140

By the terms of the partnership contract existing between E. Burr, G. M. Brown, and Kenneth W. Abbott, operating as Burr Farm, nad which expires on June 1, 1922, a dispersal sale is necessary in order to adjust the partnership interests.

This sale will include every animal in the great Burr Farm herd that is in salable condition, with the sole exception of a small group of heifers now on pasture under contract.

King Korndyke Pontiac 20th Will Be Sold

The great \$12,000.00 son of Miss Valley Mead De Kol Walker will find a new owner in this sale, also a beautiful group of his young daughters.

The herd contains a very large number of high record females of splendid breeding and good type, bred to top notch bulls.

This herd has been tuberculin tested regularly every six months by a Deputy State Veterinarian, and every animal sold is guaranteed to be a breeder and sold subject to retest by the buyer.

Watch for detailed announcements in later issues, but write for catalog now.

IT TAKES REAL CLASS to Break State Records in California

Forty-five per cent of the present State Records for Milk and Butter Production are held by cows that broke World's Records in at least one class.

Every calf we offer for breeding purposes is by the son of a former State Record Cow—brothers and grandsons of our own 4-year-old State Record Holder, Whittier Pontiac Netherland 4th, that made 1139 pounds of butter in 365 days, standing in the stanchions with only dairy care. The widest choice of 1000 to 1200 pound breeding at farmer's prices.

Los Angeles County Farm

HONDO, CALIFORNIA Three Miles South of Downey on Downey-Long Beach Boulevard

Care of the Family Cow

FEEDING and breeding almost exclusively influence the milk production of today, but there are many small management items which have considerable bearing on the milk flow of the cow. In the following article will be found the solution of many problems which face the owner of a family cow.

The Dry Cow

In practically every large dairy herd it is the common practice to have all cows dry for a short period before calving. A cow that is not given a rest before calving will start at a lower level of milk production than if given opportunity to recuperate, with a consequent lower level throughout the lactation period. Under ordinary conditions six weeks is sufficient, but if thin she should be dry for two months. A common method of drying a cow is to lengthen the interval between milkings by omitting one milking each day. After a few days the milk is drawn only once in two days until secretion is stopped. This may require two weeks or more. If a cow is producing 14 or 15 pounds a day or more the grain may be withheld from the ration, forcing her to subsist wholly upon roughage.

The dry cow is not a mere boarder, but a prospective milker. If she be run down and thin grain or other sufficient feed should be given to enable her to thoroughly recuperate. If pasture is ample no grain is really necessary. However, it is considered good practice to feed some in order that she may reach an excellent condition by calving time. She should have plenty of exercise at will. As parturition approaches it will be well to feed her a laxative ration. Her stall in the barn should not incline badly toward the rear.

The question of milking before calving is an unsettled one, some claiming it aids milk fever, others that it tends to prevent it. Only in the case of very high producing cows should this be necessary, most cows not requiring this precaution.

The strain upon the cow's system of calving brings on some fever and nervousness. If she has been dry for six weeks and is in good condition she will probably be all right. Give her plenty of fresh water, not too cold. No feed need be given for some hours. Special attention should be given to avoid infection of the navel of the calf, which would bring on white scours.

Removing Calf

Cows have a strong attachment for their calves only after having lived with them for a few days; consequently the removal of the calf at once, or within a day or so, causes her no particular bereavement. The calf should be removed from sight and hearing of the dam while she is absent from the stall. She should be fed a moderate mess of steamed oats or bran mash and while she is eating groom with a brush, handle the udder and teats, and gently draw a small quantity of milk. If handled properly she will give milk as freely as though she were suckled by the calf. The cow should be milked three times a day or oftener until the inflammation leaves the udder.

Milk Fever

The symptoms of milk fever, which may follow calving, are first, a general restlessness and nervousness. Within a short time paralysis of the hind legs begins, showing in a staggering gait. The animal soon falls and is unable to rise, unconsciousness following. Death usually occurs within from 18 to 48 hours unless treated. The injection of air into the udder by apparatus designed for this purpose is the most common remedy. In such a case the owner had best call a veterinarian.

Hard Milker

Some cows have a stronger sphincter muscle than others, closing the teat opening tighter than it should, causing the animal to milk unusually hard. This condition may be remedied by the use of teat plugs. These

plugs, which are made of lead or hard rubber, are placed in the teat duct and a tape tied around the teat through an eyehole in the plug. The animal wears the plugs from one milking to another until the muscles relax somewhat and the opening remains larger. Occasionally this treatment is not sufficient to effect a permanent enlargement of the opening and in other cases the hard milking results from a hard lump in the upper part of the teat, which drops down when milking. When the ordinary teat plug will not suffice a teat slitter or bistoury can be used which will produce a permanently enlarged opening. A certain amount of skill and practice is required to handle this instrument and where its use is necessary a veterinarian should be called.

Milk Leaking

Occasionally cows lose part of their milk by slowly leaking teats on account of a weakened condition of the sphincter muscle. There is no known practical remedy, but the teat opening may be closed after each milking with collodion.

Sore Teats

Sore or chapped teats may be caused by the udder coming in contact with irritating plant growth, cold damp stalls, milking with wet hands in cold weather, sudden chilling of the teats after the calf has suckled, etc. The animal should be placed in a clean dry stall and vaseline applied to the affected parts. If severe the teats should be thoroughly washed and softened with warm water, after which glycerite of tannin may be applied.

Warts

Warts on teats may be greatly benefited or entirely removed by the application of pure olive oil or vaseline. If large, they may be cut off with a pair of scissors and the spot touched with a stick of caustic potash.

Bitter Milk

When far along in the lactation period it is not uncommon for milk of certain cows to have an abnormal taste and odor, known as bitter milk. This condition usually occurs when the animal is fat and receiving more feed than necessary, rarely occurring when the cow is on green feed. The milk has a rather salty taste, described by some as bitter. This is present in the milk when fresh and rapidly grows worse for 24 hours or so. Reducing the grain ration to the amount the cow actually needs and giving two or three one to one and a half pound doses of epsom salts at intervals of three days usually remedies this condition.

Bloody Milk

Blood in the milk is caused by a rupture of some small blood vessel that allows blood to escape into the milk cistern or milk ducts. It cannot be prevented or stopped and the only thing to do is to reject the milk. The trouble will remedy itself in a short time.

Kicking Cow

Does the cow kick when being milked? If so it may be caused by pain and if such is the case can be remedied by removing the cause. However, if it is a habit she should be tied before milking. This is best done by taking a rather heavy strap with a strong loop. The strap is put around one leg over the hock and the end drawn through the loop. The strap is then put around the other leg and buckled so the two legs are held close together. The cow may struggle some but soon learns to stand quietly when the strap is in place.

Self Sucker

The self sucking cow is not very common but usually difficult to stop. The most effective treatment seem to be to put a bull ring in the cow's nose and hang a second ring from the first. The rings will interfere and result in discouraging the cow.

A purebred bull without a fault

Should be on every farm.

A measly scrub doesn't earn his salt, Besides, he does some harm.

LOS ANGELES COUNTY DAIRY

MAKE YOUR IDEAS PAY

With hogs selling at 11½ or 12 cents a pound, and with the prices of feeds not too high, an increased interest is being manifested in the production of pork in California. With a decreased pig crop in the east and with a large acreage of corn it is highly probable that fewer hogs will be shipped into California during the coming year than during the past year. If the demand for pork products continues, and if the supply remains constant, one might expect the price of hogs to remain good.

The president of the California Swine Breeders' Association is announcing a prize for the best slogan for the California Swine Breeders' Association. This association is composed of men producing pork in California. In announcing this prize he places upon it no restriction except that the slogan be sent with the name and address of the person writing it to the Secretary of the California Swine Breeders' Association, Davis, California.

WESTERN HOLSTEIN BREEDERS

The Western Cooperative Holstein Breeders Association, organized some time ago at Modesto, has its organization perfected by the election of its full board of directors as follows: A. M. Bibens, E. E. Freeman, W. M. Way and F. L. Hogue of Modesto, F. R. Beals of Tillamook, Oregon, Ralph Newman of Elk Grove, W. P. Coombs of Chowchilla, H. I. Sisson of Willits and Henry McCall of Pruneville.

Ray C. Gruhlke of Dixon, Solano County, a breeder of Holstein-Friesians and prominently identified with farm bureau work for the past five years, has been named field secretary and assumed active work March 1.

A DARKEY'S PRAYER

"O, Lawd, give Thy servant this mornin' de eyes of an eagle and de wisdom of de owl; connect his soul with de gospel telephone in de central skies; 'luminate his brow with de sun of heaben; pizen his mind with love for de people; turpentine his 'magination; grease his tongue with de sledge-hammer of Thy power; 'lectrify his brain with de lightnin' of de word; put 'petual motion in his arms; fill him plum' full of de dynamite of Thy glory; 'noint him all over with de kerosene oil of Thy salvation, and sot him on the fire. Amen!"

A man may smile and bid you hail
Yet wish you with the devil,
But when a good dog wags his tail
You know he's on the level.

POULTRY

Profitable Poultry News—Capacity 200,000 chicks, hence prices surprisingly low for quality. To date one County Agent has ordered 7,400 White Leghorns, 3,000 Brown Leghorns, 1,250 Reds, 200 Rocks, 200 Minorcas, 12 Breeding Males. His orders are coming after years extensive trial throughout his county. "Recommend your Turks because mine hatched June, 1921, averaged 20 lbs. at 7 months, gobblers 24 lbs." "Your Barred Rock Chicks bought May, 1919, proved great winter layers." "My Reds laid at 5 months, Leghorns at 4 1/2; cleared per pullet \$2.50 first six months." "Get more winter eggs from 60 your Leghorns than from 200 formerly." These strains 180-290 egg Leghorns, Reds, Rocks, Anconas, Minorcas, Wyandottes, Andalusians, Brahmas, Orpingtons, Ducks, Turkeys, lead many egg-laying contests; build foundation flocks, fill repeat orders for hundred. Why? **ELECTRIC HATCHED**, vigor, growth, winter-laying profit, guarantee; very low May, June prices. Smallest, largest orders welcomed. Write **PROFITABLE POULTRY**, 13 North Fair Oaks, Pasadena.

White Leghorns—Eggs for hatching; 100% fertility guaranteed. Absolutely first class cockerels and pullets ready soon. Finest laying strain. Prices very reasonable. Send for folder "Secret of Success." **Curtis White Leghorn Ranch, R. 2, Box 29, Gardena, California.**

SEEDS AND PLANTS

SUDAN GRASS SEED (The Great New Hay Crop) First introduced in the United States 1909 from Sudan, Africa. Culture. Strictly an annual, may be drilled or broadcasted, 15 to 25 lbs. per acre, grows 8 to 10 ft. high, yields 3 to 10 tons per acre, two to four cuttings. Pastureage. It will yield food for six times as much stock as any other forage without irrigation. For milk cows and hogs there is no better and more abundant pasture than Sudan. It will solve the hay proposition as nothing else can of will do in this climate. This seed is grown on our farm and is free from Johnson Grass. Price—5 lbs. \$1, 10 lbs. \$1.50; 50 lbs. \$8; 100 lbs. \$8; 500 lbs. \$35; 1000 lbs. \$50. **BOWMAN'S HDWE & IMP. CO. 721 J St. Sacramento, Calif.**

Hubam Clover—Mr. Citrus Grower, Subsoil your orchard, add humus and nitrogen and have a green cover crop growing under your trees in June and July by planting Hubam clover now. FARM LAND FOR SALE

Williams Feels Justified in Inviting Home Makers for the Reasons: We have high-class land at moderate prices. Good climatic conditions, under which any kind of fruit will grow. Thompson Seedless and Muscat Raisin Grapes have been a success here for 30 years. Land on 15-year payments, with 3 per cent interest for first three years. Deep, rich soil. Come, investigate! At the Mid-winter Fair at San Francisco we took first award for best oranges grown in the state, and at the last State Fair took first award for best prunes grown in the state. We exhibited largest watermelons ever exhibited at State Fair. The largest lemon orchard in the world is in Colusa County. For information address Williams Chamber of Commerce, Williams, California.

KROYER BUILT

A WIZARD For Hard Work

WIZARD 4-PULL TRACTOR

Performing the hardest tasks continuously, season after season—that's what makes this remarkable tractor a real WIZARD.

Endurance Added to Enormous Traction

The wonderful tractive power of the Wizard is due to the revolutionary, rigid, four-wheel drive principle, which gives it traction equal to or greater than the track tractor with surprisingly low upkeep cost.

After delivering its normal drawbar pull, the Wizard has 35% reserve power and strength. It is automatically lubricated throughout—no oil or grease cups. All moving parts, except wheels and fan are completely enclosed. The Wizard will serve you faithfully for many years.

For price, specifications and other details, send this advertisement to us with your name and address.

or other hard substance in the feed and the tooth broke through into the nasal sinus or the tooth may only be split. You will have to get a veterinarian to extract it.

To Dehorn a Calf.

I have a three months old calf and want to prevent the horns from growing. How can I do it? At what age should a calf have water? How long should a calf be fed calf meal?—Subscriber, Porterville.

The horns should be treated as soon as you can feel them raising under the skin. Clip the hair off a spot over the little button from which the horn grows, about the size of a cent. Rub in some vaseline around the spot and then rub the end of a stick of caustic potash on the skin until the place is wet. This will form a scab and stop the growth of the horn. Handle the caustic potash carefully as it will burn your fingers if it touches them. Now that your calf is three months old the horns must be well started but still loose from the bone. Run the point of a sharp knife around the horn and tip it out, then treat the spot as described above. A calf should have water as soon as it will drink it. Other ground feed may be substituted for the calf meal any time after the calf is two months old.

POPENOE PROMOTED

We understand that Wilson Popenoe, for many years plant explorer for the United States department of agriculture, has been promoted to the head of the division of plant exploration. Mr. Popenoe, who has just returned from a long and arduous trip through Ecuador, South America, will soon pay a visit to California and be present at the May convention of the California Avocado Association.

PURE OIL

This is an age of specialization. Auto parts, oils, greases, etc., are no exception. One of the larger manufacturers of the country, specializing in

oils and greases, is the Pure Oil Company. This concern manufactures Tio-lene motor oils and greases. The Pacific Coast manager of this institution, recently appointed to push the sale of Pure Oils, is Leonard Freer, formerly Pacific Coast manager of the Tidewater Oil Sales Corporation. Mr. Freer's headquarters will be in San Francisco, and his district will cover all territory west of Denver. In this territory there are said to be over a million motor cars. Mr. Freer states that he plans to lose no time in perfecting a strong and aggressive sales organization in his territory and will cover the field with a large sales force. The Pure Oil Company is establishing a nation wide sales organization and has zoned the country in such a way that it has established distributing centers in Boston, New York, Philadelphia, Atlanta, Pittsburg, Columbus, Chicago, Minneapolis, Kansas City, Dallas, San Francisco and Los Angeles.

PELTON COMPANY ISSUES NEW PUMP CATALOGUES

The Pelton Water Wheel Company of San Francisco has published its Bulletin No. 18, "Pelton Centrifugal Pumps for Irrigation and General Utility." Both the type B pump, for general irrigation service, and the type FD for tank supply are described. Rules are given for the measurement of water and several useful tables for the water user are included.

The Warr Implement Company, manufacturing an extensive line of hay tools and farm implements on East First Street in Los Angeles, suffered a loss of several thousand dollars by fire Tuesday. The warehouse of Harper and Reynolds containing general hardware was completely destroyed at the same time. Mr. Warr states that manufacturing machinery on the ground floor was not greatly damaged and that the factory will be under production again by May first.

Holly Poultry Ranch

Hatching Capacity 200,000 Eggs
White Leghorn Chicks Only

Holly Hatchery Chicks Win Again!

Our May hatched Richardson chicks are superior in laying ability to all others.

Farm No. 4, State of California Extension Poultry Experiment Farms, was first for 1921 with a record of 192.4 eggs per hen with our Richardson chicks. Can you beat it!

Why be satisfied with anything less than the Best.

Order quick as our May dates are filling fast.

Agent for "Pride of Petaluma" Brooder Stoves. Our special Egg Turning Trays are now available for other hatcheries in quantity. Send for circular.

B. R. HOLLOWAY
Box K. Van Nuys, Calif.

Poultry Stock

Specializing in White Leghorns from heavy laying strains of proven ability. Breeding, incubation, brooding and developing by most efficient methods known. Females ready when weaned from heat, hardened, and sex has been determined.

We start you right, either big or small, and save YOU TIME, MONEY AND WORRY. Write for prices, etc. Visitors welcome. Also fancy or general utility birds.

Poultry Queries

Conducted by Jean A. Koethen

Unproductive Pigeons

I have a pair of Runt pigeons that have produced squabs before, but now have built their nest and are very friendly but there are no eggs. What shall I do? I should like to catch a pair of stray pigeons that light on our roof. How shall I go about it? Can I decoy them with my own?—Subscriber, Pasadena.

You do not say how many squabs your Runts have produced nor how old they are nor how long you have had them. If you purchased them from someone who did not guarantee them to be mated it is possible, you know, that they have never produced. Assuming that you know positively that they have produced squabs, it may be they are getting old or are lacking in vigor. If they are young you might try to find mates for them. If they are old there is nothing to be done but to wait till they are ready or get rid of them. I do not know how you can catch those stray pigeons. Has any one a suggestion?

Sick Hens

For two weeks past a White Leghorn hen has seemed to be crop-bound—at least that is what we have treated her for—but we finally had to kill her. She tried to eat but could not open her mouth far enough and would hold a grain of corn in her bill several seconds before giving up the attempt, though she could manage smaller grains to a limited extent. I believe now that she was not crop-bound but had some disease. Today we lost a Plymouth Rock. Her crop did not fill up and get hard, but was soft and pliable as it should be. She did not eat and died the third day. Our hens are kept under most sanitary conditions and are fed whole corn, wheat and barley for scratch, a quart a day to 15 hens, have hopper containing dry bran and charcoal always before them and wet mash of bran and beef scrap at noon. Possibly I feed too much beef scrap. How much should be added to two quarts of bran?—Subscriber, Del Mar.

A teacup of beef scrap (half a pint) to two quarts of bran is about the right proportion, but it is better to mix your mash in larger quantities, using more ingredients, or to purchase it already prepared. A simple mash which has given satisfaction in some laying contests consists of equal parts by weight of wheat bran, corn meal, ground oats, middlings and beef scrap. With this is fed a scratch consisting of equal parts cracked corn and wheat. With your scratch mixture of whole corn, wheat and barley you could omit the ground oats and make the proportion 50 per cent bran, 25 per cent each of corn meal and middlings and about 15 per cent beef scrap. The Plymouth Rock that died was evidently suffering from indigestion, which may have been caused by an excess of beef scrap or possibly by too heavy a feeding of wet mash. It is better to keep the dry mash before the birds constantly and feed the moist mash only in small quantities when there is special need of a forcing diet. If the Leghorn seemed hungry the trouble was more likely in her throat than in her crop. Did you examine her throat? There may have been some membrane or growth there that prevented her swallowing, as in diphtheritic roup.

Feeding Poults

Will you please give formulas for feeding baby turkeys? I see no bulletin on turkeys in the list sent from Berkeley.—Subscriber, Lakeside.

A very good bulletin is issued by the United States department of agriculture at Washington, and an article will appear soon in the Cultivator. Little turkeys should not be fed till they are from 48 to 60 hours old, according to the weather and the way they act. At first all they need is quiet and warmth. Grit and water may be put before them and they must be in a clean, warm coop. The standard nursery feed for turkeys is a mixture of chopped greens (always including onion or onion tops), hard boiled egg, boiled a long time till it is mealy, and very stale bread or other cereal. My little turkeys which came

off a week ago have had wheat flakes and very stale bread dried in the oven till it could be mashed to powder. I used sometimes the wheat flakes, sometimes the bread, and sometimes a little of both. The mixture should be at least half green and the other half equal parts cereal and egg. I chop it all together and add a good pinch of grit. Alfalfa is the best green to use with the onion, but this year for the first time I am using alfalfa, which seems to do just as well. The main thing is not to feed too much. Feed four times a day at first, then after a week three times, increasing the quantity as you diminish the number of meals. It doesn't matter as much what you feed as how much.

Trapnest Bulletins

If you have bulletins on construction of trapnests I would appreciate a copy.—Subscriber, Brawley.

I am afraid my one lone copy will be worn out or lost before it gets around to you, if it is not already lost. I understood from a subscriber who had written to Berkeley that the bulletin was no longer in print, but the information may not have been correct. You had better write and make sure about it.

Muscovy Duck

I have been watching the Cultivator for an article on the Muscovy duck but have failed so far to find it. Can you refer me to any bulletin relative to feeding and diseases of these birds? My young ducks are inclined to be egg bound and several have died from this cause.—Subscriber, Arcadia.

A very useful bulletin on duck culture is issued by the department of agriculture at Washington. That egg bound condition is hardly to be classed as a disease. It is due rather to the duck's trying to lay eggs that are too large and should be treated as the same condition is treated in hens. As your ducks are all affected in the same way I am inclined to think your ration is either too forcing or too fattening. A good ration for breeding ducks consists of two parts bran, two parts corn meal, one part middlings or low grade flour, one part beef scrap with about three per cent grit added, and at least 25 per cent cut greens or boiled vegetables, such as potatoes, turnips, mangel beets, alfalfa, cabbage or clover. This is moistened with cold water and fed night and morning. At noon the ducks get a light feed of corn. To treat that egg bound condition, obstruction of the oviduct, as it is called, inject olive oil and gently manipulate the parts. In case the expulsion of the egg cannot be obtained by injection of oil, immerse vent and lower part of body in water as warm as can be used without injury and hold there till the parts are relaxed. Then inject oil again and carefully press and manipulate. In cases where there is already external soreness you will have to puncture the egg and use some healing ointment, such as resinol, on the outside.

Cannibal Chicks

My thousand chicks, three weeks old, have taken to eating the feathers out of one another's tails. If I do not remove those that have been picked they devour them entirely. They have also toe-picked some. I have a fair sized yard; have given them lots of cooked meat and meat scrap.—Subscriber, Morgan Hill.

Are you keeping chick feed in litter or before the chicks in hoppers for them to pick at, and is a dry mash before them at least a part of the day? Either your chicks are hungry or else they have fallen into the habit of picking at each other because they have nothing else to do. Some experts think dry mash should not be kept before chicks all the time, but I have always done it without any bad effects whatever, and it keeps them busy. If you are not keeping something of this sort before them, get a good growing mash and set it in hoppers where they have constant access to it. With this and grain in litter or hoppers, and green feed before them a large part of the day you ought to keep them so busy they will not think of picking feathers. If they still persist in the habit try letting them out. Green range is the best of all remedies for all chick vices. If your yard is bare the chicks have a very trying en-

BEE MAN Tractor

Macabee Gopher Trap

Small, simple, sure. At all dealers. If your dealer does not handle it, send 25 cents in stamps and mention your dealer's name and get sample by mail postage paid. Write for prices in larger quantities delivered free by parcel post. Mfg. by Z. A. MACABEE, Los Gatos, Cal.

Chickens Sick?
Hens Not Laying
GERMOZONE will rid your chickens of roup, colds, canker, sore head, chicken pox, skin disorders, cholera, indigestion, bowel trouble and other ailments—and keep them healthy. For over 50 years the dependable remedy. Get Germozone, also famous Lee Free Booklets, at drug or feed stores. If no dealer, order by card. Postman will collect. 75c and \$1.50 sizes. No extra charge. GED. N. LEE CO., Dept. F-30, Pmaka, Neb.

vironment. Most poultrymen provide green barley for them to run on.

Book on Turkeys

Please inform me where I can get a good book on turkeys.—Subscriber, Perris.

A very good bulletin is issued by the U. S. department of agriculture at Washington, and you can get bulletins on prevention and treatment of blackhead from the R. I. experiment station at Kingston, R. I. The only turkey book I can recommend is one published a number of years ago by the Reliable Poultry Journal Publishing Company, Chicago. It is not up to date but contains a good deal of valuable information.

Enteritis

What is the cause and cure of bloody diarrhea?—Subscriber, Concord.

If you mean in hens, it is what is called enteritis or dysentery, and is caused by "bacterial infection coming from filthy conditions, foul drinking water, putrid meat or decaying food" and sometimes by "poisons such as paint skins, lye, unslaked lime, salt, ergot of rye, arsenic and copper in spraying mixtures." The cause of the trouble must first of all be removed, sick birds isolated, houses and runs cleaned and disinfected, drinking vessels and food troughs scalded daily. Mix powdered charcoal in the mash. Feed less bran and more middlings in the mash. Give Epsom salts, a teaspoon to each fowl, mixed in moist mash. For medical treatment Dr. Salmon recommends subnitrate of bismuth, 3 grains; powdered cinnamon or cloves, 1 grain; powdered willow charcoal, 3 grains. Give twice a day mixed with food or made into pills with flour and water. Bloody diarrhea in chicks is coccidiosis and is treated by cutting down the mash and grain and keeping buttermilk or sour milk before them. Cutting down the other feed compels them to consume a great deal of the sour milk, and this is the best cure.

Toe Marking Turkey

Would toe marking a turkey a year old injure it in any way? When is best age for such marking?—Subscriber, Daggett.

I have never heard of toe marking turkeys. Most people put on leg bands with the number of the bird. If it were ever done it should be done, as with chickens, as soon as they are hatched. It would certainly be injurious to a grown bird, and I cannot recommend it for any age.

May Be Cholera

I have lost three R. I. Red hens within a week. They act droopy, comb gets pale, they won't eat and die in three days or so. Sometimes the droppings are a little yellow or a little green, but not so bad as I have seen and cured with castor oil, which I have given in this case without results. Two others are sick. I have been feeding some corn that got wet in the field.—Subscriber, Watsonville.

The green and yellow droppings, as well as the rapid progress of the disease, are symptomatic of fowl cholera, but one can never be certain that his chickens have this disease without a bacterial examination. Dr. P. T. Woods, who has had considerable experience with this disease, outlines the following treatment: Establish a pest house and isolate all sick birds. Give these birds a few drops of creolin in the drinking water (just enough to turn it faintly milky) or drinking water in which one-tenth of a one grain tablet of corrosive sublimate (bichloride of mercury) has been dissolved. Clean up and disinfect thoroughly. This is practically the same treatment as that recommended by Dr. Beach of our own poultry division. There is very little to be done for cholera except to clean up thoroughly and use some kind of germicide in the drinking water. It may be your hens are only suffering from the effects of that moldy corn. Don't give them any more.

EGG MARKET PROSPECTS

Among eastern egg dealers there is at present considerable uncertainty regarding market prospects. A month ago everyone felt confident of a very heavy spring production, at least 20 per cent more than even the extraordinary production of last spring, but so

far this expectation has not been realized. The impression still prevails that there are many more hens in the country than there were last year, but egg production, which began early and was heavy in January and February, has been seriously retarded by unfavorable weather. There has been very cold weather and heavy snows in the Northwest and in New England and cold rains in the Middle West. Roads have been bad so that farmers could not get to town with what produce they had. As a consequence the egg receipts at the big eastern centers have been far below expectations. The question that interests everyone most just now is: What about production in May? Will it show sufficient increase to offset the shortage of March and April?

As to this, perhaps the poultryman is in a better position to speak than the egg dealer.

CALIFORNIA EGG LAYING CONTEST

The production of the contest flock climbed to 62.8 per cent for March; 32 out of 62 entries produced over 200 eggs per pen of ten hens. Over 50 per cent of the pens laid over 200 eggs. The blue ribbon winner was Boehm & Noel's pen with a yield of 243 eggs. Alex Stewart's pen was second with 242½ and R. H. Young third with 239. Blue ribbon for high hen went to Mrs. Kleinsmith with a record of 30 eggs in 31 days.

High Pens

Boehm & Noel, 243 eggs; Alex Stewart, 242½; R. H. Young, 239; Bolfin's Poultry Farm, 234½; E. D. Crewdson, 232; D. C. Berry, 230; W. A. Ford, 229; L. A. Thornewill, 228; D. B. Walls, 228; Hanson's Poultry Farm, 226½.

High Hens

Mrs. H. C. Kleinsmith, 30; W. A. Ford, 29; S. L. Gibson, 28; L. N. Thornewill, 28; R. H. Young, 28; Alex Stewart, 28; Geo. Gray, 28.

EXPERIMENTAL WORK ON FEEDING

During March nearly all pens in the experimental work at the Southern California Farm Bureau Egg Laying Contest made large gains in egg production over previous month. The dried milk albumen pen made the highest record with a production of 71.68 per cent, while the pen getting semi-solid 1-2 was lowest with a production of 51.13 per cent. Total production figures show the fresh buttermilk, dried skim milk and dried milk albumen pens still leading in this order as at the end of February. The check pen was raised from fifth to fourth place by an egg yield of 64.29 per cent, which was only slightly less than the average production of the contest flock. This pen is fed the same as the contest birds except that the mash it receives has 15 per cent meat in place of 7½ per cent meat and 7½ per cent fish and that it receives no moist mash. It must be remembered that these experiments have not been carried far enough to date to warrant any conclusions being drawn on this work.

PROSPECTUS OF U. C. COLLEGE OF AGRICULTURE

Students who are contemplating studying agriculture should obtain the new 1922-23 prospectus of the University of California college of agriculture which has just come off the press.

The prospectus is beautifully illustrated throughout its hundred pages and gives a detailed description of the work to be carried on at the college of agriculture in Berkeley and at the university farm school at Davis. Much helpful information is given in regard to outlining courses in any branch of agricultural study that a student may desire to pursue. General information in regard to expenses of the student while at college is also given.

A copy of this prospectus may be obtained free by writing to the University of California, College of Agriculture, Berkeley, California.

DESTROY MILK THISTLE

The milk thistle, silybum marianum, is one of our more disagreeable weeds whose control can best be effected at the present season, says the California department of agriculture. The milky-white splotches along the veins of its leaves, from which the common name is derived, make it readily recognizable at all stages. The time when this weed can be easily destroyed is quickly passing with the advent of warmer and drier weather. While in most sections the milk thistles have just begun to show themselves, in many places quite large plants may already be found, and occasionally a flowering stem.

The best tool for destroying the milk thistle is the spud, but a good hoe or a sharp spade will do very well. It is important to cut the plant well below the crown, for although the milk thistle is generally regarded as an annual, it possesses the properties of a biennial in its ability to produce new stalks from buds around the crown after the original stalk has been cut off.

We would again emphasize the importance of attacking this weed at the present time when the toproot is young and succulent, for within a month's time the root will be so large and tough that it can be cut only with great difficulty; moreover, there is the danger of allowing the seed to mature and disseminate.

THERE TO STAY

The pile of flints still to be broken was a very large one, thought the stone breaker, as he gazed at is disconsolately between the bites at a large sandwich of bread and cheese. A minister came along and gave him a cheery "good morning," remarking afterward that he had a deal of work to get through yet.

"Aye," said the eater, "them stones are like the Ten Commandments."

"Why so?" inquired the genial parson.

"You can go on breaking 'em," came the reply, "but you can't never get rid of 'em."—Christian Evangelist.

Time to Re-tire?

(Buy Fisk)

TRADE MARK REG U. S. PAT. OFF.

FISK
RED-TOP
EXTRA PLY OF FABRIC
HEAVY TREAD

How a Fisk Red-Top
outwore three other
tires of another make
*and still has a lot of
mileage in it*

WHAT a country dealer said to our
Memphis Manager:

"There is my car with a 30x3½ Red-Top on the left rear wheel. It was sold to me at the old price; at the same time I bought a cheap tire, and put it on the opposite wheel. I have since purchased three of those cheap tires for that right wheel. I have paid for them in all nearly twice the price of that Red-Top which is not yet more than half worn out. I don't want anything but Fisk Red-Tops after this."

It's the extra heavy, tough red tread and the extra ply of fabric that make this tire a sure success.

There's a Fisk Tire of extra value in every size,
for car, truck or speed wagon

Squash: 4 basket crates Summer squash, 2.50@2.75 per box.

Tomatoes: Market firm. Mexicans, per repacked lug, 2.50@3.00; original lugs, best, 2.00@2.50; small, 1.75; loose, per lb., best, 10@12; poorer and overripe, low as 4 lb.
Turnips: Sack, 1.50@1.75.

FRESH FRUIT

Cantaloupes: Demand limited. Mexican, repacked, some green, pony crates, 6.00@6.25; standards, 7.50@8.00.
Loquats: Best, 15@20 lb.; No. 2, 10@12.

Strawberries: No. 1, mostly 4.50@5.00; No. 2, 3.50@4.00 per crate.

CITRUS FRUITS

Grapefruit: Market steady. Californias: Northern, packed box, 3.00@3.25; market pack, 2.75@3.00; small, 2.25@2.50.

Lemons: Demand and movement light, market firm. Locals: Loose boxes, best, 2.50@3.00; poorer, 2.00; special brands, fancy, 5.50@5.75; choice, 5.00@5.25.

Oranges: Demand moderate, market steady. Navels, special brands, 176s and

larger, 6.75@7.00; market pack, 4.50@5.50; culls, 50@1.00 per field box; few best, 1.50@1.75; Valencias, special brands, 6.50@6.75.

Tangerines: Market firm, 8@10 lb.

HONEY

Continued heavy rains have practically assured a heavy crop of honey, although there is some uncertainty as to how large the orange blossom yield will be. Sage outlook is especially promising. Both Northern and Southern California report colonies in normal condition. Supplies of best white honey reported as very limited, but supplies of lower grades said to be still fairly abundant. Movement very light during recent weeks. Demand limited and market largely nominal. Few sales in carload lots reported at 11 cents for white sage and white orange and 8 1/2 cents for light amber, f. o. b. California points.

HAY

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:
Tame Oats 20.00@26.00
Barley 18.00@22.00
Old alfalfa practically cleaned up. Prices quoted f. o. b. L. A. to producers are:
Rabbit Alfalfa 20.00@22.00
No. 1 Alfalfa 15.00@17.00
Standard Alfalfa 12.00@14.00

HAY AND FEEDSTUFF

A. W. Scott Co. reports under date April 22:
Receipts of hay past week 897 tons as compared with 748 previous week. Demand light, mainly for No. 1 Tame Oat. Export unusually slim and coast-wise shipping dull. Interior trading light. Bulk of trading for shipment to the south of the state which continues strong with the demand favoring better grades of tame oat, barley or barley and oat. Alfalfa movement has been light but steady, most of it still coming from Nevada, and the great majority directed toward the southern market.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

Citrus Markets

Los Angeles, April 26, 1922.

Navels continue to bring good prices; few sales of Valencia; Sweets, Seedlings, etc., in good demand. Tulare County estimates Valencia crop over 1,000 cars, some frost damage. Warm weather is showing up damaged fruit.

Lemons selling well; no shortage of summer fruit indicated in spite of importers assertions that Californias will not be able to fill the Eastern demand in hot months because of freeze.

Shipments

Shipment of citrus fruits to date since November 1, 1921. Southern California: Oranges, 13,022 cars; lemons, 3,728; total, 16,750. To same date last season: Oranges, 18,497; lemons, 3,771; total, 22,268. From Central California to date this season: Oranges, 4,714; lemons, 105; total, 4,819. To same date last season: Oranges, 4,684; lemons, 132; total, 4,816. From Northern California to date this season: Oranges, 372; lemons, 8; total, 380. To same date last season: Oranges, 305; lemons, 5; total, 310.

The "biggest and finest watermelons," "finest prunes" and even "sweetest oranges as shown by awards at state and other fairs" is the claim of the Williams chamber of commerce. This chamber of commerce is, by the way, one of the newer organizations of that kind in the state. The officers are: H. C. Stovall, who is president of the Williams bank, chairman of the board, and J. F. Fouch, leading merchant, secretary. The directing board consists of 15 representative business men.

A new livestock selling organization has been launched in this state. The organization has been incorporated with the following list of stockholders: Romie C. Jacks, Hereford breeder, Monterey; C. R. Thomas, sales manager, San Francisco; Frank Honeywell and Ralph Newman of the Pacific Rural Press, San Francisco; M. W. Jacks, Monterey; F. V. Cornish, attorney, Berkeley, and J. E. Thorp, Jersey breeder, Lockeford.

The dairymen's department of the Los Angeles County farm bureau is planning its regular spring quarterly field meeting May 8 at Adohr Stock Farms above Van Nuys. One of the big features of the day will be the barbecue at noon. A program of great interest is arranged. The cups to be given as prizes in the Los Angeles County farm bureau dairy competition, June 30, will be on exhibition. A special feature will be entertaining of the state farm bureau traveling conference. All dairymen and their families are very cordially invited.

It is poor economy that saves ourselves at the expense of another.

THE END OF A FAMOUS CALIFORNIA SHORTHORN HERD

Next Thursday, following the dispersal of the Ormondale Shorthorn herd, will mark the passing of one of the leading breeding establishments of the West. Ormondale ranch first gained international fame as the home of the great Thoroughbred stallion Ormonde, and for many years was a noted nursery of speed. After horse breeding was given up the owners established a herd of Shorthorns. From a modest beginning considerable progress was registered and then by a fortunate purchase the bull Golden Goods Jr. came into service. As soon as his heifer calves began to appear Shorthorn breeders remarked upon their uniformity and especially attractive heads. As they developed they continued to attract attention and when finally Thornton S. Glide purchased one of them, named Little Sweetheart, a transaction was negotiated that was destined to bring almost as much fame to the herd as was at one time enjoyed by the Thoroughbreds. After a sensational career in the show rings of the West Little Sweetheart was entered at the 1919 International, and in the greatest show of America she was made grand champion female. This exploit directed national attention to the herd and the owners found themselves in a position where they were almost forced to extend their operations. The following spring, \$12,000 was paid for the imported bull, Boquhan Guinea Stamp, and a little later an important group of females of select breeding was added. Boquhan Guinea Stamp had but a brief career and following his death, The Caledonian, a crack young son of Imp. Caledonia, was purchased. Later Count Kingwood a son of Imp. Kingwood was added. The stage seemed all set for the herd to make an enviable record when a sudden decision of the owners ordered its dispersal.

Few such opportunities have ever been presented the breeders of this state to profit by a dispersal sale as will be offered at the forthcoming event and the wide interest that has developed promises to attract one of the most distinguished crowds in the history of the breed in California.

JERSEYS AT AUCTION

Manager Thomas of the Pacific Purebred Sales Company announces all details perfected and Jerseys ready for the auction of purebred Jerseys at the fair grounds at Stockton next Thursday, May 4. The cattle to be offered are all Oregon bred. There are 39 females and one bull. Mr. Thomas says: "In bringing these cattle from Oregon it was deemed best to bring to you as our first offering almost entirely young animals whose ancestors are tried and true and through whose veins flows some of the very best blood of the breed; animals whose whole lives of usefulness will be yours, at your bidding; and every animal comes to you with a perfectly clean bill of health. These animals were selected from herds which have stood the health test from time to time and in none of these herds was there a reactor." The auctioneers will be Col. Cy N. Clark and son. The sale will be called at one o'clock.

BERYLWOOD STOCK FARM

(Continued from Page 467.)

beat the state record for butter for her age.

Many of the cows in the herd will command the spotlight before their day is done, for production or show ring winnings or both, as they have been very carefully chosen with both activities in view.

A year or more ago Mr. Snodgrass began the search for a bull to place at the head of this galaxy of females, and only recently did he find one that measured up to the standard he had set. The purchase of this young male, Prince Aaggie of Berylwood, from Morris and Sons has been fully recorded in these columns. This youngster, who is an excellent individual, has the distinction of being the highest record bull on the Pacific Coast and carries 100 per cent of the same blood as the bull sold by Morris to Arfmann and Amos of New York for \$11,000, who is backed up by an average of his seven nearest dams which

is the highest in the world. The dam of the Berylwood bull is making a record at present which promises to wrest this honor away from the Arfmann bull.

Prince Aaggie of Berylwood claims a three quarter relationship to King Korndyke Pontiac Acme, the \$41,000 bull at the head of the Santa Anita herd, and a like relationship to the \$9,250 Sir Aaggie Mead owned jointly by W. J. Higdon and F. S. Borror of Tulare. The dam is a full sister to Aralla De Kol Pontiac Mead that has just completed a yearly record of 1,065.43 pounds butter.

Another fact of impressive interest is that five of his seven nearest dams have proven their transmitting qualities by producing 1,000 pound daughters. The sixth dam has an 885 pound four year old daughter that has 954 pounds to her credit as a mature cow. The seventh dam, his own, is too young to have acquired producing daughters but as she has three daughters under milking age it is certain that she will be able to boast of at least one 1,000 pound daughter. Furthermore, five of the seven dams have each produced over 2,000 pounds butter in two consecutive years and the sixth one has 1,862.88 pounds in two years.

Not the least interesting fact is the announcement of Mr. Snodgrass that the services of Prince Aaggie of Berly-

wood will be available to the members of the Ventura Calf Club that he was instrumental in organizing and which is being carried on largely under his direction. It is entirely correct to say that no calf club in America has the advantage of such breeding.

--and, as for Spuds

—give this picture the once over and read the following letter on the influence of AGRI GYPSUM on winter potatoes in the San Fernando Valley

Scabby potatoes from untreated portion of check plot. Clean potatoes from plot treated with 1,000 pounds per acre of AGRI Gypsum. Crop harvested in winter of 1921 on ranch of H. L. Boyer, Van Nuys. Plot treated with AGRI Gypsum yielded 61 per cent more and produced clean, marketable potatoes.

United States Gypsum Co.,
Los Angeles, Calif.
Gentlemen: We are inclosing two sample lots of potatoes which will illustrate the benefit I have received from the use of Agri Gypsum, at the rate of 1000 lbs. per acre. The total cost being \$8.25 per acre, Gypsum and the labor of spreading.

On the check plot test the yield without the use of Gypsum was 68 sacks per acre, while the plot to which Gypsum was applied gave a yield of 110 sacks per acre.

The quality is well shown in the illustration, potatoes from the Gypsum plot being practically free from scab, while those from the untreated portion were badly affected.

The ground is noticeably free from cut-worm, potato bug and other insects which are often found infesting the land after plowing under a heavy cover crop.

I regard this as a remarkable demonstration of the fertilizing qualities of Agri Gypsum when used on fall potatoes. I shall make a more extensive application on both my spring and fall crops.

Yours very truly,
H. L. BOYER.

90 EGGS
120 EGGS

AND THE HEN IS JUST PAYING HER "KEEP"
AND THE HEN IS JUST PAYING A PROFIT—

but why
stop with

30 EGGS

AUTHORITIES estimate it takes 90 eggs a year to cover the "keep" of a commercial hen—and 120 eggs to make just a profit. But—there's the rub! How are you going to get the extra eggs—the eggs that make the big bank-book difference between just a *profit* and a *just* profit?

The average hen under natural range conditions will produce only about 75 eggs a year. Yet *proper feeding and care* have developed commercial flocks that average 120 to 150 eggs a year per hen. Some flocks will range even higher.

It's all a matter of feed and care. The feed must be clean, tasty, varied. The elements of an egg are derived from many sources. Therefore, the greater the variety of feed ingredients the better. SURELAY contains a dozen tested ingredients balanced and blended according to the famous Sperry formula. It is made so good, so uniform, so tasty, that every time Mrs. Hen

takes a peck at it she is eating something that goes into the making of an egg.

You know that Nature provides each hen with a certain number of embryonic ova. These are minute yolks which, under ordinary conditions, will take the hen a number of years to produce. But that isn't very profitable. So it is your job as a poultryman to secure the most eggs in the least time—and keep the hen in *good health* all the while.

SURELAY will give every hen in your flock an opportunity to pay not only her board bill but pay *you* a profit. This prime quality feed calls the "egg-making department" to order—makes it produce—and keeps the hen in "fine fettle" all the time.

Ask your dealer for Sperry SURELAY in the yellow-striped bag; and send for "Makes Hens Happy"—a practical guide to more eggs and more money. Simply clip the coupon and mail today.

Artificial Frost Protection Is Not Necessary at

La Habra Heights

Suburban to Los Angeles, Higher Than and Adjoining Famous
Whittier-La Habra Districts

The recent frost makes this the time for investigation. We invite inspection of hillside plantings showing tender one-year-old avocados undamaged by one of the most severe frosts ever experienced in California.

Our section is one of the warmest and best protected from wind of any in Southern California. Let us show you now.

Ideal conditions for avocado, citrus and winter vegetables. Beautiful homesites.

Buy now for spring planting, or we will plant and care for orchards. Special terms to those who improve.

Any acreage desired. Low prices. Reasonable terms. Send for descriptive folder.

Also specialize in Hillgrove Townsite, North Whittier Heights property, and in other choice walnut and citrus properties.

Ventura Kafir Header

Tops Irregular Fields Cleanly,
Quickly and Economically

You can make money raising Kafir and Milo now because the Ventura Kafir Harvester cuts the cost of harvesting far below what it ever was.

The Ventura solves the problem of getting the heads of all the sorghum varieties in irregular fields. By folding the stalks down onto a steel finger table with rollers, the heads are brought evenly, the high ones to the low ones, to the cutter bar. A solid reel delivers them to the canvas carrier. The heads of Kafir Milo and similar grains are topped evenly and delivered into a wagon at the side.

Tests made in various sections of California during 1921 thoroughly demonstrated the efficiency of the Ventura. Results in efficiency and economy in harvesting surpassed all expectations.

Two machines are manufactured—a one row and a 9 foot. Do you want one this year? Orders must be received early and will be delivered in turn. You cannot afford to be without one if you raise Kafir.

The Ventura Manufacturing and Implement Co.

Mfgs. Ventura Bean and Kafir Corn Threshers and Implements
Ventura, Calif.

Dealers will find a lively demand for the Ventura Kafir Header
in counties where Kafir is grown. Write for territory.

One Dollar Yearly

How May We Best Kill Jack Frost?

THE ONLY certain thing about frost injury is the uncertainty. The community suffering greatest injury one year, may prove, to a degree, exempt the next year. Again, it is most uncertain as to whether we will have any frost at all. The wisest of prophets, however, are unable to give us advance information, so the only safety lies in always being ready. Unfortunately the majority of our growers of crops which are affected by winter cold do not realize the possibilities of frost protection. There are this year, however, sufficient examples of orchards and crops saved (aggregating small fortunes in some instances), that only those who are

Thoughts Inspired by the Frost Fighting Convention at Covina

permitted the loss visited upon some sections this year. For instance, one of the richest sections in California, which last year marketed oranges and lemons to the value of \$3,800,000, to the grower, will this year market somewhat less than \$600,000 worth of fruit. This means a net loss of \$3,200,000; first to the fruit growers and equally as great loss to the bankers, the commercial interests, the doctors, the lawyers and others of the same community.

That same \$3,000,000 would have paid for a powerful amount of frost protection equipment which would have saved the crop of the present year and the vitality of the tree and probably three-fourths of next year's crop which is now gone because all trees are not going to come back quick enough to set a full crop, and many of them will not come back in time to set any crop whatever. Therefore, on top of the \$3,000,000 loss there is possibly another \$3,000,000 loss on next year's crop; this, bear in mind, in one section of a very few square miles. It is not necessary to say that this financial loss from the one cold snap will aggregate in that one community \$10,000,000 or \$5,000,000 or any other definite amount, in order to convey the truth that the loss is all too great for any one community to stand, so there are several long thoughts for residents of that community and many others similarly situated in California.

The first one which comes with a special force to the newcomer is, "Shall we quit the game and raise some other crops?" A very few will answer this in the affirmative, but the great majority will answer with a very emphatic "no," have answered it, in fact, by taking preliminary steps to provide an efficient and sufficient remedy. The proof that this remedy is available is abundant. Still there is a very natural desire to escape from some of the costs of that campaign if possible so committees are appointed, conventions are called, and we are discussing questions as to meteorology, cost of steel, windmills, electric fans; B. T. U.'s in oil, coal, briquettes, shavings, tall stacks, low

stacks, no stacks, and, in fact, everything that may affect temperature.

Last Saturday was a day especially devoted to a discussion of those topics. The matter was brought up at the meeting of the Claremont Pomological Club while at Covina thousands of automobiles fought for parking space somewhere near the arena in which the "frost fighting convention" was

held. The interest was so great that the pavilion was packed and every entrance filled with others endeavoring to catch some of the words of those who were discussing types of heaters and methods of work and urging all to action before another cold season.

The best part of the whole proceeding was the showing of good nature on the part of citrus growers. They were continually on the alert to catch the impractical suggestions—of

(Continued on Page 490.)

Agitate and Mix the Air

Two appliances at Ontario which have given practical demonstration in cold weather.

prevented by lack of capital should take chances with the weather.

This year, however, proved the most severe trial ever put up to frost fighting equipment. This because of the fearful suddenness with which temperatures dropped. Some sections reported temperatures dropping from around 30 to under 20 degrees within a very few minutes. This put a severe test on equipment and more on labor organization. The everlasting hope that we may be exempt, at least this one more year, is responsible for a degree of the inefficiency which has

Shavings and Heavy Fuel Oil Cartridges and Burner

Agricultural News Notes of the Pacific Coast

Northern California

Canners are reported offering \$35 to \$85 a ton for apricots.

The first car of cherries is scheduled to leave Sacramento May 15.

The Sutter-Butte Canal Company will deliver water to 30,000 acres of rice.

The Placer County Farm Bureau Exchange has filed articles of incorporation.

Sugar Loaf, Eldorado County, reports first movement of cattle to higher ranges.

Fair grounds at Anderson are being graded in preparation for Shasta County's fall fair.

Fed by waters from melting snows in the lower altitudes all streams in the Sacramento Valley are rising.

It is not expected that the Pioneer Trail to Lake Tahoe can be opened before June 1 because of snows in Sierra.

Horticultural Commissioner Earle Mills of Butte County is making trip through citrus growing sections of the Southern states.

June 3 will be Peach Day in Sutter County when Stanislaus County peach growers make inspection of Sutter County methods of culture.

Potato specialist Shear of the state department of agriculture is inspecting for certification plantings of potatoes in Humboldt County.

Superintendent Kreutzer of the Durham state land colony has been making tour of northern counties investigating land settlement problems.

The government will expend \$63,000 on improvement of roads and trails in Lassen forest. First work will be done on the Lyonsville-Mill Creek road.

The forest service has been notified by the commander at Mather field that because of lack of funds airplane forest patrol will not be continued this summer.

Yolo County grain men are planning to organize their own grain exchange to sell through the farm bureau instead of pooling with Solano County growers.

A cooperative grain elevator is being built at Lincoln, Placer County, to be used in marketing through the California Farm Bureau Elevator Corporation.

Sacramento canneries are putting up a big pack of spinach. One day last week four canneries packed 340 tons and shipped in crates out of the city 150 tons.

The committee of the California Wool Growers reports the railroads have agreed to give better accommodations for feeding and watering and faster time as a result of conference.

The California Bean Growers' Association has bought four acres of water front at Pittsburg, Contra Costa County, and will start at once building first unit of a warehouse and shipping depot.

Probably the most complete irrigation field laboratory in the West will soon be in operation at the University of California farm at Davis. The laboratory will be equipped to test and demonstrate practically all of the standard irrigation equipment and methods.

Central California

Orange Cove is sending out three cars of Valencias daily.

Rains and high winds have interfered with melon seeding in the Turlock section.

The Tulare County American Legion picnic will be held at Mooney Grove, May 7.

Gilroy, Hollister, Salinas, Monterey and King City will form a Chautauqua circuit this summer.

Fowler farm bureau is considering formation of an irrigation district between Selma and Fresno.

Annual May Day picnic at Los Banos will be largely attended by Merced and Stanislaus County people.

The seven mile stretch of paved road from Snelling to Hopeton bridge in Merced County is open for travel.

A complete farm survey is being made of the Owens Valley in Inyo County under direction of the farm bureaus.

Prospects are for a big year in the Yosemite Valley. Camp Curry opened April 28; there is still ten feet of snow on Glacier Point.

W. E. Hinshaw of Terra Bella has been selected to represent that district at the state olive growers' convention in Fresno this month.

Lindsay, Tulare County, now expects to ship something under 400 carloads of Valencias. This will be not more than 30 or 40 per cent of a crop.

The Stanislaus County farm bureau is sponsoring a plan for a great celebration of the Fourth of July at Modesto that will include all citizens of the county.

The Owens Valley Herald chronicles "More fine stock being shipped into this section this spring than has ever come in here before, most of it for dairy herds."

Snows in the high Sierra are so well packed that it is thought melting will be slow enough to prevent early floods and so keep up stream flow late into the summer.

Some Japanese berry growers are reported to be insistent on using half pint berry boxes prohibited by the state standardization law and threatening to take the matter into the courts.

Forty-five hogs were exhibited at Bishop, Inyo County, by the 23 boys and girls of the pig club. Average weight was 204 pounds, average age six months and ten days, net profit \$5.25 per hog.

Less than half a crop of apricots in San Benito County is estimate of Horticultural Commissioner J. O. McKinney, who, with Farm Adviser Tocher, has just completed general survey of fruit prospects.

Opponents of the Kern River water storage project are said to be approaching signers of petitions favoring the project and "informing" them that if the plan does not go through they will be obligated to bear heavy costs of preliminary work.

Contracts with olive growers of the state are now being mailed out by the organizing committee for the new olive growers association. At the same time meetings are being held in various centers of the state to acquaint the growers with the plans of the organization. Wm. Glass of Fresno is secretary of the committee.

Southern California

Banning Wild Flower Show, May 2 and 3.

Murrietta is becoming a poultry raising center.

Shipments of onions have started from Coachella Valley.

California Avocado Growers will meet at Pasadena, May 12-13.

Garden Grove Mutual Orange Association has been formally organized.

The Automobile Club of Southern California is charting water holes of Death Valley.

Lima bean planting is well under way along the coast, just beginning farther inland.

"More trout in Ventura County streams than for 15 years," says Game Warden Barnett.

The Whittier insectary is prepared to supply on request ladybirds predacious on mealybugs.

The second annual Perris Valley Livestock Day will be held at Sierra Vista Ranch May 12.

Eighteen citrus associations have agreed to aid in financing a soil laboratory for Orange County.

Citrus growers of the Pomona district gathered at Pomona, April 7, to discuss frost protection.

Imperial County supervisors have passed an ordinance limiting truck loads over county highways.

Citrus growers from all Southern California gathered at Covina last Saturday for the frost fighting meet.

One of the features of the Valencia Show at Anaheim, May 23-30, will be the industrial and automobile exhibits.

Coachella Valley growers have adopted U. S. grades for Bermuda onions. 2,400 acres have been planted in the valley.

Massmeetings of grain growers were held throughout Imperial Valley last week to explain operation of farm bureau exchange.

During March 1,114 cars of oranges were passed out of Los Angeles County packing houses by district horticultural inspectors; 968 were Navels.

A 40 acre tract at the southeast corner of E and Mill Streets in San Bernardino has been purchased for permanent home of the National Orange Show.

In spite of the freeze Highlands Exchange reports shipping 59 cars of Navels during March at an average price of \$5.22 per box f. o. b. East Highlands.

Supervisors of Los Angeles County have ordered survey of county to determine extent of eelworm infestation. Four inspectors have been detailed to the work.

The Citrus Belt Milk Goat Association at its last monthly meeting in Pomona decided not to hold a separate goat show but to exhibit at the Pomona fair in September.

An English buyer has been making contracts in San Bernardino County for oranges, dried and fresh deciduous fruits, especially Yucaipa Valley apples, for shipment via Panama Canal to London and Liverpool.

Supervisors of the 13 southern counties have united in effort to effect legislation on uniform weight for trucks. The state supervisorial association which will convene at Eureka in June will also take up the matter.

The Coast and General

Heavy snowstorms in England the last of March did serious damage to the lamb crop.

Idaho's spring lettuce crop will be placed on the market in June and early July.

A total of 43,521 cars of apples was shipped from the four Pacific Northwest states from July 1 to March 1.

Reports of frost damage to fruits in Missouri are now said to be exaggerated. Practically none will be lost from this cause.

The 436,000 acres of winter wheat seeded in Idaho last fall shows a condition of 92 per cent normal; last year at same time, 97 per cent.

In a special act of the New York legislature funds are provided for field experimental work on Long Island for study of soil problems of truck crops.

Threshing of the Argentine wheat crop is practically completed. Present indications are for an output of 154,873,000 bushels of generally good quality.

Headquarters for the newly organized Texas Melon Growers' Exchange will be located at Dallas. The exchange has contracted to deliver 5,000 carloads of melons this summer.

Southern Idaho is happy over receipt of news that the Idaho Central Railroad has begun construction on its line to San Francisco which will shorten the rail distance by 350 miles.

The Stevens County, Washington, potato growers association will this year market cooperatively through the farm bureau, which was very successful in its marketing operations last season.

The Georgia peach crop for the coming season is estimated by the railroads at 6,593 carloads. During the last few days of excessive heat there has been heavy drop of young fruit in all sections.

Tests made by cannery at Roseburg, Oregon, show very satisfactory method of canning broccoli. This will take care of the small and poorly shaped heads which find slow sale on the fresh vegetable market.

Wheat growers and shippers of Nez Perce, Lewis, Idaho and Clearwater Counties of Idaho and Asotin County Washington, organized at Clarkston recently to secure reduced transportation rates on farm products.

A "strawberry special" leaves Van Buren, Arkansas, every day during the season. It takes on berries through Arkansas and Missouri, is received at Kansas City and attached to fast freight for Chicago. The rate to Chicago is one cent per pound.

Dr. E. B. Osborn has resigned his position with the animal husbandry department of the Oregon agricultural college and as assistant state veterinarian will undertake control and cure of sheep scab, which has just broken out in central Oregon, between Bend and Paisley.

A conference of lumbermen, nurserymen and representatives of the state bureau of plant industry, farm bureau and university extension was held at Sandpoint, Idaho, in March to consider the control of white pine blister rust. It is proposed to establish three horticultural inspection stations at Sandpoint, Weiser and Pocatello.

This Month in the Ornamental Garden

Southern California

By Ernest Braunton

WHETHER or not we are to have summer in 1922 appears quite problematic. Up to present date we have no promise; no warm weather has yet been experienced. One local joker has said the present weather is like a Ford machine: just enough spring in it to make one tired. In the Cultivator's garden book it is written, in the work for April: "The warm sunshine at this season is peculiarly severe on young and tender plants, and the need for water to sustain this growth is great." It may do for May this year for in April the hot sunshine did not appear. We must assume that the gardening season this year is at least one month behind the average or normal.

It is feared that hot sunshine may appear suddenly and continue. If so, much injury may be done to bark and foliage, also to vigor of all plant life by reason of the unusual demands upon transpiration. The hot, desiccative air will pull the moisture out of the leaves very rapidly and the soil moisture must be in good supply to meet such demand. When hot weather comes sprinkling the soil surface will not do. The soil must be saturated down to the feeding roots. If water supply is carefully attended to, no harm will result and a splendid development of foliage and flower take place. Trunks and large branches not sufficiently shaded by foliage should be whitewashed on all save the north side; there it is not necessary, though not harmful.

Watch trees, shrubs and lowlier plants for insect pests and mildew. Mildew is hard to combat by the usual means—sulphur—for there has been no temperature high enough to generate the fumes. In England, a land of clouds and mists, yet of magnificent roses, the desperate gardener heats

bricks in the oven or elsewhere, places them under rose bushes and sprinkles sulphur thereon. It is said that sulphuric acid, one part to 1,000 of water, is a good cloudy weather spray for mildew. Where roses mildew badly every year it is far better to throw such plants away and try new varieties or increase the number of those proving immune. Some insects thrive best in cool weather and those we now have with us. Some will hatch only with summer heat. Watch for them.

To again return to watering, some injury may result from injudicious use of water. After foliage has developed under cloudy skies to large and soft growth, water upon it during hot sunshine may seriously injure it. Such treatment often induces mildew. When hot weather comes do watering, especially wetting the general surface, in the evening. The plants have then all the night in which to absorb moisture to meet the next day's ordeal with Old Sol. Mere sprinkling of foliage may be done in the morning before the sun rises. Do not let soil surface bake. Pulverize it after every irrigation. Hyacinths, narcissi and other "Holland" bulbs are past blooming, are making their annual growth, and will soon be ripening. So long as the tops are green new bulb growth is going on. As soon as tops turn yellow the bulbs may be dug, if they are to be dug, and properly stored. If not to be dug, cease watering and allow to dry and rest until autumn's rains awaken them. To store, pack in moist sand and place in a dark, cool spot, preferably a basement or cellar, but not where it is damp. As the sand dries the bulbs will cure and remain dormant until planted. Gardeners still plant such bulbs as amaryllis, canna, dahlia, gladiolus and tuberose. In beds of narcissi and Spanish iris (the former past blooming and the latter just commencing to bloom) the writer has flowering summer annuals which

are watered up to July each year. The bulbs are not in the least harmed and no better flowers of their kind are grown. Each spring, early, while all plants are dormant, the beds are raked off and two or three inches of well rotted stable manure is applied, the previous raking having broken up the soil surface finely. No other cultivation is given, yet for eight years the crop of bulbous flowers has been fine and the increase of bulbs good.

The lawn will need close attention now, especially as to water. Do not have a superficial coat of grass induced by daily light sprinkling. It requires lots of work, constant care, makes one almost a slave to the grass. Water only when water is needed and water so thoroughly that deep rooting is induced. Then if it is neglected for a few days during hot weather the grass will not suffer.

Northern California

By A. R. Gould

SPECIAL attention must be given to watering now as the strong winds leave the soil very dry and young plants are liable to suffer. Lawns will need a fertilizer as dressing, and a good application of guano or dried blood will help considerably. Hydrangeas, roses, heliotropes, fuchsias, etc., all need a fertilizer to help them produce fine flowers.

Vines

Roses, climbing varieties, if given liberal supply of manure and water, will make remarkable growth during the season. It is better to plant two to three year old stock and select the warmest position. Good climbing roses are Silver Moon, Cecil Bruner, American Pillar, Yellow and White Banksia, Ramona or Red Cherokee and Beauty of Glazenwood. Hiawatha and Tausendschoen are also splendid climbers. The mattress vine, Muehlenbeckia,

forms a thick wall. Passion vine comes in pink, scarlet and purple and will in a few years cover a large area. Honeysuckle and English ivy make excellent climbers for most situations. For covering cement or concrete walls ficus repens or the ampelopsis vetchii (Japanese ivy) both have the clinging habit and are very suitable. Clematis, cobeia scandens and wistaria will also prove useful for covering arches and pergolas.

Transplant Summer Flowers

The following should be planted out during this month in their flowering positions: Africa and French marigold, zinnia, aster, ageratum, cosmos, calliopsis, candytuft, godetia, centaurea, dianthus, larkspur, gaillardia, scabiosa, pentstemon, erigeron and lobelia. Transplanting must be done with care in early morning or late afternoon, but the young plants must be shaded from the hot sun during the day until they are established. Always have the soil fairly moist and water immediately after transplanting.

Dahlias

Planting of these should be completed this month, and where tubers were sprouted in boxes last month it will be possible to see how many eyes have started. Large roots may be divided, leaving one or two eyes to each. Examine young sprouts for aphids and spray before planting with weak solution of nicotine.

Chrysanthemums

Subdivision of the clumps may be undertaken now and cuttings placed in sand beds and kept shaded until they show signs of rooting. Seeds may be sown of the single types, and from these many interesting forms may be secured. The seed should be sown in boxes of sand and decayed leaf soil. In preparing new beds or borders for the chrysanthemums trench deeply with well decayed manure and apply a little lime.

This Month in the Vegetable Garden

Northern California

By A. R. Gould

THE rains have been very generous, and with a careful system of soil conservation the crops should be large. There is still time to plant more beans, cucumbers, corn, squash, tomatoes and melons.

Potatoes and Tomatoes

Keep the hoe busy between the rows of potatoes. Sturdy plants should be set four feet apart each way. Shade for the first few days after planting and water until well established. The best varieties are San Jose Canner, Ponderosa and Stone. Tomatoes thrive best on a fairly heavy soil and after the first few weeks need very little water.

Lettuce

Sow Los Angeles and Iceberg. The latter is especially adapted to hot weather. Cultivate frequently.

Beans

Successional sowings should be made this month of Golden Wax, Stringless Green Pod and Davis White Wax, all dwarf. Pole varieties to sow

now are Kentucky Wonder, Horticultural, Golden Cluster and Scarlet Runner.

Turnips

Sow early Snowball and White Egg. Purple Top White Globe is also a good main crop variety to grow. Thin out those previously sown.

Corn

Make successional sowing of Country Gentleman and Golden Bantam, also field corn, Yellow Flint and Golden Dent. Cultivate that sown last month.

Onions

Cultivate and irrigate thoroughly.

Eggplant and Peppers

Set strong plants 18 inches to two feet apart in rich soil, of the variety Black Beauty eggplant, and Chinese Giant and chili pepper.

Squash, Melons, Cucumbers

Thin to one or two strong plants to a mound and keep well watered for a few weeks.

Peas

Pick fully matured pods frequently. Sow now for late summer crop of Little Marvel, Melting Sugar and Alberman.

Celery and Leeks

Seedlings will need transplanting to other boxes during this month. Trenches should also be prepared with manure for later planting.

Berries

Cultivate and irrigate.

Southern Arizona

By M. E. Bemis

THERE is plenty of work for the home gardener during May, although the varieties of things to be planted are noticeably less than in the preceding months. Among those things which may be planted in May are casaba, pumpkin, peanut, squash, cantaloupe and Chilian watermelons. Some of the varieties of corn may also be planted such as the Pima and Papago. Mexican June corn has also been planted to a considerable extent as a garden plant for roasting ears, and climatic adaptations of this variety seem to be such that it may be planted almost any month from March to August.

The casaba is grown more extensively than formerly. Winter pine-

apple matures late and may be kept until well into the winter. When finally ripe, it is delicious in flavor.

Honey Dew has been planted as a general crop quite extensively and is being shipped out of the Salt River Valley in carload lots. This seems to fit in well with the cantaloupe growers and has found a place in eastern markets where it brings ready sales at good prices.

Late crops of watermelons, while perhaps not attaining the delicious flavor of the main crop, are always in demand both for home consumption and for local markets.

Pumpkins and squashes should be grown more extensively. They are easily grown, are valuable both for table use and for stock. The winter squash has never been grown as extensively as its merit would justify.

Last year E. F. Van Kirk of Phoenix had a small patch of winter squashes which matured along in July and August and were put on the market when there was more or less of a dearth of vegetables. These met ready sale at good prices.

Sweet potatoes should be put out and this is a crop which appears to

(Continued on Page 487.)

COMPARE THE PRICE OF Remco Tanks

With Prices of Metal Tanks of Same Capacity and You Will Find the Remco Redwood Tank Much Cheaper. It is Also Better and More Lasting

We will ship you, immediately on receipt of order, any standard Remco tank of the dimensions or capacities shown below at the prices here listed:

OUR ADVERTISERS RELIABLE
We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

It among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTE
It needs no Truth in Fabrics Bill to afford proof that our cover consists largely of virgin wool. Not an ounce of shoddy on the page. It is a scene in a county which is not generally considered a wool growers' county. For that reason it is proof of the wonderful diversity of California. Scarcely a county of the state but has at least a few wool growers, and they all add to California's material wealth.

By the way, what has become of the Truth in Fabrics Bill? Our "all wool goods" are still being offered to us, and we are accepting them, often notwithstanding a very large content of shoddy. Wool growers and wool consumers wish to be assured that our woofens are what "they" say they are, and, besides what we pay for. In other words, do we buy virgin wool or shoddy-wool or both? If both, tell us the percentage. So the producers secured the drafting of a bill which would compel common United States honesty. That bill is "having the time of its life" to even exist. It goes into

committee and out again and still never gets very close to passing. For long and weary months it has been bantered back and forth and we are still buying shoddy.

The "powerful and vicious" agricultural bloc hasn't yet been "vicious enough to get by with this most meritorious measure. Can it be that American manufacturers prefer to see under the principle "let the buyer beware?"

We seem to be born to fight. The citrus grower fights frost, heat, bug, fungus; the livestock man has his troubles, and the pear grower not only fights the thrips and a few other bugs but just at the present moment is continuing the ever present conflict with fire blight. Northern papers refer to the effective methods carried on at the James Mills orchards in Glenn County. As usual the blight is cut out carefully burned and the wound treated. Still there is an occasional attack on the trunk which sometimes entirely girdles the tree. In order to correct this there is resort to bridge grafting. Regarding this work:

"The bridge grafting work is elaborate. The treatment consists in first cutting out all the diseased portions of the tree and painting the wounds with oil of tar and salicylic acid. Then, to carry the sap over the place where the bark has thus been removed bridge grafts are put in place.

"Bridge grafting is not new, but this kind of bridge grafting, where scions six feet long are used, is quite novel. In the hands of the experts in the Mills orchard, however, the work has proved successful, and trees are saved at an average expense of 50 cents a year until their health is restored."

The Florida party arranging to come to California now plans to leave Florida on June 8. The excursionists call themselves "For California in 1922 Club." The club is organized with set of officers. The president is Dr. Mark Sample of Haines City; treasurer, W. B. Gray, Tampa; secretary, Edgar A. Wright, editor of the Florida Grower

In apples they used to say that California apples are not the equal of some of those produced in the East. However, there are only one or two states east of the Rocky Mountains which produce as many apples as does California, and California quality is one explanation why those apples are sent back and sold in Eastern apple sections in competition with the home grown stuff at much lower prices. Did anybody ever hear of New York apples coming in carlots to California?

It has been said that the best farm implement is the brain, but there are some awfully rusty implements on some farms.

Now stages must stop at railroad crossings. There have been some fearful accidents in California, and it is probable this is a wise ruling, but why pass it all up to the stages? Some states rule out the grade crossing entirely.

Poultry specialists suggest that "Biddies that turn to roosters should be given the ax." Feed is all too high to feed to the crowing hen. Give 'em the ax.

At a poultry culling school recently held in Ohio the attendants demon-

strated that the moment a hen stops clucking and begins crowing she stops laying. Do not tolerate the fat hen.

VALENCIA SHOW

Anaheim is completing its arrangements for the Valencia exposition which will open May 23. The management promises a magnificent exhibit of California Valencia oranges, in fact of all kinds of citrus fruits. Decorators are now at work and indications are for an "exceedingly rich, costly and beautiful display."

RADIO

Everybody is radiating radio. It's everywhere, in the air, even beyond. We are talking as to antenna cascade amplification, choke coil, detector, electron, ground inductance, loud speaker, resistance, vacuum tube, wave length and even henry. The weird, uncanny even absolute impossibleness of the whole thing appeals. We come to stare, then buy a few

this matter. What really is the matter with the California orange? Is it picked too green, in order that it may make the long journey East without actual disintegration? Or is it some flaw in the transportation facilities, something else to blame on the railroads? Or is it that California sends all her edible oranges through to New York, under the crassly mistaken impression that Ohio and other way stations are less important, less entitled to even-handed justice under the Stars and Stripes, less determined and ready to insist upon their constitutional right to the pursuit of happiness? Perhaps the tag-end of the Florida orange crop will last another week, but if at the expiration of that time we have not received a satisfactory explanation from Hiram Johnson, of the present low estate of the California orange, a humble apology for the past and the present, and a convincing promise of immediate and sweeping reform, we shall unlimber our heaviest guns and prove be-

ECONOMIC—NOT POLITICAL

The purposes of the farm bloc are economic, not political. It is striving for a more sensible program of national development in which agriculture will occupy its rightful position and be accorded the interest it deserves. Its aim is to bring about a better understanding and greater cooperation among all worthy elements of the population, to the end that all may be aided; and it will fight, and fight hard, to accomplish that aim. Farm bloc wants no special favors from the government for the farmer, but insists that the producer must have a fair share of the fruits of his labor if this nation is to prosper. Farm bloc deprecates class legislation and asks only that agriculture be put on a parity with other industries. Market manipulators and gamblers in foodstuffs have grown rich at expense of both producer and consumer.—Hon. Arthur Capper in the Senate of the United States.

spools, screws, wires and thingumbobs and listen in. The world do move. Bought your radio yet?

yond the possibility of cavil or peradventure of a doubt, that the full, damning responsibility rests with the California climate and that therefore there is no hope."

CLAREMONT CLUB MEET

The April meeting of the Claremont Pomological Club was held at the La Verne grammar school April 29, Mr. and Mrs. S. Ratekin being the hosts. The forenoon session was given to an address by C. E. Weatherby on "Current Events in Horticulture." After luncheon in one of the school-rooms, Z. T. Bell gave a description, assisted by a large chart, of his compressed hot air orchard heating system. This consists of a central plant in each ten acres, a heating plant with a 15 horsepower engine and an underground pipe system ranging from 12 inch down to six inch pipes on the outer range. The compressed hot air is delivered at every tree, alternate trees or rows, or as the owner desires. The air is discharged with great velocity at a high temperature, over 400 degrees Fahrenheit. But it cools very quickly and as it is not discharged against the tree no harm can result. A trial plant will be installed in the Pomona Valley in the near future under the direction of a local citrus association. It will be given a fair test and the public will be informed of its value and effectiveness. Ernest Braunton of the Cultivator staff followed with a talk on rose culture. Earl G. Dezell, manager of the California Fruit Growers Exchange gave an outline of what district representatives and individual members could do to further the interests, not only of the exchange members, but of all citrus growers. Judge Perry Wood of Claremont made an impromptu speech while the radio apparatus was being installed, and the meeting ended with a radio concert broadcasted by a Los Angeles department store.

AFFECTING OUR REPUTATION

California orange growers made an honest effort to preserve the reputation of their citrus fruits. After the night of January 19 it was realized that if every grower and shipper who lived in the "frostless belt" were permitted without any effort at standardization to ship their fruit to market a vast quantity of worthless fruit would be sent. Meetings were held, resolutions were passed, and standardization officials of the state department of agriculture, likewise county horticultural commissioners, all united in their effort to standardize. Shippers united and took the matter to the courts and reversed the action of the state and county governments, and there has apparently been some "rough work" done. We note in the Florida Grower the following: "The courts in California decided that the law pertaining to the shipping of frosted fruit, or at least some phases of it, were unconstitutional. No doubt much more frosted fruit has been shipped than would have been permitted had it been upheld. The following, from a Columbus, Ohio, paper, shows what the breaking of the dam has resulted in: "What is the matter with California, that she cannot put any juice into her oranges? This is the tail end of the Florida orange season, and yet two Florida oranges will fill an ordinary tumbler full of juice. It takes from four to seven California oranges, at 60 to 70 cents a dozen to accomplish the same feat, and even then the flavor is not particularly good. Seventy, or even 60 cents a dozen for California oranges is money under false pretenses. We are most serious about

Used by three generations —still 100% gun

THE sturdy Stevens shotgun made its first "kills" in the hands of our grandfathers. With it our fathers first experienced the joys of hunting. And today young men treasure it, not only for its past, but because right today, the good old Stevens still maintains its unbroken record for hard and straight shooting. In many cases we have found that identically the same gun has been handed down from grandfather to father to son. You can buy a more expensive gun than a Stevens; but you cannot buy better shooting qualities.

It's easy to prove the accuracy of a Stevens

Here's the test for a full choke: on a piece of paper draw a circle 30 inches in diameter; measure off 40 yards and fire into it. Your Stevens will throw an even pattern of 70% of the pellets into that circle. A Stevens modified choke will throw an even pattern of 50%. And a Stevens cylinder bore will throw an even pattern of 40%. Try it. Only a perfectly bored gun will meet this test. Stevens manufactures a complete line of small bore rifles and shotguns of every description. Ask at your dealer's or write for the interesting catalog describing in detail the complete Stevens line. Address:

WESTERN CANADA Land of Prosperity

offers to home seekers opportunities that cannot be secured elsewhere. The thousands of farmers from the United States who have accepted Canada's generous offer to settle on FREE homesteads or buy farm land in her provinces have been well repaid by bountiful crops. There is still available on easy terms Fertile Land at \$15 to \$30 an Acre —land similar to that which through many years has yielded from 20 to 45 bushels of wheat to the acre—oats, barley and flax also in great abundance, while raising horses, cattle, sheep and hogs is equally profitable. Hundreds of farmers in western Canada have raised crops in a single season worth more than the whole cost of their land. With such success comes prosperity, independence, good homes and all the comforts and conveniences which make life worth living. Farm Gardens, Poultry, Dairying are sources of income second only to grain growing and stock raising. Attractive climate, good neighbors, churches, schools, good markets, railroad facilities, rural telephone, etc. For illustrated literature, maps, description of farm opportunities in Manitoba, Saskatchewan, Alberta and British Columbia, reduced railway rates, etc., write GILBERT ROCHE 3-5 First St., Sheldon Block, San Francisco, Cal. Authorized Agent, Dept. of Immigration and Colonization, Dominion of Canada 160 ACRE FARMS IN WESTERN CANADA FREE

The Value of Thinning Fruit

WE find in a Tasmanian Fruit Grower of last fall a timely article—for our Antipodes—on thinning of apples. This article was written by a member of the staff of the Oregon agricultural college and now travels north again to meet our spring thinning season:

Thinning apples in the early summer will do more to increase the size and color of the fruit and the total value of the crop than any other operation supplementary to common orchard practices. It is also the most satisfactory as well as profitable way to prevent loss of branches from breakage on trees bearing full crops. Although it will not increase the vigor of the tree it will be a very important factor in maintaining that which the tree already has.

Thinning of the fruit becomes necessary whenever the activity of the tree is too largely consumed in the formation of fruit buds and the production of fruit at the expense of wood growth, a condition brought about by an oversupply of air foods as compared to the soil foods. The young, vigorous tree comes into partial bearing, then into full bearing and finally overbears before it is forced into the

habit of alternate bearing. A tree that overbears is undervigorous and carries a large number of very slow growing fruit spurs that seldom bloom and when they do bloom never set fruit, another large number that bloom and bear and very few that are vigorous, making a good growth, that do not bloom.

Practically all apple trees that are consistent annual bearers have 25 per cent or more of their fruit spurs too vigorous each year to form fruit buds. This will insure enough vigor in the tree as a whole to make a good annual growth, with a good number of new spurs forming fruit buds on the one year old wood. This condition cannot be brought about in overbearing trees by thinning the fruit, no matter how severe the treatment. The trouble is more deeply seated than this year's crop of fruit. It is an unbalanced relationship of the "soil foods" and the "air foods," with the latter greatly predominating. This unbalanced condition may be of short or long standing, but continually growing worse as the natural tendency of the tree is to increase rather than to diminish it.

The effects of thinning may be a big factor in keeping young, vigorous

trees from forming the alternate bearing habit, but it is not enough to get trees with the habit established back into annual bearing. It will help to conserve the vigor already there, but it will not instill new vitality into the tree. The greatest benefit from thinning will be on this year's fruit. It will pay big dividends on the increased size and color of the fruit and continue to pay for years to come on the branches saved from the breaking that so often takes place in heavily loaded trees. Time will be saved in the picking, grading and packing of the crop, equal at least to that required for thinning.

The most economical time to do this thinning is immediately after nature has done her thinning. At this time most of the apples left will mature and one need not hesitate to do all necessary thinning at one time. It is far cheaper to remove all surplus fruit the first time over the trees than it is to make two or more thinnings. In practice all imperfect fruit should be removed. Each cluster should be reduced to not more than one fruit, and then enough others removed until those remaining are at a desirable distance apart. Variety as well as vigor of the tree should be considered in determining the right distance apart to leave the fruit. On vigorous trees the smaller varieties will net most if left six or seven inches apart,

while eight or ten is none too far for the large varieties. These distance should be increased an inch or two whenever the tree shows lack of vigor.

The time required to do this work will vary with the size of the tree as well as set of fruit. Trees capable of bearing three or four boxes of marketable fruit will require about one-half hour—those equal to ten boxes in the neighborhood of one hour and those of 15 to 20 boxes' capacity will require from one and one-half to two hours each. In removing the fruit the hand is much more rapid than thinning shears and should be used with all varieties excepting the very short stemmed ones and those clinging very tenaciously to the spur. Of all orchard practices that tend to increase the size and color of the fruit, thinning is the only one under the complete control of the grower. It is sure to increase the value of the crop with the least drain upon the tree.

SMOKE CANDLES TO PREVENT FROST INJURY

Writing in *Giornale di Agricoltura della Domenica*, I. Zannoni says:

The material left over from the war has been used in the most different manners, and agriculture has not been the last to profit by it. In the English munitions depots there are certain contrivances which were intended to hide the troops at the moment of assault by generating dense clouds of smoke that formed an efficient screen allowing the soldiers to carry out their maneuvers freely.

There were known as smoke generating candles; during the time they burnt, which was six to eight minutes they produced a dense smoke, that extended along the ground and rose to a greater or less height according to the atmospheric conditions. These so-called candles consist of a cylindrical tin box eight centimeters in diameter, and 14 centimeters in height, they weigh $\frac{1}{4}$ kilogram, and are ignited by friction.

When the candle is lighted it burns under considerable pressure, which carries up the smoke to the height of one to two meters, producing a grey gas that is perfectly innocuous, as the author tested by standing in the midst of the smoke for some minutes. He inhaled it without experiencing the smallest inconvenience. There is thus no fear of the presence of poisonous gases that might injure the plants, as might have been expected.

It thus seemed possible that these smoke generating candles could well be used instead of the smoke producing fires lighted by agriculturists in spring, when they fear the effect of white frost upon the crops, especially the most susceptible ones cultivated in kitchen gardens, orchards and vineyards.

The experiments lately carried out by the author at the English camp at Rivalta di Scrivia show that there is every reason to believe that the innocuous gas generated by these smoke producing candles would afford efficient protection to crops when their young buds are threatened with injury by the early morning frosts.

The smoke of the candles forms dense clouds, which can protect the plants for half an hour at least, the exact time depending upon the wind and the hygrometric condition of the air. Therefore, if they were lighted from time to time during the hours when frosts were to be apprehended they would hinder the formation of hoar frost and prevent any fear of injury. The efficacy of smoke in protecting crops from frost has been tested already in many localities, where it has long been the practice to light fires of straw. The smoke generating candles should be placed on that side of the field from which the wind is blowing; they should be put in a single line and from 20 to 30 meters apart. Fresh ones ought to be lighted every half hour or oftener, according to atmospheric conditions. The author proposes to continue his experiments.

The executive committee of the Pine Flat irrigation district has voted to exclude the Mendota district from the project. Date for fixing the boundaries of the project district is set for May 10.

The annual farm bureau conference tour will visit the Southern California egg laying contest at Pomona, May 8.

Titan 10-20 - - - - - \$700

International 8-16 - \$670

With Free P & O Plow

(Tractor and Plow f.o.b. Chicago)

Free Plow Offer Good 20 Days Longer to Offset Late Spring Season

In many sections heavy rains and a tardy spring have delayed tillage and planting beyond the point of safety. Now extra power and help must be put to work to make up for lost time. Hundreds of farmers who did not intend buying a tractor this spring will find in the Titan or International tractor plowing outfit the answer to their big problem.

Our original Free Plow Offer was advertised to close on May 1, as that is ordinarily the end of the heavy tillage season. But after weeks of delay thousands of acres remain untilled, and an unexpected need has developed for Titan and International tractor power.

To keep in line with the unusual season we have instructed the McCormick-Deering Dealer in your locality to extend our Free Plow Offer for 20 days. Until May 20 you can buy a Titan or International tractor at the present low prices, and receive a free plow or tractor disk harrow as outlined in our original Free Plow Offer announced February 3, 1922.

Unseasonable weather has created a real emergency that can best be met with good tractor power. Every hour saved now means dollars at harvest time. See the McCormick-Deering Dealer today.

GRAIN GROWERS REORGANIZE

The recently organized Grain Growers, Incorporated, through its committee, consisting of President Gustafson, Vice President Mason and Secretary Myers, has issued the following statement:

The newly incorporated U. S. Grain Growers' Sales Company which will handle the grain of the members was given careful consideration by the new board and action taken to establish operating offices in the various terminal markets at the earliest possible date. It is fully expected that this company will be in a position to market grain in several of the large markets within 90 days.

We expect to follow the same policy this year as in the past with respect to our relationships with other organizations. We will continue to sell our own goods and let the other fellow sell his. We are anxious to cooperate and work in harmony with every other farmers' organization, but we are determined that the ideal of the Farmers Marketing Committee of Seventeen for a national program of cooperative grain marketing shall not be defeated. While we will attempt to make use of every existing farmers' terminal marketing organization we will not do so at the expense of sacrificing the original plan of the committee of 17. We are convinced that that plan is fundamentally sound and that it will succeed.

The prospects for success were never brighter than at this present time. Several dark clouds which have threatened the organization during the past year were blown away during the convention. We are meeting the new year cheerfully and optimistically and with full confidence that the American grain grower will see realized his dream of a more efficient and equitable system of grain marketing. Now that our course is definitely charted, we feel that we are in a better position to ask for the support of all grain growers.

The board of directors and officers of the U. S. Grain Growers take this opportunity to express their sincere gratitude and to thank all farmers and farmers' organizations who have consistently and loyally supported this work during the past year. We trust that our efforts will merit confidence and continued support during the coming year. With the support of grain growers, the U. S. Growers, Inc., will develop a system of marketing that will be of lasting benefit to American agriculture.

CONTROL OF CUTWORMS

By A. J. Basinger, California Department of Agriculture

"Cutworms" is a general term applied to the larvae of a family of moths known as Noctuidae. The adults are inconspicuously colored, brownish or grayish moths having the forewings usually mottled and the hind wings of a lighter, uniform color. They are about one inch long, with a wing expanse of two inches.

The larvae, or caterpillars, are also grayish or brownish and often somewhat mottled or striped. They are plump, feel rather greasy to the touch and have the habit of curling into a close spiral when disturbed. A full grown larva is nearly one and one-half inches long.

The life history in a general way is similar for all the species. The winter is either passed as a partly grown larva or pupa. The adults emerge in April and May, and being night fliers are seldom seen. The eggs are laid on the stems of small plants, grass or limbs of trees, the young caterpillars feeding on the nearest succulent food at hand. When full grown they go into the soil one or two inches to pupate and the next brood of adults emerges in two or three weeks. There are several broods in the course of the summer.

Vegetables, grass, grain, vineyards and orchards are attacked and often seriously damaged. A species hibernating in the larval stage sometimes infests vineyards early in the spring. During the daytime the worms hide away under the loose bark on the vines or crawl into the soil, and at night come out to feed on the buds, destroying them before they have grown into shoots.

The most widely practiced control consists in the use of poison bait made up the same as for grasshoppers after

the following formula: White arsenic, 1 pound; molasses (cheap blackstrap), 2 quarts; lemons or oranges, 6 fruits; water (about) 4 gallons; bran, 25 pounds. Stir thoroughly arsenic and water, grind lemons in a meat grinder and add to this liquid, then slowly pour the mixed solution over the bran and stir thoroughly until an even mixture is secured.

Scatter the poison bran mash freely over the infested plants. In vineyards

where the larvae do not leave the vines during the day but hide under the bark a little of the poisoned bait may be placed in the crotch of the vine.

When the foliage of vines, fruit trees and vegetable crops is attacked, arsenical sprays may often be used to advantage. For this use arsenate of lead (paste), 5 pounds; water, 100 gallons, or arsenate of lead (powdered), 2½ pounds; water, 100 gallons.

Where only a few trees or vines are concerned they may be protected by banding with tanglefoot or a belt of cotton. A cotton band about six inches wide is placed around the tree or vine and tied with the string around the lower edge. The band is then folded down over the string.

Cantaloupes are expected to be ready for carload shipment from the Paio Verde Valley by June 25.

Exide

BATTERIES

The impulse to fly

The propeller revolves and, like a liberated bird, an airplane soars into space. The spark of ignition comes from an Exide Battery used in so many of our airplanes.

Not only in the air, but on land and sea and under the sea, Exide Batteries play an active part in the affairs of men. They propel submarines when beneath the surface; they run the locomotives used in mines; and on the land Exide Batteries drive street vehicles, supply the current for the telephone system, operate fire alarms and railway signals, and fill many other vital needs.

In building rugged batteries for farm light and power plants experience counts heavily. A great majority of all such plants are equipped with Exide Batteries.

Many a farmer learns of Exide's dependable power through the battery in his car. And he learns that the Exide saves him money because it does not get out of repair and because it outlasts other batteries. Do not put up with battery troubles when there is an Exide made for your car.

The Electric Storage Battery Co.
Philadelphia

Service Stations Everywhere
Branches in Seventeen Cities

The nearest Exide Service Station has a battery the right size for your car. If your present battery needs repairs, no matter what make it is, it will be repaired skilfully and reasonably. If not in your telephone book, please write us for the address.

THE LONG-LIFE BATTERY FOR YOUR CAR

Citrus Diseases

By Ernest Branton

THE Los Angeles County farm advisor has been holding a series of ten field demonstrations on citrus tree diseases and their treatment. Gum diseases, scaly bark, etc., have had their scrapings, parings and paintings, and badly injured roots have had the injured parts sidetracked or ignored by inarching with seedling trees, three or more, according to size of tree treated.

These meetings were for the most part, conducted by V. F. Blanchard and K. O. Ryerson of Mr. Hodgson's staff. The citrus talks were given by Mr. Blanchard, who stated the demonstrations and treatments were along the lines laid down by Dr. Fawcett of the Riverside citrus experiment station. Two root diseases are very prevalent, and in some sections the oak root fungus (*Armillaria mellea*) is the worst. This is an edible mushroom or toadstool, but is the bane of the orchardist. Aside from the citrus, it attacks nearly all deciduous fruit trees, and in the forest, oaks, chestnuts, plums, cedars, etc. In the vineyards it lays waste the grapevines and has been known to feed upon potato crops.

The first manifestation in the orchard is a sickly yellow appearance of the foliage and the dying of certain branches. When in the last stages trees often bear very heavy crops though not of high quality. If the soil is cleared from the base and main roots it will be found that the bark is rotten and can easily be peeled off, and sometimes the white fungus may be seen lying between bark and wood. Just below, the affected roots will show the rhizomorphs, or strands like small shoe laces, running over the surface. Sometimes they follow roots clear to the end and then attach themselves to other roots with which they come in contact and so reverse the point of attack. The trouble may then be said to be resident in the soil and in plowing the orchard one is apt to help distribute the disease or parasite.

The treatment urged is digging out the tree and roots so far as is possible, and sterilizing the soil. This is done by digging holes 18 inches deep, 18 inches apart, and pouring in one and a half ounces of carbon bisulphide. Trees badly affected are doomed; nothing can save them. When one or

more trees are affected it often stems the spread to dig a trench three feet deep around the affected area, throwing the soil always on the inside. In addition to this some growers put in a sheet of tarred building paper three feet wide and replace the soil. The trench should be dug again every six months, the sole purpose being to cut off extension of the parasitic mycelium.

Foot rot is not a serious trouble except in the older orchards where lemon or sweet orange stock has been used. The remedy is to open roots and trunk base to air, cut and scrape affected area and paint with Bordeaux paste. In crown rot the bark cracks and an amber gum exudes. Cut out the affected portions and apply Bordeaux paste. Moist soil about trunk favors the disease, and the most susceptible point is the union between bud and stock. Shellbark of old lemon trees is another serious trouble and works much like scaly bark. The method of treatment is the same as for scaly bark but more accentuated and thorough.

On April 27, at the Dennison ranch, Duarte, a tree was examined that was inarched by Farm Advisor Hodgson of Los Angeles County a year ago after it had been completely girdled by a gopher. The work was done with three seedling trees of three-eighths caliper. The operation was entirely

successful. The tree is now in fine health and full of promise.

WHAT WILL THE 1922 HARVEST BE?

REPORTS which have come in from various sections of California have been most helpful to fruit growers in giving advance hints of production conditions. It is plain that the frost has materially reduced the apricot crop. It is also plain that brown rot is working havoc in some sections. But even yet it is impossible to give reasonably close estimates as to tonnage.

Frost injury in the vineyard will materially lessen the raisin output, but this reduction will not be so serious as last year. Quoting from the reports received during the past few days:

Aratus Everett, Ventura County

In Moorpark and Simi valleys the apricot trees that were thrifty and came into full bloom about 10th inst. dropped from big bumper outlook for crop to a 15 per cent estimate from frost damage of five or six consecutive days, the morning of 11th inst. of 27 degrees temperature finishing the frost damage. Walnuts were damaged in some localities. Apples, pears and prunes were yet dormant and escaped serious damage. Apricots and walnuts are the only commercial tree products that we rely on here. Apricot trees that were backward in blooming may have 50 per cent crop. High on hilly localities were only damaged slightly.

E. W. Dutton, Horticultural Commissioner, Mendocino County

Apples, 100 per cent; cherries, 100 per cent; peaches, 50 per cent, frosted; pears, 100 per cent; prunes, 100 per cent; grapes, 100 per cent. April 16. We are going through a very cold spell, our blooming is very late. Our fruits survive this period will have biggest crop in history.

H. H. Sherrard, Horticultural Commissioner, Tuolumne County

Almonds, good. Apples, good. Apricots, good. Cherries, good. Peaches, good. Pears, good. Prunes, good. Grapes, good.

D. F. Norton, Horticultural Commissioner, Nevada County

Almonds, not grown commercially. Apples, buds not commenced to swell yet; big crop of buds. Apricots, not grown. Cherries, too early for estimate. Peaches, large crop buds just turning pink. Pears, immense crop of buds just breaking. Prunes, plenty of buds not open yet. Grapes, too early for estimate.

George Threlkel, Mountain Fruit Company, Placer County

Almonds, full crop. Apples, full crop. Apricots, half crop. Cherries, full crop. Peaches, full crop. Pears, full crop. Plums, full crop, except some early varieties like the Satsuma, Wickson and Hermosa. Based on present conditions, all fruits have set remarkably full, but as the season will be at least two weeks later than usual, it is yet too early to make definite predictions.

G. H. Flournoy, Horticultural Commissioner, Tehama County

Conservative estimates modify early reports of frost damage. What percentage of fruit has been killed, it is impossible at the present writing to estimate, owing to so many conflicting reports. The amount of damage to citrus trees is not nearly as great as was supposed, and trees that have not been severely cut back too early in the season are now putting out new growth from most of the limbs, in many instances to their very ends. Lemon trees were hurt worse than any others but, like the orange trees, those that had not been cut back are showing considerable new growth.

E. B. Beeton, Beaumont, Riverside County:

In my former report I referred to April frosts, continued low temperature and lack of sunshine which had somewhat of a serious influence on the early development of deciduous fruits. The following conclusions may be of interest:

Almonds, 60 per cent of normal. Apples will undoubtedly be a light

Allwork Kerosene Tractor

It has been our aim, regardless of first cost, to have produced a tractor which was so well built that with an annual adjustment it would work through the complete season without ANY breakdown. The hundreds of satisfied Allwork owners in Southern California will tell you how well we have succeeded.

Isn't it remarkable that of the hundreds of Allwork tractors in California there never has been one traded in or discarded for another make of tractor?

crop, but what they lack in quantity will be made up in quality. Cherries blossoming heavily, but Royal Ann is not setting well. We will pass them along with this prediction that they will qualify for 90 per cent normal. Bartlett pears are looking well, clusters of blossoms large and even. Early Keifers set are dropping badly. However, as a reward of merit we will give the pear family credit for 90 per cent of normal. Apricots, 40 per cent. Peaches, 50 per cent. Prunes, 70 per cent. Grapes, 80 per cent.

Berries? Well, I had strawberries with cream today from my garden patch.

Oxnard Courier, Ventura County

When frosts are prevalent in April they are usually not very severe, that is, the temperature in the principal walnut sections seldom drops below 28 degrees. When the temperature in a clean cultured grove drops to 32 degrees it will usually drop to 28 or 29 degrees in an adjoining grove which is still carrying a growing cover crop.

Subsequently the lesson to be learned from this season's spring frost is that cover crops, even if immature, should be turned under before the trees emerge from their dormant condition. Growers in every district should give careful consideration to this suggestion, for although certain of us may have been fortunate enough to have escaped any frost damage this season, the spring frosts are usually freakish and they may be severest next time in the sections that escaped this season.

A very typical and convincing illustration of the effects of frost on a clean cultured grove as against one carrying a green cover crop was observed in one district where two groves adjoining with but road between, showed in the instance of the grove still carrying the cover crop an admitted damage by the owner of fully 50 per cent, and a possible damage of even more than that, while the other grove was about an inch more where the cover crop had been turned under ten days or two weeks previous showed no damage at all, and a quite thorough examination failed to devel-

op a single frozen nut or frozen leaf, both leaves and nuts being badly frozen in the grove still carrying a heavy cover crop.

Winters Dried Fruit Company, Winters

We have reached the time of the season when we feel that we can make report of crop conditions without further deductions. We passed through an unusually cold winter; rainfall to date 18 inches, the bulk of this falling since the first of the year. All trees bloomed heavily and early indications were for extraordinary crops. Setting, however, of apricots and almonds reduced the prospects to about 75 per cent on apricots and 60 per cent on almonds. Cold snap with killing frost commencing April 13 and continuing for three or four days damaged apricots and some almonds, some sections suffering more than others. The season is about ten days late. Give below estimate, 100 per cent normal:

Almonds, Hatch varieties, 50 per cent; other varieties, 40 per cent. Apricots, 60 per cent. Peaches, 90 per cent. (About 500 tons green acreage in last few years considerably reduced on account of sunburn and old trees.) Pears, 100 per cent. Prunes, 75 per cent. Grapes, figs, shipping fruit prospect looks favorable for normal yield.

Sydney J. Stokes, Horticultural Commissioner, Lake County

Pears, 100 per cent. Prunes, 90 per cent. Peaches, apricots, cherries, 50 per cent. Almonds, 70 per cent. Grapevines almost a month late in starting out and not affected by recent frosts. Orchards in very fine condition generally, with exceptionally heavy blossom. As peaches, apricots, cherries, etc., are very lightly planted, their partial loss amounts to very little, the main crop, consisting of pears and prunes, looks very encouraging.

GARDEN ACTIVITIES FOR MAY IN SOUTHERN ARIZONA

(Continued from Page 481.)

be growing in popularity among truck farmers. The yams seem to be more popular, yield splendidly and the qual-

ity is fine. Growers last year who were in position to place their potato crop in storehouses where they could be cured properly, realized good prices.

A late crop of cantaloupes might be planted for the home garden.

The gardener is reaping the benefits of early work in the harvesting of many crops in May, such as beets, carrots, lettuce, garden peas, etc. The ground used for these should not be allowed to grow up with unsightly weeds which absorb much water, do no good, and in maturing seeds cause endless trouble.

If it is felt that it is desirable to keep something growing on the land, cow peas may be planted any time during the summer, and this is a crop which adds nitrogen to the soil and in turning over will add humus which is so requisite to our Southwestern soils. A crop of cow peas might, in some cases, be worth all it costs to grow the peas alone, either as a vegetable, or harvested for seed or grain. The most valuable use, however, for cow peas for the garden is for turning under as a green crop for fertilizer. Where no crop is grown preparation can be made now for the fall crop by spreading manure, plowing under and keeping down weed growth.

IRRIGATION OF POTATOES

Irrigation of potatoes has been carried out for the past 12 years at the Oregon experiment station under conditions where rainfall for the growing season, April 30 to October 1, is 5½ inches, and the average evaporation about 24 inches for the period. The silt loam on which these experiments were conducted has a maximum capillary water content of about 34 per cent, an optimum moisture content of about 24 per cent and a wilting point of about 14 per cent. The minimum moisture content under field conditions is 10 or 11 per cent.

The most economical returns were secured with light frequent irrigations, which provide a uniform moisture content, for example, 1 inch every 10 days has given good results and is practicable, and much preferable to one heavy irrigation. The best results were obtained when the depth applied per season was 6 inches in wet seasons and 2 or 3 inches in dry seasons, while the maximum yields were produced with 3 or 4 inches in wet and 6 inches in dry seasons. Application of 9 inches depth decreased the yield.

Applying water in furrows 10 to 18 rods long has proved a suitable length of run for the silt loam. It was found disastrous during the experiments to neglect cultivation after irrigation. Water requirements can be greatly reduced in irrigation farming by keeping up a good rotation, including legume crops; by using good varieties; by maintaining a good fertility and tilth, and by irrigating at the right time in the proper amount.

Proper irrigation does not injure the palatability or marketability of potatoes and after 12 years there was little appreciable effect upon soil acidity or the content of available plant food. From the various determinations made, it appears that the moisture content is not appreciably increased by irrigation, except when applied in excess and then the potatoes had a less firm skin and were less solid. Proper irrigation decreased the percentage of culls.

In central Oregon experiments potassium sulphate increased the yield per acre from 24½ bushels on untreated to 39 bushels on treated land.

In eastern Oregon irrigation of 5 to 9 inches depth per acre has given the best results in several of the potato producing sections, and frequently best returns have been obtained with 6 to 8 inches total depth, applied in 2 or 3 doses.

PLANTSMAN TO EUROPE

On May 25, Jacob Dieterich, for 30 years a nurseryman in Los Angeles, will start on a tour of European plant nurseries, to be gone several months. Mr. Dieterich, who came from Germany when a boy, will spend the greater part of his vacation in his native country.

The second annual Pacific Slope Dairy Products Show will be held at

Fresno in connection with the district fair, September 23-30.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When queries are wished in Cultivator address query to 317 Central Ave., Los Angeles.

Property Overassessed

There are many property owners in this vicinity who have been badly overassessed. We have exhausted all means with the local authorities and wish to know if the matter may be placed before the superior court. If so, in what manner? And what would be the result?—Subscriber, Santa Rosa.

Unless there is some action on the part of the board of equalization which is deemed either fraud or greatly in excess of its jurisdiction no action would lie in the superior court. The proper assessment of property must be determined somewhere, and the law has given this final determination to the board of equalization. Of course it is possible that under certain rare circumstances some proceeding in the superior court might be available, but you should see some local attorney as to that matter.

Easement for Road

I purchased land from a neighbor's wife on contract. It was her separate property. The contract contains a clause to the effect that a strip of

land along the south side of tract is reserved for road purposes. Can this land be deeded to my neighbor? Has he any right to fence it in, remove fruit trees or pick fruit? Can he refuse me the right to use a bridge crossing this land?—Subscriber, Paradise.

Usually such reservations simply create an easement in the land, that is to say, the fee title of the land is conveyed but the right to use the surface of the land for road purposes is reserved. No one else, therefore, could acquire any interest in this land or to anything growing thereon, but would have solely the right to pass over it. Such action as stated on the part of your neighbor could be restrained or he could be held liable in an action for trespass. It may be, of course, that on reading the whole contract it might be found that the reservation could be so construed that the land described therein would not pass, in which event the conditions would be reversed and you would have the right of ingress and egress but would have no interest in the land.

Drainage Ditch Filled

A ranch was subdivided and sold. Originally drainage ditches ran along natural channels through this ranch. The land which I purchased formerly drained through a ditch on land which is now owned by a neighbor. He has filled up this old drainage ditch and refuses to permit drainage through it.

At the time of purchase the ditch was represented as being one into which my land would naturally drain. The subdivider reserved the right to enter and construct drainage ditches. What can be done?—Subscriber, Los Banos.

It would seem that if you can establish the fact that this ditch was formerly used for a drainage ditch while the lands were all in the ownership of one party and this ditch was in existence at the time when the lands were conveyed to you and to your neighbor and that this drainage ditch is necessary and has always been used for the drainage of your lands that you could require the neighbor and possibly the subdivider to maintain this drainage ditch in the form and manner in which it had at all times been employed. There are several cases along that line.

Personal Community Property

If all property is community property has either the husband or wife the legal right to give away or otherwise dispose of any of the household furniture, furnishings or utensils without the consent or against the wishes of the other?—Subscriber, Ripon.

The husband has the management and control of the community personal property with like absolute power of disposition other than testamentary as he has of his separate estate, provided however, that he cannot make a gift of such community personal property

or dispose of the same without a valuable consideration or sell, convey or encumber the furniture, furnishings or fittings of the home or the clothing or wearing apparel of the wife or minor children without the written consent of the wife. Under the foregoing section of the code of course the wife could not dispose of property without the consent of the husband.

Support of Mother

A father has never contributed to the support of his daughter but made his mother support her. Now he refuses to care for his mother and says that his daughter is equally responsible. The daughter has no property and is married. There is another child by the father's second marriage. Is not this son responsible? The father has some property. What can the mother do to obtain support? He refuses to take her into his home.—Subscriber, Chino.

It is the duty of the father and mother and the children of any poor person who is unable to maintain himself by work to maintain such person to the extent of their ability. This is the rule of the code and, as is seen expressly places the obligation upon the person called the father in the foregoing case, but not upon the grandchildren. The mother will unquestionably be entitled to bring action in the superior court to force the father, that is to say, her son, to support her, and as he has property the court would unquestionably give judgment sequestering sufficient of his property to enforce payment of the judgment.

Loan to Ex-Service Man

If an ex-service man has already purchased a farm, upon which he has a mortgage, could he procure a loan to pay off the mortgage from the state, that is, if the people favor the issuance of bonds in the November election?—Subscriber, Point Reyes.

It is probable that such an arrangement could be made although the law deals with purchase and sale of real estate. It would seem that the applicant in this case could sell the property which he owns to the state welfare board and repurchase it from the board upon the contract as provided in the act. That matter, however, would have to be taken up with the welfare board after the result of the November election is known.

Queries Answered

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Grafting Plum

Referring to Lodi subscriber's query regarding grafting scion or bud upon a Wickson plum tree ten years old and in full bearing for pollenization purposes, I will say he would find such procedure a losing operation for the reason that the sap of the cut off limb would naturally be quickly absorbed by the remaining limbs and at best the growth of scion would be weakly unsatisfactory and not answering the purpose for which it had been inserted. Far better that he do as you suggest, viz., plant a Climax tree, even though in place of a Wickson to be removed.—F. R. Weidenmueller, Whitier.

Fresh Manure Direct to Alfalfa Field

I have 30 acres of alfalfa and 25 dairy cows. Will you kindly tell me whether it would hurt the alfalfa to spread the green manure on it as I haul it from the corral and milking

SATISFACTION

BEFORE your grain can be marketed, it must be threshed, and nothing brings greater satisfaction than a threshing job well done. Good, clean, fast threshing, day after day, without loss or delay, and at low cost, requires certain important qualities in a machine. All these qualities are found in Case threshers. This is proved by their eighty year record in the hands of farmers and threshermen everywhere. Today, Case machines thresh more of the world's grain than any other make, because they excel in these qualities.

They Save The Grain—From the feeder to the windstacker all parts work as a unit in threshing and saving all the grain.

They Thresh All Grains and Seeds—There is not a seed or grain grown that cannot be threshed, cleaned and saved with a Case Thresher. Everything necessary to handle any kind of grain can be furnished.

They Clean Thoroughly—The moment the grain leaves the cylinder Case separators begin the work of cleaning, and continue it until the grain is delivered in prime condition for marketing.

They Are Easy to Operate and Adjust—Changing a Case from one grain to another usually requires not more than three simple adjust-

ments which can be made without stopping the machine.

They Are Durable—The average life of a Case Thresher is easily 20 years. Most of the first steel threshers we sold in 1904 are still in use and good for many more years. Our present machines are even more durable.

Because of these and other, good qualities, Case Threshers give universal satisfaction to threshermen and farmers alike.

There are seven sizes of Case Threshers, 20x28, 22x36, 26x46, 28x50, 32x54, 36x58 and 40x62.

Interesting new booklets on the advantages and money making possibilities of Case Threshers are now ready. Write for your copy.

When Writing Advertisers Please Mention Cultivator.

barn, or would it be beneficial?—Sub-
scriber.

We surely would apply the manure
as suggested. Of course there is a
limitation in application, but well dis-
tributed there could be no harm, and
irrigation would tend to distribute
and make available without any loss to
the fertility. If it is strawy it might
be well to rake over before the alfalfa
starts to grow. Of course there is one
objection in that fresh manure carries
a percentage of weed seed which thor-
oughly rotted manure does not but
where the hay comes from one's own
place this matter is under control.
Some writers maintain that fresh
manure has a greater content of or-
ganisms which are effective in causing
desirable chemical changes of organic
matter in the soil. Especially with the
heavier soil the fresh manure is the
more efficient. On the other hand, on
light sandy soil a very heavy applica-
tion of manure during hot and dry
season may ferment and cause in-
jury.

Vine Cutter

Can you give us the name and ad-
dress of manufacturers of a portable
"vineyard vine cutter"?—Subscriber.

As far as we know there is no sat-
isfactory machine for cutting or shred-
ding vine prunings. The power re-
quired to operate such a machine is
so great that it ordinarily puts it out
of the portable class. The cost of han-
dling and hauling the prunings is so
great that they cannot well be taken
to a stationary machine since their
actual fertilizer value is not great
enough to pay a return on this cost.—
F. K. H.

Grapes on Alkali land

I would like some information on
grapes. I have 40 acres and it is not
good for much of anything else due
to content of alkali. Will Muscats
thrive in such location and are they
hard to get started?—Subscriber,
Huntington Beach.

It would not be wise to plant grapes
of any variety on land so alkaline that
it will not produce other crops prof-
itably.—F. K. H.

Percentage of Loss in Dairy Cows

A subscriber wishes to know as to
percentage of annual loss in dairy
herds. We will be glad to hear from
subscribers who have had years of
experience in dairying. Meantime, the
question was referred to George E.
Platt of the Los Angeles Creamery
Company. Mr. Platt writes:

"One can only give an estimate as
the variation is so great, both in years
and the care of cows given by various
dairymen, that it is almost impossible
to give even an approximate average
of the loss. With the writer it has
run as high as 41 per cent and as low
as 9 per cent, the high year being
caused by an attack of anthrax and
the low year being an unusually suc-
cessful year after several bad ones,
when in all probability we had cleaned
out or lost nearly all those with weak
tendencies and having left only those
with strong vitality. In our judgment,
the average herd will, if kept up to a
high state of productiveness, lose
about 20 per cent yearly.

Avocado in Solano County

Could the avocado be grown outside
successfully for family use in Solano
County, or is it a tropical fruit only?
Please describe its makeup. If I have
the correct information its outside re-
sembles a melon, inside filled with one
hard seed nearly as large as a base-
ball. Meat inside is like a coconut.
The fruit I remember was in Cuba
and it was sure delicious.—Subscriber,
Fairfield.

No, the avocado is proving to us

The worst roads won't break your eggs if you have Hasslers!

YOU can take a basket of eggs over
the roughest roads in your Hassler
equipped Ford or Dodge Brothers car
and be sure, if you take care, that the
usual breakage will be greatly reduced.

Hasslers smooth out the roads for you.
They stop bad jolts at the axle. They act
instantly to check the rebound when your
springs start to toss you from your seat.
They prevent sideways and accidents.

With Hasslers your car stays tight longer.
You have less rattles, less trouble. Your
repair and upkeep expenses are reduced.
The blows on your tires are not so heavy
and you get more mileage. The saving
often pays for Hasslers in a single year.

Hassler service is made possible by the
unique design, the splendid material and
the accurate workmanship. Be sure to get
Hasslers if you want Hassler results.

You can test Hasslers ten days at our
risk. Ask your dealer.

ROBERT H. HASSLER, INC.

Indianapolis, U. S. A.

ROBERT H. HASSLER, LTD., Hamilton, Ontario

At what age should you take needless risks with your health?

Is that a queer question?

Then many people are doing a queer thing—and often it turns out to be a serious thing.

The Federal Bureau of Education says in its rules for the health of school children that children should not drink coffee or tea. This rule is based on the well-known fact that the drug element in coffee and tea whips up the nerves, and that serious ills often follow.

If it's a good rule for children to keep away from the harm of nerve-stimulation, isn't it a good rule for everybody?

Think it over.

Granted that your body may *stand* more, can your judgment afford to *risk* more? Any doctor can tell you what coffee and tea often do to the health of adults as well as children.

There's no sacrifice in being safe. Postum is a delightful, satisfying mealtime beverage, wholesome and pleasant alike for adults and children. Postum has no age limits!

Your grocer has both forms of Postum: Instant Postum (in tins) made instantly in the cup by the addition of boiling water. Postum Cereal (in packages of larger bulk, for those who prefer to make the drink while the meal is being prepared) made by boiling for fully 20 minutes.

Postum for Health

"There's a Reason"

Made by Postum Cereal Co., Inc., Battle Creek, Mich.

this year that it has a very strong dislike to freezes or even ordinary frosts. But few orchards in most protected sections of Southern California escaped any serious damage from this season's cold. It is barely possible that in Solano County one might build a frame around the tree and give a limited protection and produce a tree which might live to fruiting age. If a trial is made, however, be sure and get the Mexican type and not the West Indian, as the former is less susceptible to cold. In appearance the avocado is round, egg or pear shaped, smooth or rough skinned, green, brown or purple in color. Seed is in center of fruit, flesh lying between seed and skin.

Tourist Nuisance

I live on a ranch some distance from public thoroughfare but am pestered with sightseeing auto drivers who have no regard for our privacy or property. I have a private drive signboard at the bottom of my driveway, but they pay no attention to it. Isn't there some way to prosecute for trespassing as well as property damage?—Subscriber, Glendora.

California always has a warm welcome for the tourists visiting the state. This welcome has been so general that a few of the tourists presume that it is due them under all circumstances and to any extent. We think, however, they are not so much to blame as are some real estate agents who drive them about in the effort to make sales, and in order to create a cordial feeling often give away that which is not theirs. The time was when an orange orchard might be invaded by a load of tourists and literally dozens of valuable fruits carried away. This loss during the season sometimes aggregated boxes or even loads. Growers united in a protective league and caused some arrests and posted many notices of "No trespassing!" This in part corrected the evil. But where our rights are violated our only recourse is to ask officers of the law to protect our property.

Green "Ladybugs"

My chrysanthemums last year were very much bothered with green ladybugs while blooming. I gave the plants plenty of water. They did not bother the plants, just the flowers. Would like to hear of some help, for I am afraid they will spoil them again this year.—Subscriber, San Juan Bautista.

As to green ladybugs there "aint none." Ladybugs or ladybirds are nearly always beneficial and a friend of man and of woman. One of our warmest friends is the little orange colored "Ladybird-ladybird-fly-away-home" type of insect. Presumably, the insect referred to by our subscriber, while green, will be found to possess 12 black spots geometrically arranged over its back. It is called the western 12 spotted beetle, or, to be entirely correct, *Diabrotica soror*. This little pest will vary in length from an eighth to a quarter of an inch and causes serious loss in the garden. Some of the more resistant plants may be sprayed with arsenate of lead, but on cucumbers and some other plants care must be taken not to burn the foliage. Mix the arsenate of lead in water at the rate of six pounds to 100 gallons of water.

Thornless Blackberries

Kindly tell me what is the best way of growing Burbank Thornless blackberries. Mine were planted in March, 1921 and have made a good growth. Would like to know if it is necessary to prune and how it ought to be done. Recently people have told me that Burbanks do not bear until three

years old. If so, what can I do, if anything, that they may bear sooner?—Subscriber, Tulare.

Burbank Thornless will bear the second year if pruned heavily, otherwise not until the third year. In this respect it is decidedly inferior to the Cory. It is best to grow on a wire trellis and cut all old canes off at roots and last season's canes to four feet long. The laterals on these should be shortened to one foot. Each year repeat this pruning, leaving only last year's canes, as these bear the berries. The Burbank bears well only with severe pruning, and no other factor will so directly contribute to an early crop.

KILL JACK FROST

(Continued from Page 479.)

which there were many. We believe that as a rule the feeling prevailed that if frost fighting is to be done it will probably have to be with equipment very similar to that which has succeeded most completely during the past ten years. But as that equipment has required large investment of capital and at the same time has not been as efficient as desired there was continual asking for that which will be better. But when investigators made a showing by the use of charts and drawings of equipment which would cost a thousand or more dollars per acre to install the growers would come back with some remark similar to that of one who asked "If you should install this plant would you want all of my place in payment for it or would you be content with only a part of the ranch?" Such remarks were frequent and the speakers soon learned they must take more or less heckling.

At an equal cost of installation and operation—and, of course, with equal efficiency, there is strong preference for "smudgeless equipment." The loss and the discomfort from the pall of smoke which covers everything when a whole community gets into action with orchard heaters is not to be ignored. At the same time merchants and home makers realize that an industry of such great value as that of the citrus must be preserved. Hence the Covina convention was attended not only by orange growers but by people of all professions and callings. The banker and others realize as never before that the problem is one which concerns them as much as it does their neighbor, the orange grower. There is as yet but little talk of willingness to cooperate, but we believe when the time does come for action that other interests will aid in the campaign. Any small community confronted with the possibility of a \$3,000,000 fire loss would not commit so suicidal an act as to go quietly on without providing some means of effectively fighting fire and in addition would carry practically \$3,000,000 of insurance on all those risks. Yet our infinitely more valuable citrus properties are left unprotected and unsecured, with the commercial interests saying, "Let the grower protect himself."

On the grounds in front of the assembly hall were a large number of heaters of almost every conceivable type. Most of them were oil burners. There was the old lard pail type with the partial cover. There were the usual forms which have had use for half a dozen or even a dozen years. There were many modifications. There were cartridges of shavings and mill refuse saturated with heavy oil. There were briquettes and coal with different types of heaters for handling them. There was only one air agitator or suction fan appliance. This operated on the principle of an electric fan arranged in the bottom of a smoke stack with downward suction, the idea being to draw down the upper strata of air and distribute horizontally at the ground surface.

The afternoon session was given to discussion and study of engineers' designs or charts of the Cobb temperature regulator, the Whitlock frost control, the Ross frost prevention, the Fugit frost control, McKenzie control, the Algero control and the Bell control described by Mr. Bell of San Bernardino. The forenoon was given over to the discussion of "Practical Results with Heaters" by C. A. Griffith

Thru-Car Service
for shipments of
**Household Goods
and Automobiles**
—to and from Eastern and Pacific Coast Points

Suppose you were moving to Chicago, New York or Kansas City and your goods occupied but a portion of a freight car—by loading the balance of the car with other people's goods destined for the same locality the car is designated "thru freight," and is not side-tracked to unload part of its cargo at some way station.

This means—

**QUICK TRANSPORTATION at
REDUCED RATES**

A saving of from ten to thirty per cent. is effected, according to the size of the shipment,—because, handling is minimized and you get the benefit of a consolidated carload rate.

Motor Troubles Ended

New Invention Creates Wonderful Spark—Doubles Power, Makes Winter Starting Easy—Stops Oil Pumping—Eliminates Carbon—Saves Gas—Free Trial Offer.

Any car owner who is bothered with a motor which pumps oil, foul spark plugs, wastes gas or carbonizes badly can stop these troubles by using a remarkable device called Warren Transformers, perfected by W. H. Warren, a Kansas City motor expert.

In two minutes a boy can attach Warren Transformers. Then you will be amazed to see your car go whizzing up hills on high where you formerly had to shift gears. You will also notice a big increase in your mileage and instant starting in coldest weather. Spark plugs that formerly fouled and cylinders that pumped oil will be clean and dry and fire with full power.

If you want to save 25 to 50% on fuel and repair bills, be rid of missing cylinders, dirty plugs and carbon, have a quick start in coldest weather and pep on hills, write the Warren Mfg. Co., 203 Gray Building, Kansas City, Mo., and a set of Warren Transformers will be sent immediately, with the understanding that they do not cost you a cent if not entirely satisfactory.

So confident is the Warren Mfg. Co. that Warren Transformers will more than delight you that they offer to send a \$4 set for only \$2. This is a special introductory offer, good for only a few days, and readers should take advantage of it immediately.

Send No Money with your order—just your name and address, name of car and number of cylinders. Warren Transformers will be sent immediately. When they arrive merely pay the postman \$2 and postage. Use them 10 days. If not satisfactory return and your money will be refunded. Write today. End your motor troubles. This offer fully guaranteed.

of Azusa; "Thermometers in the Orchard" by Dr. Ford A. Carpenter; "Orchard Heaters" by E. W. Dunn.

After the address of welcome by Mr. Rinehart of Covina, Chairman Crawford proceeded to pull off the program in a snappy way which gave opportunity to bring out a great fund of information in a short time. We hope to give more detail as to the addresses made at this convention in later issues of the Cultivator. We will give next week a greater part of Dr. Carpenter's discussion on thermometers. Dr. Carpenter has made extended investigation as to their dependability or lack of dependability.

COMMERCIAL FERTILIZERS

The state department of agriculture is issuing Special Publication No. 18, "Commercial Fertilizers." It is written by Geo. P. Gray and Geo. E. Colby. It is principally made up of list of fertilizer manufacturers who are selling in California, with analysis of their fertilizers as made in the laboratories of the department at Sacramento.

The duties of the state officials charged with the administration of the fertilizer laws are:

To issue certificates of registration to manufacturers and dealers who have complied with the law by filing sworn statement of the composition and sources of the fertilizers they wish to sell.

To inspect and take samples of any lot, parcel or package of fertilizer or material or mixture of materials used for manurial purposes.

To analyze these fertilizers as found in the open market by inspectors and publish the results for the information of the public.

To analyze and report from users' samples of fertilizers.

The function of the fertilizer control is first of all to protect the consumer by requiring the manufacturer to live up to his own set standards of guarantees. To protect the legitimate licensed manufacturers and dealers against those who try to sell fertilizers outside the law. To promote harmony in all phases of fertilizer dealings among consumers, manufacturers and those charged with the control work.

During the year 1920-21 42 firms and others have registered under the fertilizer law.

IMPLEMENT ASSOCIATION FORMED

At a meeting held at the Bellevue Hotel, San Francisco, on Monday of this week the Tractor and Implement Club was organized with the following officers and directors: H. V. Carter, H. V. Carter Co., president; B. M. Davis, Oliver Chilled Plow Co., vice-president; W. V. Freeman, president Pacific Implement Co., secretary. The following were elected as board of directors: W. M. Criswell, International Harvester Co.; Geo. Brackett, Yuba Products Co.; Professor L. J. Fletcher, University of California; Thos. R. Browne, Cushman Motor Works, Stockton.

Manufacturers and dealers in farm implements and tractors are eligible to membership and are earnestly invited to join the club. Meetings will be held on the second Tuesday of each month and matters pertaining to farm machinery equipment will be considered. It is the object of the club to cooperate with users of farm machinery to the end that more and better service may be secured by owners.

IMMUNITY FROM FROST

An inspection of the J. H. Walker avocado orchards on Las Palmas Avenue, Hollywood, disclosed but four trees injured by frost, and these four are West Indian species. None of the Guatemalan type suffered damage, even the Sharpless had not a leaf "scorched." On the other hand, orchards of the same varieties higher up against the foothills in localities considered far more immune to frost injury were visibly damaged in foliage and young wood. The explanation is that the Walker orchard is in a very windy belt, a strong breeze blowing nearly all the time, night and day. This but proves the contention of many careful observers that air currents are a vital factor in protection against injury by frost.

flavor

Flavor is *everything* in chocolate. Yet flavor is a spirited, "runaway" thing. Constant "watch" must be held over it. So much do we think of the flavor of Ghirardelli's Ground Chocolate that not only do we watch it carefully in the blending—but we pack it only in cans to safeguard it every step of the way. That's why Ghirardelli's protects and preserves its flavor until the last spoonful is used.

Household Department

REQUESTED POEMS

MANY requests have come to the household department to reprint old poems. Here are a number; some we could not find.

In the Days of Forty-Nine

Will you please publish in your paper the poem, "In the Days of Forty-nine," with the author's name?—Subscriber, Visalia.

FORTY-NINE

By Joaquin Miller

We have worked our claims,
We have spent our gold,
Our barks are a-strand on the bars;
We are battered and old,
Yet at night we behold
Outcroppings of gold in the stars.

When the rabbits play,
Where the quail all day
Pipe on the chaparral hill;
A few more days,
And the last of us lays
His pick aside and all is still.

We are wreck and stray,
We are cast away,
Poor battered old hulks and spars;
But we hope and pray
On the judgment day,
We shall strike it up in the stars.

Though battered and old,
Our hearts are bold;
Yet oft do we repine
For the days of old,
For the days of gold,
For the days of 'Forty-nine.

Twenty Years Ago

Can you give me any information whereby I can find the words or music to the old time song, "Twenty Years Ago"?—Subscriber, Marysville.

TWENTY YEARS AGO

By Francis Huston

I've wandered to the village, Tom, I've
sat beneath the tree,
Upon the schoolhouse playground, that
sheltered you and me;
But none were left to greet me, Tom; and
few were left to know,
Who played with us upon the green, some
twenty years ago.

The grass is just as green, Tom; bare-
footed boys at play
Were sporting, just as we did then, with
spirits just as gay.
But the "master" sleeps upon the hill,
which, coated o'er with snow,
Afforded us a sliding place, some twenty
years ago.

The old schoolhouse is altered now; the
benches are replaced
By new ones, very like the same our pen-
knives once defaced;
But the same old bricks are in the wall,
the bell swings to and fro;
Its music's just the same, dear Tom,
'twas twenty years ago.

The boys were playing some old game,
beneath that same old tree;
I have forgot the name just now—
you've played the same with me—
On that same spot; 'twas played with
knives, by throwing so and so;
The loser had a task to do,—there twenty
years ago.

The river's running just as still; the wil-
lows on its side
Are larger than they were, Tom; the
stream appears less wide;
But the grapevine swing is ruined now,
where once we played the beau,
And swung our sweethearts,—pretty girls,
—just twenty years ago.

The spring that bubbled 'neath the hill,
close by the spreading beech,
Is very low,—'twas then so high that we
could hardly reach;
And, kneeling down to get a drink, dear
Tom, I started so,
To see how sadly I am changed, since
twenty years ago.

Near by that spring, upon an elm, you
know I cut your name,
Your sweetheart's just beneath it, Tom,
and you did mine the same;
Some heartless wretch has peeled the
bark, 'twas dying sure but slow,
Just as she died, whose name you cut,
some twenty years ago.

My lids have long been dry, Tom, but
tears came to my eyes;
I thought of her I loved so well, those
early broken ties;
I visited the old church yard, and took
some flowers to strow
Upon the graves of those we loved, some
twenty years ago.

Some are in the churchyard laid, some
sleep beneath the sea;
But few are left of our old class, except-
ing you and me;
And when our time shall come, Tom, and
we are called to go,
I hope they'll lay us where we played,
just twenty years ago.

"I Have a Covenant With Death"

Will the Cultivator send in a poem beginning "I have a covenant with

death"? I do not know the author.—Subscriber, Fowler.

We wonder if the following is the poem wanted:

I HAVE A RENDEZVOUS WITH DEATH

By Alan Seeger

I have a rendezvous with Death
At some disputed barricade,
When Spring comes back with rustling
shade
And apple blossoms fill the air—
I have a rendezvous with Death
When Spring brings back blue days and
fair.

It maybe he shall take my hand
And lead me into his dark land
And close my eyes and quench my
breath—
It may be I shall pass him still.
I have a rendezvous with Death
On some scarred slope of battered hill.
When Spring comes round again this
year
And the first meadow flowers appear.

God knows't were better to be deep
Pillowed in silk and scented down,
Where love throbs out in blissful sleep,
Pulse nigh to pulse, and breath to breath,
Where hushed awakenings are dear—
But I've a rendezvous with Death
At midnight in some flaming town,
When Spring trips north again this year,
And I to my pledged word am true,
I shall not fall that rendezvous.

'When Pa Begins to Shave'

When I was a little girl I used to
recite "When Pa Begins to Shave." I
would like very much to get it again
and am asking this of you as I notice
you are very kind in searching for-
gotten literature for your patrons. We
have been readers of the Cultivator
for many years and will be very much
obliged to you if you can give us this.
—Subscriber, Fresno.

WHEN PA BEGINS TO SHAVE

By Harry Douglas Robins

When Sunday mornin' comes around
My pa hangs up his strop,
An' takes his razor out an' makes
It go c'flop! c'flop!
An' then he gits his mug an' brush
An' yells to me, "Behave!"
I tell y'u things is mighty still—
When pa begins to shave.

Then pa, he stirs his brush around
An' makes th' soapsuds fly;
An' sometimes, when he stirs too hard,
He gits some in his eye.
I tell y'u, but it's funny then
To see pa stamp and rave;
But y'u mustn't git ketched laffin—
When pa begins t' shave.

The hired hand, he dassent talk,
An' even ma's afeared,
An' y'u can hear th' razor click
A-cuttin' through pa's beard!
An' then my Uncle Bill, he laffs
An' says, "Gosh! John, you're brave!"
An' pa, he swears, an' ma jist smiles—
When pa begins t' shave.

When pa gits done a-shavin' of
His face, he turns around,
And Uncle Bill, he says, "Why, John,
Y'ur chin looks like plowed ground!"
An' then he laffs—jest laffs an' laffs,
But I got t' behave,
'Cos things 's apt to happen quick—
When pa begins to shave.

Parody on Maud Muller

Could you kindly publish a "Parody
on Maud Muller" that starts like this?
"Maud Muller on a summer's day
Mounted her wheel and rode away."
And oblige.—Subscriber, Orland.

MAUD MULLER A-WHEEL

By S. E. Kiser

Maud Muller, on a summer's day,
Mounted her wheel and rode away.

Beneath her blue cap glowed a wealth
Of large red freckles and first rate health.

Single she rode, and her merry glee
Frightened the sparrow from his tree.

But when she was several miles from
town

Upon a hill slope, coasting down,

The sweet song died, and a vague unrest
And a sort of terror filled her breast—

A fear that she hardly dared to own;
For what if her wheel should strike a
stone!

The Judge scorched swiftly down the
road—
Just then she heard his tire explode!

He carried his wheel into the shade
Of the apple tree to wait the maid.

And he asked her if she would kindly
loan
Her pump to him, as he'd lost his own.

She left her wheel with a sprightly jump
And in less than a jiffy produced the
pump.

And she blushed as she gave it, looking
down
At her feet, once hid by a trailing gown.

Ingersoll Watches

The Utmost in Value

MORE than merely low price sets Ingersoll apart from every other watch. There are other low-priced watches. Ingersoll watches are reliable, sturdy, honestly good-looking, as well as sold for so little money. Your dealer will show you the complete line.

Announcement

By an arrangement completed on March 31st, the Ingersoll assets were purchased by the Waterbury Clock Company. Thus Ingersolls are now marketed directly by the manufacturers, who have made Ingersolls from the beginning.

Then said the Judge as he pumped away,
"Tis very fine weather we're having
today."

He spoke of the grass and flowers and
trees,
Of twenty-mile rides and centuries;

And Maud forgot that no trailing gown
Was over her bloomers hanging down.

But the tire was fixed, alack-a-day!
The Judge remounted and rode away.

Maud Muller looked, and sighed, "Ah
me!
That I the Judge's bride might be!

"My father should have a brand new
wheel
Of the costliest make and the finest
steel.

"And I'd give one to ma of the same de-
sign
So that she'd cease to borrow mine."

The Judge looked back as he climbed the
hill
And saw Maud Muller standing still.

"A prettier face and a form more fair
I've seldom gazed at, I declare!

"Would she were mine and I today
Could make her put those bloomers
away!"

But he thought of his sisters, proud and
cold,
And shuddered to think how they would
scold

If he should, one of these afternoons,
Come home with a bride in pantaloons!

He married a wife of the richest dower,
Who had never succumbed to the bloom-
ers' power;

Yet oft, while watching the smoke
wreath curl,
He thought of that freckled bloomer girl;

Of the way she stood there pigeon-toed,
While he was pumping beside the road.

She married a man who clerked in a
store,
And many children played round her
door.

And then her bloomers brought her joy!
She cut them down for her oldest boy.

But still of the Judge she often thought,
And sighed o'er the loss her bloomers
wrought.

Or wondered if wearing them was a sin,
And then confessed: "It might have
been."

Alas for the Judge! Alas for the Maid!
Dreams were their only stock in trade.

For of all wise words of tongue or pen,
The wisest are these: "Leave pants to
men."

Ah, well! For us all hope still remains,
For the bloomer girl and the man of
brains.

And, in the hereafter, bloomers may
Be not allowed to block the way.

OUR BABY COLUMN

By Mrs. M. S. Sirdevan

While I am on the subject of diet I
wish to give a recipe for Boston Brown
bread, as children are very fond of it,
and it is very nourishing.

Boston Brown Bread

One cup corn meal, one cup whole
wheat flour, one cup Graham or bran,
three-fourths tablespoon soda, one and
one-half teaspoons salt, three-fourths
cup sorghum or molasses, two cups
buttermilk or sour milk. Mix well
and put into buttered baking powder
tins and steam two hours or longer.
Raisins may be added to part of this
mixture providing the child is over
two years of age and masticates his
food well. Two simple and nourishing
desserts are prune whip and apple
snow.

Prune Whip

One cup prune pulp (prunes cooked
and rubbed through a coarse sieve),
whites of two eggs, one teaspoon sugar.
Beat the whites stiff and add prune
pulp gradually. Serve with cream.

Apple Snow is made the same way,
using one cup apple sauce instead of
prune pulp, and serve with a boiled
custard.

Boiled Custard

Two cups scalded milk, yolks of
three eggs, one tablespoon sugar,
pinch salt, one-half teaspoon va-
nilla. Beat egg slightly, add sugar
and salt, stir constantly while adding
hot milk. Cook in double boiler, con-
tinue stirring until mixture thickens
and a coating is formed on the spoon;
chill and flavor. When eggs are
scarce use yolks of two eggs and one-
half tablespoon corn starch.

Plan Baby's Care

Please tell me how I can make the
care of my baby easier! I seem to

Work---Food Time

Men now need foods that *energize!*

NOW'S the season when men need *energy* to withstand the hard work
of the long farm day. And *work-foods*—foods that provide this energy
—should be the rule at all farm tables. For food is the body's *fuel*.
Work burns it up and it must be renewed in full each day.

Raisin pie is the great American energy-dessert.

A great morning fruit dish
is stewed raisins served with
cream. Rich in energy and
iron. A fine laxative effect.

Raisin Pie

2 cups Sun-Maid Raisins,
1½ cups boiling water, ½
cup sugar, 2 tablespoonfuls
cornstarch, 2 tablespoonfuls
lemon juice, 1 tablespoonful
grated lemon rind, juice of 1
orange, 1 tablespoonful
grated orange rind, 1 cup
chopped walnuts.

Cook raisins in boiling
water for 5 minutes, pour
into it sugar and cornstarch
which have been mixed.
Cook until thick, remove
from the fire and add other
ingredients. Bake between
two crusts. Walnuts may be
omitted if desired.

All measurements for this
recipe are level.

Blue Package (seeded) best
for pie and bread.

Raisins furnish 1,560 calories (a unit of food
value measurement) of energizing nutriment per
pound—more energy than eggs, milk, potatoes
and most meats supply.

So a luscious raisin pie is ideal at this time.
Also rich in food-iron—good for the blood.

Digestible because the raisin's pure fruit-sugar
is in practically predigested form.

Men feel the refreshment from it almost
immediately after eating. They'll thank you for
a pie like this.

Try making one according to recipe printed
here, using your own delicious crust. The juice
forms a luscious sauce. It makes a perfect pie.

SUN-MAID RAISINS

Always ask for *Sun-Maid*
Raisins, produced from Cali-
fornia's choicest table grapes.

Tender, thin-skinned, juicy
—the finest raisins grown.

Prepared and packaged in
a great modern glass-walled
plant in a famous California
valley, they come to you im-
maculate, wholesome and al-
ways good.

Raisins are 30 per cent
cheaper than formerly—see
that you get plenty in your
foods.

Seeded, blue package (*seeds*
removed), best for pie and
bread; Seedless, red package
(*grown without seeds*), best
for stewing; Clusters (*on the*
stem). A delicious quick
dessert.

Your grocer has them. Ask
for the *Sun-Maid* brand.

* * * *

Mail coupon for *free book*
of more than 100 tested
recipes for nutritious raisin
foods.

make such hard work of everything.—Neighbor.

Have you your things conveniently arranged? In the bathroom let me suggest a rack over the tub so that the baby's tub may be placed on that

and save stooping. Even after the children are older and bathe in the large tub they can stand on this to be dried and dressed. One can buy tables to dress a small baby on, but I have a chest of drawers just the right height

and width. In one corner I have my toothpicks, cotton, oil, powder and vaseline, and in the drawers below are the diapers, shirts, stockings, dresses, etc. I have a paper bag hanging near in which I throw all pieces of used cotton gauze, etc., and this is burned every day and a clean bag put in its place. This is more sanitary than a waste paper basket and much easier to dispose of.

In this way a baby can be bathed and dressed in less than 20 minutes, and you haven't moved more than three or four feet from the tub to the chest of drawers. Have everything ready before you get the baby.

HOUSEHOLD QUERIES

Vegetable Turkey

I wonder if any of The Cultivator subscribers are in possession of a recipe for vegetable turkey. Many years ago I attended a Thanksgiving dinner and the turkey consisted of a squash stuffed and dressed and roasted with different vegetables, fruits and nuts. I remember that there were bananas and carrots, but I cannot recollect just what other vegetables and fruits were used. Please give full directions just how to proceed and how long to roast.—Subscriber, Arcata.

Here are directions for mock turkey which may be of use to subscriber. We do not know of a recipe including fruits: Four cups breadcrumbs, four cups chopped walnuts, four cups boiled rice, 12 hard boiled eggs, chopped, six raw eggs, two tablespoons grated onion, salt, pepper and grated nutmeg to taste.

Put breadcrumbs in saucepan with four cups water and cook a few minutes. Add hard boiled eggs. Take saucepan from fire and add nut meats and rice. Mix well, add raw eggs, slightly beaten and seasonings.

Form this into shape of turkey, reserving portions for legs and wings. Take two tablespoons of mixture in your hands and press into shape of leg. Put piece of dry macaroni into it for bone and fasten to turkey. Do other side same way. Form remaining portions into small pieces looking like wings. Brush over with melted butter or fat and bake slowly one and one-half hours. Serve with cranberry sauce. If carrots are liked we would suggest substituting two cups of finely chopped cooked carrots for two cups of rice. Bananas are delicious served with roasts of any kind. Skin, remove strings, lay whole in roasting pan about roast, baste when basting roast, like potatoes. Put bananas in 30 minutes before roast is done, one at least for each person served.

Variety of Salads

I would appreciate any recipes for salads of any kind. I have boarders so like to have salads. I have the recipes for salad dressings.—Subscriber.

Substantial Salads: Cooked Baby Lima or Red Kidney beans, minced onion, dash paprika, teaspoon mayonnaise.

Diced, cooked potato, minced parsley and green onion, teaspoon mayonnaise.

Cottage cheese, mashed with sour cream or mayonnaise, minced green onion, dash paprika on top mayonnaise or French dressing.

Head lettuce cut as for slaw, sliced hard boiled eggs, olives, teaspoon mayonnaise on top, dash paprika.

Mold thoroughly cooked rice. Sprinkle over grated sharp cheese, garnish with two or three strips cooked pimiento, teaspoon mayonnaise on top, dash paprika.

Cottage cheese mixed with cream and chopped green onions, cooked string beans on each side, teaspoon mayonnaise or French.

Pieces cooked cauliflower marinated in French dressing. Sprinkle grated sharp cheese over top, dash paprika, teaspoon mayonnaise.

Diced cooked carrots, peas, minced onion, olives, teaspoon mayonnaise.

Half ripe banana, chopped nuts, teaspoon mayonnaise.

Diced banana, apple, orange or grape fruit, teaspoon mayonnaise.

Sliced tomato, lettuce, hard boiled egg, minced onion, mayonnaise.

Leftover spinach (put through sieve), asparagus, potato, cauliflower,

pickles, olives, meats or fish of any kind may be put through fine cutter of food chopper and blended with mayonnaise. Place in neat mound on lettuce leaves or sliced or whole tomato, garnish with strip or two pimiento, an olive, add teaspoon mayonnaise and dash paprika.

Green Salads: Sliced fresh cucumbers, thoroughly mixed with sour cream dressing.

Lettuce cut fine as for slaw with strips canned or fresh pimiento, olive. Lettuce, tomatoes, cucumber onions.

White or red cabbage, cut very fine as for slaw, sour cream dressing.

Chinese cabbage, cut fine, olive mayonnaise.

Whole tomato, hollowed stem and filled with mayonnaise or chopped celery, apple, green onion blended with mayonnaise.

Fruit Salads: Oranges or grapefruit or combination, peeled, all white skin removed, broken into sections, skin removed from sections. Serve with French dressing.

Oranges, apples, bananas, with French, olives.

Slice pineapple. Grate over sharp cheese, add teaspoon mayonnaise.

One-half canned pear, white grapes or plumped seedless raisins, slice pineapple, maraschino cherry.

Canned fruit salad now comes in several brands. To it may be added fresh oranges, apples, bananas, grapefruit, etc.

Plumped seedless raisins will be found a delicious addition to many fruit salads.

Combinations pleasing to the taste are almost endless. The main point in salad making is to use only crisp, fresh material, cut everything cleanly, using sharp knives, put on garnishing and dressings daintily. No salad should look messy.

Collection Cowboy Songs

Would like to know where I can buy one of those books containing cowboy songs published by Sturges & Walton.—Subscriber, Hanford.

Why Hundreds of Farmers Use Motorcycles for Business Errands

SHORTENING the trip from farm to town—saving time on every errand to store, post-office, railroad station, creamery or to neighboring farm—saving most of the wear and upkeep expense on automobile—that's the job of the Harley-Davidson on the farm!

There's no end to the work you can do with a Harley-Davidson. In use 365 days a year—easy to handle—master of roads that would stall an automobile—big carrying capacity in the roomy side car—no wonder this sturdy, dependable, wonderfully durable machine is a real profit-earner on so many modern farms!

50 miles for a dollar—gas, oil, tires and all. Think of it! You owe it to yourself to get the facts. Write us today for FREE, illustrated literature, and reduced prices.

Attractive dealer proposition for unassigned territories. Address Desk A-2.

Earl J. Sturgis, manager of the Fred Hartsook ranch at Lankershim, is greatly tickled over a new addition to his big Holstein family. This is a bull calf out of Miss Aralia De Kol Mead, the first daughter of Sir Aaggie De Kol Mead to freshen on the Hartsook ranch. This heifer was bred by Morris and was sold in the National sale at St. Paul in 1920 to W. G. Davidson of the Brentwood Farms, from whom she was later purchased by Mr. Hartsook. She was bred to the young bull, King Korndyke Pontiac Acme, who is at the head of the Baldwin herd. If his dam makes 600 pounds butter in a year his 15 nearest dams will average over 1,000 pounds. The new arrival is of splendid type and with the exceptional production behind him should prove to be a valuable asset to the herd.

Eleven California Jersey herds were represented in the 50 pound list for January. Dr. H. G. Gross of Humboldt County had the high cow from this state with Marian of Butler Valley that produced 77 pounds of butterfat from 1358 pounds of milk.

William Briggs and Son of Dixon have sold the two year old Hereford bull Pilot to Thomas Ockenden of Academy. Pilot won the junior bull class at the 1920 state fair. He was sired by Beau Blanchard 76th, grand champion at the same show. The University of California has been using this bull for several months.

According to a news story under date of April 20 a group of Chicago capitalists selected 70 head of milk goats in Southern California for a total price of near \$250,000. If such be true our California goat breeders have got the oil business backed off the boards for quick and easy money.

The second annual picnic of the Riverside County farm bureau will be held at the Sierra Vista Ranch, Perris, on May 12. The Sierra Vista Ranch is owned by the famous author, Peter B. Kyne, and is managed by Bert H. Wilkinson. It is the home of the great Duroc boar, Royal I Am, undefeated grand champion boar in all 1921 California shows, and many of his excellent progeny. A small high class herd of pure bred Holsteins is also maintained.

The University of California has recently installed A. L. Lovejoy as superintendent of the Eldorado County range experiment. Lovejoy has had wide experience in the forest service of several western states.

Professor Gordon H. True has compiled a chart contrasting the winnings of the various agricultural colleges that have competed in the Clay, Robinson & Company college specials at the Chicago International since 1916, the first year that California exhibited. At the past six shows 15 of the leading colleges of agriculture have exhibited one or more years in the classes mentioned. California, showing four years, won a total of \$1600; Iowa, showing six years, won \$1125; Purdue, showing six years, won \$1010. The other colleges won less than \$500. Out of a possible 40 firsts in the four years that California exhibited our college won 19 firsts. Out of eight possible championships in beef cattle and sheep classes, for the four years that California exhibited we won five. Such a showing is not approached by any institution in America.

NEW LOW PRICE

SAME HIGH QUALITY

The price of the new SHARPLES SUCTION FEED SEPARATOR has been cut to a figure below the prewar price but the quality remains the same—with the same dependable features that have built a world wide reputation for SHARPLES (over one million in use).

Any one can operate a SHARPLES because it skims clean at any speed. Knee low supply tank saves heavy lifting yet suction feed supplies the correct quantity of milk at all speeds. There are no dises to clean with a Sharples only the patented tubular bowl. Friction ball bearings make easy turning while oil tight gear case requires oil only once a month.

You can depend upon SHARPLES to deliver cream of the same unchanging density at all times—not thick today and thin tomorrow—and that a minimum of butter fat (1/100 of 1 per cent) will be left in your skim milk.

What SHARPLES is doing for over a million users it will do for you. You can't afford to be without one at the new low price.

Reaping

By A. L. Spellmeyer

UNANIMOUSLY, persistently, everywhere we are assured that the coy maid, Prosperity, is tripping blithely towards business of this U. S. A. The agrarian after supping some two years upon a diet of loss is fairly quivering with eagerness to greet her. Rumor states that Miss Prosperity is just a week or a month or six months distant, but never has the greatest pessimist estimated her distance at over six months, even though three times six months have passed.

But this we know, and without doubt, things will be better soon—or much worse. The economic system of the nation has had a shock, and most men are confused with uncertainty,

but there are some steady workers who are reaping. Henry Ford for one seems to find the going suits him, and he either knows his path or throws a colossal bluff and has luck as his first assistant. Henry started a tractor war, bought a railroad, fought Wall Street, established a paper that would have been suppressed a few years ago, and was not satisfied, but took on an auto war with higher priced cars, added the International Jew discussion, and finally ends up with the Muscle Shoals project and a general attack on the present money system of the world. Whether Henry is great or not, seems to puzzle the only great man we know we have, Thomas Edison, and Edison is Ford's camping crony.

Some 30 speculative brokerage firms

adorn Wall Street as complete derelicts, and the wobbly ones, still hoping to survive, hardly dare acknowledge they know their erstwhile pals. These men, together with various confidence men of large ideas, endeavored to reap and graduate into financial captains, but failed and became reapers of wrath instead.

Retailers of a nation have reaped for several years, but the toils are now enfolding them. The attraction of profit through a comparatively small investment has brought into the retailing of food a multitude of new shops, a division of volume, a competition of chain stores which cripple the small store with limited purchasing power, and finally a competition of chain stores with chain stores, both backed by a bonding and stock system of finance. The retailer is reaping what he sowed, and it seems to know no end. Though times are undoubtedly bettering the retail plight is not showing bright hopes, and the very bankers who coddled the retail accounts in these new ventures now assert it patriotic and helpful to as-

sist retail prices downward and farm product prices upward.

This condition is not a prophecy but a statement of existing fact. Today your wife can buy a dress for \$1 that had a \$40 mark on it a year ago; a fur coat for \$200 that had a \$500 price on it, and you can buy a pair of good shoes once more for eight dollars or a good shirt for two. It is a fact that the old dollar's buying power is back again with a vengeance on everything except plumbing and house building and rents, but these are also en route to the lower level.

No longer are you forced to a hearty meal of spuds and soup bones and bread pudding, for you can luxuriate in meat that is both tender and juicy at small cost. In a hundred shops today you can buy a noble steak, the regular old two inch aristocrat, with nice firm fat in the right places, and this noble three pounder will probably cost you a dollar. Knowing the ropes, I can get it for 90 cents in dozen shops. And once more with 1 cent lard and cheap eggs the long unknown real pound cake can be on the family table.

The average carcass meat price have advanced four cents in Los Angeles in a month, and this advance has been partly passed on to the live stock men, and has not all stuck to the packers' fingers. Yet in passing we may note that the meat packer is doing better than he was, for a while in the profit line. The consumer has not paid more, as the total meat advance has been absorbed by retailer. Last month the packers' list showed 30 cent loins, yet sirloin steak so at 30 cents in a hundred shops. The lamb list was 25 and hinds 32, yet some fine baby lamb legs could be had for 30 cents. It is no wonder the packers did not desire to enter the retail field. With a few small moves they have changed the retail situation, exactly when they desired change it, and not before. Building time has started, building time allay the farmer discontent and feed him up a little to a quiet, until ready for another blood letting at some auspicious future moment. The war things have been going the finances slightly uneasy, have passed the word to the meat packers and food controllers to ease up or the rules of play the game may be changed.

These things exist, not as a permanent fact or as a permanent state, but today these things exist, viz.: Ten cent hogs and 50 cent corn in spots, eight cent steers and good 30 cent steers, cheaper clothing and shoes, and better chance for a 1922 farm profit than last year. Instead of the old being 50 to one against a cost of production price they are yet only about five to one and may be even up with 90 days if affairs still progress. Even the range cattlemen, with good year certain, have a chance to get 75 to 100 per cent of their production cost instead of the 30 to 50 per cent prevalent for the past two years. Broken cow and sheep men, ex kings and barons of great ranges, like the hounds are commencing to sample the wind for a taint of activity and chance to come back.

A recent government investigation showed that retailing of meat today costs 5.86 cents per pound as compared to 3.19 in pre-war period. The "curtailed consumption" and less volume and less export propaganda, generally promulgated as the reason for low prices have been forebodingly shown to be bunk, with export greater than the pre-war period, and abattoir slaughter greater than the pre-war period. Neither export nor meat kill equals the war period total but they exceed the pre-war total. From a scale of two per cent and pre-war for producers, 14 per cent above the packers and 42 per cent above for retailers, a rough guess would put today's prevalent prices of range cattle at \$30 for two year old steers or cows (the ancient standard was a two year steer or cow at equivalent price), or a pre-war price; fat cows and steers 20 per cent over pre-war prices, the average packers' return 10 per cent over pre-war and retail meat about 35 per cent over pre-war. I distinctly state the above is guesswork, the beef price is temporary as yet, altogether impossible to check, but truly noble plan of distribution seen in progress, whether it be to effect temporary diversion or to actually give a little impetus and relief to our livestock circles. Our farming citizens are not now, after hearing

horse profits

No. 2 of a Series

Published Monthly in the Interests of Better Horses and Better Harness

Louis Lichtenberger, Editor

BACK TO THE HORSE IS FARMER'S EDICT

Investigation Proves Economy of Horse Over Other Forms of Power on Farm---Dept. of Agri. Report

The farmer's truest friend—his horse—has served him faithfully for long years, while experimentation with mechanical machines to supplant the horse has proved that the horse is, and always has been, the cheapest, most flexible power supply on the American farm. In a recent survey made by the U. S. Department of Agriculture on 286 machine-equipped farms, a record of all the work done during the year, both with machine power and horse power, was obtained from each farmer. It was found that the draw-bar work furnished by the horses totalled 70% and the cost of feeding each horse was only 45c per day. This survey was made at a time when feed prices were high. The low initial cost of horses, their steady market value, their low cost of upkeep, their ability to serve the farmer economically, are only a few of the reasons why the farmer is so thoroughly "sold" on horses.

New Book Gives Many Amazing Horse Facts Copy FREE

Our research department has gathered from authoritative sources interesting facts about horses, their cost, upkeep, replacement value, etc. The book also gives valuable statistics of interest to every California farmer. It illustrates the different types of horses and also shows different kinds of harness sets in popular use throughout California. We will gladly mail you a copy upon request.

465,826 HORSES, MULES on California Farms

There is an average of 4 1/2 heads of horses and mules on every California farm, with a total valuation of approximately \$43,000,000. The total number of work animals in use in America is approximately 26,000,000, and the number is steadily growing.

Your Horses Are Worthy of Good Harness

California farm horses should be equipped with the finest harness obtainable. In this State the number of horse working days is about twice that of other states, and therefore the harness is subjected to double service. Superior Brand Harness, produced by Lichtenberger-Ferguson Company, embodies the necessary reserve strength and inherent durability to give longest wear. Years of first-hand observation and testing have enabled us to produce harness that meets every need of the western horse owner. There is a dealer in your locality handling Superior Harness. Write for his name.

SEMI - DISPERSAL SALE
50 REGISTERED
JERSEYS
HYNES, CALIF.
at Rhoades & Rhoades Sale Pavillon
Tuesday, May 9, at 10 a.m.

Here is the opportunity registered Jersey buyers have been hoping for for months past—to find available for purchase a high class lot of Jersey females.

This sale includes every cow and bred heifer in the well known herd of GEO. W. THOMAS & SONS, Arlington, Calif., also the two herd sires. Mr. Thomas and his sons are retaining only their unbred heifers and heifer calves as foundation for their future herd.

THIS IS A HERD OF SPLENDID INDIVIDUALS, IN EXCELLENT PHYSICAL CONDITION, THE ENTIRE HERD IN MILK AVERAGING 38 LBS. BUTTER FAT PER MONTH AT THE PRESENT TIME.

The entire herd was recently tested by a Deputy State Veterinarian, and not a single animal responded to the test. Every animal guaranteed to be a breeder and sold subject to tuberculin test by the buyer.

TERMS OF SALE: Responsible parties may arrange for credit on basis of one-third cash, balance in three, six and nine months before sale with California Breeders Sales and Pedigree Company.

the many vain promises like that of war finance relief, etc., and government kindness, quite ready to take anything for granted, and all of us are prone to examine very closely anything that appears like relief in order to ascertain if there is possibly a concealed tarantula in the bunch of bananas.

Possibly the darkest cloud that keeps the damsel, Miss Prosperity, from our midst, is the taxation burden, and in this connection it is interesting to surmise the species of wampus cat our estimable politicians are creating. It is a fact that most of the progressive political usage that now is prevalent (which usage spelled the end of the private political boss) was born from rural communities that were oppressed by something.

Study the enlightened and public spirited utterances of the platforms of both parties, and the majority of its doctrine was first formulated in some hamlet in Kansas or Oregon or somewhere else, by some populists, progressives or some other new ismists in the political line. Undoubtedly something will be reaped for the insistent burden of political gangsters of this nation keeps adding in taxes and useless expenditures. If the Washington clique had spent billions upon transcontinental paved highways and great land and water improvements which would have created a definite future asset and given employment to idle millions there would have been little or no criticism, but the billions have been spent and are being spent and for nothing in which the average citizen can see any good.

Because it seems that these hard times are passing without any violent upheaval it is the more significant that there is within the minds of the thinking and leading agrarians and other citizens a definite intention to make repetition of the hardships suffered during the past few years impossible. Just how this is to be done they do not yet know, but here and there men are quietly talking and writing about certain phases and facts, and it is these men who will be in action later. Many of the pre-war stalwarts who holed up during the war, did what they could but admitted the younger men probably knew better how to do it, are coming out of their seclusion. I see the same disposition in cattle and other associations, in farm bureaus, etc., some of the actors are gathering information and steam, and these are not always the present limelight leaders. The utterances of a national light in cattle circles was fully described by one of these thinking rebels, as "flapdoodle with a large fine sounding ring" in a recent letter to me. I know many of these rebels who infest livestock circles, and they are growing in number, north and south, here and there. Some day there will be an agitation in cow circles with a group action that will cause those who think they are "leading" and are sure they are "controlling," a great surprise. What's true in cattle applies to many lines of farm produce growing and many producing associations.

"By their fruit, ye shall know them," and California has put forth some very fine cooperative producer examples. As the Hebrews expected a Messiah, so does the farming world expect California to produce a regular, practical working relief plan of marketing and safeguarding farm and livestock production.

The next decade will be an interesting period, probably a money making period for many folks, and certainly a less difficult period for the California farmer than these last two years have been.

First and second highest cows in association in pounds butter fat for month owned by John Van Ruiten, 85.7, 82.7. Highest average test of herd, J. W. Gains, 5.35.

*"It is as Wasteful
to Milk by Hand
as to cut Grain
with a Scythe"*

The Empire Milker saves labor, produces cleaner milk and increases yield from each cow

ONE of the great farm authorities recently stated that it is as wasteful for the farmer who has six or more cows to milk by hand as it would be for him to cut a field of grain with a scythe.

Most users of the Empire Milking Machine know how true this statement is. These progressive dairymen have studied the question of milk production and have found that with the Empire Milker, they can reduce their labor cost 50%; they can produce Grade A certified milk and keep their bacteria count down to a minimum far below legal requirements; they increase the milk production from each cow, for the Empire has a beneficial effect because of its regular, soothing action.

No dairyman who has six or more cows can justify milking by hand. Every time he milks his herd, he loses profits which belong in his pocket and which the Empire Milker would put there.

The Empire is now selling at the lowest price since it was first placed on the market more than a decade ago. Write today and find out how much you can save by installing the Empire on your farm. Ask for catalog 52M

Smaller Crowds but Better Exhibits at U. C. Farm Picnic

By R. P. Royce

THE fourteenth Annual Picnic was held at the university farm, Davis, Saturday, April 29. It was generally conceded that this year's event was better conceived and staged than in former years but the selection of the date proved unfortunate, as it brought the picnic into competition with several May Day and rodeo celebrations in nearby towns. As a consequence the attendance was smaller

than has been registered in several years.

A successful effort was made to make the many educational exhibits and demonstrations more available to the visitors. In former years these have been scattered about the campus, and unless one was familiar with the location of the different departments considerable confusion was experienced in finding what one was most interested in. This year most of the demonstrations and exhibits were con-

centrated in centrally located tents. In addition to the centralized exhibits all the divisions maintained open house and thus provided additional entertainment.

The livestock exhibits were in a large tent and included representatives of nearly all the leading breeds from the herds and flocks of the animal husbandry division.

Another tent covered an impressive lot of exhibits from all the other divisions. Home gardens, orchard and field crops, an extensive weed exhibit, agricultural machinery, the dairy industry, and veterinary science all came in for attention.

The morning program as usual was given over to the livestock judging and fitting contests participated in by university and farm school students. In addition a judging contest was provided for high school teams. These contests have developed into important events and furnish stimulus and enthusiasm for the boys. During the morning several athletic events, including a baseball game, were staged.

Following the noon hour, during which the visitors spread their lunches under the campus trees, came the parade, always the big feature of the day. This year's parade compared well with parades of former years and differed but little in extent or original features. Throughout the day the crowds were entertained by radio concerts and dancing was provided.

Saturday was the first opportunity agricultural California has had to become acquainted with C. B. Hutchison, the new director of the Davis branch of the college of agriculture, and judging from remarks overheard, the visitors came away with a mighty fine impression. Hutchison fully appreciates the fact that he has a man's size job, but comes to his new work with enthusiasm and a record of past accomplishments that presages success. Certainly he has a united faculty behind him and the good wishes of all.

Since last year an extensive building and improvement program has been started which includes a magnificent creamery building, a modern horticultural building, new water and irrigation provisions, a mile or more of new walks and considerable road improvement.

The winners in the judging and fitting contests follow:

The perpetual trophy donated by the regents was won by the Esparto union high school. The trophy for sheep judging went to Woodland high school; hogs, Esparto; dairy, Antelope Valley; beef cattle, Esparto; horses, Salinas; highest individual stock judge, Ernest Clooney, Esparto; high man in university contest, G. Sheesley. The permanent cup donated by the Sacramento Bee also went to G. Sheesley.

Prizes for best fitted Holstein cows were awarded by the California Holstein Breeders Association. H. C. Smith won first; P. J. Van der Merwe, second, and G. Sheesley, third.

First prize for Ayrshires was won by W. Ford; second and third, H. C. Smith and W. D. Auerbach.

The California Jersey Cattle Club awarded three prizes: J. G. Brown, first; J. E. Coke, second; H. C. Funder, third.

The California Wool Growers Association awarded three prizes for fitting all breeds of sheep. J. Harper, first; W. N. Reusser, second; W. B. Houghton, third.

The Shropshire sheep prize was awarded to J. Harper. The Hampshire sheep prize was donated by men at the university farm who are interested in the development of the breed. It was won by W. B. Houghton.

The gold medal for the best fitter of all breeds of hogs was given by Ralph Dunham, herdsman at the university farm. It was won by F. Clutter.

The prizes for Poland China hogs were won by F. Klutter, who took first, and H. Sylvester and W. N. Ruesser tied for second.

The California Duroc-Jersey Breeders Association awarded three prizes: F. O. Blake, first; R. Pennoch, second; S. H. Freeman, third.

The Western Berkshire Congress gave three prizes: A. W. Boon, first; H. K. Luke, second; F. Klutter, third.

The Beef Cattle Sweepstakes prize (gold medal) was awarded by Alec McDonald, herdsman at the university farm, and was won by D. R. Fletcher.

The California Shorthorn Breeders Association awarded three prizes, L.

The Holstein Sale of the Year

BURR FARM DISPERSAL

140 REGISTERED
Holsteins

SELLING AT

Burr Farm, Los Angeles
June 1st and 2nd

This Is the Opportunity of the Entire Season to Buy
Tuberculin Tested Cattle of Excellent Breeding,
Good Type, and With a Large Number of High
Record Cows and Heifers, Both Short
and Long Time Tests

King Korndyke Pontiac 20th, the Famous \$12,000 Son of Miss Valley Mead De Kol Walker, Will Be Sold; Also a Beautiful Group of His Young Daughters and a Considerable Number of Cows and Heifers Bred to Him

The sale list includes a large number of A. R. O. cows and heifers with records up to over 33 lbs. butter in seven days, many with good yearly records.

A large number of daughters of Sir Veeman Korndyke, sire of the world's record heifer Maida Veeman Hengerveld, will be sold, a remarkable group of heifers.

Every animal positively guaranteed to be a breeder; every animal tuberculin tested by a Deputy State Veterinarian and sold subject to retest by the buyer except as announced in the sale ring.

71—REGISTERED GUERNSEYS—71

Selling at Rhoades & Rhoades Pavilion, HYNES, CALIF.

Wednesday, May 17, at 10 A.M.

In dispersing his herd of registered Guernseys, Mr. Strobeck is affording buyers an opportunity to buy from a herd whose home is one of America's most famous breeding farms, due to honors won both in the greatest shows and in the official production lists of the American Guernsey Cattle Club.

IMPORTED COWS AND THEIR OFFSPRING

The offering includes imported cows of most approved breeding, and daughters of imported cows by sires of equal worth. The offering of such cattle of the Guernsey breed is so rare in California as to make this event one of utmost importance to prospective buyers.

A SPLENDID LOT OF HEIFERS

A considerable percentage of the offering is made up of bred and open heifers, the class of females that is in strongest demand for foundation purposes.

BRED TO OUTSTANDING SIRES

Many of the choice cows and heifers in the sale are in calf either to MASTERPIECE OF EDGE-

MOOR or to DEANIE'S MAROSE OF APPLE-TREE POINT, two of the best known young sires of the breed, both of which command widespread esteem because of their rich breeding and great individual merit.

14 BULLS IN THE OFFERING

The fourteen bulls in this sale are all old enough for service, most of them ready for heavy service, presenting a rare opportunity for selection by breeders and dairymen alike.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and sold subject to retest by the buyer.

He lost enough cream every six months to pay for a DE LAVAL

"I had a cream separator that I had been using and thought was all right. I have five cows and had been selling cream and feeding skim-milk to hogs as fast as separated. A few days ago I sold the hogs and left the skimmed milk in the can. The next day I noticed cream on it. I was so surprised that I skimmed it off by hand, churned it, and made one pound and six ounces of butter.

"It took little figuring to show how much cream I had been feeding my hogs each day. I figured I had paid the price of a No. 15 De Laval every six months."

This letter is typical of many letters we receive.

Perhaps this same thing is happening to you and you don't realize it. If you are using an old or partly worn-out separator, or are skimming by hand, undoubtedly you are wasting enough cream to pay for a De Laval in a short time. The waste of cream occurring every day is criminal — more than enough to pay for the entire output of the De Laval Factory.

Most any kind of cream separator will do fairly good work the first few months, when it is new. But if it is cheaply made, after the first few months your trouble will begin.

And the worst of your experience with such a machine will not be the fact that it wears out quickly or that it runs hard, or that you are piling up repair expenses, but that you are losing a lot of butter-fat.

Why take chances at all when you can get a De Laval which has won hundreds of prizes, thousands of contests, and is used by millions? Experience has proved that it is the best cream separator that money can buy, and in the long run the cheapest.

Order your De Laval now and let it begin saving cream right away. See the local De Laval Agent, or if you don't know him, write to nearest office.

De Laval Pacific Company

San Francisco, California
Sooner or later you will use a De Laval Cream Separator and Milker

W. Davis taking first; A. E. Lyons, second; R. Mahnsten, third.

The California Hereford Breeders Association awarded three prizes; D. R. Fletcher, first; T. B. Carter, second; P. W. Hunter, third.

The American Shire Horse Association, Springfield, Illinois, awarded three prizes; L. C. Jones, first; C. L. Cairnes, second; A. C. Adams, third.

The Percheron prize was awarded to W. E. Caswell.

ALFALFA MAKES BETTER HAY THAN SILAGE

As a silage crop alfalfa is not altogether a success. In fact, one reason corn is so popular for silage is that it yields a large tonnage at one harvesting, something which can not be said of alfalfa. Alfalfa is somewhat difficult to handle with ordinary silage machinery and is hard to pack properly in the silo. It often becomes moldy and slimy, as do various other legumes when put up in this way. Special care must be taken in packing this silage because of the high percentage of protein in it, which causes it to putrefy instead of ferment when too much air is present.

There are times, however, when alfalfa may be made into silage, for instance, when weather conditions are unfavorable for the curing of hay. Good silage may be made from partially wilted alfalfa if it is cut fine enough and well packed. If it is partly cured before running through the cutter some added water may improve the silage, but experience has shown that a "washy" silage may result if freshly cut alfalfa is put up while wet with rain. Under reasonably favorable conditions alfalfa can be made into hay at less expense than into silage.

Alfalfa and corn mixed make good silage. The corn adds the sugar and starch necessary for the right fermentation. For the same reason the mixing of sorghums or small grains with the alfalfa improves the silage. The addition of crude molasses to alfalfa also increases the chances of producing a good quality of silage. The United States department of agriculture has made some preliminary experiments which indicate that good silage can be made by mixing straw of any of the small grains with alfalfa, if the mixing is done as the material passes through the cutter and water is added to make it pack well.

Although alfalfa is not an ideal silage crop, it makes a nutritious silage when properly handled.

CAMPAIGN AGAINST TUBERCULOSIS

Tuberculosis, the worst enemy of the livestock industry, is now definitely slated for ultimate eradication, the plan of attack having been already laid out and successfully demonstrated by the bureau of animal industry of the United States department of agriculture. The success of the different phases of the plan and figures showing the progress made are given in the annual report of the bureau recently issued. In the beginning of the campaign, which began four years ago, most of the work was devoted to cleaning up and accrediting individual herds, but now that sentiment has been sufficiently aroused definite areas in various states are being freed of the plague, and it is shown that its eradication is as feasible as the cleaning out of the cattle tick in the southern states.

The first public sale of Herefords by H. M. Barngrover, since his removal to Stockton, was held at the San Joaquin County fair grounds April 20. Although 40 bulls and ten females were cataloged but 15 head were sold. The prices ranged around \$100. Lack of condition militated against higher prices and wide appeal.

One hundred and seventy head of Holstein cattle constituting the F. H. Harvey herd were dispersed at public auction at the Harvey ranch near Galt, April 26-27, for an average near \$100.

The annual ram sale sponsored by the California Woolgrowers Association will be held at the university farm, Davis, June 15.

At a meeting recently held at San Francisco the offer of the Fresno

County chamber of commerce to cooperate in the holding of the Second Annual Pacific Slope Dairy Products Show was accepted, and the show will be held in conjunction with the district fair at Fresno, September 23 to 30, 1922. The fair management has agreed to turn over one of the modern show buildings on the grounds for the machinery and products exhibits, and the board of supervisors has agreed to

erect the latest design in sheds for the exhibit cattle. Other Pacific Slope states will be invited to participate in the show.

Bulk Handling of Grain and the Farm Bureau Elevator Corporation

BULK handling of grain was the very interesting subject of a talk given recently before the Capistrano center of the Orange County farm bureau by, Grant W. Kenney of the California Farm Bureau Elevator Corporation. The subject, being one that very much concerns the growers of the state, as well as of vital importance to the individual himself, brought out a large attendance. Representatives were there from El Toro, Riverside, Hemet, San Jacinto, Perris, Oceanside and Fallbrook.

Motion pictures and slides provided by the U. S. department of agriculture were shown to more thoroughly explain Mr. Kenney's subject. These were especially interesting as they brought out in a clear and concise way how this new method of handling grain may be put into use. In substance, Mr. Kenney said:

"About 18 months ago the new million bushel terminal elevator located on deep water at Oakland was taken over and since that time has been in operation as the Farm Bureau Terminal for the handling and exporting of our grain. As feeders for this plant we have started construction of a state wide system of bulk handling elevators located in grain growing localities and where impossible to install such plants, encourage the installation of portable car loading facilities and farm storage bins.

"Large concrete plants with up-to-date cleaning, mixing and handling machinery were built and operated last year at Montpellier and Patterson in Stanislaus County and San Lucas in

Monterey County, representing a combined expenditure of over \$100,000 subscribed and paid for by the farmers in these localities. In dozens of the grain sections they have adopted farm storage and portable contrivances which answer the same purpose with an outlay of but a very small expense.

"This year we have under construction a large cribbed elevator at Lincoln, Placer County, where an enormous quantity of fine quality wheat is produced, and also in contemplation several other plants in other grain growing localities varying in size and capacity from 25,000 to 60,000 bushels.

"In localities where funds are insufficient to install elevators we are encouraging the growers to install metal farm storage bins and portable loading devices, many of which are constructed to perform practically the same operations as a full sized elevator at much less cost.

"The grain can be harvested in bulk, deposited in these bins and after the first rush to market subsidies may be cleaned, hauled to cars and loaded for shipment, going through practically the same operation that the grain would go through, provided there was a 100,000 bushel plant located at the point.

"These combined car loading and cleaning devices have a handling capacity of from 300 to 1500 bushels per hour and range in price all the way from about \$300 to \$1,500, according to the size and handling capacity, while the farm metal storage bins may be installed for in the neighborhood of 20 to 22 cents per sack or for about

what the grower would save per sack on his first year's operations in handling his grain in bulk.

"Oregon and Washington have been changing to bulk handling during the past three years, and last year practically all of the United Kingdom vessels loaded at those ports were loaded with a percentage of grain in bulk,—many with entire cargoes in bulk.

"Buyers interested in sacks told us last season that ships would have to be coopered especially for carrying bulk grain, that they would have to be burlapped at a prohibitive cost of several thousand dollars per ship, while we find that for the past three years bulk loaded vessels have been plying the Pacific coast from the north laden with bulk grain, for years, loaded with the grain next to the skin of the ship and would have stopped for California grain had we the facilities we now have on San Francisco Bay.

"The largest warehousing concern in one of the prominent grain counties of the state told us last year there would be nobody to buy our grain in bulk, but strange to say, this concern itself was the largest buyer and paid the best price for bulk grain in that county last year.

"In contracting barley with our San Francisco export concerns, foreign buyers request same made on basis of what is called the 'California Barley Contract,' which reads, 'either in sacks or in bulk, sacks to be weighed as barley.' Therefore it is up to the California shipper as to whether he wants to ship his grain in bulk at the same price.

"This year the California Farm Bureau Exchange will be in position to handle your grain direct to foreign buyers, charging but a small overhead for the service to defray expenses, and as the foreigner would just as soon have his shipments in bulk,

this competition is going to have an influence in forcing all grain to a bulk handling basis in consequence of the expense of handling it in sacks.

"At the present time the exchange will act as the growers' selling agent in contracting the growers' grain on basis of from one to three years handling. The grower may pool his grain with others and thereby obtain an average price with those participating in the pool, or he has the privilege of setting his own figure in case the market will permit. The only difference between the way he is now disposing of his grain and the way he would dispose of it should he become a member of the exchange is that he contracts to sell all of his grain, when he does sell it, through the exchange of which he is a member.

"Arrangements have been made with foreign connections so that when this grain is sold the only items deducted from the price are the small charges that the exchange makes for operating and the \$1.00 per ton that is paid the foreign connection making the sales for us abroad, making a combined charge of about \$1.50 or \$2.00 per ton all told, which covers the entire middle charge between the producer and the consumer.

"One of the main things that last year's experience taught us is that with storage on the farm, the grower is in a position to ship either in bulk or in sacks and in any direction that the best prevailing market might be. As the greater number of farm storage bins on the market have a combined sacking arrangement attached to each bin sacking can be done from these storage bins much cheaper than in the field.

"If his grain is stored on the farm and the best market for the grain is north, south or east, it is in much better position than it would be if he had the grain stored at terminal points, on which must be paid the freight from local stations.

"This, because the freight rate from all California points to the East is the same.

"Should the grower wish to borrow money on his grain stored in metal bins on his farm, the banks advise us that this may be accomplished with practically the same ease that it is borrowed on grain in warehouses that are always subject to an enormous fire risk and rat destruction. If the grain is housed in metal bins there is absolutely no risk from fire and rat-tage and the grain is kept in much better shape than in the average warehouse where rats and vermin abound."

CATCH THE GOPHERS

One of the boys in the Cultivator family, A. B. Zinn, Ojai, Ventura County, writes: "I am only a boy but make it my work to catch the gophers. With three traps I caught more than 40 gophers and had but one failure and did not lose a trap. I fastened a two foot piece of bale wire to each trap, then made a ring at the other end and drove a 15 inch stake through the ring about six inches into the ground." Mr. Zinn further suggests that traps be kept in best of condition, bright and clean, and that one should stay by the trap he finds successful.

TEHAMA COUNTY FARM BUREAU MEETINGS

Regular meetings for the centers of the Tehama County farm bureau: Johnson-Reeds Creek, May 8; Dairyville, 10; Antelope, 11; Oak Park, 12; El Camino, 15; Red Bank, 17; Bend, 19; Richfield, 22; Stanford, 24; Liberal, 25; Flounoy, 26; Bowman, 27; directors, Red Bluff, 22.

Farm home department meetings: Antelope, May 9; Oak Park, 11; Henleyville, 12; Vina, 16; Richfield, 17; Dairyville, 18; North Capay, 19; Bowman, 23; Squaw Hill, 24; Flounoy, 25; Reeds Creek-Red Bank, 26.

Grain and hay farmers are being requested by the California state board of forestry to protect their fields from fire during the dry season by cutting hay strips and turning a few furrows of ground. Farmers of large tracts are asked to cut these hay strips through their fields so that should a fire start it can be confined to a given area.

McQUAY-NORRIS PISTON RINGS

Increase Power—Save Gas and Oil

Piston rings wear, just as tires do. Worn and leaky rings waste motor power and money. They should be replaced with McQuay-Norris equipment. It will increase power, save gas and oil, and decrease carbon troubles in any make or model of passenger car, truck, tractor or stationary engine. The McQuay-Norris line is complete for every need. Through the addition of

McQUAY-NORRIS
WAINWRIGHT
PISTONS & PINS

McQuay-Norris Wainwright Pistons and Piston Pins to the McQuay-Norris Piston Ring line, you can now secure for your gas engines complete McQuay-Norris-made Pistons, Piston Pins and Piston Ring equipment.

Send for Free Booklet—a valuable explanation of the relation of piston rings to gas engine operation. Address Dept. AB

McQuay-Norris Manufacturing Co.
St. Louis, U. S. A.

LEAK-ROOF—an exclusive two-piece design, preventing loss of gas and compression. Gives equal pressure at all points on cylinder walls. For all piston grooves except top, which should have Superoyl. Each ring packed in a parchment container. Price per ring—

\$1.25

In Canada, \$1.50

Superoyl—Keeps lubricating oil out of combustion chamber. Collects excess oil on each down stroke of piston and empties on each up stroke, which ordinary grooved rings cannot do. Each ring packed in a parchment container. Price per ring—

\$1.00

In Canada, \$1.25

JIFFY-GRIP—a one-piece ring. Non-butting joint which can be fitted closer than ordinary step cut—velvet finish—quick seating. "Seats in a jiffy." To keep them clean and free from rust, each ring is packed in an individual glassine envelope. Price per ring—

50c

In Canada, 50c

Snap Rings—of the highest grade. Raised above the average by McQuay-Norris manufacturing methods. Their use insures all the satisfaction possible for you to get from a plain snap ring. They are packed twelve rings to the carton and rolled in waxed paper.

And Snap Rings of the highest grade

Made of Electric Iron

GRAIN SORGHUM HARVESTER

The problem of harvesting kafir and all sorghum grains has been a perplexing one. The uneven lengths at which the grower found the heads made harvesting by hand necessary,

the price at a point where it is included with the profitable crops of the state. A California firm, the Ventura Implement and Manufacturing Company of Ventura, for many years manufac-

the greatest services in sparing farmers disappointments and useless expenditures. — Journal des Debats, France. Shipment of mutton from Arizona starts with May.

A million and a half people visited the forests of California last summer for recreation. Forestry officials point to this fact as a reason why care should be used with fire so that our forests will not lose their attractiveness.

A Successful Grain Sorghum Header
Ventura kafir header operated by tractor power, harvesting three rows.

and this method has always been expensive. It has been so expensive, in fact, that much profit that would ordinarily accrue from a good crop of kafir has been spent for labor to harvest. California has thousands of acres of land that can be profitably utilized in the production of sorghum grains. With a rapid increase in stock and poultry the consumption has kept

Save Your Orchard with Woolner's California Smudge

An entirely new principle for saving orchards from frost at a low cost. Does not need expensive storage facilities, as it is a combination of combustible material treated with crude oil. It is not a liquid. It is put up in bags and can be stored anywhere, ready for use whenever needed by simply dumping same into our especially designed smudge pots. It can be used in any smudge pot on the market, but not to as good advantage. It can be used in old pots even though perforated by rust. It will burn five to eight hours and throw off a good heat, and if desired will produce a smoke screen. Heat or smoke can be regulated as desired.

There is a saving of 50 per cent by using Woolner's California Smudge over any other smudge fuel now on the market. Price is \$1.25 a bag, terms 50 per cent cash with order, balance terms to be agreed on. Special discount for cash. Our especially designed smudge pots are 75c each, complete with pan. Plain pots 40c each. Pan 10c extra. Above prices F. O. B. Los Angeles. We sell by mail only. Have no solicitors and will send samples on request.

Under ordinary conditions it will require about 10 bags to an acre of Woolner's California Smudge, and about 50 pots. If not used one season his smudge can be kept in storage indefinitely, as it does not deteriorate, or evaporate like distillate. One man can handle any moderate sized acreage. Minimum shipment, 10 bags. Kindly arrange for early shipment to avoid delay. — WOOLNER OIL CO., 951 W. Fourth St., Los Angeles, Calif.

Novo Hoists for the Ranch In Stock

Novo "Handy" Hoist
Called "Handy" because they're the simplest thing on the place. COME AND SEE THEM or write for details.
SMITH - BOOTH - USHER CO.
Machinery, Industrial and Contractors' Equipment, Supplies
SAN FRANCISCO LOS ANGELES

turers of California implements, bean threshers and bean tools, has developed a kafir header made in two sizes that did remarkably successful work with kafir and other grains last season. This machine solves the problem of the uneven heads by a series of rollers running above and in front of a cutter bar. The rollers gradually fold the kafir stalks forward and down. Even with the cutter bar the stalks enter a finger table where a solid reel flips them back on a canvas elevator as the sickle clips them off. In the folding process the problem of cutting off the long and short heads at the heads is solved. Once cut off, the heads are elevated in much the same manner as other grain in other harvesters. At the university farm last fall the header gave a splendid demonstration, proving its dependability and practical application to the work.

It was possible to displace a large number of men cutting by hand in demonstrations last year. On Tacker Brothers' Ranch at Brawley the header cut two acres an hour in corn that made 2,500 pounds per acre. It was estimated that kafir could be headed with the header at a cost not to exceed \$1.25 per acre.

THE USE OF PLASTER AS FERTILIZER

New experiments have just been made by Director Zacharawicz of the agricultural service of the department of Vouchuse. The author has made a double observation relative to the employment of gypsum or plaster and the utilization of this fertilizer in associating it with others.

The author cites the happy effects of plaster fertilizer, especially when mixed with other mineral fertilizer, for grapevines. The formula with plaster would be as follows, per acre: Nitrate of soda 190 pounds, sulphate of potassium 165 pounds, superphosphate of chalk (?) 260 pounds, plaster 520 pounds.

On suppressing the plaster the grape crop was seen to diminish 664 pounds per acre the first year and 1881 the second year. The experiment is, therefore, convincing. Here are the conclusions of the author. Plaster is a valuable aid for the nitrification of organic matters; the addition to the soil of the sulphuric acid and the chalk which compose it is a source of fertility for soil which is poor in these elements. We must note, however, that plaster should not be employed alone. It must be mixed either with manure or with mineral fertilizers to avoid the exhaustion of the soil. The formulas for complete fertilizers which have given us the best results in our experimental fields were accompanied, for the fertilization of an acre, with 500 pounds plaster for grapevines, 250 pounds plaster for cereals, 500 pounds plaster for pasture, 350 pounds plaster for vegetables. All these experiments can render

BIG W TREAD
Cord Tires
10,000 Mile Guaranty

Hand-Made Tires of "Watkins Quality"

With the Watkins Specific Mileage Guaranty behind them.

Watkins Products standard for over 50 years.

Judge Farmer

THE American farmer is the best judge of values. His dollars represent bushels of grain, hours of toil. And he has learned to spend them wisely—to secure the best of values when he buys. For over 50 years he has been buying Watkins Products because nowhere else can he get better value for his money.

Watkins tires are built for the American farmer, for

long life and rough roads with hard usage. They deliver the maximum of service at the minimum of cost—the best value in the tire market. And they come to you with the double insurance of "Watkins Quality" and our unusual mileage guaranty.

Ask the Watkins Dealer who calls at your home about these tires; or send for our Tire and Auto Supply booklet.

THE J. R. WATKINS COMPANY

POULTRY

Baby Chicks: When you buy baby chicks the big thing for you to remember is QUALITY, in both the chick itself and the parent stock. By investigating you will find that our chicks are in a class by themselves, for we have absolutely the best equipment obtainable to produce them and very high class stock from which we get our eggs, and then, too, we know how to handle and deliver chicks. We are hatching every week White Leghorns and Anconas that will lay; R. I. Reds and Barred Rocks that are well bred and will produce. Send for our circular and prices and order immediately for 1922 delivery ORANGE COUNTY HATCHERY, Santa Ana, California.

Profitable Poultry News—Capacity 200,000 chicks, hence prices surprisingly low for quality. County farm advisors, county agents, large, small ranchers, city people have for years bought these 180-290 egg Leghorns, Reds, Rocks, Minorcas, Anconas, Wyandottes, Andalusians, Ducks, Turkeys. They lead many egg-laying contests, are growing in popularity yearly. Why? ELECTRIC HATCHED, vigor, growth, winter-laying, profit, guarantee. All feel as this customer writes: "Count me among your boosters." Very low May, June prices. Smallest, largest orders welcomed. May chicks, turks grow quickest into profit. Write Profitable Poultry, 13 North Fair Oaks, Pasadena.

Better Baby Chicks—Assuming you are anxious to get the Best Chicks for your money we are offering you our "BETTER CHICKS" from thoroughly hoganized stock and hatched by electricity in a scientific manner. Why not get the best when they cost you no more. Let an order prove our claim. Quality our motto. Rhode Island Reds, Barred Rocks, White Rocks, White Wyandottes, Anconas, Black Minorcas, Brown Leghorns, White Leghorns, Single Comb White Leghorns, Turkeys and White Pekin Ducklings. Artesia Hatchery (Electric), Artesia, California. Phone A422. Capacity 125,000 eggs. (World's original electric hatchery.)

SEEDS AND PLANTS

SUDAN GRASS SEED

(The Great New Hay Crop)
First introduced in the United States 1909 from Sudan, Africa.
Culture. Strictly an annual, may be drilled or broadcasted, 15 to 25 lbs. per acre, grows 8 to 10 ft. high, yields 3 to 10 tons per acre, two to four cuttings.
Pasturage. It will yield food for six times as much stock as any other forage without irrigation. For milk cows and hog there is no better and more abundant pasture than Sudan. It will solve the hay proposition as nothing else can. It will do in this climate. This seed grown on our farm and is free from Johnson Grass.
Price—5 lbs. \$1, 10 lbs. \$1.50; 50 lbs. \$100 lbs. \$8; 500 lbs. \$35; 1000 lbs. \$50.
BOWMAN'S HDWE & IMP. CO.
721 J St. Sacramento, Calif.

NATIONAL MARKETING OF FRUITS

News dispatch from Chicago states that the Federated Fruit Growers, an organization to cooperatively market the country's fruit crop, was formed here April 28. Formation of the National Sales Agency is the result of the work of the producers' national fruit marketing committee appointed by the American Farm Bureau Federation to develop an improved marketing system for the fruit growers.

A temporary board of directors was named by the committee as follows: James Nicol, Michigan, president; S. Edwards, California, vice-president and acting general manager; W. Armstrong, Washington; Sheridan Baker, California; C. E. Durst, Illinois; B. F. Moomaw, Virginia; N. R. Peet, New York, and C. E. Stewart, Florida.

National standardization of fruit grades and a campaign to increase the consumption of all kinds of fruit will be two of the tasks undertaken, it was stated.

FIELD CROP PLANTINGS AT DAVIS

Field plantings at the University Farm, Davis, to provide seed for distribution next season have been made of White Federation wheat, Hard Federation wheat, Burt oats, Four Thousand barley, Tennessee Winter barley, Mariout barley and Yolo. Yolo will also be planted as an indicator crop on ground used for sunflowers and Honey sorghum last season, to determine the residual effect of sunflowers and sorghum upon succeeding crops. If sufficient rain falls in February a planting of Yolo will be made as an unirrigated or fallow crop. Choice Danish Sludstrup Mangel seed and Purple Top Swede seed is being obtained from Canada. In the new plantings of alfalfa, common alfalfa and Hairy Peruvian alfalfa will be compared from a pasture standpoint. A small area will be planted to Harding grass to determine its pasture value and to provide a paddock in which valuable stock may be turned without danger of bloat.

A new series of irrigation experiments will be undertaken investigating the duty of water with hemp, beans (Blackeye), Sudan grass, milo, honey sorghum and root crops. A small tract will be utilized for potatoes under several methods of irrigation. The agronomy irrigation area will be utilized in the further study of root crop production, the selection of Yolo, Milo and Indian corn, cotton, tobacco, miscellaneous trials of newly acquired seed, grass and forage plant testing, and the production of a large variety of crops for illustrative and teaching purposes.

EXPERIMENTS IN CHERRY POLLINATION

Extensive experiments in pollenization of cherries are being carried on in Wasco County, Oregon. Professor C. E. Schuster of Oregon agricultural college, a corps of assistants, County Agent Jackman and Horticultural Bureau Chief Nelson are in charge. It is expected that more than 20,000 individual cherry blossoms will be pollenized artificially from the several varieties of trees now known to be fertile. Records will be kept of each blossom.

It is hoped to bring out definite information regarding which of the new known pollinating varieties are the most fertile, especially upon such varieties as the Bing, Lambert and Royal Anne cherries, which are not only sterile themselves, but intersterile, or incapable of pollenizing other varieties.

THE EUSTIS LIMEQUAT

"Owing to the lack of acidity in Florida lemons and the high price of California lemons I believe the Eustis limequat will prove a good fruit for Floridians to grow for the making of summer drinks." Thus spoke a member of the Florida State Horticultural Society at its last annual meeting. This citrus novelty, a cross (as its name implies) between the lime and the kumquat, is quite hardy, more so than any lime, and is quite resistant to the usual insect pests and diseases common to citrus trees. The flavor of the fruit is that of the lime while the tree is much like the kumquat.

SELF STERILE PLUMS

Growers of plums on a small scale are warned that many varieties, notably the Satumas, are self sterile and will need another variety (Wickson in this case is good) planted nearby for cross pollination. Experiments with 18 varieties of common plums (not Japanese) proved that 11 were self sterile and only three were fully self fruitful, the four others being partially self fruitful.

The baby trees in our forests today must furnish the lumber and other forest products for our children since at the present rate of consumption our existing forests will meet the building program for only about sixty years. Fires must be kept out of the forests and from logged-off areas, however, if these young trees are to become big trees.

A column of smoke rising from a forest fire was measured by an aviator and found to rise 6,500 feet—a case of money going up in smoke.

Dollar for Dollar—

We know of no investment that will yield as high returns with as low first cost and annual upkeep as

Irrigated Vineyards in Southern California.

Growers are now receiving annually from \$250 to \$500 an acre for their crop.

You Can Use Universal Brand Sprays With Confidence

Universal Brand Sprays are specially made to save citrus groves from Red Spider, Citricola and Black Scale. Everywhere trees have been sprayed with Universal Brand products these destructive pests have been promptly controlled.

Here is the spray you should use now. It will clean your groves, and stimulate the trees so the fruit will mature earlier.

B. T. S.....15 lbs.	per 200 gal. tank.	B. T. S.....12 lbs.
TRIUMPH.....1 1/2 to 2 1/2 gals.		TRIUMPH.....1 gal.
K-SEEN GLUE.....1 lb.		K-SEEN GLUE.....1 lb.

(for citricola and black scale) (patented formulas)

The economy of Universal Brand Sprays is not realized only in the crops that are saved and bettered, but also in the purchase price. Our prices have always been consistently low.

Be sure to call on Mr. Herbert, our assistant entomologist, if you have a special problem regarding your grove. He can be found at our Los Angeles office.

Wipe Out Every Rat and Gopher

Amazing New Discovery Quickly Kills Them All. Not a Poison.

Rats, Mice, Gophers—in fact, all Rodents can now be wiped out easily and quickly. Imperial Virus will do it. This new discovery is a fluid, true Virus. Entirely harmless to humans, poultry, stock, pets, etc.

Infects Rodents only. Greedily eaten on bait. Sets up burning fever. The pests communicate it to others, and all die outside, hunting air and water. Imperial Virus is put up in sealed bottles, thus insuring full strength and potency. Only safe, sanitary method to overcome these pests. Protect your Poultry, especially Baby Chicks and Egg Hatches.

YOU CAN GET YOURS FREE

Here's how! Send \$1.00 today (currency, M. O. checks, etc.) and we will give you by return mail, postpaid, two regular, full sized (double strength) \$1.00 bottles of Imperial Virus. Use one to rid your place of these pests, and sell the other to a neighbor, thus getting yours free. Special inducements to represent us.

If more convenient, send no money, just your name and address to Imperial Laboratories, Dept. 435, 2110 Grand Ave., Kansas City, Mo. Pay postman \$1.00 and few cents' postage when two bottles arrive. Guaranteed to do the work to your entire satisfaction within 30 days or your \$1.00 will be cheerfully refunded.

Poultry Stock

Specializing in White Leghorns from heavy laying strains of proven ability. Breeding, incubation, brooding and developing by most efficient methods known. Females ready when weaned from heat, hardened, and sex has been determined.

We start you right, either big or small, and save YOU TIME, MONEY AND WORRY. Write for prices, etc. Visitors welcome. Also fancy or general utility birds.

Geese and Goslings

By Jean A. Koethen

FIVE varieties of geese are bred on the farms of England and America: Embden, Toulouse, White Chinese, African and Canada. In addition to these there are the more rare Egyptian, Sebastopol, Spur-winged, Hutchins' Snow and White Fronted, some of which are never seen in America, and none of which are of interest to any but a fancier.

Among the domesticated geese the Embden is easily the leader. Originating in the town of Embden, in the province of Westphalia, "geese from Embden" soon became an expression synonymous with the finest quality, and they are bred the world over. They are beautiful birds, pure white, large and heavy, the gander frequently attaining a weight of 30 pounds, and especially well adapted because of their rapid growth to market requirements. Their feathers,

form, graceful carriage, long slender neck, large orange knob and soft, dove-like purity of plumage, it does not require a great stretch of imagination to see the most beautiful bird extant. Hardiness, activity and vigor are traits peculiar to the breed. By carefully managed tests made upon my own farm, the Chinas have the highest number of eggs to their credit. They are prompt to mate and the gander will mate with more geese and the eggs will be more fertile than in the case of any other breed.

"The wild or Canada goose is bred pure in a domestic state perhaps more extensively than brown or white Chinas," says Mr. Flagg in Rhode Island experiment station report; "in fact, these three breeds are in demand as ornamental waterfowl for parks and private grounds. The Canada gander is also used for mating with the African or Toulouse goose

POULTRYMAN'S CALENDAR—MAY, THE TURKEY MONTH

May is a good month for turkeys if the sun shines. If it is foggy the little birds must be very carefully protected. If they are in brooders keep them in except for a little run outside now and then. Confinement is hard on poults, but dampness is their deadly enemy. If they are hovered by hens confine the hen in a coop so small that she cannot move about much, and if necessary darken it so that she will give her whole mind to keeping her charges warm. Then they can run in and out as they please but will always have a warm place to come to. Chilling and overfeeding are the main causes of the great mortality among baby turkeys. Keep them warm and dry and do not overfeed. "Keep them hungry" is the rule, and it is not an easy one to follow. There are many good rations, but none so good that it can be fed ad libitum.

being pure white, are more valuable than those of other geese, and the German owners pick them regularly at least twice a year. Picking live geese is far less common on this side of the Atlantic, and less common in the West than in the South.

The Toulouse is next in size to the Embden and more commonly bred in California. It is bluish gray above and white underneath and is believed to be the lineal descendant of the "gray lag," the "old gray goose" of the nursery rhyme. French in its origin, this variety is thus described in a "Treatise on the Breeding and Fattening of Poultry," translated from the French in 1810: "It is in upper Languedoc especially that geese breed well and are as large as swans; their distinctive mark is in having under the belly a lump of fat which hangs on the ground the moment these birds walk. The fat is not very prominent till the month of October; it increases as the bird gets plump, and is called in the language of the country 'panouille.' The Toulouse produces more eggs than the Embden but hardly equals it as a market fowl."

One of their admirers thus described African geese: "African geese are as large as most Embden and Toulouse geese and are more prolific and profitable. They lay the largest eggs of all varieties and as many of them as the best Toulouse. Goslings from old Africans are the strongest and hardest of all, and after the first two days one is rarely lost except by accident. They grow faster and larger up to the time they should be marketed. Africans have large size and great strength without the sluggishness of other varieties and are very docile compared with Chinese geese. The ganders are active and sure breeders and mate promptly with any geese. They can be mated with five times as many geese as can a Toulouse gander and twice as many as an Embden gander. The females are good sitters and mothers and therefore do not lay as steadily as the Toulouse. It takes a few days to break them up and get them to laying again. A drawback with this breed is its dark bill and skin and the fact that it is harder to pick than the Embden and Toulouse."

There are two varieties of Chinese geese, the Chinese or Swan goose, which is colored, and the White Chinese, of which a Massachusetts breeder says: "It is only necessary to see the White China goose to become its ardent admirer, for, with its fine

for the breeding of the mongrel or 'wild mongrel' as it is sometimes called, which has the reputation of being only second to canvasback duck when prepared for the table." The Canada goose is also known as the Honker goose, Common Wild goose and Bay goose and breeds as far north as Hudson Bay, Labrador and Behring Straits.

Hatching

Goose eggs take 30 or 32 days to hatch. They should be brought into the house as soon as laid and kept in a room the temperature of which is between 45 and 60 degrees, and turned every day. A chicken hen will comfortably cover four goose eggs if she is large; if she is small three eggs are enough. She should be watched when the eggs begin to pip for she is not always willing to mother these queer looking children.

When a goose sits under natural conditions she leaves the nest every day and goes into the water for a short swim. Goose eggs incubated under hens should be sprinkled daily with tepid water to take the place of the moisture the goose would bring on her feathers. If this is not done the shells and their inner membranes become so dry it is difficult for the gosling to pick its way out.

Feeding the Goslings

The goslings should be left quiet in the nest for 24 hours. If the hen is restless it may be necessary to put them in a warm basket covered with a blanket or old wool sweater. When the hen has been fed and made comfortable on clean litter in a warm coop the goslings are returned to her. If she refuses to care for them they may be brooded in a box with a jug of hot water for warmth. Goslings do not require heat long, but they must have some at the first.

Goslings, like ducklings, require moist food at first, but unlike ducklings they soon pass on to something better suited to their taste. Bread crumbs moistened with milk, bread crumbs and rolled oats or rolled oats and bran, made just crumbly moist with sweet milk, are all good for the first meal. Theodore Jager, former secretary of the Waterfowl Club of America, recommends for the first eight days nothing but stale bread, crumbled fine. After eight days it is mixed with a very little corn meal and bran and moistened slightly. Another good starting feed, he says, is a mixture of equal parts corn meal, mid

Kid Hens and Chicks of Lice and Mites

Few Drops of Wonderful New Remedy in Drinking Water Does It—No Dusting, Spraying or Greasing

Any poultry raiser can easily and quickly clean out Lice and Mites by using a new Remedy recently discovered by a Kansas City chemist and called Imperial Lice and Mite Remedy.

All that is necessary is to occasionally put a few drops of this amazing remedy in the fowl's drinking water. It renders them immune from attack of all blood-sucking parasites, as these pests positively will not live on a fowl taking this remedy.

It also acts as a splendid Tonic and Blood Purifier, as well as increasing egg production and growth, with these pests eliminated, hens lay better and the stock grows faster. It is positively guaranteed to affect the meat or eggs.

The manufacturers of Imperial Lice and Mite Remedy are anxious to get it quickly introduced among poultry raisers everywhere, and make this Special Introductory Offer. Send no money, just your name and address to the Imperial Laboratories, Room 586, 600 Grand Ave., Kansas City, Mo., and they will send you a regular full sized \$1.00 bottle and will also send you a big full sized (double strength) \$2.00 package of Imperial White Diarrhoea Remedy, standard, time-tested remedy. Pay the postman \$1 and a few cents postage when both packages are delivered. Any time within 30 days, if you are not satisfied with results, just say so and your money will be cheerfully refunded.

dlings and bran, with a little grit added, heated well in the oven. After the goslings are ten days or two weeks old a mash of equal parts bran, middlings and corn meal, moistened with water, should be their regular meal three times a day. They are fed four times a day till the fourteenth day.

It is rather an anomaly that the young of waterfowl are more easily injured by water than chicks, but it is so. Water should be given in fountains so arranged that their down and feet cannot get wet, and no water is given to swim in till they are fully feathered. Goslings do well without any water to swim in, but a tub in which they may swim a little is a great comfort, at least while they are young.

Greenbacks From Grass

The goose differs from other domestic poultry in that it is a true grazer. It requires no animal food, but where the grazing is good, gets its living mainly in that way. It is probably because California has so little natural grass that goose culture has never thrived here. The natural habitat of the goose is a shady pasture with a little stream running through it, where natural green grows the summer through. Lacking such an environment it consumes vast quantities of ground grain, literally eating its head off. This, at least, was my own experience. A fine flock of young Embdens which I hatched one spring attained such a size and such an appetite by July that I was forced to let them go at a loss. Where it has natural and sufficient grazing the goose should be immensely profitable.

Marketing Geese

In his article on geese in Mr. Weir's Poultry Book, Mr. Jager says: "When and how must geese be marketed? Goslings when eight to ten weeks old should weigh from 12 to 15 pounds if they have been treated to the best of fattening food. Treat them as Rankin does his ducks when he wants to surprise the people of Boston, and you have hit the nail on the head. It does not pay to raise and hold them for the holidays. Sell them when your birds are ready.

"To kill them, hang up each bird separately with a weight attached to its bill by a little wire hook. Draw a sharp knife diagonally across the roof of the mouth, starting way back in the mouth, thereby severing the main artery, causing a clean bleeding and rapid death. Steam, dry or scald pick, as preferred, and remove the down by rubbing a little powdered resin over it. Steam the fowl again and the remaining down will come off. Lay the birds back down on boards to shape up, or in warm weather plunge them and leave them three or four hours in spring or ice water."

Steamed potatoes, mixed with buckwheat or ground oats, are recommended as one of the best fattening feeds for geese. Breeding geese should have some hard grain in addition to grass and a daily meal of moist mash.

Poultry Queries

Conducted by Jean A. Koethen

Trapnest Bulletin

Can you send me a bulletin on trapnest construction?—Subscriber, Anaheim.

If you will write the College of Agriculture, University of California, Berkeley, they may perhaps be able to send you such a bulletin. I have no more.

Sex of Chicks

Will you kindly let me know the best signs for detecting the sex of White Leghorn chicks between the ages of six and eight weeks?—Subscriber, Burbank.

The comb begins to develop in many cockerels by the end of the second week and is almost always conspicuous before the birds are a month old. Pullets do not develop comb till they are nearly ready to lay. The wings, on the other hand, develop earlier in pullets. Look over your chicks and those you see with noticeable combs but no wings are cockerels, while

those with wings but no combs are pullets. Cockerels also are taller, standing up high on their legs, while pullets are longer in back and shorter in leg.

Chicks Won't Roost

My Rhode Island Red chicks two months old insist on crowding into

HAY AND FEEDSTUFF

A. W. Scott Co. reports under date April 29:

Receipts past week, 1,078 tons, 897 previous week. Prices have ruled fairly steady. Export shipment has picked up and coastwise shipping is moving in greater quantities. Interior trading a little heavier, seeming to be benefited by road and construction work starting as the rains seem to have blown over. Southern demand continues good and general trading over the state has been active. Alfalfa continues in light movement. Many sections are cutting the first crop and the coming week will see several baling machines at work. Nevada hay is moving toward the South with still a little coming into the local market. Export shipment light.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the market in San Francisco (for prices to consumers, charges switching, cartage, commission and handling expenses must be added according to conditions).

Citrus Markets

Los Angeles, May 3, 1922

Valencias are becoming more popular though they started with decidedly discouraging return. Navels will soon be cleaned up, and the limited number seedlings, Mikes and others makes the but a slight factor from this time on. It is thought there may be not over 13,000 or 14,000 ears of Valencias to go.

The lemon market is decidedly easy.

Shipments

Shipment of citrus fruits to date since November 1, 1921. Southern California Oranges, 15,490 cars; lemons, 3,987; total 19,477. To same date last season: Oranges, 19,755; lemons, 4,052; total, 23,807. From Central California to date this season: Oranges, 4,835; lemons, 1,051; total 4,940. To same date last season: Oranges, 4,948; lemons, 1,341; total, 5,089. From Northern California to date this season: Oranges, 372; lemons, 8; total 380. To same date last season: Orange 305; lemons, 5; total, 310.

POULTRY QUERIES

(Continued from Page 505.)

corners instead of trying to roost, and several are smothered every night. How can I persuade them to roost, and what is the best way to make roost for them? I have lost a large number by smothering. When they were in the hover house, after heat was taken from them, they crowded in corners just as they do now. Do chicks learn to roost better if hen are with them?—Subscriber, Hemet.

Most poultrymen put some sort of a roosting platform of lath or other very narrow lumber in their brooder houses so that the chicks may become accustomed to them from the beginning. Then as soon as they are moved into a house with regular roosts they learn in one night where to go. Now that yours have gotten into this bad habit of piling up on top of one another it will not be so easy, but this is the way I should go about it: Get a number of clean boxes, apple boxes or lugs, a sufficient number so that you will not need to crowd the chicks. You can tell when you see the chicks in them how many each one will hold and give each chick room to lie down comfortably. Put a little straw in each box and range them under the roosts. When night comes get the chicks into these boxes and cover (allowing cracks for ventilation) with burlap sacks. The chicks will soon learn to go to bed in these boxes, and when they have learned that so that you do not need to cover to keep them in, they will soon begin going on the roosts. If getting them into boxes is too much trouble put a good lot of

straw under the roosts and lay an old blanket or some other cover over them. The chicks evidently began this piling up because they were cold and perhaps it has made them tender. You could have nailed something over the corners, as many poultrymen do, so that there will be no corners to crowd in, but it is rather late for that. Your chicks are old enough now to roost on the ordinary laying house roosts, which are from one to two inches in width. I have never noticed that chicks learn to roost any more quickly when they are with hens. In fact, my hens always leave their chicks before the chicks are ready to roost, and the chicks have to sleep in a box.

Fattening Cockerels

What is the best method of fattening cockerels for market, and what feed is required? — Subscriber, Burbank.

The best method is crate fattening, in which the birds are confined in crates, six or eight to a crate, so that they have hardly room to move, and fed a moist mash for two weeks. Very few poultrymen, however, take the trouble to crate feed. They confine the birds in coops with small runs where they will be able to get some exercise, but not too much, and feed them mainly moist mash from the time they are put in the coop till they are ready for market. There is no better fattening ration than that used at Cornell experiment station, which consists of 50 pounds corn meal, 20 pounds middlings and ten pounds ground oats, mixed to a batter fresh for each feeding with buttermilk or skim milk. If milk is not available, 20 pounds beef scrap is added to the ground grain and the mixture moistened with water. This is fed three times a day.

Melilotus

Are Melilotus Alba and Indica of any use as green feed for chicks?—Subscriber, Burbank.

Melilotus of either kind is excellent, but alfilaria is better for chicks. Any succulent green is good, such as the wild radish, mustard, milkweed, malva, bur clover, in fact, the clovers, of which melilotus is one, are among the very best of greens for all ages of chickens.

Soft Shelled Eggs

Why do my hens lay so many soft shelled eggs? They have mash in the morning, cracked corn and barley at night and are on the range during the day. They do a lot of scratching on horse manure. Could that harm them?—Subscriber, Irvington.

Hens have scratched in horse manure from time immemorial without injury. You do not mention oyster shell as part of their ration. Probably the reason they lay soft shelled

eggs is that they have not lime for shells. If you keep shell before them I think you will see a difference.

Die in the Shell

Many of my chicks this season have died while hatching without being able to get out of the shell. I have seen so much good advice in your magazine I feel sure you can help me. —Subscriber, Irvington.

You do not say how you hatch. When incubator hatched chicks fail to get out of the shell we sometimes lay it to lack of moisture, sometimes to faulty incubation, sometimes to lack of vigor in the germ itself. When chicks that are hatching under hens die in the shell it is more often due to the latter cause. I wonder if you were very particular about not keeping your eggs too long before they were incubated. Incubator experts say ten days is the very limit for keeping eggs. If eggs are kept too long they never hatch well.

White Faced Black Spanish

Mrs. T. T. Middleton of Lone Star Ranch, Lankershim, sends the name of Rowan Bros. of Rowan Realty Company, Los Angeles, as the only breeders of White Faced Black Spanish in Southern California.

Breeders' Names on Liner Page

Almost daily we have requests for information as to "Where can I buy a setting of Ancona, Houdan, Bronze Turkey or Pekin eggs?" Often these come in when the last issue of the Cultivator in its classified liner ads gave the names of breeders in many parts of the state. Read the little liners. There are three columns devoted to poultry ads.

Also a word to the breeder who is not carrying an ad. He will accommodate a vast number of people and at the same time make a speck for himself if he will simply tell the world through the California Cultivator classified liners.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

Report on high producing pens from April 10 to 20: The 620 contesting birds laid for the ten days 4,348 eggs, or an average of 70.1 per cent for each day. Six pens laid over 80 per cent. The highest hen was that of Boehm & Noel of Hayward with a production of 84 per cent.

High pen productions: Boehm & Noel, 84 eggs; J. J. Shore, 83; Hanson's, 82; Alex Stewart, 82; Geo. Gray, 82; Fred Stallings, 82; E. D. Crewdson, 79; L. A. Thornewill, 78; Ely's, 78; Geo. B. Ferris, 78; Hollywood Farm, 77; Pacific Trapnest Station, 77; W. H. Marshall, 76; S. L. Gibson, 76; Sunrise Poultry Farm, 76; Wm. Bacon, 76; San Jose Poultry Yards, 75; R. H. Young, 75; Geo. B. Ferris, 75; Bolfig's, 75; W. J. Neef, 75.

SECOND EGG LAYING CONTEST AT POMONA

The second annual Southern California farm bureau egg laying contest at Pomona will begin October 1, 1922, and end September 30, 1923. This contest is limited to California entries. For information address Southern California Farm Bureau Egg Laying Contest, 814 South Garey Ave., Pomona.

Missouri experiments put 56 pounds on grade lambs in 90 days, while scrub lambs, fed and handled the same way, took 122 days to make this weight. Also, the scrubs required 40 per cent more feed and sold for \$2.85 less a hundredweight.

One Washington County, Ohio, dairyman reports a net increased income of \$44 per cow from three years in a cow testing association.

Says Sam: Every man is his own university in the long run.

Buy the Tractor That Saves You Most Money

What you want on your farm is power that will do your work faster, better and cheaper. The form of power is not the most important question. You want the best and cheapest available.

If any one tractor produces cheapest power—if it does your work day after day, year after year, at cheapest cost—that is the tractor you should buy.

OILPULL TRACTOR

The Cheapest Farm Power

Triple Heat Control

A perfected system of kerosene burning has made possible the remarkable OilPull savings. Mail the coupon for a FREE copy of our new booklet on Triple Heat Control.

The cost of tractor power is determined largely by fuel cost—upkeep expense and length of tractor life.

The OilPull saves money on fuel. According to the results of exhaustive expert tests, the OilPull fuel bill is 39% less than the average of all other tractors.

The OilPull is guaranteed to burn distillate and stove-tops successfully.

The OilPull saves money on upkeep. The upkeep expense reported by owners is 50% less than the average upkeep expense reported to the Government in a recent tractor investigation in the Corn Belt.

The OilPull saves money on depreciation. Thousands of OilPulls are still giving faithful service after eight, nine, ten and even twelve years of use.

Let us send you more detailed information on how the OilPull will save money on your farm. In the meantime, see your local dealer.

Advance-Rumely Thresher Co., Inc.
17-19 Main St., San Francisco, Cal.

The Advance-Rumely Line includes kerosene tractors, steam engines, grain and rice threshers, alfalfa and clover hullers, husker-shredders and farm trucks.

Served through 30 branch offices and warehouses

Power!

Judge the 'Caterpillar' T35 Tractor by its performance—don't let its small size mislead you

Don't confuse "Caterpillar" T35 Tractor with the ordinary small tractor, either in dependability, endurance or power. T35 is small, but small in size only. In power it surpasses many tractors of much greater size. In quality of design and workmanship, and in dependable, enduring performance, it is not even approached by any other tractor.

In addition to a liberal warranty covering materials and workmanship, the T35 is guaranteed to deliver 15 drawbar horsepower, with the following drawbar pulls:

2600 pounds at $2\frac{1}{8}$ miles per hour
1850 pounds at 3 miles per hour
1100 pounds at $5\frac{1}{4}$ miles per hour

Read what the users say regarding the power of T35

With a 10-foot disc weighted down and cutting from 4 to 6 inches deep, the tractor walked right along and even on the turns it did not slow up. It will handle a 7-foot scraper without any trouble and a 15-inch spring-tooth cultivator set to its extreme depth.

THEO. C. SJOQUIST, Turlock, Calif.

I used the T35 to subsoil and went down 20 inches deep the second time. I pulled my 3-gang plow nine and ten inches deep and the "Caterpillar" went along so easy you could hardly tell it was working.

JACOB DITTENBIR, Reedley, Calif.

I have pulled a new subsoiler apart twice and have had to instruct my man to use the soft pedal in the future.

W. O. GAINES, Lindsay, Cal.

I have subsoiled 65 acres of vineyard and 30 acres of pasture land to a depth of 16 to 18 inches.

OLIVER S. NEWMAN, Woodbridge, Calif.

I have subsoiled 16 inches deep. Have also pulled a 7-foot double disc—the T35 simply played with this load. It was no work for the engine at all, even on the turns at the end of rows.

G. WEYAND, Acampo, Calif.

Keeping Livestock Records

By Jack Klein

BREEDERS of pure bred livestock are as a rule very busy men and a thousand and one things are constantly demanding their attention. A sick cow, a new born calf, an occasional visitor who wants to buy something or a lot of visitors who drop in to gossip for no good reason at all take up all the time they can spare from their very actual work of feeding and caring for the stock. The task of keeping up the records is one that is very distasteful to the majority of breeders and is usually the last thing they attend to. Negligence on the part of the breeders has cost many a fine animal its place in the world and has made a grade out of one that was bred in the purple. In some cases whole herds have been sold out as grades because some one was not smart enough or did not take enough interest in his own welfare to keep up the records.

If the breeders could only be brought to see the value of a competent bookkeeper, one who cannot only keep a record of the income and outgo of the place but who can keep a check on the herd and have a reliable record made out in such a way that anyone can see at a glance whether an animal is doing what it should or not, there would be a lot more of them making money.

When W. R. Harriman took charge of the Los Angeles County farm he found practically no records of the big herd of Holstein grades on hand. Also he knew that some very excellent pure bred had been bought from one of the most prominent breeders of the state but they had completely disappeared and to this day no trace has been found of them. One of the first things he attended to was the introduction of a comprehensive system of bookkeeping by which he could tell

from day to day what was going on in the herd. This system has been changed and modified from time to time until now it is remarkably simple and could easily be adopted by any big breeder who would care to give a few minutes daily to its operation.

A card index is kept of the entire

herd, in which each animal has a card which shows all the vital statistics, including date of birth and by whom bred. For the cows there is a space for each service, also showing date of calving and sex and disposal of offspring. On the reverse side are spaces for monthly milk records for six

years. In this way a complete record of the cow is kept close at hand. The cards are arranged in a file such as room clerks keep in large hotels, and such information as when she was born, went on test and is due to calve is available without removing the card from the file.

Another report which is filed daily in the office of the superintendent is (Continued on Page 531.)

Lifetime Record of WHITTIER PONTIAC NETHERLAND 4TH

-Reported semi-official tests showing comparison with Tilly Alcartra—more butter than Tilly at the same age.

She came to us three weeks before her first calving, thin and weak after months of nothing but salt grass pasture. In three years three months she has more than doubled her body weight; has had three calves and has made 2380 pounds butter on semi-official test.

During each lactation period she has had an average of only 17 days on four time milking, the balance of the time being handled in corrals and stanchions with the rest of the herd. She has been milked by an average of five milkers each period.

She holds the California state record for junior four year olds, being credited with 1139.2 pounds butter from 22,399.5 pounds milk in 365 days.

Federal Quarantine No. 37

By W. R. Wood

THE conference to be held in Washington, D. C., on May 15 between the federal horticultural board of the department of agriculture and the fruit and nursery interests of the country should command the attention of every horticulturist in the state of California.

The question at issue is whether or not there shall be a modification of Federal Quarantine No. 37. Those desiring this modification for the most part are the foreign growers, importers and nurserymen, dealing largely in imported plants, bulbs and flowers. On the other hand all American horticulturists having the good of the industry and the welfare of their country at heart should stand firmly behind the federal plant board in their efforts to maintain and enforce this quarantine.

The purpose of Federal Quarantine No. 37 was not to prohibit the importation of plants, bulbs, flowers, etc., but to restrict their entry into the United States, so that it would be

Box of Contraband Caught in the Act of Endeavoring to Get by Quarantine Officials

The potatoes, corn, peppers and other insect carriers shown in the above photograph were consigned to the furnace instead of securing entrance to the country and spreading insects and possibly disease in Arizona. This box was picked up by the plant quarantine office at Los Angeles harbor from a South American vessel. The box was brought in by an Arizona farmer in the hope of introducing potatoes, corn and other seed which might prove of great value to American agriculture. Note the frass and offcastings of insects plainly visible in center of picture. He was entirely innocent of any intent to do wrong. This is only a simple illustration of the necessity of protecting American agriculture by continuance of the plant quarantine board and enforcement of Quarantine Order Number 37.

possible to more carefully guard against the introduction of dangerous insect pests and diseases. Ample provision is made for the importation of such stock, bulbs, seeds or plants as may be necessary to supply this country's needs, provided the proper precaution is exercised with reference to pests and diseases.

California growers should realize more clearly perhaps than those of any other state in the Union the necessity for the enforcement of these quarantine regulations. Our fruit industry represents a large part of the wealth of the state and we are already spending millions of dollars annually in fighting pests and diseases, a large part of which came to us from foreign lands, and one has only to spend a short time with any of our quarantine guardians at the different ports of entry to be impressed with the fact that every steamer from a foreign port brings new pests and diseases, many of which might be more serious to our horticultural industries than those we now have.

(Continued on Page 535.)

Agricultural News Notes of the Pacific Coast

Northern California

A cow testing association is being organized in Glenn County.

Wool fleeces are weighing up to five pounds heavier this year than last.

Storage stocks of apples are smaller throughout the state than last year.

Eight thousand acres of rice land is now flooded in the Glenn-Colusa district.

May farm bureau meetings in Glenn County; Plaza, 19; Grapevine, 24; Glenn, 26.

Effort is being made to organize a 40,000 acre irrigation district near Roseville, Placer County.

The Trinity Valley farm center held its first picnic of the season, April 23, at Salyer, Trinity County.

Sutter County farm bureau will hold its annual picnic at Dow Grove in the Sutter Buttes, May 20.

Yolo County farm bureau meetings: Capay, May 17; Zamora, 18; Willow Oak Park, 19; Plainfield, 25.

A 90,000 pound sale of new clip wool was made by F. J. Mendosa of Colusa County at an average price of 31½ cents.

The new premium list for the state fair is nearly ready for the printer. It will provide for many new agricultural classes.

The Sutter Basin Company is greatly increasing its asparagus plantings. This concern will ship this season 15 carloads.

The membership drive of the California Rice Growers Association has closed with 304,000 acres signed under five year contracts.

At a massmeeting in Hayward a plan was enthusiastically launched for building permanent quarters for the Eden Township Show.

The Tehama County fair will award prize to livestock exhibitor maintaining his stock and quarters in best condition at fair grounds.

The third annual ram sale of the California Wool Growers' Association will be held at the university farm at Davis on June 15 and 16.

The California Rice Growers' Association reports membership signed on five year crop basis controls approximately 204,000 acres.

The Placer County farm bureau exchange has been organized with headquarters at Lincoln. The principal business of the exchange this season will be handling of grain.

The Superior California Development Association purchased 1,000 acres of the J. L. Mendenhall property and is planning to plant Thompson Seedless and Muscat raisin grapes, and alfalfa.

Farm bureau meetings in Shasta County: Inwood, May 13; Cottonwood, 15; Bella Vista, 17; directors, Redding, 20; Millville, 23; Palo Cedro, 24; Hat Creek, 26; Fall River, 27; Mountain, 28.

The Jacinto irrigation district limits flow of water allowed one person to five acre feet in season, with rates for all in excess of two or three acre feet which will eliminate rice growing from the district.

Fifty thousand refrigerator cars will be needed to handle California's deciduous fruit crop this summer, according to estimates forwarded the transportation companies from fruit growers, dealers and shippers.

Central California

Many ranchers about Lemoore are increasing their poultry.

Owners of 200 cows at Crows Landing have signed up in the cow testing association.

The Kings County cannery at Armona has a force of 240 working on the spinach pack.

Tulare County this season will add nearly 1,000 acres of bearing prune trees to its producing acreage.

The 14th annual Raisin Day parade at Fresno, April 27, brought out a crowd of 125,000.

Irrigation started on Delhi Colony last week of April, several weeks later than in the usual season.

Because of cold weather it is expected that fat cattle will be about two weeks later than usual in getting on the market.

Mariposa cattlemen report pasture in Bald Hills short, but heavy and stocky with thousands of sheep in splendid condition.

Grain growers of the Tulare lake district have put in a lot of protective work on levees in preparation for expected high water in June.

Reported importation to Mono County of bulls from scab infested area in Nevada is being investigated by the state department of agriculture.

Turlock melon growers are encouraged over the warmer growing weather. Sales Manager Cross of the association reports new members signing daily.

First cutting alfalfa in the Oakdale section of Stanislaus County is averaging better than a ton to the acre. A large new acreage has been seeded to alfalfa.

The Fresno County tree planting committee and directors of the county farm bureau are conferring on tree varieties for highway planting throughout the county.

Experiments have been started by the growers' service department of the Sun-Maid Raisin Growers to determine effect of irrigation on frost damaged vineyards.

Farm bureau meetings in Kern County: Mountain View, May 15; Pond, 17; Inyoken, 18; Muroc, 19; Rosedale, 19; Shafter, 22; Arvin, 26; directors, Bakersfield, 27.

Kings County farm bureau directors add their endorsement to purchase of 46 acre site for a county park six miles north of Lemoore and eight miles northwest of Hanford.

Growers of alfalfa representing more than 2,000 acres in the Kerman district have set \$20 per ton in the field as price for first cutting. The next meeting of the alfalfa growers will be held May 15.

The Southern Pacific is running "spring lamb specials" on Tuesdays and Fridays from points north of Fresno and on Mondays and Thursdays from points south. First unloading at Sparks, Nevada, second at Ogden.

An experimental vineyard has just been planted at Weed Patch by the growers' service department of the Sun-Maid Growers. The chief purpose is to test out cultural methods. Similar work is carried on at Clovis and at Mendota.

Southern California

Five federal inspectors are now busy on Coachella onion shipments.

Monrovia celebrates her 37th birthday anniversary, May 20, with Football Fiesta.

An experimental planting of 200 pecan trees is being made near Piru, Ventura County.

Diamond Brand News estimates at least 3,000 tons of walnuts lost through the freeze.

Blythe, Riverside County, is making large express shipments of peas to Los Angeles market.

Walnut growers think their chances good for securing four cent tariff on unshelled nuts, 12 cents on shelled.

The Escondido, San Diego County, farm bureau is canvassing possibilities of reopening the local cannery.

Several packing houses in Orange County closed for a few days to let accumulated fruit get off the market.

The Mojave Valley Fruit Association is planning to build a packing house at Victorville, San Bernardino County.

The Imperial County Fair Association is asking supervisors to call election on a \$50,000 bond issue for the fall fair.

Ventura County requires all incoming trees to be vacuum fumigated before planting as protection against scale insects.

Effort is being made to organize all livestock breeders of Riverside County. A mass meeting will soon be held at Riverside.

Approximately 5,000 cars of lettuce shipped from Imperial this season is estimate of C. W. Runge of the Southern Pacific.

Fruit growers of Yucaipa Valley last week listened to a talk on apple and pear spraying by Prof. E. O. Essig of the state university.

The Temescal Water Company of Corona has filed on 20,000 acre feet of water from the Santa Ana, to be taken out at Barton Flats.

Keeping of individual tree records and giving of individual tree care was emphasized in walnut field meetings held by Los Angeles County farm bureau.

Three hundred sacks of peas were shipped from Arroyo Grande, San Luis Obispo County, to Los Angeles on April 24. The same day 300 were sent to San Francisco and a carload of artichokes to the East.

Citrus and walnut growers have proved during the past cold season that temperatures average three to five degrees colder in orchards carrying growing cover crop than neighboring orchards under clean cultivation.

A great irrigation and power project has been started on the San Luis Rey River in San Diego County. A dam will be built on the San Luis Rey and two others on the San Diegito. The project is said to be backed by the Santa Fe.

The Imperial County Farm Bureau Exchange has been formally organized with A. T. Taecker, Brawley, president; G. E. Weist, secretary-treasurer. Twenty-three grain growers, controlling 1,200 acres, signed memberships.

The Coast and General

Yuma sent out 33 carloads of hay in one day last week.

Arizona farm bureau is forming a marketing agency.

Frosts of the last week in April injured apricots in Southwestern Colorado.

Several deciduous fruit orchards have been planted about Tucson, Arizona.

Fifty-five cars of steers were shipped to California from Douglas, Arizona, last week.

Grape growers of Casa Grande, Arizona, have organized a marketing association.

Potato growers of Canyon County, Idaho, will pool their crop through their farm bureau.

Arizona wool growers are holding on, expecting prices to improve. Few sales have been made.

The cow testing association of Tempe, Arizona, had 89 cows producing over 40 pounds fat during March.

Livestock men of Grant County, Oregon, are facing serious condition with shortage of hay and feed and snow still on the ground.

The North Pacific Cooperative Berry Growers plans selling as much of the strawberry crop as possible on f. o. b. Seattle basis.

Shipments of early cabbage estimated by United States department of agriculture at 25,250 cars, 43 per cent more than last year.

A beet sugar factory has been established at Valdivia, Chile. The greater part of Chile's sugar now comes from Peru in the raw state.

A \$2,000,000 sale of timber has just been made at Grays Harbor, Washington, 6,000,000,000 feet of timber at the head of Hoquiam River.

The Yakima Valley of Washington last year produced 17,000 crates of strawberries. Twice that amount is estimated as this year's output.

Idaho regards as an evidence that horses have increased in value the fact that horse thieves are again operating in many parts of the state.

To restore worn out pineapple fields in Florida and rid soil of nematodes it is recommended that they be grown to Natal grass for a two year period.

The Texas and Southwestern Cattle Raisers' Association at its recent convention at El Paso elected H. L. Johnson of Wilcox, Arizona, vice-president.

Farmers of Yuma Valley, Arizona, are warned against baling uncured hay. Some dockage has been suffered by shippers on this account. An average of 20 cars a day is being shipped to California.

The Cochise-Graham Stock Growers' Association of Arizona held their annual convention at Phoenix last week, electing J. C. Page of Willcox, president; Wm. Lutley, Tombstone, vice-president; Wellington Johnson, Willcox, secretary. The next meeting will be held at Willcox.

Oregon dates: Stock show and Shorthorn meeting, Rainier, May 20; Oregon Jersey Jubilee, Willamette Valley, May 25-27; Guernsey Gayeties, Tillamook County, June 1-3; State Grange Annual, McMinnville, June 6-9; Rose Festival, Portland, June 7-9; Union Livestock Show, Union, June 7-9.

Trustworthiness of Thermometers

By Dr. Ford A. Carpenter, Manager Department of Meteorology, Los Angeles Chamber of Commerce

ARE your temperature readings accurate?" is one of the questions being asked with increasing frequency in California. It may be answered in the affirmative if the thermometer has been properly made or tested, if it has been properly located, if it has been correctly read, and if the readings have been promptly recorded.

It is the purpose of this paper to present some of the difficulties encountered in the manufacture of thermometers; to describe some of the methods used in their calibration; to show how they may be placed in localities giving

certification of thermometers used by the citrus growers of Southern California, so in November, 1920, a testing bureau was established.

Orchard Temperatures Incorrect

The result of a year's tests of thermometers brought to the testing department by over 100 fruit growers gave interesting figures. It was found that 43 per cent of the thermometers read too high, 45 per cent read too low, 6 per cent were structurally out of

oil in smudging for frost protection by having incorrect thermometers."

Types of Thermometers

There are three general types of thermometers in use in the orchards for frost protection: The U-tube (Sixe pattern), the ordinary stem thermometer, and the horizontal or minimum thermometer. The first named were notably inaccurate; only 1 per cent were found to be without error and nearly one-third were thrown out as being dangerously inaccurate. The ordinary kind of thermometer fared only a little better, only 2 per cent being reliable. Of the horizontal variety 32 per cent were dependable and 3 per cent were sufficiently erroneous to be classed as dangerous.

For over 30 years the governmental meteorological services of this and other countries have adopted a standard maximum and a standard minimum recording thermometer. This instrument, being somewhat more difficult to make than other types, probably caused the manufacturers to advertise and sell the other simpler varieties without regard to accuracy. The commonest kind of thermometer used in the orchards of Southern California is the U-tube model designed half a century or more ago by Sixe of London. Where errors of 3 to 6 degrees are inconsequential, this thermometer may serve, but for use in situations where half a degree may determine the danger point such instruments invariably invite disaster.

The chart shows in graphic form the relative dependability to be placed on the different types of thermometers:

Shading or Screening Thermometers

The exposure of a thermometer is most important, second only to the original accuracy of the instrument. As the object sought is the temperature of the air, the thermometer should be exposed to air currents (not that wind affects temperature per se, for it cannot if the bulb of the thermometer

be kept free from dust) and yet shaded from the sun's rays. Wherever possible thermometers for orchards should be given the standard weather bureau exposure, i. e., in a suitably made instrument shelter screened from the sun, double roofed and open only to the north. The necessity for protecting thermometers from the sun in order to obtain the true temperature of the air was shown during a South Pole expedition. Commenting on this, Dr. Griffiths Taylor, the Australian meteorologist, stated: "If we expose the thermometer to the sun we do not obtain the air temperature by any means. For instance, 154 degrees Fahrenheit is undoubtedly hot, yet this was recorded in Antarctica in 1902! But the true free air temperature at this locality was 24 degrees, or eight degrees below freezing!" In other words, the difference between the reading of the thermometer in the sun and in the shade was 130 degrees.

The size of the shelter for the thermometer is immaterial, provided it is not too large. It is important, however, that the shelter be made of thin wood and painted white. The thermometer should be located, if in an orchard, in that portion giving average condition, not too close to a tree, free from the influence of a dwelling, and also distant from the relatively warm air emanating from an irrigation standpipe or ditch. These are some of the ideal conditions under which dependable temperatures may be secured.

Observation in the Orchard

The personal equation in reading thermometers cannot be overlooked. Observers should cultivate the habit of reading to tenths of degrees. This is not difficult for it is only a matter of training the eye to estimate. Milham summarized what he aptly terms "temperature blunders" as follows: "There are four avoidable blunders: A good thermometer must be used in determining the temperature. It is a waste of time to attempt to make accurate determination of the tempera-

(Continued on Page 520)

Photograph of the inside of a special meteorological observer's shelter at a cooperative United States weather bureau station, showing a standard weather bureau horizontal minimum recording thermometer with an extra minimum thermometer above and two extra thermometers below

he best results; to explain how personal errors may be avoided; suggest the making of satisfactory records; enumerate the results of a year's tests of various types of thermometers and summarize the relative accuracy of the different types in use by orchardists and others.

Necessity of Thermometer Testing

It is an unsolved problem whether redulity or incredulity is responsible for the greater amount of error. In the matter of thermometers ordinarily in use there appears to be no doubt at all about the solution: it may be said without hesitation that it is the former, for not one person in a hundred ut what believes that the thermometer is reliable. This is not only true of the processes of taking temperature readings in the citrus orchards of California or elsewhere, but the same criticism holds good in the use of clinical thermometers and thermometers when applied in the arts and in the industries. Human nature is apt to accept a printed statement or an engraved or stamped scale as being correct without personal investigation. And is it not natural? We never think of checking up the accuracy of a foot ale or a yardstick; it is accepted as being dependable. If the making of thermometers were as simple a matter as dividing off the tenths or sixteenths of an inch on a wooden or metal strip most of the difficulties in the use of a thermometer would be solved.

When the practical research department dealing with meteorology applied to agriculture and aeronautics was created in the Los Angeles chamber of commerce, one of the objects at forth was the standardization of certain instruments used in industry. A few tests were convincing proof that one of the most important fields for investigation was the examination and

order, and only 6 per cent were accurate. The 210 thermometers that were submitted for test by the orchardists during the year were not the ordinary kind, but instruments bearing names of well known makers and cost their owners on an average of \$5 each. One fruit grower reported, "Ninety per cent of the thermometers we were using were incorrect, and after having same tested and marked we were able to save several thousand dollars. I believe that citrus growers of California have wasted thousands of gallons of

RELATIVE ACCURACY: THREE STYLES ORCHARD THERMOMETERS

EDITORIALETTES

America is in line for feeding
all the world on asparagus. Califor-
nia has large producing possibilities,
and some day may have canneries
sufficient to meet the demand of all
the world. Finer quality and greater
quantity is not to be found than in
the delta land of the San Joaquin and
Sacramento Rivers. As to quantity
we are already producing two-thirds
of all in the United States. See how
it grows in the photo on the cover.

Mr. Reed of the Sacramento cham-
ber of commerce has given the fol-
lowing regarding the asparagus in-
dustry: "The Sacramento Valley
delta district has almost finished har-
vesting, marketing and canning its
1922 asparagus crop which is worth
more than \$4,000,000. Of the total
acreage in the entire United States
amounting to a little over 32,820, two-
thirds, or more than 20,479 acres, are
in the central California district,
which makes it the asparagus center
of the world. This season it is esti-
mated the canneries at Sacramento

and delta points will put up over
900,000 cases which carry the choicest
brands and will be distributed in
every corner of the globe. The crop
comes on early in the spring, and the
pack lasts until cherries ripen, and
other fruit and vegetable crops in ro-
tation are handled."

The tall stack hasn't gone yet.
Some will be made and sold this year.
The committee reported favorably on
the modified stack but individual
growers may prefer the perfect com-
bustion possible with the tall stack.
Mr. Scheu finds that many growers
still insist that the greater number
of heat units secured through perfect
combustion and by direct radiation
from sides of stack abundantly com-
pensates for loss, if any, from the
column of heat delivered from the top
of the tall stack.

Congressman Swing has introduced
a bill which provides for an appro-
priation of 90 million dollars for
preliminary steps in the building of
Boulder Canyon Dam and All-Amer-
ican Canal to the Imperial Valley.
This fact was no sooner made public
than the fight began on the bill. It
will continue as long as there is pos-
sibility of defeating it. In the mean-
time Imperial Valley people and the
majority of the people in Southern
California will aid Congressman
Swing in every way in their power.

Dr. Walker, president of the State
Federation of Farm Bureaus, informs
the Cultivator that the grain growers
of this state are now organizing to
take advantage of the U. S. Grain
Growers, Inc. The U. S. Grain Grow-
ers, by the way, is the child of the
American Federation of Farm Bureaus
which is responsible also for getting
the livestock people of the country
into a great cooperative organization.
Dr. Walker says that the value of the
grain which will be handled by the
Grain Growers in California this year
will put it in line amongst the larger
cooperative marketing organization.

Dr. Walker is at present visiting
farm bureaus of Southern California,
touching various points in connection
with the farm bureau conference jour-
ney. He will attend the meeting of
the Los Angeles County dairy depart-
ment and the Orange County annual
at Orange County Park.

The last two weeks have shown
marked activity by the farm bureau.
In addition to many annuals of county
associations there was the state con-
ference of farm advisers at Berkeley
followed by the conference of farmers
and members of farm bureaus in au-
tomobile trip covering over 800 miles.

The automobile, the truck, the tele-
phone and good roads have cut the
mile in two, and the farm formerly,
as sometimes expressed at least, out
of touch with civilization is today
brought to the outskirts of the town.
In addition the phonograph, electricity,
modern plumbing, and other aids to
comfort and social life have brought
much to even the most remote ranches.
Now comes the most wonderful of all,
the radio. Some of us are still won-
dering and asking, "Where is the end
and what will it amount to?" While
we are wondering and asking the high
school boy is taking an elementary in-
struction book, buying a few supplies
and installing the radiophone to the
joy and astonishment of his own fam-
ily and the surrounding neighbors. It
is simple, it costs but little and we be-
lieve will ultimately result in not only

a wonderful plaything but an aid to
farm efficiency. More another week.

Speaking of radiophones we are re-
minded of a news item in a recent
daily paper. The item was headed
"Be Gentle With Electricity." Four
boys putting up aerial wires for a
radio receiver let them fall over a
high tension electric light wire, not
thinking of the danger. The light wire
was insulated, but the scraping of the
radio wires back and forth wore off
the insulation. Suddenly there was a
blinding flash and the two boys fell
to the ground, one dead and the other
seriously shocked and burned. The
father of the dead boy, running out,
seized the wire and was killed. It is
scarcely possible there may be any
danger in radio equipment but the
hint of the tragedy referred to above
should make our boys careful, very
careful, while playing with electricity.
While working with the radio keep in
mind that high voltage electricity has
its perils.

Everybody in Sacramento is grow-
ing whiskers, that is, "them as what
can." This in commemoration of a
time in California when safety razors
were unknown. The Days of '49! In
all history there is nothing to equal
this great romance of California, and
Sacramento is now inviting the world
to join her in celebrating those days
of gold. The invitation is being ex-
tended not only by all the papers of
California but many in the East are
giving pages of publicity, reprinting
posters and saying all kinds of in-
teresting things about California.

USE THE OPEN ROAD

No other place in the world can
offer greater inducement or compen-
sation for the use of its highways than
can California. The roads themselves
are of the best built and most exten-
sive, and their way lies along the
ocean or through the valleys and into
the mountains, with wonderfully beau-
tiful scenery at every turn. This week
we are observing "The Open Road,"
and as there is an automobile for every
five or six of our inhabitants it is to
be assumed that few of our residents
but will join in the celebration. Like
many other celebrations the effect of
this one will not end with Saturday
night for many are saying: "We have
not seen all we expected to this week
but we have planned for a trip
amongst the sequoias or into the
Yosemite or to Yellowstone, to the
Grand Canyon or to some of the more
quiet seaside or mountain resorts."
Some are planning to visit Europe,
more to see California first.

A LATE RAIN

The melting snows of the Sierra
Nevada sent down such a flood that
Kings River broke its bank and
threatened to fill old Tulare Lake, the
bed of which is now covered with
nearly 400,000 acres of ripening
wheat. The light rain of Monday and
Tuesday struck terror to the hearts
of all but fortunately it turned into
such a cold storm that the hardening
of the melting snows finally turned
the rain into an advantage and it is
now hoped no great damage will
result.

The rain covered the entire state,
ranging from a trace to nearly two
inches. Sacramento had a precipita-
tion of .12 inches, San Francisco .26,
Red Bluff .18 for Tuesday only,
Fresno .18, San Luis Obispo .42, Los
Angeles .61, Redlands 1.30, Yucaipa
1.12, Santa Ana .55, Pomona 1.06,
Monrovia 1.03, Riverside .87, Glen-

dora .82, Bakersfield .30, Long Bea-
.52, Corona .70, Pasadena .89, Port-
ville .55. Sacramento County report
millions for it will plump up to
ripening grain. A few sections we
caught with some alfalfa down b
the state over the benefits are vast
greater than the losses.

A GOOD THERMOMETER

A thermometer according
Webster is "any device for measure-
temperature," then adds: "Strictly
speaking, temperature is not a mea-
urable property, but its rise and fall
can be estimated in terms of accom-
panying changes."

Too many growers are content with
"any device" rather than one which
will enable a correct estimate of "ac-
companying changes" occurring in
one's fruit. Still any device even
though costing but few cents may
enable that correct estimate if it
tried out and we learn its idiosyncra-
sies. They may be learned by fol-
lowing the rules of standardization.
Some manufacturers are following
those rules, and tested, standardized
thermometers are to be had.

A fund of valuable information on
thermometers is to be found in Dr.
Carpenter's article on fifth page of
this issue. This article is from a
address delivered by him before the
Southern California Academy of Sci-
ences and again before the orange
growers attending the recent frost
fighting convention at Covina.

DYNAMITING FROST

A new and almost startling
suggestion is made as to frost control.
It is made by Bingham T. Wilson,
long time observer of California
weather conditions and one who has
a desire to protect California orchards
without the nuisance of smoke. Mr.
Wilson writes to the Cultivator:

"During the recent frost preventive
convention at Covina I was deeply im-
pressed by the general sentiment ex-
pressed in favor of eliminating the
smudge pot by bringing down the
warmer air currents from above. There
can be little doubt that under normal
conditions those currents do exist, at
even with a freeze like the one of the
past winter, which took on somewhat
the elements of a blizzard, the higher
orchards were saved by these same
warmer air strata, proof conclusively
in favor of the mechanical warming of
our orchards. I have given this mat-
ter much thought and am convinced
that this heat descension can be suc-
cessfully brought about by the use of
explosives in the form of frost grenades.
Bombs exploded at an elevation
of 100 feet over our orchards will ef-
fectively drive the warmer air down
and create artificial air currents that
will assimilate with the colder air be-
low, thereby warming it all. This sys-
tem requires but little expensive ap-
paratus. A small bomb trap that would
throw the grenade is about all, while
the bombs themselves need not be ex-
pensive or extensively used. Next
winter I shall experiment and would
like to enter into cooperation with
whatever organizations exist in order
that we may thoroughly test its ef-
fectiveness and, if successful, present
it to the farmer free from patent
encumbrances and at the least pos-
sible expense.

"Bombing the air would have its ob-
jectionable features, no doubt. During
the process of bombing no orchardist
could sleep, but then what orchardist
can when the thermometer is at 27
degrees and falling? An investigation

(Continued on Page 539.)

Here is a real *in a* HOLT Harvester **SMALL SIZE**

Model 32 "Caterpillar" Combined Harvester

A harvester built to last a lifetime

MODEL 32 is a Holt Harvester in every respect, possessing the same qualities that have established the enviable reputation of the larger machines, employing exactly the same separator design; reaching, in addition, a higher point of achievement in harvester design than has ever before been approached. It is a lighter-running harvester than has ever before been built, easier handling, adaptable to every harvesting condition, an all-metal machine that will last a lifetime.

Never before has the grain grower—unless he farmed big enough acreage to purchase the larger Holt Harvesters—been able to buy equipment that would harvest his crop so *quickly*, so *efficiently*, so *economically*. Never before has a *real* combined harvester been offered in such small size—a harvester that takes only 2 men to operate it, 6 to 10 horses to pull it, that weighs less than 7000 pounds, that saves and cleans the grain in the same thorough manner as the larger Holt Harvesters. Only as a result of Holt experience is such an achievement possible—only Holt could build such a machine.

The 1922 production of Model 32s is limited—to make sure of obtaining delivery, your order should be placed at the earliest possible date. Don't delay filling out and sending the coupon for full information about the Model 32.

Weights less than 7000 pounds

6 to 10 horses pull it easily

Cuts full 12 feet

Requires only 2 men to operate

Hyatt Roller Bearings throughout

Alemite Lubrication System

All-Metal separator

20 horsepower motor

Cylinder direct-driven from motor

Safety sprockets eliminate breakage

Easily moved over roads

Tear out and mail this coupon

SURE POWER—AND GOODYEAR BELTS

"My Goodyear Klingtite Belt operates smoothly and powerfully, under all weather conditions. A belt of another material that I had on the same pump jack was as useless as a piece of rope. This one is strong and close-gripping."
—ELMER THOMPSON, Farmer, Little Sauk, Minnesota

You can leave it out there alone, without a man to watch or tend it, and be sure your Goodyear Klingtite Belt is holding steadily to the pulleys and delivering full power every time the engine turns.

It goes right on working through winter snows, spring rains, and summer heat. Atmospheric changes do not affect it. It keeps a slipless grip on the pulleys.

For every farm power duty, there is a Goodyear Klingtite Belt, designed, built and tested specifically for farm service.

Your local dealer in hardware or implements has Goodyear Klingtite Belts for sale. For further information about their economical and trouble-free performance in farm service, write to Goodyear, Akron, Ohio, or Los Angeles, Calif.

New Walnut Diseases

There recently appeared in the "Re vista Agraria" of Naples, Italy, an article on a new walnut disease, with suggestions of treatment, in which the ailment would seem identical with the one now puzzling California growers. We quote:

"On a farm belonging to the Comune of Sant'Anastasia (Province of Naples) there are about 700 walnut trees which should be in full bearing, but for some years two-thirds of them have shown signs of withering. The foliage is very scanty, the shoots of the year are short and weak, and the pith is more or less brown; during the summer, the leaves turn yellow, and in June a larger or smaller number of the small nuts are shed. Finally the branches become partially or wholly withered, and when the course of the disease is very rapid the whole tree succumbs. From cracks or lesions in the trunks there exudes, especially in spring, a blackish, somewhat mucilaginous substance, which frequently comes out from small bubble like cavities in the heart of the tissues. These are, however, often not very noticeable, but an unfailing symptom of the disease is the more or less distinct blackening of the living tissues situated immediately beneath the cortex, which also extends irregularly to some extent up the trunk. As a rule, only the base of the trunk and the large roots are thus attacked, the lower branches remaining immune.

"The whole root system, as well as the larger roots, is infected to a certain degree, and crystalline deposits are often found in large numbers in the tissues. On the thick roots especially as far up as the root collar, or even higher, are seen masses of whitish mycelia or thin black rhizomorphous filaments which wind among the tissues or make their way between the wood and the cortex. The white mycelia sometimes assume arborescent forms which are very characteristic, being arranged in a fan like manner. Sometimes the mycelium causes the delignification of the large roots, which become quite soft.

"A cursory investigation reveals the fact that the soil on which these walnut trees are growing varies in depth, but is everywhere shallow and rests upon a very compact bed of rocks which from their nature cannot easily be penetrated by the roots and contain but few elements suitable for plant food. It is thus permissible to suppose that the roots of the walnut trees, when the latter have reached a certain age do not only meet with an obstacle preventing their further expansion but are also unable to abstract from the soil all those substances which are necessary to the life of the tree. Further, it is well known that walnuts need rich deep soil and therefore do badly where the soil is poor and shallow. All these circumstances contribute to lower the activity of the root system and predispose it to the attacks of the cryptogamic flora of the soil which derive great benefit from the humidity resulting from the impermeability of the sub-soil. Hence the constant presence of large numbers of mycelial hyphae which can be seen from outside, lie hidden under the cortex, or wind concealed from sight through the various tissues of the cortical and ligneous zones. Another fact of a general nature must also not be lost sight of, viz., the climatic conditions. In Campania rain falls frequently and heavily from October to March so that the ground is constantly moist; if to this fact is added the relatively warm temperature of this region which prevents the soil freezing, even during the coldest months, it is easily understood that the cryptogamic soil flora has every opportunity of growing with extreme rapidity and of attacking the roots during their winter rest and, moreover, when they are already weakened by complex conditions of a cultural nature.

"It is advisable to scarify the infected wood and to disinfect the lesions, but this is not enough to control a disease which originated and has its chief extension in the root system. Therefore, unless it is decided not to take any measures, seeing that the soil is probably quite unsuited to the cultivation of walnuts,

the only thing to be done is to use substances to destroy the fungi in the soil and prevent their growth. This would at all events give a certain respite to the roots so that the length of the life of the tree would be prolonged and a fairly good crop of walnuts secured for a few years. Carbon bisulphide could be injected to a depth of 40-50 centimeters, 30-35 grammes being used per square metre; other suitable substances are a 2.5-3 per cent solution of sulphate of iron, a 5 per cent solution of sulphate of copper (the roots having been properly uncovered), or quicklime.

"These remedies must be applied at two different seasons, quicklime, carbon bisulphide or copper sulphate being used in the winter from November to December, and sulphate of iron sprays in the spring, after the leaves have unfolded."

OLIVES IN THE SOUTHWEST

The first olives were introduced into southern California by Franciscan Fathers 150 years ago. The original plantings were made near the San Diego Mission. Since then olive growing has been carried on in many parts of California, in Arizona, and in a few other sections. Within the past 25 years the olive industry has assumed a place of importance in the commercial fruit industry of the United States. The basis of the industry in this country is now the production of ripe olive pickles, although for a number of years small quantities of green olive pickles were made of the larger types of fruit. Until 1900 almost the entire production of olives in this country was utilized for oil. At the present time oil is chiefly pressed from those olives which are too small to be acceptable commercially.

For olive growing a comparatively mild climate is necessary. A temperature of 10 to 14 degrees Fahrenheit above zero is likely to prove disastrous to the tree, and the fruit will usually be injured by a drop below 28. The dry atmospheric conditions of California and the arid Southwest, where irrigation supplies the necessary soil moisture, appear to meet its requirements. A new Farmer's Bulletin, No. 1249, Olive Growing in the Southwestern States, by C. F. Kinman, pomologist, describes in full the methods used in olive orchards, the conditions most favorable to successful results and the proper handling of the fruit in the pickling plants. Many illustrations are given, so that the bulletin will meet the need for information of those contemplating engaging in the industry. It may be obtained upon application to United States Department of Agriculture, Washington, D. C.

BROWN ROT OF CITRUS

During and after heavy rains investigators have found brown rot injury to oranges and lemons in a number of places. In one case on a single tree 24 affected fruits were found.

Brown rot injury is always likely to occur in citrus orchards when conditions become favorable to its activity. The fungus causing brown rot is a natural resident of our citrus soils but is prevalent more particularly in the heavier soils. This fungus grows to the surface during wet weather and the spores are splashed up on the low hanging fruit by rain drops, resulting in the characteristic spotting and decay so well known. This same fungus is the one responsible for most of the gummosis in citrus trees.

It is always a good thing, particularly if the soil is rather heavy, to spray the ground under the trees with a thick Bordeaux mixture as soon after fumigating as possible, as a precautionary measure.

After damage has occurred the ground under the trees as well as the lower foliage and fruit should be thoroughly saturated with Bordeaux mixture. A good strength is 3-3-50. It is also desirable to remove affected fruits from the tree and from the ground under the tree so as to prevent at least a part of the infection.

4 Door Sedan
New Superior Model

The World's Lowest Priced High-Grade All-Year Sedan

The Ideal Family Car

The Comfort and Weather Protection of a Limousine For Less Than the Cost of Most Open Cars

Never before has a Fisher Body Sedan of this quality been offered at a price so low. The beautiful lines, superb finish, luxurious upholstery and refined appointments that have made Fisher Bodies the standard of excellence in closed cars, are all here in full measure. Its four doors fit perfectly and cannot rattle.

The heavy plate glass windows can be instantly lowered to any desired point, or as quickly raised, and the plate glass windshields are both movable, permitting instant conversion of the Sedan into either a closed or an open car.

Mounted on the New Superior Model Chassis, this car is fully equipped mechanically, and combines ample power and speed with steadiness and ease of handling.

No matter what car you now use, or think of buying, investigate this Sedan. Its power, speed, appearance and appointments please discriminating motorists accustomed to paying higher prices for closed cars.

Its low price and low maintenance appeal to all who find it desirable to economize. In no other car on the market can you find this unusual combination of Style, Quality, Economy, and Year-'Round Service.

How to Thin Apricots

By A. H. Hendrickson, Deciduous Fruit Station, Mountain View

APRICOTS should be thinned to increase the size of the fruit, prevent breakage of limbs due to excessive loads, and to stop the spread of brown rot in clusters of ripening fruit. The practice of thinning apricots on heavily loaded trees is one to be recommended in order to produce fruit of large size and highest quality. Ordinarily, unless prevented

by frost or disease like brown rot or shot hole fungus, the apricot tree tends to set more fruit than it can size properly. This means a great quantity of pits is produced. The grower, however, is chiefly interested in fruit—not in pits.

There is no stated time for thinning, but the work should be done before the pit hardens. A good time to thin is when the fruit is from one-half to

three-quarters of an inch in diameter.

Apricots should be thinned so that no two fruits will touch when ripe. Ordinarily the young fruit should not be left closer than from three to five inches on strong shoots and only one fruit to each short spur. Two fruits may be left near together on opposite sides of a limb if no other fruits are closer than four or five inches. In orchards where irrigation is possible a larger number may be left than in the drier foothill sections where the trees cannot be watered. On young and vigorous trees which have set a major portion of their crop on the main branches, the fruits may be left fairly thick, as they will in all probability grow to proper size. Clean fruit of large size is what is wanted both for canning and drying.

In the coast counties it is especially desirable to see that the fruits do not touch when ripening. Brown rot during certain seasons works very rapidly in ripening apricots. In clusters there is often enough moisture between the fruits in the morning to permit the spores to germinate. The disease thus works very quickly from fruit to fruit and within two or three days the entire cluster may be infected.

Thinning in Long Pruned Trees

Thinning apricots on trees which have been pruned according to the "long" method requires special consideration. In practically no case does the grower thin a "long" pruned tree heavily enough. Where the pruning method has been changed from the

"short" to the "long" system, it must be remembered that in most cases the bearing area of the tree has been greatly increased. Fruit wood, formerly removed, is left, and the tree usually sets a larger number of fruits than in the case of a similar tree short pruned. Due to the fact that many branches have been left uncut this increased set is not very apparent. The result is that too many apricots are left on the tree and cannot be fully sized.

In some cases, particularly near the coast, the trees often set fruit on the slender one year wood beyond the fruiting whorl. As the season advances the branches bend out and downward, exposing the fruit near the end to the direct rays of the sun. A period of exceptionally warm weather such as occurred in June, 1921, may cause a scalding of these fruits at the ends of the branches. Furthermore, as these apricots near the extremities of the branches are farthest from the source of sap, they oftentimes do not grow as large as those on the large branches in the center of the tree. In a long pruned tree which has made a vigorous growth the previous season no fruits should be allowed to remain on the end two or three feet. They can be removed easily by means of a cane or light stick on the end of which has been fitted 12 or 14 inches of old spray hose. The branch may be struck with this hose to knock off the apricots at thinning time without material injury to the branch or buds. This work can be done very quickly and cheaply, removing the danger of having small or scalded apricots.

The Strongest
Rake Made

Self Dump
All Steel
Construction

High Quality

Low Price

Farmers Who Know Demand THOMAS Hay Tools

If you want the **BEST RAKE MADE, BUY A THOMAS HAY RAKE**—Because it is the **STRONGEST RAKE MADE**, all steel construction, and the weight is put where it is most needed. The wheels and axle are the heaviest and strongest ever put on a hay rake. The raking teeth are extra heavy, with double coils made of crucible steel oil treated. Every part of the Thomas rake is so constructed as to give the greatest durability, strength, ease of operating and accessibility.

If you want a rake that will give you no trouble, that is always ready for use, requires no repairs, and above all, that is easiest to operate—**BUY A THOMAS HAY RAKE**.

The Thomas Crown
Mower is the only
Two Speed Mower
Made

The Thomas Crown
Changeable Speed Mower
with Double
Eccentric
Arch
Connection.

For Team or
Tractor

Sizes 3½, 4½, 5, 6 and 8 foot, with wide rim ground wheels. Slow speed for 90% of work, causing less wear. High speed for very heavy work. Cutting where other mowers fail.

The foot lift and hand lever work in conjunction automatically, and with the gag lever gives absolute control in raising and lowering the bar. The tilting lever is easily operated, with ample adjustment for any condition of the grass.

The swath board is adjustable so it can be raised or lowered.

Double eccentric steel arch connection, stronger, more adjustment than others, and giving practically instantaneous adjustment on cutting bar.

Inner shoes malleable, not cast iron, as are many others.

Wearing lugs in heel of each guard, less friction, better support for knife. All boxes removable; no wear on frame. Ball thrust bearing for crank shaft pinion. Heavy drop forged steel pitman straps. Sliding hitch, direct pull; no side draft.

Also have a perfected 8-foot tractor mower.

Frosted Walnut Trees

By Ernest Braunton

THE agricultural extension service of Los Angeles County held two meetings on treatment of frosted walnut trees, one at Pomona, May 3, and one at Van Nuys, May 4. Dr. L. D. Batchelor, from the Riverside citrus experiment station, was the lecturer, and D. C. Wylie of the field department, California Walnut Growers' Association, the surgical operator.

Dr. Batchelor stated the damage was done during the nights of November 17, 18 and 19, the first frosts, and unusually severe for the season. At some points the temperature dropped the first night to 25 degrees at 11 p. m., and registered 20 before morning. As a rule the upper parts of the trees only were injured as these included the tender growing tips. Where there were no air currents some trees were frozen to the ground.

To overcome the injury which may otherwise occur every year in some sections it is necessary to ripen the wood before frosts come. This does not mean that leaves have dropped or turned yellow, but the tips have stopped growth and will extend no farther. The remedy is to control irrigation, for growth will continue so long as soil moisture is present. In silt loam such as is present in the H. W. Hall orchard at Pomona, where the first meeting was held, soil moisture remains for a long time, and irrigation must be suspended early, or about July 15. In sandier soils, where moisture is early dissipated, irrigation may be done a month later, or August 15. Dr. Batchelor said three irrigations each season should be given—in May, June and July. In young orchards make the last irrigation light, not wetting the soil to a depth greater than three feet.

Among varieties the Eureka is more generally susceptible to frost injury than Placentia or Erhardt. If injury is light, only the tips being killed, Dr. Batchelor advises no pruning until the all walnut pruning is done. Do not all walnut pruning is done. Do not be discouraged so long as there is life above the bud or graft; some of the

best orchards were badly frost injured when trees were young. Nearly all frosted trees may be made over if vigorous shoots appear. Where irrigation has been suspended in July or August, one should not wait later than Christmas for rains. If none fall by that time irrigate immediately.

CAPRIFIG FIELD DAY

Caprification of the Calimyrna fig is essential to the success of that variety. Ever since the introduction of the blastophaga in 1900 improvements have been made, new varieties discovered and material progress made in the success of this interesting process of fig culture. The details of caprification are important and must be attended to carefully in order to make for greater success in the growing of the Calimyrna.

The planting of 50 acres of caprification in the foothills at East Orosi has probably done more to insure the success of the Smyrna type of fig than any other one thing during the past 23 years. This orchard was planted in the spring of 1921 and is growing vigorously at the present time. Members of the Peach and Fig Growers are planning to hold an all day field meeting on May 19 at the Caprification chard to discuss varieties, baskets, methods of distribution, summer pruning and other important points leading to success.

The following tentative program has been prepared by the department of horticulture of the California Peach and Fig Growers, which is cooperating with the Tulare and Fresno County farm bureaus in arranging this program:

9:30 a. m.—"Caprification Varieties and Their Identification," I. J. Condit
"The Maslin Varieties of Caprification," G. P. Rixford; "Caprification Baskets and Distribution," "Question Box."

1 p. m.—Inspection of caprification orchard; Hutchinson & Toler orchard at orchard of A. J. Dye; summer pruning of caprification trees; caprification grafted into Calimyrna trees; caprification of Kadota figs; visiting neighboring orchards.

Every fig grower who is interested in learning more of the details of caprification should prepare to attend this meeting. Growers who attend are requested to provide their own baskets and lunches as the picnic under the

trees near the orchard can be enjoyed. This orchard is located on the place previously owned by L. P. Sorenson and adjoining that of E. A. Sorenson, who is caring for the orchard.

CALIFORNIA VALENCIA ORANGE SHOW

Notwithstanding the fact that California Valencia oranges are bringing the highest price in history, millions of Valencias will be exhibited at the forthcoming California Valencia Orange Show to be held in Anaheim, May 23 to 30. Valencia growers have been keeping a watchful eye on their best fruit, and some of the finest specimens of Valencias ever grown will be entered in the competition for prizes at the show.

The crop this year is said to be exceedingly heavy and producers are planning to exhibit in far greater numbers than ever before.

Practically all of the fruit distributing associations in Southern California will have feature and rack exhibits. Municipal and civic bodies will also place beautiful displays. The decorations will be exceedingly beautiful this year.

It is expected that the growers will find a great deal of interest in the industrial section. Here will be shown every conceivable kind of implement and article used in citriculture. Nearly 90,000 feet of floor space comprise the various sections of the show. There will be 280 exhibitors in the industrial and automobile sections, the two departments being housed under different tents.

The show will be located in the beautiful new 20 acre city park at Anaheim. Besides the large tents here will be two smaller canvasses which will house the baby welfare department and the exhibit of the Laguna Beach Art Association.

Accommodations for motorists are being arranged. An official parking place, adjacent to the show grounds, is being arranged and will care for 5,000 cars.

SUTTER COUNTY PEACH GROWERS CONTEST

When we hear of a five year old orchard of cling peach trees producing 10 tons, 242 pounds per acre, on an entire orchard of 13½ acres without fertilization, the most credulous of us open our eyes, but that is exactly what happened in our 1920 peach growers contest and that record still holds.

Peach trees are not supposed to be in full bearing until they are ten years old. What are the possibilities of a five year old orchard? That is one of the things we are delving into by means of our annual contest.

Already our years of contests have taught us much about the peach industry. They have had a large influence in increasing the use of cover crops among the contestants from 11 per cent in 1920 to 28 in 1921. What is true of the contestants is largely true of the fruit industry of the county as a whole.

They have caused longer pruning to be practiced throughout the entire country and long pruning, as recommended by the university has been adopted outright by 500 acres of orchard where two years ago practically no pruning of this kind was done.

Each orchard that wins a ribbon or cup takes its place as a demonstration of improved orchard practice. It goes away with hide bound traditions of orchard culture and sets up the most progressive practice that gives results.

Cups and ribbons have been put up by the California Cannery League for trees of leading varieties, and the varieties have been divided into different age groups so that the competition might be as fair as possible.

The points were awarded on a basis of 100. Eighty points were given for the highest tonnage of No. 1 fruit, ten for perfect condition of orchard and ten for the perfect delivery of the fruit.

The tonnage of No. 1 fruit was taken from the weigh tags, returned by the canneries, the Cannery League returned the grading on the fruit, and the condition of the orchards was judged by Professor J. C. Whitten of the University of California.

Each contestant was obliged to fill out a card with regard to all the cultural methods practiced by him in pro-

ducing a crop. This card was held in the farm bureau office. From these cards it was possible to obtain valuable information in regard to the peach industry and its improvement. All the zest of healthy competition has been brought to the full.

This year we are out to beat that 20 ton record.

WALNUT GROWERS FIELD DAY AT SANTA BARBARA

At a recent meeting of the executive committee of the walnut growers' department of the Los Angeles County farm bureau at which representatives from Orange, Ventura and Santa Barbara Counties were present, it was decided to hold the second annual walnut growers field day at Santa Barbara on Saturday, September 2. A special program committee was appointed which is to meet at Santa Paula to outline the program for this activity. Plans are being made for special rates at the hotels and an excursion trip through the beautiful Santa Barbara district for Friday, September 1. It

is believed that walnut growers of Southern California will attend in large numbers. At the first annual field day held last year at Puente more than 1,000 walnut growers were present.

*CROP PROGRESS IN ARIZONA

Under the influence of higher temperatures all vegetation has made rapid advance during the week. Early planted cotton has made the second joint and in many places plants are six inches high. Where replanted, cotton is making a sturdy growth and presents a uniform and healthy appearance. Potatoes are doing extremely well and recent weather conditions have been favorable for a large yield. Cantaloupes are coming on nicely notwithstanding attacks of aphids which are also reported to infest cotton and potatoes. First cutting of alfalfa in the Salt River Valley is reported as poor and light owing to the effects of cold weather. Barley is turning yellow and a considerable amount of grain hay is being cut. Grapes are blooming in the Yuma sec-

tion, summer squash is on the market and string beans are appearing. Annual shipment of date stock from Yuma has been completed, the greater part going to India.

CASEIN SPREADERS INCREASE SPRAYING EFFICIENCY

The use of preparations of casein to increase spreading properties in liquid sprays is rapidly coming into prominence. The last ten per cent of efficiency in covering often counts more for control purposes than the ordinary 90 per cent application usually given, and any factor which thus tends to make up for the element of human laxity ought to be widely adopted. Several firms now have for sale such casein spreaders.

Within the San Joaquin valley itself Raisin Day is coming more and more to be regarded as the day when we sing the praises of cooperation, regardless of the industry that may be affected.—Fresno Republican.

Willard Standards of Service Protect Batteries of All Makes

The same principles of battery care apply to all makes of batteries, just as the same principles of fairness, courtesy and helpfulness apply in dealing with the owners of these batteries.

No matter what make your battery may be it must have water put in—it must be kept charged—and it must be given prompt attention at the very first sign of trouble.

The ability of the Willard Battery Station to provide this care for the Willard Battery, qualifies it to render similar service on all other batteries, regardless of make.

There is a Willard Battery Station near you. It will pay you to go there *now* to make sure your battery—whether it is a Willard or not—is in good condition to keep on serving you to the limit of its ability.

Wherever water is to be lifted

Southern California Vegetable Garden for May

By D. F. Reichard

THE month of May this year finds us just about a month behind in weather conditions. Consequently our gardens are backward. Beans, corn, melons and the like that ordinarily would be good sized plants have been struggling along making slow progress under the adverse weather conditions. But, look out! Keep your ground in good shape, a spell of hot days is liable to come on unawares, then the plants will tell you whether you have kept the moisture where it is available. It is imperative that there be enough moisture available in the soil to keep the plants in good growth; lack of moisture soon stunts the plant, making it or its fruit tough and pithy instead of the nice savory succulent vegetable anticipated when the garden was started. Apply water either by sprinkling or slowly running the water in furrows near the rows of plants—the latter way is preferred. Thoroughly cultivate as soon as the ground is dried out enough to work.

For those who have not already started their gardens we would sug-

gest that you thoroughly soak your ground and work it at least ten inches deep and pulverize it. There is still time enough to "put over" a good summer garden in which may be planted beans, corn, cucumbers, melons, okra, roselle, tomatoes, peppers, squash, eggplant, as well as many of the hardier vegetables, but do not try to grow peas nor Irish potatoes; they do not do well when planted at this time of the year.

Watch your garden closely for pests. They attack with full force this month. Get after the aphids with a solution of Black Leaf 40 or nicotine. For chewing insects, as slugs, snails, worms and beetles, use arsenate of lead either as a spray or in the dust form. On very young plants just coming up a very good plan is to scatter tobacco dust or slaked lime, on the hills. These act as a repellant to the insects. Mildew, rust and other fungi are treated with Bordeaux mixture lime-sulphur solution or sulphur. Gophers and moles are best controlled by the free use of traps. Thorough cultivation keeps the weeds out which are most lusty thieves of moisture.

Commercial Floriculture

By Ernest Branton

EVERY year the Cultivator receives queries from subscribers who wish to grow cut flowers for the market, usually as a "side line," to fill a gap in the horticultural program, or to make use of soil areas not in use during some part of the year.

Last week a request for information on commercial floriculture came from Carlsbad. That section may have as good soil and general conditions as any part of the state, but lying nearly midway between San Diego and Los Angeles, it is not close enough to either city to be readily available. Of course, daily shipments may be made with regularity, even as they are made from Los Angeles and San Diego to points in Arizona. But florists like best to deal with fields immediately available. When one gets a "hurry up" call and wishes all the 'mums, carnations or roses of a specified color he can obtain within an hour or two, the home fields are the only ones drawn upon. It is possible to phone and have them delivered in an hour's time or to send an auto to field and bring them in. This matter of availability should be the first consideration in choosing a location. Rapid transportation comes next and one should be close enough to market to deliver personally and not rely upon train service.

The choice of soils is a serious matter. A light, rather than a heavy soil is preferable for a majority of flower crops, and one should be able to get the flowers picked every day, no matter how much it rains. Good drainage is therefore essential. Freedom from frosts is a fundamental unless one expects to grow on limited lines only.

All commercial growers, as a rule, suffer losses each year from frosts. Even though plants like rose bushes are hardy, sharp frosts nip and spoil the buds. Years ago the writer knew a grower near Los Angeles who could market but one variety of rose during cold snaps, Catherine Mermet; 20 other varieties were frozen in the bud.

Abundance of water at low cost is another fundamental necessity, for cut flower crops are from short season plants largely, a 90 day period at most, and must be heavily supplied with water throughout. Good flowers are more dependent upon water supply

than upon any other contributing factor. After all these points are settled one still has to decide what flowers should be grown for the local market. Not all market demands are for like supplies, even of the most popular flowers.

TRUSTWORTHINESS OF THERMOMETERS

(Continued from Page 513)

ture with an inferior instrument. The error of parallax must be avoided. The correct position of the eye is such that the line of vision is at right angles to the stem of the thermometer. The observer must avoid heating the thermometer by the presence of his own body. A thermometer must be given time to indicate a new temperature.

Temperatures Should Be Plotted

To secure best results orchardist and others using thermometer readings should enter them on contour maps of their plantings. One of the first things that will become apparent will be that contours of elevation and lines of equal temperatures do not coincide. Higher ground does not always indicate a warmer region nor do lower levels correspond with decreased temperatures. The drainage of the air, the drift of surface currents, the orientation of the locality to the sun's rays, and the character of the immediate environment all contribute to the varying temperatures encountered over a comparatively restricted locality. Temperature control can be studied and definitely determined by the use of accurate thermometers properly placed and carefully observed.

COVER CROP YIELDS

In order to discover the best type of cover crop to use and the proper method of producing the highest possible yield a group of experiments have been carried out by the agricultural extension service at Yuba City in Sutter County, and the following figures have been secured:

Anderson Bros.—Purple vetch, 1.3 tons per acre; Melilotus Indica, 3 tons per acre (planted December 14 under similar conditions).

F. L. Hutchinson—Purple vetch, 7.4 tons per acre; Melilotus Indica, 4.4 tons per acre (planted in October).

Anderson Bros.—Melilotus Indica (irrigated one month after planting) with irrigation, 7.8 tons per acre without irrigation, 3.3 tons per acre (planted in October).

Dr. E. S. Moulton—Purple vetch, 6.4 tons per acre; common vetch, 5.4 tons per acre (planted in November).

A. J. Clarke—One ton lime on Melilotus Indica, yield 3 tons per acre; two tons lime on Melilotus Indica, yield 6.75 tons per acre.

Life Insurance

A person insured in a fraternal society for over 20 years. At the expiration of this period under the California law is the insurance collectable? If so what method should be taken?—Subscriber, San Luis Obispo.

Such matters turn entirely upon the contract of insurance which in the above case would of course include the charter and by-laws of the particular insurance society. The insurance may be in the nature of endowment insurance payable at the expiration of a particular period or may be straight life insurance payable only after death.

Land Not Used by Railroad

Land is deeded to railroad with proviso that if the road is not constructed the land would revert to the owner. How long would the owner have to wait in order to enforce this reversion?—Subscriber, Winters.

It would depend entirely upon conditions and the particular wording of the deed. Generally speaking it would be a reasonable time and what would be a reasonable time would have to be construed by the court.

Pumping Plant Owned by Four

Four brothers whose land corners at one point wish to put in a well and pumping plant at the corner. Can an agreement be drawn or can each buy a fourth interest in the one-half acre upon which the plant is located so that if one should sell out he could sell his interest in the plant without furnishing a water right to the buyer, or could one of them own the plant and sell water to the others without assuming the obligation to do it perpetually?—Subscriber, Fair Oaks.

Such a matter could be easily handled in several ways. One method would be to have the agreement between the four parties putting down the well so drawn that in case one desired to sell his land at any time the others would have the right to purchase plant at valuation of his interest; or an agreement could be drawn by the four so that water might be sold by one for a limited period.

Damages from City

I fell over the border of a road by reason of negligence upon the part of the city. This road is very dangerous. Would I be able to collect damages from the city? If so in what court would the action have to be taken, and would I have to have an attorney and if so where would I get one?—Subscriber, Pleasantville.

The liability of incorporated cities for injuries received in the case of streets and highways out of repair is strictly limited by statute and this seems to vary in different cities. It has frequently been held that cities are not liable for injuries sustained by private individuals through the neglect of the officers charged with the duty of keeping streets in repair. In other words, the officers themselves are the only ones who could be held liable. These matters depend so much upon the exact facts of the particular case that whether there is any liability in this case could not be stated. It would undoubtedly be necessary for you to take the matter up with an attorney so that the facts of the case could be thoroughly and intelligently investigated. It is not necessary for you to go to an attorney in

your city but any one in the state would be entitled to take the matter up. For economical reasons it would undoubtedly be best to get one as near your locality as possible. Such action would be prosecuted in the superior court either against the city or against the officers of the city.

Loan to Veterans

Under the laws by which the state undertakes to help ex-service men to buy a farm must a person have cash to make part of the payment? I have implements and a tractor but no cash.—Subscriber, Anaheim.

There are two acts involved in this question. One is the act whereunder the veterans welfare board purchases property and in turn sells it under contract to ex-service men for a period to be fixed by the board, not exceeding 40 acres, wherein one-fortieth of the principal is paid each year with interest at five per cent per annum. In such cases the ex-service man must

make an initial payment of ten per cent of the purchase price of the land in the case of a farm and five per cent in the case of a home or homesite. The other bill is one for the purchase and subdivision of land into farms. In this instance any veteran who is not the owner of agricultural land or right thereto to the value of \$15,000 or who by his purchase of land under the act shall not hold land to that amount, may become a purchaser of one of these farms, each of which shall have a value not exceeding, without improvements, \$15,000, or in the case of farm laborers allotments each of which shall have a value not exceeding, without improvements, \$1000. Preference in the allotment of these farms is by law required to be given to veterans trained in agriculture or those who were wounded or disabled in the military service and are otherwise qualified by experience. No provision is required in this instance for a first

cash payment. The period of payment for the land is the same as that above stated. The purchaser may be required, however, to apply for a loan from the federal farm land bank to pay the amount of such loan to the welfare board then taking the remaining contract subject to that loan.

CITRUS BUD WOOD FROM KENTUCKY INTERCEPTED

The bureau of plant quarantine of the California department of agriculture has been advised that S. A. Sexton, state quarantine guardian at Exeter, Tulare County, recently intercepted a shipment of citrus bud stick from Newport, Kentucky, in the parcel post. Commenting upon this timely interception, Mr. Strong, chief of the bureau, says, "No better way to introduce citrus canker into the groves of California could be conceived."

Horticultural Commissioner Pomerooy of Kern County reports bearing raisin vineyards, 1243 acres; non-bearing, 5680.

The Newest Goodrich Tire

30x3½ Clincher Fabric

\$10.90

also made in 30x3 size

The latest addition to the Goodrich list of tires. It completes the line. It enables your dealer to give you full service under the Goodrich name and trademark.

It is great news for every user of 30 x 3½ clincher fabric tires. It is an opportunity to secure Goodrich quality—with the advantage of a price which speaks for itself.

\$10.90 will buy this Goodrich "55"—the new tire for the popular light cars. The splendid construction is made better yet by the thick anti-skid tread of scientific design, made of specially toughened rubber.

Your dealer is ready to supply you.

A Profit-Making Machine for Western Grain Fields

IN the golden grain fields of the West, Deering Harvester-Threshers save grain and reduce harvesting costs. They are labor and crop savers—harvesting, threshing, cleaning and delivering the grain into a wagon box in one operation. One "combine" will harvest from 20 to 25 acres a day, depending on the rate of speed.

A Titan 10-20 Tractor will pull the machine under favorable conditions, while the International 15-30 will pull it practically everywhere. It can be operated by 8 to 12 horses. Two men run it, one on the driver's seat and one to look after the operation of the machine. Wagon loader, which is furnished as regular equipment, eliminates use of sacks. This year a new 12-ft. machine is placed on the market. A 3-ft. extension, for use where conditions permit, may be had at extra cost with the 9-ft. harvester-thresher. For stationary threshing a feeder and rake stacker are furnished at extra cost. Bagging platform with canopy top can be supplied if desired. Tractor hitch regular.

It will pay you to get complete information on these profit-making machines. Write us today for descriptive booklet or talk to the nearest Deering dealer.

AT LAST A Spray That Equals Fumigation

After many months of patient labor and grievous disappointments, the chemists of a Los Angeles Laboratory have successfully perfected a hydro-carbon oil emulsion spray which combines the effectiveness of fumigation with the economy and ease of spraying. It positively will not injure the most tender growths nor mar the beauty of bud or blossom. It is non-poisonous and non-inflammable, and, what is very important, the component parts of the spray will not separate. The ingredients are of the purest and best and are so combined that the finished product will mix with water in all proportions.

This spray has been aptly named "FUMISPRAY," for this very good reason—for a considerable time after spraying fumes are thrown off which

act as effectively as direct contact of the liquid—thus every tiny crevice is FUMISPRAYED!

FUMISPRAY kills by contact and fumes the following parasites—Oyster Shell, San Jose, Purple, Black, Red, Brown, Cottony Cushion and Scurfy Scales; Green, Black and Woolly Aphis; Thrips, Red Spider, White Fly, Pear Psylla and other forms of insect life.

FUMISPRAY is the last word in insecticides. Do not confuse it with any other spray on the market. We guarantee you satisfaction. Sold in large or small quantities. Write for prices or see your dealer. Special proposition to commercial sprayers.

Questions and Answers

Planting in the Moon

If there any truth about the value of planting all vegetables that grow under ground in the dark of the moon and those that grow above ground in full moon? There has been more talk about that in this neighborhood than I ever heard before. I never before heard such argument.—Subscriber, Burbank.

Specialists connected with the United States department of agriculture and other specialists have made thorough investigations and report that they are unable to find any advantage in planting any seed or plant "in the moon." The time was when some farmers started almost every operation on the farm "in the moon." This was especially true as to laying fences, setting posts or even pruning trees. Moon farmers are not so numerous as they were in those good old days.

Gum Disease

What treatment and care should be given to a tree that has gum disease?—Subscriber, Redlands.

The inquirer does not say as to whether tree is citrus or deciduous. On the assumption that it is a citrus tree we would refer our inquirer to page 124 of the California Cultivator of August 6, 1914, where Prof. H. S. Fawcett fully discussed the problem in a two column article. We do not believe the treatment then recommended has been improved upon. In effect the treatment is: Use sharp knife, first determining area of the disease, then cut back from the diseased line half an inch or more into clean healthy bark. Remove the bark in this healthy strip and cut or scrape all the diseased wood until clean white surface is secured. Paint thoroughly with Bordeaux paste. Bordeaux paste consists of one pound bluestone dissolved in three quarts of water and two pounds unslaked lime slaked in three quarts of water. When lime cools stir the two mixtures together.

Various Bugs

Am sending small box containing big grub or "worm"; also black thousand legged worm and a beetle. What are they?—Subscriber, Oilfield.

The big black beetle is the ground beetle which infests apricot trees, eating the leaves, and sometimes attacking watermelon vines. It is a rather difficult pest to handle because poison sprays are of little avail unless made very strong. As to its attack on trees, that may be prevented by use of tanglefoot or some sticky band around the trunk near the ground. The millipede, or thousand legged bug, does not belong to the insect family and is usually not considered of sufficient importance to justify a regular campaign. They may be partially controlled by clearing up rubbish or sticks under which they congregate and live, in part, on decaying vegetable matter. However, when their regular diet is short they may attack growing lettuce or similar plants. The big soft grub over an inch in length was the larval state of the ordinary June bug or May beetle. They usually infest lawns or ground filled with roots and little disturbed by cultivation.

Shothole Borer

I have found some holes on the outside of my front door which seem to be caused by some kind of an insect. They are about the size of pinholes and are on the oak part of the door. Can you tell me what kind of a bug does this harm, and what I can do to stop this trouble?—Subscriber, San Marcos.

The attack of this pest, which is probably the common shothole borer, might have been prevented by keeping the door varnished or painted. The best way to prevent the pest from attacking fruit trees is to keep the tree in good healthy condition at all times. The borer prefers dead wood. Where a tree is infested it may be covered with a coat of carbolated whitewash. It is possible the live insects now infesting the wood of the door may be controlled by washing thoroughly with gasoline which may penetrate and kill the insect. This should be followed by a coat of varnish or paint.

Dates in Imperial

Are dates grown successfully in Imperial Valley. If not, why not? If successfully grown, how do they compare with those grown in Coachella Valley. At what age do they begin to bear and what is considered an average yield per acre? What varieties do best, and can offshoots be had in small quantities of 25 or 50 and at about what price?—Subscriber, Orange.

Dates are grown to quite a large extent in the Imperial Valley, but the culture has not extended as rapidly as in the Coachella Valley. Being farther removed from the river and gulf influence Coachella is possibly hotter and certainly more arid than the Imperial Valley. The dry, or sometimes called bread, date has succeeded admirably in the Imperial Valley. The moister or Deglet Noor type has proven better adapted to Coachella Valley conditions. The date will bear at three or four years of age, and an average yield is practically impossible to estimate because there are but few plantations of sufficient scope to give a fair average. Individual trees have yielded as high as 600 pounds. On this point Paul Popenoe writes: "Yields as high as 500 or 600 pounds for a single palm have been recorded, and it is not unusual to find a tree bearing half that much in California or Arizona. But in such cases will bear less next year. One hundred pounds per tree per year should satisfy." As to varieties there are literally hundreds. Question as to best may be better answered when one knows exact conditions under which they are to be planted. There are but few suckers from imported plants available, and prices range around \$10 to \$15 each.

Damp Soil

Some spots on top of our soil have turned moss color. Kindly explain and give cause and remedy. The soil has had plenty of manure.—Subscriber, Wyandotte.

It is possible the soil has poor drainage, has become acid and needs application of lime and a system of tiling.

Artichokes, Etc.

I have bearing artichokes in my vegetable garden where they get water every evening when I sprinkle. This morning I noticed many flies, lady bugs and ants on them and the under leaves rusty looking and coarse, and the fruit on them, the little ones, look as if they were not going to be anything. Have I given them too much water? Can I transplant them now, or is it too late? Can such plants as carrots, beets, etc., be transplanted when two or three inches high? What is the cause of all my bush Limas not coming up, also okra? Is the earth still too cold for okra?—Subscriber, Burbank.

Keep the under leaves pulled off just as soon as they begin to look old or unhealthy. They harbor the flies

and aphids. Clear away all rubbish under the plants and cultivate lightly. Spray with nicotine solution or scatter over tobacco dust if former measures do not rid plants of aphids. Give plenty of manure or complete fertilizer. Give plenty of water but do not drown out. If it can be avoided withhold sprinkling water but irrigate deeply and heavily occasionally. Beets, onions and most other plants can be transplanted when three inches high. It is probably too late to transplant artichoke shoots although in a cool season such as this small shoots might be moved successfully. Be careful there is no drying of roots and irrigate immediately after resetting. Beans and other seed not coming up may be due to wireworms in the soil, too much water and cold weather rotting the seed, or other reasons which can only be determined by examination.

Curl Leaf

Some of my new fruit trees look badly, show something like curly leaf, leaves shriveled up and are covered with ants. Please let me know with what to spray them. — Subscriber, Burbank.

Curl leaf is showing up exceptionally strong this year. It is too late to secure best results but a weak spray of commercial lime-sulphur may prove beneficial. The most satisfactory preventive of this trouble is early spray of Bordeaux or strong lime-sulphur.

Small Fruits Profitable

Do raspberries, blackberries or strawberries pay best, and is there a good living in any of them? — Subscriber, Burbank.

The best answer to this question should come from the market which one is able to supply and the amount of fruit produced around that market. While waiting for more definite information why not diversify and plant all three of those varieties which will do well in the Burbank section. As to the living, that depends upon the fruit grower being able to grow fruit and hunt up good market.

No Chickens Allowed

We have lived a year on an acre of land, have about 500 chickens and now some people are trying to get this neighborhood to do away with all poultry. That will leave us in bad shape after all the money we have put into the place, so we were wondering what we could do to make a living. Our place is all in young trees, a general assortment for family use and some to sell. I believe they will finally succeed in making this district do away with chickens.—Subscriber, Burbank.

It is unfortunate that roosters will crow and that some late sleepers object to the racket, and, worse, it is to be regretted that some excellent productive sections near large towns become so desirable as strictly gilded residence districts that chickens with feathers are not wanted.

Look for cheaper land. Presumably good prices prevail and ready sale may be counted on. But if one likes his own section and prefers to remain, we think the courts will protect one in the use of property so long as a nuisance is not created. A reasonable degree of cleanliness and care as to elimination of crows should put a poultry yard where it may not be declared a nuisance. The "swat-the-rooster" campaign was started by poultrymen as a purely economic one and may well be continued in order to lessen opposition to poultry as neighbors.

Paint costs less than decay.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Cow Bloating

I have a cow that bloats on alfalfa hay no matter how little she eats. Is there any remedy for her?—Subscriber, Orland.

Doubtless there is a large roll of feed in the large stomach that will not pass nor form into cuds and return to the mouth to be remasticated. This you will have to work out gradually, and when it is all out the cow will be all right again. Get two quarts raw linseed oil, add eight ounces turpentine, two ounces aloin and one ounce powdered nux vomica. Mix thoroughly and divide into eight doses. Give one dose every day while it lasts; also once or twice a day stir up the contents of the stomach by using your fist on the left side of the cow and kneading the stomach to move the contents about. This will help to break up the mass so it will pass away. Give the cow salt and give her very little grain until she stops bloating, and you see her chewing her cud when resting.

Bruised Knee

I have a cow that slipped several times when the stanchion was open and has fallen on her knees. On one knee there is a swelling that bothers her in lying down and walking. The bunch is soft and is growing larger. Would like to know your opinion of it, and also what you would advise doing for it?—Subscriber, Artesia.

It is an abscess full of serum but not pus. If left it will form a hard,

callous tumor and make the knee stiff. Slash it wide open with a sharp knife. Make the cut up and down, but not across the knee. Do not be afraid to make the opening large, so the skin will not heal before the cavity closes up. With your finger clean out all the contents of the cavity and then wash it out once a day with a warm solution of permanganate of potash, using one-fourth teaspoon of the permanganate to the quart of water. When it is healed grease it once a day with bacon fat to remove the swelling. It will take some time to get it back to normal.

FIRE CRUELTY

The California state board of forestry asserts that there is a cruel side to forest fires that is often overlooked, a cruelty that if thoroughly understood, would cause every person to join the ranks of those who are extremely careful with fire while in the forests or rural communities. If those whose sheer carelessness allows fires to start could but conceive the suffering that forest fires entail, "they would never allow a fire to start and would be first to aid in combating a fire that they found burning uncontrolled. Nobody could relish the sight of a rabbit, caught by the fire, speeding over hot ashes and coals with its fur smoking or ablaze, its eyes blinded so that it may run directly into a burning bush. Even a big timber rat, seen in the act of trying to drag its young to safety through hot coals after the fire has swept its home, is a thing to incite pity and admiration.

"But small animals do not suffer alone in forest fires. Time and again, after the fire has swept by and the blackened earth becomes cool, a number of buzzards will be seen to congregate and examination will result in the discovery that a young deer, some-

times an old doe, has been hemmed in or blinded by the fire and has died an awful death from suffocation and heat. If every one of the million and a half people who visit the forests of California annually knew the suffering that fire brings, as well as the loss, there would be no further need to combat carelessness in our forests."

CROP REPORTS

Wm. B. Jackson, Ontario, San Bernardino County

Apricots, half crop; cold rain first of April caused drop. Peaches, good at present. Pears, trees in full bloom. Grapes showing up well.

C. G. Marchus, San Pasqual, San Diego County

I find the cots in this valley will be 80 per cent crop. Only the first bloom has been saved. The frost took the second bloom completely. We will be two weeks late this season.

I again wish to commend the service you are doing in this survey of crop conditions. Keep it up.

J. W. Mills, Farm Adviser, Solano County

Almonds, 20 per cent. Apricots, 95 per cent. Cherries, too early to tell but indications are for 60 per cent crop. Peaches, 100 per cent. Pears, 75 per cent. Prunes, 50 per cent. Grapes, too early.

Harold L. Pomeroy, Horticultural Commissioner, Kern County.

Almonds, 65 per cent. Apples, too early to estimate. Apricots, 60 per cent. Peaches, 85 per cent. Pears, too early. Prunes, 90 per cent. Grapes, 90 per cent.

Fresno is chosen for the second annual Pacific Dairy Show next September in connection with the Fresno district fair. The states so far signed up for participation are California, Arizona, Utah, Idaho, Washington, Oregon and Nevada.

U. S. MOTORS

IRRIGATION TYPE 40° MOTORS

Built to meet western irrigation conditions. Vertical and horizontal types, in any size or speed.

REQUEST LITERATURE

Produced under ideal manufacturing conditions, under the supervision of the foremost electrical engineers. U. S. motors are the logical choice of Western motor users. The location of the factory eliminates delay in shipment of new motors or replacements, and our engineers are "right on the ground" to study conditions and give the purchaser first-hand assistance.

The Thrifty Citizen Who Caught the Plugged Nickel

Mr. Brown had swallowed his lunch and had paid his bill. Cautiously he counted his change. "Here!" he said, sharply, "Take back this plugged nickel and give me a good one!"

Mr. Brown walked proudly out. They couldn't fool old Brown.

But old Brown had fooled himself.

Brown's day was heavy and dull. He lacked "pep." There was a mid-afternoon drowsy spell when he needed to be awake—the direct and natural result of heavy, starchy breakfasts and lunches, taken on faith and without question as to value—just because the food looked and tasted like food.

Thousands of shrewd business men who count their change, take their food for granted.

That's what builds up the sanitarium business, and puts the tired "all-done" feeling into the mid-afternoon of a business day.

Grape-Nuts is a scientific food whose delicious, appetizing flavor and crispness are an introduction to well-balanced nourishment—a nourishment easily and quickly assimilated, so that body, brain and nerves are well fed and kept free of the stored-up poisons left by so many ill-selected foods.

Served with cream or good milk, Grape-Nuts is a complete food, always ready, always a delight to the taste—and always a safe selection for the man who thinks his stomach is entitled to some of the same protection he gives to his pocket.

Grape-Nuts—the Body Builder "There's a Reason"

GARDEN PLANTIN' TIME

When that lazy sort o' feelin'
Gets to playin' down your spine,
An' you get a sort o' itchin'
Fer a fishin' hook an' line,
An' the bees begin their hummin'—
As they do in early spring,
An' the mockin' birds out yonder
In the trees begin to sing;
When you're lovin' all creation
With a love that's most sublime,
Strikes me that it's gettin' somewhere
Close to garden plantin' time.

When the idle summer dreamer
Takes his lay beneath a tree
In the shade, to greet the comin'
Uv a summer reverie,
An' he longs to sit an' ponder,
Not a care upon his mind
While the cheerful, soothin' sunshine
Spreads around him, you will find
If you trace the dates o' nature
To the scenes o' yester year
That the garden plantin' season
Is a-gettin' somewhere near.

When the happy country youngster
Has a sun grin on his nose,
An' you know he's been a-wadin'
By the mud between his toes,
An' the work's a-cumulatin'
Like the work will, as a rule,
An' the weather seems invitin'
Down towards the swimmin' pool,
Then just count your stars as lucky
If, in castin' round about,
There ain't somethin' in the garden
That is needin' settin' out.

Still, in all my meditations,
An' I guess I've had my share,
I have found in life its pleasures
Sort o' flavored with its care,
An' there's been some tribulations—
Not, to say, complain about—
But jes' fretful little moments
Sorter wafted in an' out,
An' I've often been discouraged
Borderin' upon that clime,
But I've found the world good natured
'Long at garden plantin' time.—Jack
Dunaway in Farm and Ranch.

AMERICAN TRACTORS AND IM- PLEMENTS IN OTHER LANDS

HERE is a department of commerce report which opens to the general reader the pages of history, of travel, of the thrilling romance of man's conquest of the earth. Get out the family atlas!

The vital need of machine power in Turkey has become obvious and urgent, as a result of the exhaustion of the available supply of animals in the long drawn out wars, most of the draft animals having been used for cavalry and artillery purposes, and many of them to supply food for the soldiers. Consequently a demand is arising for the tractor and the plow, says Consul General Ravndal in a report to the department of commerce. American tractors, as well as other American made farm machinery, possess a fine reputation in Turkey and at present dominate the market. The Hahnemann (German), Fiat (Italian), and Renault (French) tractors are in the field, but they cannot compete successfully with the American machines which are being offered. The chief desiderata are price, efficiency and simplicity, and the American tractors have been found to fill these requirements.

Similar considerations also apply to other agricultural machines and to tillage instruments, for which the demand is growing in the Near East. These include reapers and binders, threshing machines, plows, harrows, cultipackers and drills.

Near Eastern Market

There appears to be good ground for encouraging American manufacturers of agricultural implements and machinery to pay increasing attention to the Near Eastern field. In the extension of this trade it is essential to extend credit to dealers in order that the latter may be able to carry out the practical demonstrations which are so necessary in these virgin markets and to accommodate the farmers financially. It is also important that measures be taken to have a full supply of spare parts on hand in suitable repair shops.

The opportunities for the development of the Anatolian, Thracian and adjoining markets for agricultural machinery and implements are considered very good. The situation at the present time is adversely affected by the absence of highways and railways and other means of transporting farm produce to the central markets, but this defect is certain to be gradually remedied.

No duty is charged for the admittance of agricultural machinery into Turkey. As a rule, general agencies

are established in Constantinople with branches in other cities.

American Colonists in Mexico

Over 1,000 members of an American religious society which is organizing colonies in Mexico recently arrived in the district of Benito Juarez, Chihuahua, Mexico, where they plan to establish themselves. Fifteen thousand more colonists are expected to reach this district within the next few months, and as their activities will be mainly agricultural, this should open up an excellent field for the disposal of American agricultural implements and machinery, says the agricultural implement division of the department of commerce.

Agricultural Machinery in China

The total imports of agricultural machinery into China for 1920, which is the latest year for which statistics are available, amounted in value to \$1,259,005 United States currency. Of this amount approximately 57 per cent came from the United States, 23 per cent from Canada and 12½ per cent from Japan. About 15 per cent of these imports were imported into Manchuria through the port of Dairen, says Consul General Pontius, Mukden, in a report to the department of commerce.

Tractors Move Haycocks in India

In the Ambala district of India during the farm harvesting season the demand for transport and labor exceeds the supply. It was with this point in view that during November of last year experiments were conducted in drawing hay in cocks to the stack or hay press by means of tractors. The experiments, according to reports received by the agricultural implement division of the department of commerce, were quite successful, and the new method was found to be much more economical than the old system of transporting hay from the cocks to the stack by means of bullock carts. The tractor is fitted with a long chain. This chain is pulled around a cock of hay, and both ends of the chain are attached to the drawbar of the tractor. The chain is lifted about one foot from the ground and the tractor set in motion. It gradually tightens on the hay until the whole cock moves off sliding over the ground on its own base. The speed varies according to the load, but cocks of from 4,000 to 5,000 pounds can be pulled at a fair walking pace. The system, besides being economical, is a labor saving device, as one tractor with three men takes the place of at least 15 carts with 15 men.

Vegetable Oil for Fuel in Belgian Congo

The extremely high cost of transportation of gasoline into the interior of the Belgian Congo, largely due to tsetse flies, which make it impracticable to use animals for transporting goods and necessitates the use of native porters, led the Belgian colonial ministry to organize a trial of road tractors using palm oil as fuel. The results of these trials gave full satisfaction. The semi-Diesel two and four cycle engines ran normally on the palm oil, and the power developed was equal to if not greater than that obtained with kerosene. Nothing was noted that suggested possible difficulties in using palm oil in these engines. Starting up, without gasoline injection, was good, and there was no carbonization.

HINTS FROM HOUSEKEEPERS

Boston Brown Bread in Tube Pan

Here is another case of necessity mothering a happy invention. I had my Boston Brown bread ready to cook but could not find one of my can molds. What was to be done? In looking through my pan cupboard my eye lit upon the tube cake pan. I poured all the batter into this and put it into my steamer. Result—the best brown bread I ever made. Anyone who has bothered with greasing can molds and keeping tops on tight so there should be no soggy ends to the loaves will appreciate this discovery.—Reader, Los Angeles.

HOUSEHOLD QUERIES

"Buckeye Cookery"

Please tell me where I can secure copy of "Buckeye Cookery." It is certainly a fine collection of recipes and I would like to get hold of it.—Subscriber.

A collection of recipes under title "Buckeye Way Cook Book" was published some years ago by Powell & White, Cincinnati, Ohio. We do not know whether it is still available or not.

Lime in Aluminum Teakettle

Would you please tell me how to take the lime out of an aluminum teakettle.—Subscriber, Meridian.

Ordinarily it is sufficient to hold teakettle upside down and tap lightly. The lime does not stick to the smooth surface. Boiling a little vinegar or lemon juice in the kettle should make it perfectly clean. Do not boil longer than necessary to loosen lime.

Music of "The Dying Cowboy"

In the Cultivator of April 8 Ruth Christenson of Fresno asks for the music to the song, "The Dying Cowboy." It is a parody on a very old ballad, "Bury Me Not in the Deep, Deep Sea," and can be found only in collections of old songs. The air is as dolorous as the words. I send the information to the household department rather than direct to Miss Christensen, as others no doubt would like to put the words to music.—Cecelia Stahl, Claremont.

Steel Cut Oatmeal Cookies

In answer to "Subscriber, Sebastopol," I am sending my best oatmeal cooky recipe:

One cup butter, 2 cups sugar, creamed together; 2 eggs well beaten, 6 tablespoons sweet milk, 2 cups steel cut oats, 2 cups flour with 2 teaspoons baking powder sifted in it, and spices to suit taste. Mix in the order given and drop in small amounts (about a teaspoon for each cooky) on a greased pan and bake. Chopped nuts and raisins, 1 cup each, are an improvement and a variation. These are fine and a great favorite with the children.—Mrs. F. M. Carlson, Biggs.

Bleaching Flour Sacks

Would like to ask through your question department what is the best method of removing the coloring and lettering from muslin flour sacks?—Subscriber, San Fernando.

Dampen flour sacks, sprinkle the lettering liberally with kerosene, roll up tightly and let stand over night with just enough water to cover. In morning rub out in warm water with washing powder dissolved in it. If it is desired to whiten the whole material, finish by the usual boiling and bleaching in the sun.

BUT NOT VICE VERSA

When little Percival arrived at school on the opening day, he carried the following note to the teacher: "Dear Teacher: Our sweet little Percival is a very delicate, nervous child, and if he is naughty—and he is likely to be naughty at times—just punish the boy next to him, and that will frighten him so he'll be good."—Wayside Tales.

POPULAR REQUEST

Customer: "I say, do you ever play anything by request?"
Delighted Musician: "Certainly, sir."
Customer: "Then I wonder if you'd be so good as to play a game of dominoes until I've finished my lunch?"

The man who is worthy of a kindness is the man who will pass it on when it comes to him.

LETTER FROM A HOME IN THE REDWOODS

Walking as a recreation has become a popular pastime. Come visit with me in the country ten miles from the nearest railroad station and about 100 miles from the city. The home was selected because of its charm. Some of the acreage is pure "wilderness" with bush and virgin trees such as redwood and is unusually adapted to hiking. New trails are being made which are charming. They wander about so capriciously; they climb so cheerfully up the slopes and hillsides and lead you through so much freshness and varied scenery that the pleasures of sight soon make one forgetful of bodily fatigue, but we should have names for those new trails and I would be glad of suggestions. Wild flower seed has been sown broadcast, so, soon there will be thousands and thousands of wild flowers. Seats made of blocks of redwood are placed conveniently for enjoying beauty spots. Steps are cut into the trails to make climbing easy and rustic bridges are built over the creeks. In one place a live tree growing horizontally across the creek has steps cut in it, and we call it the "living bridge." This trail may be called "Las Cruces" meaning "The Crosses."

Squirrels and quail run about quite fearlessly, or sit up and watch you pass, so close, they can almost be touched.

Being so far away from the city makes it a little hard to get help in the house, or maybe there isn't enough to go round, so here was an unforeseen problem to solve. How I have done it may interest other country dwellers and if so, will write about it later.—Mrs. A. Stainton.

(Wouldn't we, all of us, like to visit Mrs. Stainton's home in the redwoods! These columns are open to letters containing suggested names for those redwood and flower bordered trails, and we will all be glad to hear how Mrs. Stainton has solved the "help" problem.—Editor).

OUR BABY COLUMN

By Mrs. M. S. Sirdevan

Most children object to having their teeth brushed, but if you will let them do it themselves they will think it great sport, and even a two year old can do it, if mother will guide the hand at first, until the habit is firmly established. Tell them the importance of cleaning the teeth, and the danger of eating sweets or biting hard things, and most children are willing to do the right thing if you give a good reason. Children demand fairness above everything, and although this may take time, you will be rewarded in the end.

If a child seems to have a great many colds, it is time to attend to the diet, clothing and general care. They should be given very little cereal or any starchy food or sweets. Don't have them overdressed so that they perspire, and see that they sleep in cool rooms that are well ventilated.

When teaching a child to blow the nose, compress one nostril and have him blow and then compress the other nostril.

I am going to give a personal experience of mine in hopes that it may solve a problem that most mothers go through.

My little daughter was four years old when she informed me that she would live with someone else when things didn't go just her way. I realized that this could not continue, so one day I took her into the nursery and we had a talk. I told her that if she was not happy here I couldn't have her in the house, for it would make me very unhappy; but I did want her to be contented, for I wanted to go on loving and caring for her. But if she wanted to go, I would pack her suit case, only it would mean that she could never come back again. She remarked that maybe she would only want to stay a few days, but I said, "No, I couldn't have that; it would mean for good."

This ended it, for "mother" and "home" mean "love and shelter" to them all, bless their hearts!

You'll Enjoy Working These Little Wonders In Your Home

IT'S surprising how much you can accomplish in beautifying your home with a little paint and work "that is really fun."

Floors, woodwork, furniture, bric-a-brac and other home things are very easy to do over when you know how. The reward in improved appearance is worth many times the cost and effort required.

We have a special "Home Service Paint Department" which devotes its time to telling women just how to refinish home things successfully.

Just write this department, describing what you want to paint, enamel, or varnish and how you want it to look and our experts will tell you exactly how to do it.

We make special paints, varnishes, enamels, wall finishes and stains for you to use. They are the finest materials of their kind that we know. We have been

making these products for 73 years.

Fuller's Free Advice and Fuller's Products will be very helpful to you in beautifying your home. Take advantage of them now.

Free Advice

Write us now—a postcard—for Fuller's "Home Service" Paint Book, which tells you just what to buy for every kind of painting. Send full description and get our free advice on any kind of painting you want to do.

Decoret Varnish Stains for refinishing furniture and interior woodwork. They stain and varnish in one operation. Match the color of any natural wood. 8 colors.

Silkenwhite Enamel produces a rich, beautiful finish on woodwork and furniture. Flows out smoothly and does not show brush marks. Produces a mirror-smooth surface. Stays white and wears long. Gloss white, semi-gloss white and 8 colors.

Rubber Cement Floor Paint: A durable, sanitary, waterproof paint for floors of kitchens, closets, etc. Spreads easily, covers well. Dries hard over night. 12 colors.

Fullerwear: An all-purpose spar varnish which is unexcelled for all interior and exterior surfaces. Fine for linoleums, floors, woodwork, furniture, front doors and vestibules. Dries hard and glossy. Very durable.

Also makers of House Paint, Fifteen-for-Floors Varnish, Washable Wall Finish, Auto Enamel, Porch and Step Paint, PIONEER WHITE LEAD, Fuller's Hot Water Wall Finish (kalsomine), Silo Paint, Tractor Paint, Milk Can Enamel, Fuller's Oil Stain, Implementation Paints, Barn and Roof Paint,

MAKING BEEF HAMS

Here is how a Missouri farmer, Marshall Gordon of Boone County, does it.

"I select heeves not over two years old, preferably two year old heifers, which should be corn fed," says Mr. Gordon. "I butcher my beeves, along with the hogs, late in November or early in December when the weather is cold enough to thoroughly cool the meat before salting. Meat should not be frozen before salting, as it does not take salt as well and is harder to trim properly. The day after the butchering, the hind quarters are trimmed much like pork hams with beef ham proportions. I use the rest of the carcass for fresh meat. If I want several beef hams I buy some small hams from the local butcher."

"I put the beef hams in the dry salt box with the other meat and cure in the same way. I place a layer of hams in the box, taking care that they do not touch each other, and fill the spaces with salt. I cover the hams with about a quarter inch of salt. The meat remains in the box about a month or more, depending somewhat upon the weather. If the meat is frozen most of the time, the hams will require more time to take the salt. I usually pack hog shoulders in the same box and I can tell about my heef hams by the way the shoulders are taking salt."

"I hang the hams on wire hooks in the smokehouse where I smoke them for about a month. I build a small smoldering fire of hardwood chips each morning under the hams. I am careful about keeping the hams from touching each other in this process, too. A month seems like a long time, but the smoke gives the proper color and flavor to the meat."

"After the smoking the hams are carefully wrapped in three layers of heavy paper and placed in canvas sacks especially prepared for them by Mrs. Gordon, who takes measurements and makes a tailor-made job of it. Ordinary flour sacks will not do. The hams remain hung where they are smoked. The hams are rarely opened before midsummer following, although they are ready to eat as soon as smoked. When we cut our steaks off, the sacks are fastened up and the hams hung again. The cut edges of the ham are sealed with flour to prevent the hams from hardening."

A writer in Texas Farm and Ranch adds:

"Mrs. Gordon says that the best way to cook the ham is to broil it, and the many hundreds of guests at Rockhurst unanimously say that she knows."

"The smokehouse where Mr. Gordon prepares all of his farm meats is a good one. The walls have a thin layer of concrete and the floor is of cement. These help to maintain an equable temperature and are rat and mice proof, but as an additional precaution against these Mr. Gordon has his meat box suspended from the joists by heavy trace chains. This box is a large one, but is very shallow, not over a foot deep. This enables him to lay the meat so that it will not touch and it insures good opportunities for cooling. But, as Mr. Gordon puts it, the equipment in handling and curing meats is not as important as the care one may take in the process."

DELICIOUS WAYS OF USING ALMONDS

Blanched and Salted Almonds

Pour boiling water over the fresh meats. Let them stand for ten minutes or until the skins can be easily stripped off. Dry the big, white almond meats between the folds of a clean dish towel. Put them in a baking pan with a teaspoon of melted butter or olive oil and turn them over and over until they are well coated. Then place them in the oven stirring occasionally so that they will brown evenly. A sprinkle of salt next, and sift them in a colander to dislodge superfluous salt or butter. Cool and keep in a dry place.

Almond Devil Cake

2 cups brown sugar, ½ cup butter, 2 eggs, ¾ cup sour or butter milk, ½-½ cup chocolate, 2 cups flour, 2 teaspoons baking powder, ½ teaspoon soda, ½ teaspoon salt, 2 cups chopped blanched almonds, ½ cup boiling water. Cream butter and sugar, add

eggs well beaten, add milk alternately with dry ingredients mixed and sifted, add almonds dredged with 1 teaspoon flour, add boiling water, bake as a loaf in a moderate oven.

Almond Roll

1 cup California dried figs, 1 cup almond nutmeats. Wash and dry figs. Blanch almonds. Cut out stems of figs and put nuts and figs through meat chopper together. Work, using hands, on a board dredged with confectioner's sugar, until well blended. Make a thick roll and cut in slices with a sharp knife. Dip slices in sugar and put away in layers—using oiled paper between. Will keep indefinitely.

Almond Brittle

2 cups sugar, 2 tablespoons Karo, ½ cup water, ½ teaspoon soda, 2 cups almonds, blanched and broken. Boil sugar, Karo and water until a drop in water will crack, add soda, beat until frothy, add nuts, pour on a huttered plate, cut when nearly cold.

Caramel Almond Fudge

3 cups sugar, ¾ cup milk, 1 to 1½ cups chopped almonds. Put 1½ cups sugar in saucepan with milk, boil slowly, put 1¼ cups sugar in pan and caramelize—just as soon as it is all melted pour into the other pan. Cook the combined mixture to soft-ball stage. Cool, then add nutmeats—beat thoroughly and drop by spoonfuls on oiled paper.

Almond and Prune Cake

½ cup butter, 1 cup sugar, 2 eggs, ¾ cup sour milk, 1½ cups flour, 1 teaspoon soda, 3 teaspoons chocolate, ½ teaspoon cinnamon, ½ teaspoon allspice, ½ teaspoon cloves, ¼ teaspoon salt, 1 cup chopped cooked prunes, 2 cups almonds. Cream butter and sugar. Add yolks of eggs well beaten, add milk alternately with dry ingredients mixed and sifted, add prunes, and almonds chopped and dredged with flour, fold in egg whites beaten stiff, bake as a loaf in a moderate oven 45 minutes to 1 hour. (This cake is moist and improves with keeping.)

WHEN THE PAPER DOESN'T COME

My father says the paper he reads ain't put up right.
He finds a lot of fault, he does, perusin' it all night.
He says there ain't a single thing in it worth while to read.
And that it doesn't print the kind of stuff the people need.
He tosses it aside and says it's strictly on the bum—
But you ought to hear him holler when the paper doesn't come.

He reads about the weddin's and he snorts like all get out;
He reads the social doin's with a most derisive shout.
He says they make the papers for the women folks alone;
He'll read about the parties and he'll fume and fret and groan;
He says of information it doesn't contain a crumb—
But you ought to hear him holler when the paper doesn't come.

He's always first to grab it and he reads it plumb clean through,
He doesn't miss an item or a want ad—that is true.
He says they don't know what we want, the durn newspaper guys;
"I'm going to take a day some time an' go and put 'em wise.
Sometimes it seems as though they must be blind and dumb—"
But you ought to hear him holler when the paper doesn't come.—Exchange.

THE MYSTIC THREE

There are three words; the sweetest words

In all the human speech—
More sweet than are all songs of birds,
Or page's poets reach.

This life may be a vale of tears,

A sad and dreary thing—
Three words and trouble disappears
And birds begin to sing.

Three words, and all the roses bloom,
The sun begins to shine;

Three words will dissipate the gloom
And water turn to wine.

Three words will cheer the saddest days—

"I love you!" Wrong, by heck!
It is another, sweeter phrase.

"Enclosed—find—check."

"OI! VAT A SEEKNESS!"

Isadore Levinsky was dying of smallpox. The doctor had just told him the terrible truth.

"Send for the priest," he murmured. "You mean the rabbi, don't you?" asked the doctor.

"No, the priest. Do you teenk I want the rabbi should have soch a seekness what I got it?"

A wide awake man waits until night for his sleep.—"Aesop's Film Fables."

Many are awakened but few get up.

The Cultivator Patterns

3901. Child's Dress: Cut in four sizes, 2, 3, 4 and 5 years. A two year size will require 1½ yards of 32 inch material. Price 10 cents.

3900. Ladies' Dress: Cut in six sizes, 34, 36, 38, 40, 42 and 44 inches bust measure. A 38 inch size requires 3½ yards of 54 inch material. The width at the foot is 2¼ yards. Price 10 cents.

3702. Girl's Dress: Cut in four sizes, 8, 10, 12 and 14 years. A 10 year size will require 3¼ yards of 40 inch material. Price 10 cents.

3691. Ladies' House Dress: Cut in seven sizes, 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 4¾ yards of 44 inch material. The width at the foot is about two yards. If made of contrasting material, collar, belt, cuff and pocket facings require three-quarters yard. Price 10 cents.

3889. Girl's Dress: Cut in four sizes, 4, 6, 8 and 10 years. The gulmpie will require 1½ yards of 27 inch material, and the dress 2½ yards for a 6 year size. Price 10 cents.

3890. Ladies' Wrap: Cut in four sizes, small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches bust measure. A medium size will require 4¾ yards of 44 inch material. Price 10 cents.

3410. Junior's Dress: Cut in three sizes, 12, 14 and 16 years. A 14 year size will require 4 yards of 44 inch material. Price 10 cents.

3896. Ladies' Apron: Cut in four sizes, small, medium, large and extra large. A medium size will require 2¾ yards of 36 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Do not expect patterns under Two Weeks from date of order.

CATALOGUE NOTICE

Send 12c in silver or stamps for our Up To Date Spring and Summer 1922 Catalogue, containing over 500 designs of Ladies', Misses' and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker. Also colored plates.

California Cultivator Los Angeles

Ormondale Shorthorns Dispersed at \$259 Average

With 52 head of Shorthorns selling for an average of \$259, the Ormondale Ranch herd passed out of existence at the close of the dispersal sale which was held at the ranch Thursday, May 4. The above average, while conservative, was generally regarded as satisfactory by the Shorthorn fraternity for there was included in the sale every hoof that made up the herd, and many of the cows were well along in years. At the same time such values on the class of cattle sold cannot fail to spell a profit to the buyers.

With one of the most charming settings ever provided for a cattle sale in California the auction was started promptly at one o'clock, and throughout it progressed with a smoothness and snap that held the large crowd at close attention.

As was expected, the top of the sale was established with the great young bull, The Caledonian, son of Imp. Caledonia. This youngster, with faultless breeding and an individuality that carried him through the last show season without defeat, was sought by a number of the leading herds, but the final bid of \$2,000 sent him back to the farm from which he came, and it is probable that he will again wear the colors of Caledonia Farms at the fall shows. Edward Cebrian of Caledonia Farms was the most extensive buyer at the sale and, aside from the above mentioned bull, selected seven of the better bred females which naturally included the top female at \$700, the attractive roan daughter of Imp. Gartley Landsdowne.

William Ward of Blackhawk Ranch was the next heaviest buyer, taking six head for himself and others. A particularly good buy was made by Ward when he got the red Bruce Mayflower cow.

An interesting feature of the sale was the selling of the cow Sweetheart and her three daughters. It will be remembered that this cow is the dam of the famous international champion, Little Sweetheart. Two full sisters to the champion were in the group. The Pacheco Cattle Company got one and I. C. Muddux took the other.

William Edinger of Hood bought the two year old bull Count Kingwood for \$475. This bull was purchased last fall for \$2,000. The Newhall Land and Farming Company was a strong supporter of the sale as was E. R. Dimond of Redwood City, who is just laying a foundation for a herd.

The sale was held under the management of the California Breeders' Sales and Pedigree Company and Ben L. Rhoades and John A. Davis were the auctioneers.

A complete list of the sales follows:

- BULLS
- 1, The Caledonian, roan, Sept. 1920; Caledonia Farms, West Sacramento, \$200.

2, Count Kingwood, roan, Oct. 1919; Edinger-Johnston Co., Hood, \$475.

8, Unnamed, roan son of Imp. Boquhan Guinea Stamp, Oct. 1921; Frankenheimer Bros., Stockton, \$285.

15, Roan Volumnia, roan, June 1917; Caledonia Farms, \$200.

16, Edna S., red, Jan. 1908; W. J. Muddicoat, Palo Alto, \$50.

17, Guinea's Bud, roan, Jan. 1921; Newhall Land & Farming Co., \$165.

18, Maplewood's Supreme, red, Oct. 1921; W. T. Sesnon, San Francisco, \$125.
- FEMALES
- 3, Mayflower 4th, red, Sept. 1914; Blackhawk Ranch, Diablo, \$360.

4, Boquhan's Mayflower, roan, Feb. 1921; Caledonia Farms, \$350.

5, Snowball, white, May 1916; Caledonia Farms, \$400.

6, Ormondale Lady, roan, Oct. 1919; Caledonia Farms, \$700.

7, Ormondale Snowball, white, Oct. 1920; Caledonia Farms, \$350.

9, Lancaster Snowball, white, Mar. 1915; H. C. Muddux, Sacramento, \$125.

10, Boquhan's Snowball, white, Feb. 1921; H. C. Muddux, \$225.

11, Orange Lassie, roan, Mar. 1918; C. Slack, Tracy, \$190.

12, Maplewood Violet, 3d, red, Feb. 1913; F. Petersen, Haywards, \$200.

13, Good Volumnia, red, Jan. 1912; R. V. Traynham, Davis, \$180.

14, Red, Volumnia, red, Mar. 1909; Newhall Land & Farming Co., San Francisco, \$110.

19, Gem's Beauty 2d, roan, Jan. 1911; Blackhawk Ranch, \$140.

20, Ramsden Queen, roan, Sept. 1917; Newhall Land & Farming Co., \$150.

21, Choice Orange, red, April 1917; R. V. Traynham, \$135.

22, Queen Generosity, roan, June 1917; H. Matthews, Porterville, \$160.

23, Ormondale Gratitude, white, May 20; C. A. Slack, \$205.

24, Roan Volumnia 2d, roan, Jan. 1919; Newhall Land & Farming Co., \$240.

25, Maplewood Maid 4th, red, Jan. 1913;

- Blackhawk Ranch, \$225.
- 26, Choice Beauty Milmar, red, Feb. 1919; Caledonia Farms, \$300.
- 27, Sultan's Galaxy, roan, Sept. 1916; E. F. Petersen, \$240.
- 28, Boquhan's Galaxy, roan, Jan. 1921; J. H. Matthews, \$225.
- 29, Ormondale Maid, red, Dec. 1915; Blackhawk Ranch, \$330.
- 30, Scottish Amanda, red, Nov. 1910; H. C. Muddux, \$135.
- 31, Boquhan's Amanda, roan, Feb. 1921; E. R. Dimond, Redwood City, \$210.
- 32, Boquhan's Volumnia, roan, Feb. 1921; E. R. Dimond, \$200.
- 33, Scottish Jane, red, Dec. 1911; Howard Vaughn, Dixon, \$110.
- 34, Roan May, roan, March 1918; Blackhawk Ranch, \$180.
- 35, Ormondale Aconite, roan, March 1921; Wm. B. Murphy, Brentwood, \$215.
- 37, Sweetheart, red, Sept. 1913; C. A. Slack, \$310.
- 38, Little Sweetheart 2d, red, April 1918; H. C. Muddux, \$310.
- 39, Little Sweetheart 3d, red, April 1920; C. A. Slack, \$280.
- 40, Little Sweetheart 4th, red, April 1920; Pacheco Cattle Co., Hollister, \$300.
- 41, Ormondale Countess, red, July 1920; E. F. Petersen, \$250.
- 42, Ormondale's Viola 2d, red and white; E. R. Dimond, \$175.
- 43, Ormondale Chieftess, red, Dec. 1919; Newhall Land & Farming Co., \$250.
- 44, Ormondale's Gypsy, roan, Dec. 1920; Caledonia Farms, \$210.
- 45, Orange Crest 6th, red, Jan. 1920; Newhall Land & Farming Co., \$215.
- 46, Ormondale Lassie 3d, red, Nov. 1920; E. R. Dimond, \$160.
- 47, Lady Volumnia, red, Nov. 1920; E. R. Dimond, \$175.
- 48, Ormondale's Gold Gem, roan, Dec. 1920; E. R. Dimond, \$185.
- 49, Sultan's Galaxy 2d, roan, Jan. 1919; A. Mangini, Redwood City, \$120.
- 50, Roan Lassie, roan, Jan. 1918; Blackhawk Ranch, \$160.
- 51, Butterfly Countess, red, Sept. 1912; E. F. Petersen, \$180.
- 52, Unnamed, April 1921, heifer calf out of No. 51; Wm. F. Murphy, \$150.

53, Unnamed, Oct. 1921, bull out of No. 49; W. F. Sesnon, \$140.

INNISFAIL SALE, A BARGAIN EVENT

California breeders and ranchers who are interested in Milking Shorthorns missed a lot of rare bargains by not attending the first public sale from the Innisfail herd that was held at the farm near Davis, Friday, May 5. There has never been a better lot of Milking Shorthorns exposed in the West than were catalogued for the sale, and the average of \$203 on the 21 females and \$191 on the eight bulls does not begin to represent the real value of the cattle. It can certainly be said to the credit of Messrs. Rowe that they were game and that every animal was sold regardless of what the final bid happened to be. Furthermore cattle were offered as long as there appeared to be buyers. Some day the efforts of Messrs. Rowe will be more appreciated.

Two bulls, Innisfail Favorite and Snow White, were the tops of the sale at \$310 and \$400. Both went to Foothills Farm, Carleton, Oregon. The top female was Greenhill Susan that was purchased by Horace O'Rear of San Francisco for \$300. The University of California secured three very attractive heifers.

Buritt B. Allen of Ravenna, Ohio, was the auctioneer. A complete list of sales appears below:

- BULLS
- 1, Innisfail Favorite, Feb. 1919; Foothills Farm, Carleton, Ore., \$310.

2, Snow White, Sept. 1920; Foothills Farm, \$400.

- 3, Innisfail Favorite 3d, March 1921; H. J. Need, Galt, \$285.
- 4, Westward Knight, March 1921; C. B. Younger, Santa Cruz, \$210.
- 5, Innisfail Louie, April 1921; Richard C. Cassell, Woodland, \$165.
- 7, Innisfail Favorite 4th, March 1922; E. H. Day, Gazelle, \$60.
- 9, Bill Clay, Jan. 1922; J. W. Dutton, Duttons' Landing, \$65.

FEMALES

- 11, Imp. Favorite 34th, April 1912; A. Humbert, Alamo, \$230.

12, Greenhill Susan, April 1914; Horace O'Rear, San Francisco, \$300.

13, Waterloo Daisy, March 1916; E. H. Day, \$195.

14, Glenside Fern, Feb. 1913; J. C. Jones, Alamo, \$155.

15, Louise, June 1915; Wm. Lewis, Oroville, \$185.

16, Island Buttercup, Aug. 1916; C. B. Kidwell, Dixon, \$150.

17, Marsh Curlew, Nov. 1917; Caledonia Farms, West Sacramento, \$225.

18, Greenhill Betsy, June 1914; J. C. Jones, \$180.

20, Carol, Oct. 1916; E. H. Day, \$225.

21, Madge Wildfire, May 1918; C. H. Meyer, Menlo Park, \$205.

22, Rose Fairfield 2d, Dec. 1917; C. B. Kidwell, \$150.

23, Valley Belle 7th, Dec. 1919; Caledonia Farms, \$135.

24, Phoebe, May 1920; G. C. Long, Payne's Creek, \$145.

25, Lola, May 1920; G. M. Eastman, Fairmead, \$160.

26, Solano Fillipall, June 1920; H. V. Traynham, \$145.

27, Innisfail Betsy, Nov. 1920; G. C. Long, \$120.

28, Innisfail Lady, Oct. 1920; Van Gordon, Alamo, \$110.

29, Oleta, Oct. 1920; H. V. Traynham, \$190.

30, Innisfail Betsy Jane, Dec. 1920; H. V. Traynham, \$140.

31, Rose, March 1921; J. C. Jones, \$160.

32, Annabel 2d, March 1921; Horace O'Rear, \$180.

33, Valley Belle 8th, May 1921; Max C. Bollman, Placerville, \$135.

34, Valley Belle 9th, May 1921; University of California, \$155.

35, Island Betty, June 1921; University of California, \$155.

36, Frances, June 1921; University of California, \$130.

Three profit-making factors in cow feeding---

1. FEED GOOD SILAGE
2. USE CHOPPED HAY
3. MAKE YOUR OWN ALFALFA MEAL.

This machine will prepare these feeds

The ACME Cutter

THE COMBINED SILO FILLER, HAY CHOPPER AND ALFALFA MEAL MACHINE

The Acme is light running and dependable

The compact steel frame construction insures rigidity—vibration is reduced to a minimum—no undue wear is thrown upon the bearings—all of which means low power consumption and extreme durability.

The spiral cutting knives produce a silage of superior quality—short and clean cut—no waste.

Put that first crop of alfalfa and foxtail into the silo—it makes poor hay but good silage. The Acme will do the work.

Use the Acme all summer chopping hay, alfalfa, wheat straw, bean straw, etc., and making meal, then fill the silo with it this fall. We have the size that will fit your requirements.

Making American Cheese

By C. M. Gere, in Farmers' Bulletin 1191

CHEESE may be made at any time of the year, and on farms where there is a surplus of milk during certain seasons cheese making offers an exceptionally advantageous means of conserving, for later use, milk which otherwise might be wasted. The making of cheese does not require a great deal of time, and if good milk is used and directions are followed no one should have difficulty in making good cheese.

Approximately five or six hours are required from the time the milk is placed in the vat for heating until the cheese is put into the hoop for final pressing, and during that time it is not necessary for the operator to give it his entire attention. From this point until the end of two weeks only a few minutes are required each day to turn the cheese. After that time the cheese is turned only twice a week until fully cured.

For making cheese in small quantities on the average farm the Cheddar process used in factories is somewhat too complicated to be practicable. With the more simple method, known as the hand stirred or granular process, presented in this bulletin, however, good cheese can be produced on the farm.

Favorable Conditions

Best results have been obtained in regions where the nights are cool throughout the summer and where cool water may be obtained. These factors favor the production of a high quality cheese. Where these conditions do not exist it is more difficult to produce a high quality cheese during warm weather, as gas producing bacteria are more abundant at that time.

Only whole milk should be used, as skim milk cheese made by this method is hard, dry, and lacking in flavor.

Because the market requires a uniform product it is not generally economical or practicable to make farm

cheese for the general market. Cheese that is satisfactory for home consumption, however, can be made wherever a supply of fresh, clean milk is available.

Yield of Cheese

Approximately 10½ pounds of cheese are obtained from 100 pounds (11⅓ gallons) of milk containing four per cent butterfat. The yield varies with the fat content of the milk and also with the quantity of solids lost in the process of manufacture. A cheese of any size may be made.

It is important to have fresh, clean milk for cheese making. If milk is to be kept over night it should be cooled to a temperature of 60 degrees Fahrenheit or lower and held in that temperature until used. The milk should not be held more than 12 hours, as it is very essential that the milk be perfectly sweet.

Cheese Vat

A wash boiler, large kettle, or tub may be used for cheese making, but if cheese is to be made frequently or on a large scale a regular cheese vat is more satisfactory. A cheese vat is so constructed that hot or cold water may be circulated around the milk for regulating the temperature.

Having control of temperature throughout the manufacturing process is essential to the successful making of cheese. A good thermometer therefore should be used.

The milk is heated in the vat or wash boiler to a temperature of 80 degrees Fahrenheit, at which it is held until after the curd has been cut.

Coloring

Cheese made without the addition of coloring matter is light yellow or straw color. If a deeper shade of yellow is desired a small quantity of coloring is put into the milk. Regular cheese color should be used and no butter color, as the latter colors the fat but not the curd. From one-half to one teaspoon of cheese color to 10 pounds of milk is sufficient. The color should be stirred thoroughly through the entire mass of milk.

Adding Rennet

Rennet extract, which is used to curdle the milk, may be obtained from a dairy supply house. If the extract is not available rennet tablets may be used, which sometimes may be obtained at drug stores. Rennet should be added at the rate of one-third ounce or two teaspoons for each 10 pounds of milk, or enough to curdle the milk in from 30 to 45 minutes. The rennet should first be mixed with a pint of cool water and then stirred into the milk very thoroughly, and the stirring continued slowly for about three minutes. It is very important that the temperature of the milk at this time be 86 degrees Fahrenheit and that it remain at this temperature until the curd is properly set, which should be in from 30 to 40 minutes, depending upon the quantity of rennet used, the acidity, and other qualities of the milk. After the rennet has been stirred in, the milk must stand undisturbed until curdled. If there is the slightest motion to the milk while curdling the curd will not be firm. The vat should be covered to keep the surface of the milk from cooling.

Cutting the Curd

The curd must be cut at the right stage of firmness. If cut when too soft it will be broken up, resulting in a loss in yield, or if allowed to get too hard it will be cut with difficulty. The usual method of determining the proper stage for cutting is to insert the forefinger in the curd at an angle of 45 degrees and about one-half inch under the surface. The finger is then raised slightly and the curd split with the thumb. If the curd splits smoothly without leaving particles on the finger it is ready to be cut. Special curd knives may be obtained for cutting the curd into cubes of equal size. Uniformity in the size of these cubes is necessary to insure uniform firming of the curd. The curd should first be cut lengthwise of the vat with a horizontal curd knife and then cut crosswise with a vertical knife, thus leaving the curd in small cubes. To insure a maximum yield of cheese it is necessary to avoid crushing the curd or breaking it into very small pieces. The curd knives should be inserted and removed from the curd in such way as to cut the curd rather than to crush it. The horizontal knife should be placed in the vat and moved slowly to the opposite end of the vat, where it is turned half way round, and not removed from the vat until all the curd has been cut.

If curd knives are not available the curd may be cut with a large butcher knife, cutting both lengthwise and crosswise of the vat, and then, after carefully giving the curd a quarter turn so that one side is now on top, cutting lengthwise again. When the cutting has been completed the pieces of curd should be about three-eighths inch in size, each dimension.

Heating and Stirring Curd

As soon as the curd is cut it should be stirred gently in order to prevent the pieces from sticking together and forming large lumps. The cubes of curd contract slowly and expel whey. As soon as a considerable quantity of whey is separated from the curd usually in about 15 or 20 minutes heating should be started. It is very important to raise the temperature very slowly, at the rate of about two degrees in five minutes, until a temperature of 100 degrees Fahrenheit is reached. Various methods of heating

For Poultry House

Dirt and Disease Take Profits

Carbola provides the easy, quick, and best way to "clean-up" your farm buildings. It is a paint combined with a disinfectant many times stronger than carbolic acid but harmless to the smallest chick or stock that licks a painted surface.

Use Carbola Instead of Whitewash and Disinfectants in

Poultry Houses	Stables	Hog Pens	Warehouses
Rabbit Hutches	Cellars	Dairies	Creameries
Outbuildings	Factories	Garages	Dog Kennels

Carbola comes in powder form and is turned into a smooth-flowing paint simply by mixing with hot or cold water—there is no waiting or straining. Applied with a brush or spray pump to wood, brick, stone, cement, plaster board, etc., or over whitewash. Will not clog sprayer. Dries a snow white. One gallon (a pound of powder) covers 200 square feet. Carbola doesn't blister, flake or peel, has no disagreeable odor to taint milk or food products, and doesn't spoil if kept standing.

Carbola Makes "Clean-Up" Jobs Easy

on the thousands of poultry, dairy and breeding farms and many agricultural colleges and experiment stations that now use it regularly. It helps make buildings light, sweet-smelling and sanitary. A trial will prove that Carbola saves time and labor and gives better results. Get some today—money back if you are not pleased. The dry powder has no superior as a louse powder for use on horses, cattle, poultry, hogs, dogs, etc., and costs less than other brands.

Your Hardware, Feed, Drug or Paint Dealer has Carbola or can get it. If not order direct. Prompt shipment by post or express.

10 lbs. (10 gals.), \$1.50; 20 lbs. (20 gals.), \$3.00; 50 lbs. (50 gals.), \$6.25; 200 lb. bags, \$22.50. Trial package and booklet, 35c postpaid.

the curd may be used. There is less danger of heating too rapidly, however, if some of the whey is dipped out, heated to about 140 degrees

More Milk—More Money From Every Cow

The experience of hundreds of dairymen proves that cows housed in sanitary STAR stalls yield more milk and earn bigger profits. Star equipped barns are healthy for cows—less work for cow owners. Lines cow at gutter and keeps stall, bedding and cow clean and comfortable. The Star Unit System enables you to put in as few or as many stalls as you need. Simply add more stalls as you add more cows.

GENERAL LABORATORIES
Madison, Wisconsin

Fahrenheit, and gradually poured back into the vat. During the entire heating process the curd should be stirred just enough to keep the small cubes from matting together. The curd should remain in the whey at a temperature of 100 degrees Fahrenheit until it is firm and is sufficiently acid.

If the cheese is made in a vat or other large vessel it will be found convenient to use a rake for stirring the milk and curd. A rake can easily be made at home.

Testing for Firmness

The proper degree of firmness of the curd may be determined by pressing a mass of it between the hands. If when suddenly freed from pressure the pieces fall apart at once and show no tendency to stick together, the curd is of the proper firmness. At this stage the cubes have contracted to about one-half the size they were when the curd was cut. If the curd becomes too firm, the cheese will be dry and "corky," while, on the other hand, if the curd is not firm enough, the cheese will be soft, too moist, and likely to sour.

Testing for Acidity

The amount of acid which is allowed to develop in the curd before removing the whey is the most important step in the cheesemaking process. The curd while in the whey should be closely watched to prevent the development of too much acid, as a curd that is overacid produces a dry, mealy cheese with a sour flavor, while a curd with too little acid is likely to develop gas and bad flavors during the curing process and does not keep well.

The proper amount of acid to develop in a curd before removing the whey may be determined by pressing a little curd in the hand, pressing gently but with increasing firmness for about a minute, or until the particles adhere and moisture is expelled. This piece of curd is rubbed gently on a clean, hot iron until it adheres and is then very slowly and carefully pulled away from the iron. If in doing this fine silklike threads one-quarter to one-half inch long are formed, the whey should be removed. If threads do not form, sufficient acid has not yet developed, and the curd should be left in the whey to permit the development of acid. During this period occasional stirring is required to prevent matting. The iron should be just hot enough so that the curd will stick to it and not burn the fine threads.

Removing Whey

As soon as the curd is firm and the proper amount of acid has been developed, the whey should be removed. The curd is allowed to settle, the free whey is dipped off, and the curd is then placed on the rack to drain. While on the draining rack the curd should be stirred continuously until all the free whey has escaped; after that it should be stirred every 5 or 10 minutes to prevent it from matting together, and to keep it broken into pieces of the size of a large hickory nut. The curd should be kept warm and as near 100 degrees Fahrenheit as possible, to permit the development of acid. This may be accomplished by keeping the curd covered with a muslin cloth, and if a jacketed vat is used, warm water may be employed also.

A simple and inexpensive draining box can be made from a wooden box about two feet square and eight inches deep. A close-fitting V-shaped bottom, sloping from both sides toward the center, should be provided. The lower edge of the V-shaped bottom should be on a level with the bottom of the box and the sloping sides should meet the box sides three inches from the bottom, giving a slope of about three inches to the center. This provides drainage for the whey which drips from the rack placed above.

The rack is made of slats one-half inch thick and three-fourths inch wide, set one-fourth inch apart and nailed to crosspieces. A three-fourths-inch hole should be made in the end of the drain box near the bottom to allow the whey to drain from underneath the rack. Before dipping the curd into the draining box a muslin cloth should be spread over the rack to prevent the curd from passing down between the slats.

If only a small amount of cheese is

"I would not think of returning to hand milking"—

So says Mr. Bolmert, a De Laval milker user, shown above, who along with many other dairymen from thirty different states and Canada give their experiences with the De Laval Milker in the book shown to the right.

Mr. Bolmert goes on to say, "My cows are also doing much better than they did by hand milking. They hold first place in the Rogue River Testing Association, and I have cut the time of milking by half."

There are now thousands of De Laval Milkers in use in all sections of the country, and practically all these users agree with Mr. Bolmert that the De Laval Milker increases production over any other way of milking, keeps the cows' teats and udders in better condition, produces cleaner milk, saves time, and makes dairying more pleasant and profitable.

A De Laval Milker soon pays for itself. If you are milking a herd of cows by hand or using an inferior milker, you are losing enough milk and time, and enough money in other ways, to pay for a De Laval. Sold on easy terms.

Latest and Best Information on Milking—Free!

This beautifully printed and illustrated book contains pictures of cows, barns, etc., from De Laval milker users in thirty different states and in Canada. The pictures are accompanied by statements from these milker users concerning their experience not only with the De Laval but with other milkers. The best thing of its kind ever issued. It also gives you an idea of how dairying is conducted in all parts of the country—and may suggest how you can make your dairying more profitable.

Ask your De Laval Milker Agent for a copy, or write to the nearest De Laval office for one. Ask for the new "Better Way of Milking."

THE HOLSTEIN SALE OF THE SEASON Burr Farm Dispersal

Burr Farm, Los Angeles
June 1st and 2nd

This is One of California's Foremost Herds, and If You
Want Some of the Good Ones Make Your Plans
Now to Attend This Tremendous Sale

This is the last opportunity of the spring season to buy tuberculin tested Holsteins at public sale in California, a fact that will be of interest to many inquirers for cattle.

HIGH RECORD COWS, INCLUDING TWO WITH RECORDS ABOVE 33 POUNDS BUTTER IN 7 DAYS!

MANY YEARLY RECORD COWS AND HEIFERS, AND OTHERS WELL ALONG ON YEARLY TEST!

DAUGHTERS OF 1,000 POUND COWS OF MOST ATTRACTIVE BREEDING AND TYPE!

TWO THREE-QUARTER SISTERS TO THE NEW WORLD'S RECORD 32 POUND 2 YEAR OLD!

FEMALES BRED TO KING KORNDYKE PONTIAC 20th, SIR VEEMAN KORNDYKE PONTIAC, AND TO A SON OF THE WORLD'S RECORD HEIFER, PRINCESS MAIDA VEEMAN!

Breeding, type, production, good health are all features of this offering, presenting a wealth of selection such as will probably not be available again for a long time to come in this state.

KING KORNDYKE PONTIAC 20th, the famous \$12,000.00 son of Miss Valley Mead De Kol Walker, sells in this sale. Here is an opportunity for a breeder or group of breeders to secure one of the best known and most popular young sires of the breed.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested by a Deputy State Veterinarian and sold subject to retest by the buyer except as announced in sale ring.

112 MARKET STREET SAN FRANCISCO, CAL.

to be made, a large kettle or dish pan may be used for draining the curd. A rack can be made to fit these receptacles, leaving a space underneath the rack which will serve as a reservoir for the whey that drains from the curd.

In case a vat is used for making cheese, no draining racks will be needed. The whey is drawn off through the faucet provided for that purpose. The draining and other operations necessary before the curd is ready to be pressed are completed in the vat.

Salting Curd

The stage for salting the curd is determined by the hot iron test. When the curd shows fine silklike threads from three-fourths to one inch in length when rubbed on a clean, hot iron, the salt should be added. About three ounces of salt for each 10 pounds of curd is sufficient. After the salt has been thoroughly stirred through the curd it should be allowed to dissolve and the curd allowed to cool to a temperature of about 85 degrees Fahrenheit before it is put into the press.

Preparing Press and Hoops

A very good cheese press can be made easily and quickly. A hoop or mold for pressing the cheese can be made from galvanized metal sheeting, the most convenient size being seven or eight inches in diameter and ten inches in height. A wooden bottom should be made to fit inside the hoop, and a number of three-sixteenth inch holes bored in it to allow the whey to escape.

Cheese hoops may be obtained from dairy supply houses; the Young America style, making a cheese of from five to ten pounds, is suitable for farm use.

In order to aid in the formation of a good rind and to improve the appearance of the cheese, a cheesecloth covering is used. Before putting in the curd the hoop is lined with cheesecloth, which is left on the finished cheese.

The cloths for this purpose are of two styles: (1) Circles of the diameter of the cheese for the top and bottom; (2) a bandage made by sewing cheesecloth into a "sleeve" that will fit very snugly into the cheese hoop.

In preparing the hoop for the curd a circle of cloth is placed in the bottom, then the bandage is put in, with the seam on the inside, overlapping on the bottom about one inch and extending high enough so that it can be turned over the upper edge of the hoop and held in place.

If a regular cheese hoop is used the bandage should be put over the part known as the bandager and this placed inside the closed hoop.

Pressing Curd

After the salt is dissolved and the curd cooled to 85 degrees Fahrenheit it should be put into the hoop and pressed. Pressure should be applied gently at first in order to avoid squeezing butterfat out of the curd. To do this a weight should be placed on the lever of the press about halfway between the hoop and the end of the lever, which should be about 12 feet long. A pailful of stones weighing 35 or 40 pounds makes a suitable weight. After half an hour the weight should be moved to the end of the lever and allowed to remain about an hour. Then the cheese should be taken out and dressed.

Dressing Cheese

To dress a cheese it is first removed from the hoop and dipped in warm water; the cloth circles are then removed from both ends and all wrinkles drawn from the side bandages. If the side bandage laps over the ends of the cheese too much it should be cut off, allowing only about an inch lap over each end of the cheese. The end circles are then replaced, using plenty of warm water to insure the formation of a good rind. The side bandage should not be removed at any time during the curing process. After the cheese has been properly dressed it should be put into the press and full pressure applied for 24 hours.

Curing Cheese

Curing is an important part of cheesemaking. Both the temperature and humidity should be under reasonable control. If properly ventilated, a cellar is probably the best place, during hot weather, for curing cheese on

the farm. If it is desired to cure cheese quickly it may be kept at a temperature of 65 degrees or 70 degrees Fahrenheit, but a temperature of from 50 degrees to 60 degrees Fahrenheit is regarded as the most favorable. Should mold appear on the cheese, the shelves should be wiped with a dry cloth when the cheeses are turned. If the cheese molds badly, it should be scrubbed with strong brine and placed in a drier curing room. When cheeses are placed in the curing room they should be turned daily until they are paraffined, after which they need not be turned more than twice a week.

Paraffining

The cheeses are paraffined when they are two weeks old. Cheese should be paraffined to prevent the cheese from drying too much and also to prevent molding. A convenient method for paraffining cheese on the farm is to heat the paraffin to a temperature of 240 degrees Fahrenheit, in a receptacle of suitable size, then roll the cheese in the hot paraffin for about five or ten seconds. The cheese is then removed and the top and bottom are dipped. The paraffin must be hot; otherwise the coat of paraffin will be so thick that it will not adhere to the surface of the cheese properly.

Great care should be taken to keep flies from the curing room. All windows should be covered with cheesecloth. Screen wire does not answer the purpose, as the fly which damages cheese by causing skippers is smaller than the ordinary house fly and can easily pass through the meshes of the screen wire commonly used.

Cheese may be cured enough to be eaten when six weeks old. The flavor, of course, is then quite mild.

If an even, low temperature is provided for curing the cheese it will cure slowly, and if a sharp flavor is not objectionable the cheese may be kept for many months.

Fast or Slow Curing Cheese

The manufacturing process and the temperature of curing the cheese may be modified to produce either a fast curing or a slow curing cheese.

The following conditions hasten the curing process:

1. A high curing temperature—70 degrees to 80 degrees Fahrenheit.
2. The development of less acid at time of salting (threads of approximately one-half inch by the hot iron test).
3. Using very little salt.

The following conditions retard the curing process:

1. A low curing temperature—below 60 degrees Fahrenheit.
2. The development of more acid at time of salting (threads of approximately one inch by the hot iron test).
3. Using a large quantity of salt.

Although the amount of acid developed influences the rate of curing, it is inadvisable to deviate from the directions given because of the danger of producing a cheese of poor quality.

Summary

1. Use clean, sweet milk for cheesemaking.
2. Heat milk to 86 degrees Fahrenheit. Use a thermometer to determine the temperature.
3. Add cheese color if desired, using one-half teaspoon to 100 pounds of milk. Do not use butter color.
4. Add rennet, first diluting it with a pint of cold water. Use one-third ounce (two teaspoons) to 100 pounds of milk. Stir rennet in thoroughly, then leave milk and container undisturbed for 30 minutes.
5. Cut the curd when sufficiently

firm. Do not crush or break it.

6. Stir the curd gently for 15 or 20 minutes.

7. Heat at the rate of two degrees in five minutes until the temperature reaches 100 degrees Fahrenheit. Stir while heating.

8. Allow curd to remain in whey at 100 degrees Fahrenheit until firm and until acid enough has developed. Do not let curd mat together.

9. Sufficient acid has developed when the curd will form strings one-fourth to one-half inch long on a hot iron.

10. The curd is firm enough if a handful of it pressed together between the hands falls apart readily when the pressure is released.

11. When the curd is firm and sufficient acid has developed, draw off the whey and put the curd on a draining rack. Do not let the curd form into pieces larger than a hickory nut. Keep the curd warm while on the rack.

12. When the curd forms strings from three-quarters to one inch long on a hot iron add salt at the rate of three ounces for 10 pounds of curd.

13. Have the curd at a temperature of about 85 degrees Fahrenheit; put it into a hoop, and apply pressure gently.

14. Dress cheese, return it to the press, and apply full pressure for 24 hours.

15. Place cheese in a curing room at a temperature of between 50 degrees and 60 degrees Fahrenheit.

16. While curing turn the cheese daily for two weeks, then twice a week. Paraffin cheese when two weeks old by dipping it in paraffin heated to a temperature of 240 degrees Fahrenheit.

CHAFFEY JUNIOR FAIR

The Chaffey Junior farm center of the San Bernardino County farm bureau will hold its second annual fair at the Chaffey high school in Ontario on May 19-20. The fair will include a show of pigs, calves, chickens, pigeons and rabbits, and it is expected a large showing of each will be made. The animals in order to be eligible for prizes must belong to a club member in the Chaffey district. This does not bar any outsider, either club member or breeder, from exhibiting animals. The Italian Vineyard Company will exhibit Berkshire hogs and Guernseys; Wessels & Mahoney will exhibit Guernseys and Fred Hall of Perris will have a class of Short-horns there. The animals brought in by the breeders will be used in the judging contest, which is open to teams and individuals from any high school. The students will be called upon to place a class of horses, sheep, hogs, dairy cattle and beef cattle. The judging contest will be in the hands of Professors Hughes, Howell, Thomson and Wilson of the university farm at Davis. Everyone is invited to attend, and the youngsters promise that there will be something to interest everybody.

It appears that the fight that the dairy industry in making, not only in California, but also throughout the country, for protection under the pending tariff bill, is not yet settled. Casein, copra, and soya beans were left on the free list, and the interests that are opposed to a tariff on dairy products are continuing their attack. California Dairy Council has been keeping in close touch with the situation in Washington and has been bringing all possible influence to bear to obtain a duty on casein, as well as on copra and soya beans. A telegram received from Senator F. R. Gooding states that the group of senators that is carrying the fight for the dairy industry has recommended a duty of four cents a pound on casein and three cents on milk sugar. Senator Gooding expresses confidence that it will succeed in protecting casein. The efforts of the Dairy Council so far have been successful in keeping the coconut and other Oriental oils on the dutiable list.

Adirondack Wietske Dairy Maid, the "marvel cow," owned by Bridgford Holstein Company, Patterson, has just completed her yearly test by coming through with 1,424.77 pounds butter and 34,402 pounds milk. This production entitles her to first place among all California Holsteins and, combined with her former record, constitutes a new world record for two years production. Adirondack Wietske Dairy Maids' most recent performance is a fitting climax to a series of records made in the Bridgford herd since January first, that stand without parallel in the breed. Prior to this last record three world records and eight state records have fallen to this herd.

Hogs sold up to \$10.80 in the farm bureau auction held at Hanford, April 27. At Tulare and Visalia the top was \$10.50 and at McFarland, \$10.35. Feeders sold from \$9.45 to \$10.25.

William Ward, junior member of the firm of Easton and Ward, owners of Blackhawk Ranch, Diablo, is planning to leave early in the fall for Scotland. While abroad Ward will attend the leading Scottish Shorthorn sales and will more than likely make selections for the Blackhawk herd. Ward reports a fine crop of calves by the imported bull Collynie Prince Lavender.

J. I. Thompson, manager of Straloch Farm, Davis, has returned from a trip among the Hampshire sheep breeders of the Northwest. Thompson selected 75 yearling rams, 30 yearling ewes, and 20 two year old ewes from the Selway and Gardiner flock, Detweiler, Idaho. According to Thompson the demand for Hampshires is taxing the production of the Straloch flock. It is probable that a number of the rams will be entered in the Davis sale next month.

The first California Shorthorn herd to make application to become an accredited herd is that owned by the Pacheco Cattle Company of Hollister. The first official test has just been administered, and the manager C. N. Hawkins is well pleased with the result.

John A. Bunting, owner of the Mission herd of Herefords, Mission San Jose, has taken the preliminary test on his herd as the first step toward accreditation. It is believed that this is the first California Hereford herd to apply for the federal test.

There were 12,424,000 breeding sows on farms April 1, the United States department of agriculture estimates. This is 1,237,000 more than on the same date in 1921 and represents an increase of 11.1 per cent.

KEEPING LIVESTOCK RECORDS

(Continued on Page 511.)

reproduced here. It gives a lot of information, and from it much of the data for the individual cards is compiled. There are no boarders in the big herd at the county farm as all animals which do not pay their way are weeded out. Each animal is charged with board and its share of the overhead expense and given credit for its performances at the pail and as a parent. If it fails to show a decided net profit it is soon on its way to the butcher. The effect of a few years' operation of the system has been that the herd at the county farm is now the highest producing herd containing over 100 cows in the world.

The herd book at the farm is always kept strictly up to date and a pedigree of each animal inserted so that there is no hesitation when someone wants to know the blood lines. Incidentally Mr. Harriman is somewhat of a shark on pedigrees and can recite offhand the breeding of many famous animals and of others not so famous. The charge of the farm and its 1,000 patients takes so much of his time that he is unable to give much attention to the dairy, but he carries a small book which shows the monthly production of each animal in the herd. His recreation is the cows and the last thing at night he reads the dairy papers.

When the Holstein breeders visited the farm after the guaranty sale they were shown a poster which is reproduced here. It was gotten up to answer many of the questions which the constant stream of visitors to the farm is asking. As everything in life is relative and it is only by comparison with some known thing that we can arrive at the value of an unknown article, Mr. Harriman has taken Tilly Alcartra's record as a basis—since she is perhaps the most widely advertised milk cow in the world—and from a chart of her record up to five and a half years ago shows where his pet cow has beaten Tilly, and for that reason he purchased her sire and is keeping her sons as herd bulls.

Another drawing shown was a diagram of the blood lines of the great cow, De Kol of Valley Mead, through her sons and daughters and how it appears in the herd sires of the county farm. From this diagram it is possible to work out a very comprehensive system of breeding, using first one bull and then another.

The beauty of the records is that they are not out of the reach of any breeder who is willing to give a little time to them, and they serve to emphasize the need of good bookkeepers on every big farm.

BIG PRICE REDUCTION
LOWEST IN 14 YEARS

Realizing that farm equipment must be reduced to the same level as the prices of farm products the SHARPLES SEPARATOR CO. have reduced the prices of their separators to less than one-half of the former price and have not in any decreased the quality. The new price will produce such a large volume of business that a satisfactory profit will be realized by the manufacturer. The new SUCTION FEED SHARPLES skims clean at any speed, is easy to operate, does not require an expert, easily cleaned, long lived and thoroughly dependable.

It is in constant use by more than a million satisfied users. It skims to 1/100 of 1 per cent clean all the time,—the same even quality of butter fat today as tomorrow. Put a SHARPLES to work for you. Write to the nearest distributor for detailed information and name of nearest dealer.

Females and Males

EDGEMOOR FARM
Owned by G. L. Strobeck
SANTEE, CALIF.

SELLING AT

Rhoades & Rhoades Pavilion, Hynes, Calif.
Wednesday, May 17, at 10 A.M.

The dispersal of the Edgemoor Farm herd makes available to purchasers a herd from a breeding establishment that has won a foremost place during the past ten years both in official production lists and in the principal show rings of America.

A Wide Selection of Females

The fifty-seven females include imported cows of most approved blood lines and daughters of such cows by richly bred sires, also a splendid lot of bred and open heifers, just the kind that careful buyers want for foundation purposes.

Females Bred to Outstanding Bulls

* Many of the cows and heifers in the offering are bred to MASTERPIECE OF EDGEMOOR, or to DEANIE'S MAROSE OF APPLE TREE POINT, two young sires of national prominence because of their breeding and individual merit.

14 Bulls in the Sale

The fourteen bulls are all of service age, most of them ready for heavy service, and offer a rare selection to dairymen and breeders alike. It is not often that so many registered Guernsey bulls are offered at public sale in California, and coming as they do from this famous herd the opportunity is one not to be overlooked.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER—EVERY ANIMAL OVER SIX MONTHS OLD TUBERCULIN TESTED AND SOLD SUBJECT TO RETEST BY THE BUYER

THE AUTO-OILED AERMOTOR A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

Write today for Circular. **AERMOTOR CO.** Chicago Des Moines

Two Thousand Acres of New Vineyard

The Fontana Farms Company has just completed a large planting of 2,000 acres of grapes. Since early in March a crew of some 50 planters has been in the field, interrupted only by rains. While the process of planting a single grape cutting is very simple, this process multiplied by 900,000 over an area of 2,000 acres becomes a farming operation worthy of interest.

The Fontana ranch, located six miles west of San Bernardino, be-

tamped with the foot. It takes about five minutes to complete one row 640 feet long and containing some 67 cuttings.

The varieties planted at Fontana are: Muscat, 30 per cent; Sultanahs, 15 per cent; Zinfandels, 15 per cent, and Mission, Tereusa, Alicante Bouchet and Cornichons, each 10 per cent.

Grape culture at Fontana is no experiment as the vineyards are located in the center of the largest and oldest grape section in Southern California

A Five Year Old Vineyard at Fontana

tween the Foothill and Colton Boulevards, is divided into 20 acre tracts. Three crews of 13 to 20 men each are separated over each tract. Each crew has two chain men, 16 planters and one or two men to distribute the cuttings, while a small truck is kept busy hauling the cuttings to the crews from where they have been kept buried.

The chain consists of a wire 640 feet long marked at intervals of nine and a half feet. It is the business of the chain men to stretch this wire to stakes nine and a half feet apart previously placed along each side of the tract, each stake having an indication of the variety of grape to be planted. When the chain is stretched taut the planters, each equipped with a steel bar, proceed to their work. The bar is driven into the ground to a depth of 14 inches, the cutting inserted, leaving three to four inches above the ground, the soil firmly packed with the bar and the surface

There are some 18,000 acres of grapes in San Bernardino County as against 13,850 acres in the remaining counties south of the Tehachapi according to the California Grape Grower.

While much of this acreage was originally without water, it is interesting to note that, according to a survey recently made by the Fontana Farms Company, over \$500,000 is being spent by the vineyardists in the Etiwanda, Cucamonga and Fontana for installing irrigation systems.

The Fontana vineyards were all piped for irrigation before they were planted, being served by the Fontana system, getting its gravity water from Lytle Creek and distributing it in a system comprising over 250 miles of concrete pipes.

The Fontana Farms Company reports that since it began planting over \$100,000 worth of these young vineyards have been sold in ten and 20 acre tracts.

Sub-Irrigation

Since tillage of irrigation lands began we have wished for a method of applying water so it would reach the roots of tree or plant without large wastage and with saving of labor. The labor of preparing soil for irrigation

and of undoing it and fitting the surface for holding the moisture is simply appalling. Hence we continue to ask, is there not some way of getting this water down to the roots and being relieved from the incessant labor of re-

Practical Sub-Irrigation.

The upper illustration is taken in an orchard near Glendale, Los Angeles County. The system is laid deep enough to escape tillage implements. The percolators and pipe shown on the surface are merely to illustrate location of percolators underneath. These percolators are connected with the irrigation system by ordinary screw galvanized water pipe. The lower illustration shows the different forms of percolators. These are all made of coarse sand and Portland cement. The bucket form at the right shows by the dark line how high the water stands in the percolator when water is turned on full force from three-quarter inch garden valve. The elongated percolator on top of the bucket form near center of picture is the form ordinarily used under strawberries or other truck crops.

When Writing Advertisers Please Mention the Cultivator.

newing the dust mulch. So our ears and eyes are open when it is suggested that possible relief is in sight. We were glad recently to inspect the system of Messrs. Bean and Woodberry at Glendale.

This is a system for applying irrigation water to trees and plants underground by means of porous containers which are connected by suitable pipes and through which containers the water percolates and is diffused through the surrounding soil. As each percolating unit uses water only as fast as it can be diffused through the surrounding ground and any in excess of this amount passes on to the next in line, it follows that the number of units is limited only by the size of the connecting pipes and the quantity of water available.

It will eliminate the labor of preparing the ground for each irrigation, the labor of applying the water and the labor of cultivating the soil when sufficiently dry, but what is of more consequence by far, it will place every gallon of water in, not on, the ground and right among the roots of the vegetation, no loss of water by evaporation or in wetting the surface soil which contains no tree roots. This means that by use of this system one inch of water will do the work of two or three as usually applied. It will call the rootlets down from the surface instead of up to the surface where they are affected by atmospheric conditions.

The different forms of containers are shown in the illustrations on opposite page.

TOMATO GROWING

About 2½ quarts of canned tomatoes is the yearly per capita consumption in the United States. How the tomato is grown, put up and shipped, together with practices followed in communities where its cultivation is highly specialized, are given in Farmers' Bulletin No. 1233, recently issued, copies of which may be obtained free of charge upon application to Department of Agriculture, Washington, D. C. The bulletin also contains valuable suggestions to growers as to methods which are profitably followed where the crop is most successful.

By 1887 the total pack of canned tomatoes in the United States was about 3,000,000 cases of 24 one quart cans each. Now the commercial pack, exclusive of soups, purees, ketchup and pulp, exceeds 10,000,000 cases of 24 No. 3 cans. These figures do not include the millions of cans put up by housewives for home consumption or the fresh tomatoes which grace American tables during the growing season.

CHANGE IN FEDERAL GRAIN GRADES

Changes in grades to facilitate export trading in Pacific Coast wheat have been made, effective July 17. When the proposed changes as to excess moisture and excess foreign material were under consideration, there was proposed also a change in the classification of white wheats so that the classes Common White and White Club would be combined into one class designated White Wheat, this new class to be subdivided into three subclasses—Hard White, Soft White and Western White—making the same application of the Hard White and Soft White subclasses as at present and designating as Western White all white wheats or mixtures of white wheats containing more than 10 per cent of white clubs or Sonora.

SUDAN SEED SHOWS JOHNSON GRASS

A warning is issued to those farmers intending to plant Sudan grass this season to be certain seed is free from Johnson grass seed. Quite a number of the samples of Sudan grass seed submitted to the seed laboratory of the state department of agriculture have been found to contain traces of Johnson grass, reports W. S. Wilkinson, Jr., seed specialist, bureau of standardization.

REMEDY FOR CUTWORMS

The extension service in Los Angeles County recommends the use of poison bran mash or citrus bran mash for the control of cutworms. The formulas for preparing the materials are:

Poison Bran Mash

Bran, 25 pounds; white arsenic, 1 pound; molasses (cheap blackstrap preferred), 2 quarts. Mix the arsenic

and the bran dry and add the molasses, which has been diluted with water. Add enough water and mix thoroughly to make a dry mash which will broadcast easily.

Citrus Bran Mash

White arsenic, 1 pound; molasses (cheap blackstrap preferred), 2 quarts; lemons (or oranges), 6 fruits; water, about 4 gallons; bran, 25 pounds. Mix the above materials as follows: Stir thoroughly the white arsenic, molasses and water first. Grind the lemons, including the rinds, in a meat grinder, or chop fine, and add to this liquid. Then slowly pour this over the bran and stir thoroughly until an even mixture is secured.

The amount of water to use in the preparation of these baits will vary according to the coarseness of the bran or substitutes. A barely moist mash is preferable to a wet one, because it does not harden under the heat of the sun and remains palatable, while wet mash becomes baked and unattractive.

DESTROY MILK THISTLE NOW

The milk thistle, *Silybum marianum*, is one of our more disagreeable weeds whose control can best be effected at the present season, says the bureau of pest control, California department of agriculture. The milky white splotches along the veins of its leaves from which the common name is derived make it readily recognizable at all stages. The time when this weed can be easily destroyed is quickly passing with the advent of warmer and drier weather. While in most sections of the state the milk thistles have just begun to show themselves, in many places quite large plants already may be found, and occasionally a flowering stem.

The best tool for destroying is the spud, but a good hoe or a sharp spade will do very well. It is important to cut the plant well below the crown, for although the milk thistle is generally regarded as an annual it possesses the properties of a biennial in its ability to produce new stalks from buds around the crown after the original stalk has been cut off.

BET SUGAR PRODUCTION LAST YEAR

Final report of a beet sugar production of 1,020,489 short tons in this country in 1921, is announced by the United States department of agriculture. This is 68,532 tons less than the production of 1920 which was a record one and was the first to pass the million ton mark. The sugar beet crop of 1921 grew on 814,988 acres, an area that was 56,688 acres less than that of 1920. This report is the result of enumeration and not of estimating.

Farmers received an average of \$60 per acre and \$6.32 per ton, nearly as low as 1916. 92 factories were in operation for 76 days on the average. The fraction of sucrose actually extracted by factories was 13.76 per cent of the weight of beets, as compared with an average of 13.55 per cent for the six years 1915-1920.

Sutter County reports peach buyers busy among the orchardists though prices are still vague. Most of the peach growers are in the association.

Cletrac Is At Home Among The Trees

CLETRAC is low-set and smooth-bodied. It slips in and out among the trees with short quick turns—comes about at the end of the row in less space than a team requires. Standing only 13 hands high—with no projecting lugs to catch low-hanging branches or scrape and bruise the bark—Cletrac is the ideal "orchard tractor."

With a Cletrac to turn under your cover crop, you can work right up close to the trees. This tractor leaves no patches of unplowed ground that so often make orchard plowing a half-power, half-horse job.

After plowing, Cletrac follows through with discing, fertilizing and lime-crushing. Its broad tank-type treads carry it lightly over soft ground without slipping and packing—it gets through with your heavy spraying no matter how wet the soil.

Today Cletrac is the admitted leader in orchard work. More fruit growers every year are using it exclusively. Remember—there's no obligation connected with learning all about Cletrac's proved ability. We'll demonstrate at your convenience.

SEEDS AND PLANTS

SUDAN GRASS SEED
(The Great New Hay Crop)
First introduced in the United States 1909 from Sudan, Africa. Culture. Strictly an annual, may be drilled or broadcasted, 15 to 25 lbs. per acre, it grows 8 to 10 ft. high, yields 3 to 10 tons per acre, two to four cuttings. Pasture. It will yield food for six times as much stock as any other forage without irrigation. For milk cows and hogs there is no better and more abundant pasture than sudan. It will solve the hay proposition as nothing else can or will do in this climate. This seed is grown on our farm and is free from Johnson Grass.

Price—5 lbs. \$1, 10 lbs. \$1.50; 50 lbs. \$8 100 lbs. \$8; 500 lbs. \$35; 1000 lbs. \$50.

BOWMAN'S HDWE & IMP. CO.

PACKERS OF AIR LINE HONEY

CITRUS BUD VARIATION

Features of interest shown by the Wase variety of the Satsuma type of orange are discussed from the technical and scientific viewpoint by Tazaburo Tanaka, botanical assistant and translator, in Department Circular No. 206, "A New Feature of Bud Variation in Citrus," issued by the United States department of agriculture. This variety is liked particularly on account of its early ripening habit and its remarkably polished large sized fruits. Its origin was traced to three authentic grafted plants, located at Aoe, where the original budwood for propagation was furnished.

A novelty produced in this way is sometimes of real agricultural worth, as is evidenced by the fact that the Wase orange industry of Japan has grown in 20 years from nothing to a production of 150,000 yen (\$75,000) worth of fruit annually.

In addition to the strains of Wase now cultivated commercially on a large scale in many parts of Japan, Dr. Tanaka has located six other strains in various parts of Japan, of which five were brought by him to this country and are now growing in the greenhouses of the department of agriculture.

The Wase Satsuma originates as a very rare bud variation on branches of the Owari Satsuma, a variety cultivated on a considerable scale in Alabama and other Gulf Coast states. The Wase bud sport ripens several weeks earlier and has larger fruits of equally good quality. Dr. Tanaka finds that the Wase strain reverts rather commonly to the parent variety, the Owari Satsuma, and discusses at some length the scientific and practical significance of this fact.

TOADSTOOLS ON POTATOES

Reports come from time to time of potatoes being attacked by the oak root fungus, *Armillaria mellea*. In Oregon the attacks on potato fields have become quite serious. The trouble is more apt to be serious in sections of constant rains, summer rains being a considerable aid to all fungous diseases.

Among the conspicuous needs of the peach industry today are standard grades and more careful attention to the harvesting, handling and packing of the fruit. Each year large numbers of shipments are received in the consuming centers of the country, which, on account of immaturity or improper methods of grading and handling, are sold at prices that represent severe losses to the shippers. The situation is rendered even more serious because the presence of poor fruit on the market weakens the confidence of the consuming public and so affects the sale of the good stock as well.

FEDERAL QUARANTINE NO. 37

(Continued from Page 511.)

When we take into consideration the fact that the annual loss to the horticultural and agricultural interests of the United States from the depredation of injurious pests and diseases, fully half of which were introduced from foreign lands, runs into billions of dollars, we cannot help but be impressed with the necessity for more carefully guarding against such importations.

On the other hand the importers would have us believe that Federal Quarantine No. 37 absolutely prohibited the importation of any plants, seed, bulbs or flowers from other lands and that we were being deprived of many new and rare plants and flowers, as well as economic fruits, etc. This is not the case, for, as stated elsewhere, under proper

Annual Farm Bureau Conference Ready for the Start from Berkeley

Farm bureau conference conducted by the experiment station left Berkeley on the morning of May 3, journeyed by the coast highway to Los Angeles, thence east through Southern California valleys to Redlands and on to San Diego where the conference ended on Thursday, May 11. Really, however, the journey will not end until the various machines have returned to their homes, some having come from extreme northern counties, making the length of the entire trip nearly 1,500 miles. There were 47 automobiles carrying 185 farm bureau people.

restrictions such importations are provided for, and the only articles prohibited entry are those that are being grown here in sufficient quantities to supply our needs.

It is true that American grown plants cannot be produced as cheaply as those from Europe, but it is equally true that the plantsman pays as much or more for the imported goods as is charged for the American grown article, the difference going to the importers or middlemen.

To sum up the proposition, these people are willing to jeopardize the interests of the entire country for the sake of the few dollars additional profit they can make on imported goods produced by cheap labor.

Every fruit grower, nurseryman and florist who has the interest of the industry at heart should make an earnest effort to see that this quarantine is maintained.

PUTTING FIGS ON THE MARKET

Growers of figs in California are very much encouraged over the prospects of disposing of their crops as fresh rather than dried fruit. The industry has been built up almost entirely on the basis of dried figs. These figs are dried in the sun and marketed mainly in bulk for cooking purposes.

The Calimyrna, Kadota and Mission varieties of fig are admirably adapted for shipping to fresh markets, both local and distant. The first two are especially fine for canning and preserving. The fresh fig is one of the most delicious, palatable and healthful fruits known to mankind. Since the fig cannot be grown commercially in the colder sections of the United States, the California Peach & Fig Growers, which now has 8,500 members, is arranging to preserve the fresh fruit in its original form and flavor as nearly as possible. It is predicted that canned figs put up in syrup will be as common a commodity as canned apricots, peaches, or cherries, and preserved figs put up in a heavier syrup, a delicious dessert which will be available at all grocery stores.

In addition to its two modern plants put into operation last year, the Peach & Fig Growers has under construction a third plant at Dinuba representing an investment of \$105,000 where large

quantities of fresh figs will be handled this season. Both Calimyrna and Kadota figs are of a beautiful golden yellow when ripe and the preserved product in glass presents a very attractive appearance. The quality is even better.

Cooking or preserving the fig does not in any way destroy its laxative properties or detract from its food value. The high food value of figs is mostly due to their sugar content, one of the most valuable of the carbohydrates and certainly the most easily digested and assimilated of all. The fuel value or calories per pound of dried figs is 1395 compared to 1336 for raisins, 1292 for prunes, 1125 for dates 1290 for apricots, 1350 for dried apples and 1,650 for bread flour. The fig ranks second therefore, only to flour in the number of calories per pound.

Wipe Out Every Rat and Gopher

Amazing New Discovery Quickly Kills Them All. Not a Poison.

Rats, Mice, Gophers—in fact, all Rodents can now be wiped out easily and quickly. Imperial Virus will do it. This new discovery is a fluid, true Virus. Entirely harmless to humans, poultry, stock, pets, etc.

Infects Rodents only. Greedily eaten on bait. Sets up burning fever. The pests communicate it to others, and all die outside, hunting air and water. Imperial Virus is put up in sealed bottles, thus insuring full strength and potency. Only safe, sanitary method to overcome these pests. Protect your Poultry, especially Baby Chicks and Egg Hatches.

YOU CAN GET YOURS FREE

Here's how! Send \$1.00 today (currency, M. O. checks, etc.) and we will give you by return mail, postpaid, two regular, full sized (double strength) \$1.00 bottles of Imperial Virus. Use one to rid your place of these pests, and sell the other to a neighbor, thus getting yours free. Special inducements to represent us.

If more convenient, send no money, just your name and address to Imperial Laboratories, Dept. 435, 2110 Grand Ave., Kansas City, Mo. Pay postman \$1.00 and few cents' postage when two bottles arrive. Guaranteed to do the work to your entire satisfaction within 30 days or your \$1.00 will be cheerfully refunded.

Poultry Stock

Specializing in White Leghorns from heavy laying strains of proven ability. Breeding, incubation, brooding and developing by most efficient methods known. Females ready when weaned from heat, hardened, and sex has been determined.

We start you right, either big or small, and save YOU TIME, MONEY AND WORRY. Write for prices, etc. Visitors welcome. Also fancy or general utility birds.

The Care of Ducklings

By Jean A. Koethen

DUCKLINGS are the easiest of all young fowl to raise. They require little heat, little exercise, a very simple diet, and cleanliness means nothing to them. They are far less susceptible to disease than chickens, and it requires only a little knowledge of and respect for their idiosyncrasies for the veriest novice to raise them with little loss. When their idiosyncrasies are not known raising them may be as much of a problem as it has been to the writer of the following:

"On March 20 I purchased four dozen Pekin ducklings. They were delivered to us when they were 30 hours old and appeared to be all right although their legs were somewhat weak. When they were 42 hours old we fed them lightly on bran and grit. We kept them at a temperature of 90 degrees for five days, reducing to 75 degrees when they were two weeks old. They were allowed to run in the sun when they were a week old and protected from drafts as much as possible. We fed them hard boiled eggs and bread crumbs and grit for two days, then baby chick mash and one-third grit and greens chopped fine, what they would clean up in five minutes three times a day. Water was before them constantly. They have died consistently, one, two and three a day, till the last one died today. They gained in size and weight, but could not stand on their feet, would toddle around, then roll over on their backs and die. We held an autopsy on several and found their stomachs full of water as a rule. This is my first experience with ducks but I have heard most everyone say they were easy to raise and required less care than chickens. I have always had lots of chickens and have been very successful with them."

The first experience with any kind of young things is quite likely to be unfortunate and is always illuminating. This writer's fundamental mistake was in supposing that ducklings require the same care as chickens. They are essentially different and demand very different care. The requirements of ducklings may pretty well be summed up in six rules: 1. Very little heat and that at night. 2. Soft feed. 3. Sand with every meal. 4. Greens with every meal. 5. Water only with meals and slightly warm if weather is cold. 6. Shade.

Isn't that simple? No worrying about the little birds' chilling. No fussing with a variety of rations. No dusting or spraying for lice. A little room for exercise, but not much.

I do not know exactly how much heat breeders give who raise their ducklings in brooders, but I do know that most people raise them in fireless brooders without any heat at all. If the nights are very cold a jug of hot water may be given the first week, but it is hardly necessary. Seventy-five degrees at the start would be ample heat and could be done away with entirely after the first week. The coop should be sheltered from sun as well as from wind, and the ducklings allowed in their little yard all day. They must be kept carefully yarded, because they have not the homing instinct chickens have, but a board a foot wide is ample for keeping them in. An Inglewood man whom I visited some years ago was raising hundreds of Pekin ducks for the green duck market in a yard not over 20 feet square. He put them in cold brooders at night, and I believe the first week or so kept the brooders in the house. The yard was divided into small sections for the different ages of ducklings and here they lived and grew to six pounds weight with barely room to move around in. The wind was cold in the shade of the tree which protected their yard, but they minded the cold wind far less than they would have minded the hot sun.

Soft Feed Essential

The duck has no gizzard, and hence cannot easily digest hard grain. All the big duck men stick to moist mash for their ducklings. The first feed, which is given whenever the ducklings want to eat, may consist of bread crumbs or bran served on a board. With ducklings one need not

worry about feeding too soon, for they will not eat too soon. After this first meal, which should always be mixed with clean sand, a simple mash mixture of ground grain and cut green feed moistened with water till it is crumbly, and always with five per cent or more sand added, is given at first four or five times a day, and later on three times a day. At the Hallock Ranch, one of the big Long Island ranches, the ration at first consists of two parts bran, one part shredded wheat, one part corn meal, with a little meat scrap added gradually after the first two or three weeks. Two parts bran, one part middlings and one part corn meal, with sand and greens added, and the whole moistened till it is crumbly, makes a good ration for ducklings after the first two weeks. It is better not to use corn meal too freely at first but it must be added after a little and the amount gradually increased till the mixture is equal parts bran, middlings and corn meal. Beef scrap should not be added till the birds are two weeks old or older and must be used cautiously and the amount gradually increased till it is one-eighth of the whole. Always add cut alfalfa or other greens until the birds are old enough to pick the uncut green stuff just as it is thrown into the yard, and never, never omit sand.

Water ad Libitum

Water to play in or too cold water to drink makes havoc with ducklings. They must have it with their meals, but it is neither necessary nor wise to leave it before them till they are fully feathered. Then a pail or tub to dip their heads in is a great pleasure to them and helps keep them free from vermin. The books say ducks are not troubled with lice and other vermin, and this is ordinarily true, but the first ducks I ever owned came to me with their heads full of stick-tight fleas. They soon washed them off and probably would never have been bothered if they had had water to dip their heads in. Ducklings, however, until their down has turned to feathers, are easily chilled by getting wet, and must be kept dry. Probably the water which was so carefully kept before the unfortunate ducklings in the letter quoted above had no little to do with their sudden deaths, especially as they were kept far too warm at night. It used to be said that cold water, inside or out, gave ducklings cramps.

Shade Always

Because their circulation is slow and their blood temperature low, ducklings cannot bear the hot sunshine and must be kept well shaded in our climate. Cases one hears of, of ducks dropping dead, are probably generally due to exposure to the sun. The natural habitat of ducks is a cool, marshy place and it is probably a little more difficult to raise them here than in the East. For the same reason they are rather less profitable though green ducks often pay pretty well.

Ducklings that are heavily fed are liable to have weak legs, and care must be taken not to let their bodies outgrow their legs. If symptoms of leg weakness develop give them a chance to run once in a while and cut down the amount of corn meal in the mash.

Poultry Queries

Conducted by Jean A. Koethen

Chicks Dying

What can I do to keep my little chicks from dying? I feed rolled oats, chick mash and cracked wheat and milo. They did well till they were four weeks old, then I changed them into the Corning house, and after a week they began to droop and die. I had alfalfa hay on the floor instead of straw. What is best?—Subscriber, Chula Vista.

My guess about those chicks is that there were mites in the house, and as soon as they fairly got to work sucking their blood the chicks began to die. There is nothing in the ration

DR. HESS Instant Louse Killer Kills Lice on Poultry and Stock

Use it on your lousy hens and chicks—your lousy colts, horses and cattle. You'll get better chicks—bigger, better fowls—more eggs—better contented stock.

Chicks are apt to be lousy now. Give them a chance. Sprinkle Louse Killer into the feathers, about the coops, on roosts, in nests of laying and setting hens. Always keep Louse Killer in the dust bath. For lousy horses and cattle, colts and calves, stroke the hair the wrong way and sift in Louse Killer.

We authorize dealers to return your money if it does not do as claimed.

SAN FRANCISCO LOS ANGELES

that would affect them so, though they should have a growing mash instead of the chick mash, now that they are over a month old. Growing mash is frequently given after the first week. Alfalfa hay is better than straw for chicks, so the trouble is not in the litter. Of course, there may be something wrong with the feed that you have not noticed—mold, perhaps, or some poisonous substance mixed with the wheat. You do not mention green feed, but I hardly think the lack of it would be fatal so soon. Even if your houses have been sprayed regularly it is quite possible the work has not been done thoroughly and that some mites have found refuge in cracks or under roosts. If you will go to the house late in the evening and put your hand in among the chicks for a minute or two you will find the mites if they are there, and they will find you.

Liver Trouble

The combs of my chickens turn black. They stand around, don't eat and die within a week. I feed Sure Lay, dry sprouts, barley and as much moist mash as they will clean up in ten minutes in the morning. — Subscriber, Arroyo Grande.

I believe your hens have diseased livers from lack of green feed. The dry sprouts (sprouted grain?) do not take the place of succulent greens, such as alfalfa, barley, kale and clover. Hens that have been forced for heavy egg production during the winter are quite apt to develop liver trouble when the warmer days come, unless their diet is lightened to suit changed weather conditions. It would be a good plan to add bran to the

mash, making it half bran and half Sure Lay, and make the scratch part wheat with a little corn added. It is always best to feed more than one grain. Drop off the moist mash for a time and give all the greens the hens will consume. A dose of Epsom salts all round, mixed in moist mash, allowing ½ teaspoon salts for each hen, may help some, but it is not medicine the hens need so much as a lighter ration.

Dying in the Shell

Cecilia Stahl, Claremont, sends this suggestion in regard to chicks dying in the shell, which we are very glad to publish:

In the poultry department a subscriber asks why chicks nearly ready to hatch die in the shell, apparently drowned with too much moisture, yet none showing on the glass at hatching time. If she will examine them more carefully she will probably find there is no air cell at all. This is due to insufficient cooling of the eggs, which should be cooled each time they are turned till the egg is barely warm to the cheek. There should be no draft, but temperature of room should be about 70 degrees. If the cellar is too damp it can be made less so by burning a large circular burner lamp during incubation, but care must be taken to have plenty of moisture in the air the last week. At hatching time there must be sufficient moisture to show on the glass.

Overheated

Several of my chicks, at about nine weeks of age, began to lose the feathers from neck and head. One has died, but the others seem active as

any of the flock. We were burned out two weeks ago, and since then the chicks have been crowded and have no good roosts. This is my first experience in brooding and I didn't start them roosting as early as I should. Can you give me any suggestions about teaching them to roost? —Subscriber, Arcadia.

As you say, the chicks have been overcrowded. It is likely they were overheated at the same time or possibly in the brooder still earlier. The only thing you can do is to give them a ration which will help new feathers to grow. Give them a mash containing 15 per cent meat meal and a little linseed meal. For the scratch feed give cracked corn and whole wheat, and, if you can, a little sunflower seed. The easy way to teach chicks to roost is to put roosts of lath or other light wood in the brooder house from the first. As it is now too late for that you will have to let them sleep under the roosts till they learn to roost, which will probably not be long. Spread litter on the dropping board under the roosts, and with a broom drive the chicks up an inclined plane or ladder, made of a couple of wide boards with cleats nailed across at intervals. You may have to shut them in at first with boards, but they learn very quickly where to go. You will be surprised to see how soon they go on the roosts.

Feeding Formulas

Please give me the names of grains that would be good for laying hens. I want to grind the grains and feed as a scratch feed. Also what mixture would be best to crack for baby chicks? —Subscriber, Sanger.

Grains are not ground for scratch feed for hens. Barley is rolled and corn is cracked and oats and barley may be hulled, but they are not ground except for the mash. The scratch mixture recommended by the poultry division consists of 100 pounds whole or rolled barley, 50 pounds Egyptian corn or milo maize, 50 pounds cracked Indian corn. The mash to accompany this scratch feed contains 50 pounds bran, middlings and ground barley, 10 pounds soybean or linseed meal, 10 pounds coconut, soybean, linseed or cottonseed meal or ground beans, 30 pounds beef scrap or fish meal, 5 pounds charcoal and 1 pound salt.

The Cornell grain mixture for chicks from 1 to 6 weeks old consists of 5 pounds cracked corn, 3 pounds cracked wheat, 2 pounds pinhead oats or oat flakes. From 6 to 12 weeks the mixture is 6 pounds cracked corn and 4 pounds whole wheat. This latter mixture can be fed to chicks from 3 to 4 weeks old, or even younger, and milo or gyp corn may be added.

OAT HULLS FOR POULTRY LITTER

For some months past the Sperry experimental farm has been experimenting with oat hulls for use as litter for poultry houses. These hulls are obtained in the process of milling oats for table purposes and are clean and free from all objectionable matter. They have proved very satisfactory not only on our own farm but wherever we have placed them with poultrymen for trial purposes. They have the following advantages:

On account of their lightness they are readily scattered around the floor of the poultry house, which greatly eliminates the accumulation of moisture so pronounced in the use of straw.

They readily absorb the droppings, yet do not pack and can be raked when other litters would require a complete change.

They are very desirable for feeding scratch feed because the grain quickly sifts below the surface which does not pack. This compels the fowls to work for their scratch feed and gives them needed exercise.

As a litter for baby chicks they are particularly valuable and eliminate the labor of chopping straw or alfalfa hay for the purpose. They contain a certain percentage of oat groats and when placed about two inches thick on the brooder house floor, the chicks lose no time in scratching for these particles of oats. Searching for feed in such a litter keeps them busy and helps eliminate such vices as toe picking, etc.

Rid Hens and Chicks of Lice and Mites

A Few Drops of Wonderful New Remedy in Drinking Water Does It—No Dusting, Spraying or Greasing

Any poultry raiser can easily and quickly clean out Lice and Mites by using a new Remedy recently discovered by a Kansas City chemist and called Imperial Lice and Mite Remedy.

All that is necessary is to occasionally put a few drops of this amazing remedy in the fowl's drinking water. It renders them immune from the attack of all blood-sucking parasites, as these pests positively will not stay on a fowl taking this remedy.

It also acts as a splendid Tonic and Blood Purifier, as well as increasing egg production and growth. For with these pests eliminated, hens lay better and young stock grows faster. It is positively guaranteed not to affect the meat or eggs.

The manufacturers of Imperial Lice and Mite Remedy are anxious to get it quickly introduced among poultry raisers everywhere, and make this Special Introductory Offer. Send no money, just your name and address to the Imperial Laboratories, Room 546, 2110 Grand Ave., Kansas City, Mo., and they will send you a regular full sized \$1.00 bottle and will also send you free a big full sized (double strength) \$1.00 package of Imperial White Diarrhoea Remedy, the standard, time-tested remedy. Pay the postman only \$1 and a few cents postage when both packages are delivered. Any time within 30 days, if you are not satisfied with results, just say so and your money will be cheerfully refunded.

Grapefruit: Market steady. Californians: Northern, packed box, 3.50@3.75; market pack, 3.00; small, 2.25@2.50.

Lemons: Demand and movement light, market firm. Locals: Loose boxes, best, 2.50@3.00; poorer, 2.00; special brands, fancy, 5.50@5.75; choice, 5.00@5.25.

Oranges: Demand moderate, market steady. Navels, market pack, 5.50@6.00, according to size and quality; culls, 1.00 per field box; few best, 1.50; Valencias, special brands, 7.25@7.50.

Tangerines: Market firm, 8@10 lb.

HONEY

Winter loss for the state as a whole is estimated at 5-10 per cent, largely resulting from the severe freeze early in the spring which injured brood as well as bees. Prospects continue favorable for a good crop of honey with normal weather conditions. The new crop is being delayed by the late spring. Few large sales have been made during the past two weeks, as supplies are said to be limited to scattered holdings. In addition to selling practically all of the 1921 crop, a large holdover from the 1920 crop has been disposed of. Rather extensive

exporting during recent months has accounted for part of the movement.

HAY

Alfalfa is in a decidedly unsettled condition, price ranging much the same as ten days ago which was around \$18 for No. 1 Dairy. The rain caused slight injury, the first cutting being largely under cover so that market will not be affected by the storm.

CALIFORNIA CATTLEMEN'S MARKET REPORT

San Francisco, May 1, 1922: The Chicago market held steady during the past week, with an increase of 8000 head more cattle received than the previous week. This indicates a strong demand and a very healthy condition of the eastern market.

San Francisco market remains about steady, few sales of fat grass cattle being reported because of the lateness of grass. Sales are reported from Tulare County for as high as 8c f. o. b. cars for steers averaging 1225 pounds. A few small lots of fed steers have been sold for approximately the same price during the past week.

Los Angeles market has received very little grass beef so far. Cattleman seem to be holding strong for 7½c to 8c f. o. b. ranch for prime steers. Sales of fed steers are reported in Phoenix, Arizona, at 7½c f. o. b. Phoenix. The veal market continues strong at 10c f. o. b. ranch. Grass-fat cows are reported sold at 6½c f. o. b. ranch.

Read again very carefully the Market Report sent you last week, and do not let the buyers try to give you information to the contrary. Get everything possible out of your first sales this spring, because (1) there is no surplus beef in the state and buyers have stopped eastern buying, waiting to get California grass cattle; (2) the first few sales establish the price for the season, and that price must not be too low. Do not force your cattle onto the market at a sacrifice.

Orderly marketing is the only method of stabilizing our price during the next few months. Study again the calendar sent you, and particularly the ten year pre war average price curve in the lower right hand corner. Half fat cattle always break the market. Sell only prime beef. Sell only f. o. b. ranch or shipping point.

It is the man without accurate and reliable information who sells too cheap. His low sales hurt you. Protect yourself and get him as a member, so that our Weekly Market Report will keep him advised each week. So far during 1922 we have taken in 181 new members. Now is the important time—how many new members can you add during the next two weeks?—R. M. Hagen, Secretary.

CALIFORNIA CATTLEMEN'S MARKET REPORT

San Francisco, May 8: The Chicago market advanced approximately 10c last week over the previous week, in spite of the fact that receipts again increased, being 6000 heavier than the previous week.

The San Francisco market is now buying considerable grass fat beef in California. Grass fat steers are bringing 7½c to 7¾c f. o. b. ranch, sales being reported from San Luis Obispo, San Joaquin, Tulare and other counties at these prices. Cows are bringing from 6c to 6½c f. o. b. ranch with most sales at 6¼c. Veal is still at 9½c to 10c at the ranch, and a shortage of both veal and cows is reported from the San Joaquin Valley.

The Los Angeles market is also materially increasing its purchases of grass fat cattle in California. Sales are reported at 7½c f. o. b. ranch in Imperial Valley and other southern points. Cows are reported sold to Los Angeles packers at 6c to 6¼c, and veal at 9½c to 10c at the ranch.

Northern buyers are already active and purchases in San Joaquin and adjacent counties have been made by them. Within the next week two trainloads of grass fat cattle will be shipped to Portland and Seattle. The fact that the supply of fed cattle from Nevada and Utah is exhausted and that Arizona will have no grass beef, together with the fact that northern buyers are now actually operating here is very encouraging.

Remember that orderly marketing is the only method of stabilizing our market and that this is the most critical time of year. Remember that half-fat cattle always bring a poor price, and always reduce the price paid for fat cattle. Therefore, sell only prime beef. Top your herd, and sell only those which are ready. Sell only f. o. b. ranch or shipping point.

The Tulare County branch of the C. C. A., held a barbecue a week ago Saturday, which was attended by more than 1,000 people. In the one day they secured 4 new members to the association. It is that sort of enthusiasm and work that helps to put the association on the map and enables the organization to be of greater service to its membership. Last week we asked you to help increase the membership. Let's go!—R. M. Hagen, Secretary.

DYNAMITING FROST

(Continued from Page 514.)

will surprise you as to the comparatively small cost of bombing."

This may not sound good to those who would sleep undisturbed, but as a matter of simple accomplishment any suggestion which will lead to the downfall of Jack Frost and do it fairly

economically will be received by the orchardists. One most hopeful feature of this matter is in the offers which Mr. Wilson is now receiving from the largest manufacturers in the world. They write expressing appreciation of the suggestion and offering cooperation on the part of their scientific departments. Besides that we think we may count on the cooperation of all the small boys who dote on a real racket.

KERN COUNTY COW TESTING ASSOCIATION

The Kern County cow testing association tested 883 cows during April. Average pounds milk per cow, 643.9; average pounds fat, 29.5. The three best cows for month were owned by: P. Cattani, Bakersfield, grade Guernsey, 1,413 pounds milk, 67.8 pounds fat. I. J. Lytle, Delano, grade Jersey, 810; 64.8. Peacock & Goode, Bakersfield, grade Holstein, 1,728; 63.9. The two highest herd averages were made by herds of A. V. Bennett,

Wasco, Jersey, 19 cows, 837.4 average pounds milk; 41.6 average pounds fat. C. P. Morgan, Shafter, Holstein, 11 cows, 1,153.2; 42.6.

MERGER OF PACIFIC COMPANIES

Announcement has been made of the merger of the Pacific Guano and Fertilizer Company and the Hawaiian Company of San Francisco. The new company will operate under the name of the Pacific Guano and Fertilizer Co. The names of the officers are: George N. Wilcox, president; E. D. Tenney, first vice-president; Norman Watkins, second vice-president and general manager; G. P. Wilcox, secretary; C. G. Owen, treasurer and Honolulu manager; W. J. Horstmann, California manager; P. L. McCreary, manager Los Angeles branch for Southern California. Directors are: George N. Wilcox, E. D. Tenney, J. Waterhouse, E. F. Bishop, E. Wodehouse, J. M. Dowsett, A. W. R. Bottomley, Norman Watkins, P. A. Drew, Wallace Alexander, Walter E. Buck, A. P. Welch.

These are the two largest fertilizer concerns on the Pacific Coast, and the deal represents the merging of several millions of dollars in capital and vast commercial activities. The California manager will be William J. Horstmann and the sales manager, Weller Noble. The manufacturing plant of the Hawaiian Fertilizer Company at Honolulu will hereafter be the chief mixing plant in the islands, while in California the plant of the Pacific Guano and Fertilizer Company at Berkeley will be used.

The main object of the merger as explained by officials of the company is to give service to the grower and obtain through service and scientific research and investigation, maximum results from the company's products. Wherever fertilizers are used only those shown to be necessary for the crop and soil are recommended.

P. L. McCreary, manager of the Los Angeles office, was connected with the reclamation service and geological survey for four years and for five years was with the University of California in the departments giving attention to soil and fertilizer control. Since 1914 he has been passing on his experience to field men, orchardists and others, giving valuable service to agriculture and horticulture in California in securing maximum results in the application of fertilizers.

With the combined facilities of the two companies the merged companies' annual output will be from 160,000 to 180,000 tons of fertilizers.

HARTSOOK COW BREAKS THIRD WORLD'S RECORD

Miss Aaggie Ormsby Segis, Fred Hartsook's remarkable young cow, who holds the world's record for milk at 2½ years of age with 22,072.6 pounds in 305 days, and another world's record as a senior three year old with 40,938 pounds butter in seven days, has just broken a second senior three year old world's record by making 157.11 pounds butter from 3008.5 pounds milk in 30 days. This is six pounds more butter than the former record holder had.

Field certification work, which is being done this spring in the Yuma valley by the Hairy Peruvian Alfalfa Seed Growers' Association of Yuma, Arizona, is practically completed. This is the first time the certifying of their alfalfa fields has been just at the right time of year. Their maps and notes covering the entire acreage of Hairy Peruvian alfalfa grown there will soon be complete and mean a great deal toward improvement of conditions in marketing genuine Hairy Peruvian seed.

"Keep pace with your day and generation. The man who does not avail himself of modern methods is right at the outset giving himself a handicap that scarcely the wit of Mark Twain, or the genius of an Edison or the ability of a Rockefeller can overcome."

INSTITUTE OF AGRICULTURE

H. E. Van Norman, president of the World's Dairy Congress Association, has been appointed commissioner of agriculture and delegate of the United States to the general assembly of the International Institute of Agriculture, which is to be held from May 8 to 18, at Rome, Italy.

Other delegates to the general assembly previously announced are Dr. Nat C. Murray, Dr. L. C. Gray, Dr. Perley Spaulding and Dr. H. H. Kimball, of the United States department of agriculture in Washington; E. A. Foley, agricultural commissioner for the department, at London; L. G. Michael, representative of the department at Budapest; Dr. W. H. Stevenson, permanent delegate to the institute at Rome; Dr. J. G. Lipman, director of the New Jersey agricultural experiment station; Mrs. Charlotte B. Ware, consultant in agriculture, Boston, and Francis B. Keene, United States consul general at Rome.

The World's Dairy Congress is expected to attract much attention in Europe, as it will be the first international dairy meeting to be held in the United States, and of broader scope than any similar meeting held anywhere. It was provided for by the federal agricultural act, approved March 3, 1921, which authorized the president of the United States to invite foreign governments to send representatives. The congress, which is to be held in 1923, will continue a week and will be followed immediately by the National Dairy Show. The city in which the congress and show will be held has not yet been selected.

TULARE BREEDERS TURN BIG HOLSTEIN DEAL

What is reported to be one of the largest cash sales of registered Holsteins ever made in private sale in Tulare County was made by F. S. Borrer & Son of Tipton of seven of their choicest bred heifers to P. M. Longan, owner of the Toteco Stock and Fruit Ranch of Tulare. These heifers are all from well bred yearly record sires and some of Borrer's best record and producing cows.

All seven are due to calve to the service of one of the greatest yearly record bulls of the breed, Sir Aaggie Mead, whose three nearest dams have yearly records averaging 1,229 pounds butter in one year. Six of his seven nearest dams have either made world records or produced world record daughters or both. Sir Aaggie Mead is owned jointly by W. J. Higdon of Tulare and F. S. Borrer & Son of Tipton.

The Toteco Stock Ranch is starting right by breeding all its females to this popularly bred bull. One of the heifers, Winnie Walker, has six nearest dams averaging 935 pounds butter in one year, and when she calves and is tested her calf will have 14 dams averaging over 100 pounds butter in one year. Borrer & Son retain this calf and rebreed the heifer to Sir Aaggie Mead. Two heifers are daughters of Sir Aaggie De Kol Acme 2d, whose three nearest dams average 1,191 pounds butter in one year. Two are daughters of Segis Pontiac Abbecker, a 35 pound bull for which R. C. Sturgeon paid \$3,200. Two are daughters of Prince Gelsche Walker Alcartra, the former herd sire of the Borrer herd, that carries the blood of two world record milk producers, Tilly Alcartra and Segis Pieterje Prospect, the present world's record milk producer of all breeds and ages. The heifers are to be given official records and started on yearly record work by Mark L. Borrer, and some creditable records are expected as they are a promising bunch.

Mr. Longan is developing one of the show places on the road between Visalia and Tulare. He has a \$25,000 building program under way at present which includes a modern dairy barn of the finest type. His ranch now is set to alfalfa and young vines and he expects to set 40 acres to prunes next year so that he will have a well balanced diversified farm with his Holstein herd as the central feature. With this type of foundation females bred to Sir Aaggie Mead, Mr. Longan is following the most popular breeding in the state and laying the foundation for one of the greatest producing herds in the country.

There is no severer test of a tire than constant use on the lava rock roads of the Hawaiian Islands where the average mileage for cord tires is between 2,500 and 3,500 miles.

This letter proves that Coast Tires have made good in Hawaii.

Coast Tire & Rubber Company,
Syndicate Building,
Oakland, Calif.

Gentlemen:

"Up to the morning of September 10th, a 34 x 4 1/2 Coast Cord had travelled exactly 7,319 miles, on the rear wheel of a Hudson Super-Six Rent Car, which travels daily between Lahaina and Wailuku on the Island of Maui, T. H., a distance of some 22 miles each way, over one of the roughest roads on the Island. (When we say "roughest" we mean that the tire had to travel over seven miles of mountainous road, which is nothing better than loose rock.)

One might say that this is an official test made under the auspices of the Royal Hawaiian Sales Co., Ltd., Territorial Agents for Coast Cords.

Very truly yours,

ROYAL HAWAIIAN SALES CO., LTD.

A FARM BUREAU MEETING WHERE NEARLY EVERY COUNTY IN THE STATE
IS REPRESENTED

There is a representative from nearly every county in California in the above group. The photos were taken at the time the Los Angeles County Bureau entertained the visiting delegates during the Annual Conference and trip through the state. A trip followed the meeting of county agricultural agents which was held in Berkeley. The agents were joined by officials or delegates of various county bureaus so that by the time the delegation reached the southern end of the state nearly half a hundred machines were in line and each machine was filled with loyal boosters.

The upper group shows the farm advisers gathered in Adohr alfalfa and endeavoring to look handsome while half a dozen cameras are trained on them. The lower left hand illustration shows the delegates and visitors sampling barbecue and Guernsey milk. The other illustration contains a group of cups in the milk house window. These cups are those offered by the Los Angeles County farm bureau to best performers in the County Cow Testing Association for the year ending June 30.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against
loss through dishonesty of any advertiser
in the Cultivator. We do not attempt,
however, to adjust trifling differences
between subscribers and honest, respon-
sible advertisers, nor will we pay the
debts of honest bankrupts. Notice of
complaint must be sent us within 30 days
from date of the transaction, and the
subscriber must have mentioned the Cul-
tivator when writing the advertiser.

If among the more than 40,000
Cultivator's weekly circula-
tion any fail to find any article they de-
sire to purchase advertised in the Cul-
tivator's columns, a special request is
extended you to let your wants be known
to the California Cultivator and we will
place you in touch with proper parties.

EDITORIALETTES

All work and no play might pos-
sibly make the farm adviser less keen
on the job. But fortunately the farm
adviser believes in mixing in a bit
of the play. Likewise other members
of the farm bureau join in the sport.
So they load themselves into the fliv-
vers and do the state or a portion
of it once every year. Nor is it a play
spell entirely for a bit of good grimy
work is mixed with the play, a school
of methods is conducted and the
school room is covered with the blue
sky and extends from Berkeley to
San Diego. Once on the trip, they
stopped long enough to be photo-
graphed and the Cultivator camera
gives a good idea as to how the bunch
look.

The new California Ripe Olive
Growers Association is organized.
Its president is H. T. Miller of Bak-
ersfield, and Mrs. U. Stewart of High-
land is secretary. Capitalization at a
million and a half is expected. Fur-
ther, it is expected that the grower
members will put up the capital. The
boosters who are more responsible
than any others for the building of the
new organization are T. V. McKelvy
and Wm. Glass. The organization
meeting was attended by representa-
tive growers of practically every olive
growing section in the state.

The airplane has been carrying in-
formation as to the Valencia Orange
Show which opens in Anaheim next
Tuesday. Everything is declared to be
ready for the exhibit. It will be en-
tirely in order to have the news of
the formal opening broadcasted and
all of us given opportunity of hearing
the opening program.

The cooperative mutual fire insur-
ance companies of California are send-
ing delegates to the annual convention
to be held in Turlock, Thursday and
Friday, May 25 and 26. These mutual
companies have had a wonderful
growth in this state and they are sav-
ing to farmers of the state many thou-
sands of dollars. The slogan for this
annual convention is "Help Prevent
Fire." This slogan thoroughly burned
into the minds of the delegates who
will attend the convention and carried
to the four corners of the state will
justify the existence of these mutual
companies to say nothing of the econ-
omies made possible.

The livestock outlook offers oppor-
tunity for optimism according to the
most hopeful articles which appear on
third page of this issue. United
States Senator Capper and some of
our best Californians are uniting in
giving to Cultivator readers a hopeful
view of this foundation industry.

STOCKYARDS

Friends of the stockyards move-
ment in the city of Los Angeles now
announce that stockyards and the full
complement of packing houses and by-
products plants are assured. Two hun-
dred and forty-seven acres of land
have been purchased from the La-
guna Land and Water Company. The
land and the improvements will cost
in excess of \$2,000,000.

MAY STILL GAMBLE

Senator Capper's bill, which
made effort to control gambling in fu-
tures in the grain and other ex-
changes, has been given a death blow
by the supreme court. In an opinion
written by Judge Taft it was ruled, in
effect, that this form of gambling has
nothing to do with interstate trade.
Hence its control does not come un-
der the direction of the United States
commerce.

Well, Senator Capper still lives and
he's a come-backer.

ALMOND GROWERS EXCHANGE

This is the closing week of the
almond growers fight to save their in-
dustry. We have no inside informa-
tion but we are going to make the pre-
diction that the growers win. Com-
mon sense and a cooperative spirit
must prevail, and it is unthinkable
that enough growers of almonds
should refuse to sign the contract with
the association to ruin their industry.
The association announced:

"As far as present plans are con-
cerned the almond growers' campaign
for signatures closes next (last) Wed-
nesday as that is the date set by the
directors for a meeting at which they
will total the tonnage under some
1700 contracts in hand. Whether they
will recommend liquidation depends
upon the total tonnage signed under
the contracts received up to that date.
It is the intention of the directors to
call a general meeting of growers as
soon as possible after Wednesday. At
their meeting Wednesday they will de-
cide whether to recall all their field
agents from the work of solicitation.
It is being pointed out to almond grow-
ers by impartial authorities that there
is nothing in the five years agreement
which the grower need fear. The lien
clause does not enable the exchange
or financing banks to place a mort-
gage upon the lands of the farmer,
but only guarantees the payment of
five cents per pound liquidated dam-
ages for each pound of almonds sold
outside of the exchange in violation
of the agreement."

NEXT WEEK

There will be more of interest-
ing material in the next issue. Much
of this will have to do with the live-
stock industry, and it will be worth
reading. Besides, in the fruit indus-
try there is much of discussion these
days as to growing sub-tropicals and

growing them successfully every year.
There have been occasional years like
the present when some orchards have
suffered because of unfortunate
weather conditions. Those who have
tried it say we can control these
weather conditions. One of those who
takes that view is Wm. R. Wood. He
is urging thorough investigation.
Meantime he has written an article on
"Frost Fighting" which will appear
next week. Avocado growers have
also been affected by the cold. They
have a greater number of problems to
study because of variation in resist-
ance of different varieties as well as
locality changes. Wm. Hertrich began
an investigation immediately after
January 19 and continued for weeks
traveling hundreds of miles to get the
lessons which the avocado had to give
after that cold snap. The lessons of
this trip were incorporated in a re-
port made at the convention. It will
also be largely quoted from next week.
Mr. Adams and members of the va-
rietal committee of the avocado grow-
ers have made extended investigations
as to best varieties of avocados and
these were reported at the annual
meeting just held at Pasadena. This
report will be liberally quoted on
next week.

THE AVOCADO GROWERS

A looker in at the Avocado
Growers convention could not help be-
ing impressed by the discussions car-
ried on by a most optimistic bunch of
growers. President Hardin said in his
opening address:

"The California Avocado Associa-
tion has now completed its seventh
year. During this time we have built
up an organization of 450 enthusiastic
members. The avocado industry in
Southern California has had a phenom-
enal growth since the organization
of this association. It is not my pur-
pose to enter into a discussion of what
our association has done in the past,
however, I will say that we have col-
lected valuable data concerning the
different varieties of avocados and
their adaptabilities to the climate of
Southern California. A large amount
of work has been devoted to the task
of selecting from a large list some of
the better varieties for propagation
here. In fact, we have successfully
performed the preliminary work which
is essential to the success of any new
horticultural industry."

Then he said much more having to
do with the necessity for "continually
meeting new and complex problems,"
"continuous and systematic research,"
"improvement of the chemical compo-
sition," "importance of increasing pro-
tein content of the avocado," "bud
selection," and other topics of interest
and great value. Mr. Hardin's address
will be quoted from liberally next
week.

JAPANESE MAY PURCHASE

The California supreme court
decision in effect that Japanese par-
ents may act as guardians of native
born children and purchase real estate
for them complicates the Japanese sit-
uation in California. It is now be-
lieved that until a new law can be
enacted there is no hindrance to any
Japanese with children making as ex-
tensive purchase of real estate as he
may be able to handle. The San Fran-
cisco Chronicle suggests:

"The situation in this state with
respect to ownership of land by Ja-
panese presents some interesting
phases. In the light of the oft re-
peated desire of Japan to maintain
cordial relations with this country it
is difficult for the layman to under-
stand the attitude of Japanese resi-
dents here and the similar attitude
of the Japanese government with re-
spect to this matter.

"Aside from the strictly legal aspect
of the situation one inclines to won-
der why the Japanese insist on own-
ing and controlling land in California
in the face of state wide opposition.
Even assuming them to be within their
legal rights, why do they persist in
seeking to gain a foothold where they
obviously are not wanted as land
owners? If the Japanese are sincere
in their desire to engender more
friendly feeling between themselves
and the people of this country they
are adopting a queer method of show-
ing that desire."

Governor Stephens is asking attor-
neys of the state to draft a new guar-

dianship clause which may conform to
the court's interpretation of constitu-
tional requirements. Certain it is
there will be additional enactments
at the next session of the state leg-
islature.

THE AVOCADO CONVENTION

By Ernest Branton

THE seventh annual meeting
of the California Avocado
Association was held on
May 12-13 at the hotel Vista
del Arroyo, Pasadena, be-
ginning at 1:30 p. m., on the 12th with
an experience meeting in which many
took part in brief discussions of
nearly every phase of avocado culture.

J. M. Elliott and other owners of
orchards on both hillsides and lower
levels were very emphatic in their as-
sertions that pronounced upper slopes
of hillsides are the only safe lands on
which to plant the hard shelled, or
Guatemalan varieties. As has been
stated in past issues of the Cultivator
this means elevation above immedi-
ately surrounding land, not necessarily
high altitudes above sea level. The
air drainage must be good. The ques-
tion of irrigation during blooming pe-
riod brought out the practice of those
present of irrigating at all times
needed, no harm resulting.

William Hertrich, superintendent of
H. E. Huntington's large estate, read
an exhaustive paper on "The Effect of
the Recent Cold Weather on the Dif-
ferent Varieties in Different Locali-
ties. (More another week.)

Friday evening, at 6:30 the annual
dinner was held in the south dining
room of the hotel, there being present
about 275 who enjoyed avocados
served in various ways from cocktail
to ice cream.

Following the dinner Wilson Pope-
noe (of California), agricultural ex-
plorer of the U. S. department of agri-
culture, delivered an address on
"Trails and Trials of an Agricultural
Explorer." The lecture was illustrated
throughout with a fine series of col-
ored lantern slides, many showing
avocado trees in gardens and native
haunts.

Saturday morning the program
started with President Hardin's ad-
dress, which will be given later.

The next was "A Comparison of the
Composition of Standard Varieties of
Avocados Grown in the Same Or-
chard," by C. G. Church, assistant
chemist, Laboratory of Fruit and Veg-
etable Chemistry, U. S. D. A., Los An-
geles. Mr. Church gave analyses of
seven of the Wilson Popenoe varie-
ties: Benik, Cabnal, Cantel, Lamat,
Mayapan, Nimlioh, and Pankay; also
further analyses of the list of "offi-
cial five"; of the Knight varieties and
of several others submitted to the
laboratory. E. M. Chace, chemist in
charge of this government laboratory,
followed with a lucid explanation of
what an enzyme is and what are the
principal enzymes of the avocado.
Prof. M. E. Jaffa of the University of
California gave a talk on nutritional
studies of some new varieties of avo-
cados. He also gave analyses of three
comparatively new citrus hybrids:
tangelo, orange-lemon, and citrange.
He praised the tangelo very highly
and said it should be extensively
grown. It occupies a place midway
between the orange and the pomelo,
having more "snap" than the orange
and less of bitterness than the pomelo.
Knowles A. Ryerson, of the Los An-
geles County farm advisor's staff gave
an outline of possible fertilizer tests
for avocados and expressed the desire
of the office to cooperate with grow-
ers in such tests.

The business meeting occupied Sat-
urday afternoon, President Hardin
announcing his retirement from the
presidency and the directorate but the
maintenance of his membership and
active interest. Three directors were
elected: E. W. Camp, Sierra Madre
(re-elected after short term by ap-
pointment to fill vacancy); T. J. Wal-
ker, San Fernando; C. E. Utt, Tustin.
A resolution was unanimously adopted
requesting the directors to apply for
state or federal aid, or both, in secur-
ing the hybridization and selection of
new varieties as the result of crossing
the Mexican and Guatemalan types to
secure good hardy varieties for wide
planting in California.

The report of the varietal commit-
tee will be liberally quoted from next
week.

The Outlook for the Livestock Industry

What of livestock for the next few years? At the present moment it is looking up and vastly more promising than it was 12 months ago. We recently sent to representative men of the country request for their estimate of the hopefulness of the outlook for the livestock industry. We wrote to Senator Capper, who is perhaps the most able of any of us to take a wide angled view of the entire industry. Others with large vision of livestock affairs on the Pacific Coast were asked to give of their estimates. These are quoted below. We believe these letters contain an invaluable fund of information for livestock men.

By Hon. Arthur Capper, U. S. Senate

NEVER has the outlook for the livestock industry been more favorable than at present. The trend of most products since the beginning of the year has been upward, and that has been especially true of livestock. This has increased the farmers' purchasing power and is exerting a dominant influence in the return of business to normal conditions.

Hog prices are on a sound basis and probably will continue so for some time yet. In fact feeding hogs at the present time is even more profitable than during the war when prices were high. During war times 100 pounds of pork on the "13 to 1" ratio was expected to bring as much on the market as 13 bushels of corn so that when corn was selling for \$2 a bushel pork was supposed to be worth \$26 a hundred pounds. With corn at 40 to 50 cents a bushel, under the 13 to 1 ratio pork should be worth from \$5.50 to \$6.50 a hundred pounds, but the present price is around \$10 or from \$3.50 to \$4.50 more than would have been possible under the 13 to 1 ratio. This means that corn marketed through

hogs at the present time brings the farmer a return of 77 cents a bushel. There is also an added profit in the manure which goes back to the soil and is not shipped away as when the corn is hauled off to a distant market and sold. When hogs are running with cattle the return on the corn will be increased so that a still greater price can be obtained for the feed.

However, we must not lose sight of the fact that the summer hog market may be a somewhat erratic affair. Some market authorities think that there will be larger numbers of fall pigs coming on the market in May and June than was the case a year ago. Again there will be larger numbers of brood sows coming on the market in the late summer than usual because more sows were bred last winter than usual. There will also be the tendency of the market to weaken in expectation of large numbers of spring pigs coming on the market next fall and winter. However, as an offset and a counterbalance to this will be the enormous losses sustained in the present spring pig crop, and the strong demand from the East due to the acute and unusual shortage of hogs in the Eastern states. Nevertheless if packers, farmers, and the United States department of agriculture will cooperate in broadening the outlet for pork both at home and abroad all danger of any serious break in prices next fall may be averted.

A high sheep market it seems to me may be expected all summer on account of the meager supplies now available. There is a general shortage of sheep throughout the country, but it is most acute in the states east of the Mississippi River. Much, how-

ever, will depend on the nature of the permanent tariff which congress will finally pass. If this tariff is made high enough to make it necessary for us to produce at least three-fourths of the wool we consume instead of only one-half as we have done in the past it may be possible that sheep will bring even higher prices than they did in 1899 and 1906. The Capper-French Truth-in-Fabric bill if passed by congress also will help to stabilize the sheep market by creating a bigger demand for wool. However, until the sheep industry is properly safeguarded by national legislation I would not advise farmers who have had but little practical experience with sheep to make any heavy investments in the sheep industry. Later when permanent protection has been provided for our sheep raisers against the cheap wool and mutton of Australia and Argentina sheep will prove highly profitable and satisfactory. Such protection I think may confidently be expected at an early date.

The outlook for the cattle industry is much better now than it has been for some time past. The trend in the market has been upward although there have been occasional recessions. Cattle, however, should sell at still higher levels for we are seriously threatened with a shortage of beef producing animals that would have become acute before now had not the business depression last fall and through the early part of the winter caused an increase in marketing at the same time that it curtailed the demand of the consumers. According to government reports there are now in this country about 380 beef cattle for every 1,000 persons as compared with

410 beef cattle per thousand persons two years ago and 600 beef cattle per thousand persons for the period extending from 1901 to 1907. There has been a gradual shrinkage in the per capita consumption of meat and its products ranging through the last 20 years, and this has a very important bearing upon the present economic position of the producer of livestock and agriculture in general. While the population of the United States has been increasing at a rapid rate the total production of meat has remained almost unchanged. The production of meat in 1907 amounted to 16,003,000,000 pounds while in 1921 it was 16,160,000,000 pounds. From this it will be seen that the production of meat from all meat animals in 1921 only showed an increase of 157 million pounds over that of 1907. With the demand ever increasing and the supply remaining almost stationary it is evident that there ought to be no permanent recession in prices for most meat animals and this is especially true of beef animals.

Recent statistics published by the United States department of agriculture show that beef cattle have been decreasing steadily on the farms of the 27 principal cattle states of the nation. On January 1, 1922 there were on farms in these 27 states 35,250,000 head of beef cattle out of 41,993,000, the total number on all the farms of the nation on the same date. On January 1, 1921 the number of beef cattle on farms in the 27 principal beef producing states was 36,188,000 as compared with 36,966,000 on January 1, 1920. The heaviest producers of the beef cattle states are, Texas, Iowa, (Continued on Page 554.)

Greater Economy in Irrigation

AS trees, having low hanging branches, get older irrigation is complicated. We tried overhead irrigation, sub-irrigation, furrows and basins. The furrow and basin irrigation have been aided by appliances for following the furrower and closing the furrows so as to throw the water between trees and into sections which are not reached by straight furrows. This latter method calls for cross furrows and necessitates sometimes three or four operations to get ready for irrigation. This labor has been somewhat reduced where trees are far enough apart by making a figure

eight about every two trees, but this calls for so much shoveling that it is still an expensive procedure. To overcome this expensive and more or less inefficient work Bingham T. Wilson of Covina has been experimenting during the past few years with an extension furrowing machine. The two photographs on this page give a better idea of its method of operation than is possible by any description. The photograph showing the furrows most plainly gives an idea at first that the tractor was performing some exceptionally eccentric or crooked stunt across the field. Such was not the case, however, for it was making a

bee line and parallel with the row of trees. It is obvious that for young trees these furrows might have better been laid with a straight furrower, but this ground has been chosen to give a better idea of the operation of the machine.

Therefore imagine the trees to be of bearing age with need for water on all four sides. The furrower is passing along the row with the shovel or traveling plow toward the row as close to each tree as is perfectly safe. At the proper moment a cord pulled by the operator, who is also the tractor driver, releases the trip or operating mechanism and the shovel nearest the tree not only goes forward but moves laterally and carries the furrow some two or three feet as desired between the two large trees, thus bringing it within seepage distance of the furrow which has been laid on

the opposite side. The implement does an acre every 20 minutes and puts the furrow down the dry middle, or on every side of the tree, making all parts of the orchard irrigated exactly alike with furrows within three feet of the body of the tree. This machine did over 1100 acres during the season of 1921 and was given a year's try-out before put on the market. The best of it is the job is completed when the machine makes the round of the rows, no cross furrowing or shoveling whatever being required.

The first patent for this machine was issued some two years ago but has had a thorough testing in various orchards of California. It is manufactured entirely of steel and in California. It can be operated by any tractor or can be used with teams if preferred. It has been declared to be practically indestructible.

A Closeup Showing Details

Near the center is gear case with cord attached to trip which makes possible the side motion. Right hand plow has nearly completed side thrust.

How It Works Around the Trees

The Wilson furrower and how the lateral as well as forward motion of the right hand plow or shovel makes impossible "dry centers."

Buyers for 1922 dried apricots are already making offers, say growers of Arbuckle, Colusa County.

Horticultural Commissioner Harney of Yuba County has resigned, resignation to take effect June 1.

California produced last year 2,170,800 bags of beans. Sutter County produced 110,160 bags; Yolo, 96,600.

A farm home department meeting will be held at Arcade, Sacramento County, May 23 on garment making.

Farm bureau meetings in Sacramento County: District 1,000, May 25; Franklin, 26; directors, Sacramento, 27.

Modoc County sheep shearing is late this year because of continued cold. Many contracts are reported at 28 and 30 cents.

The Tri-county Wool Growers Association of Colusa, Yolo and Solano Counties is conducting a drive for increased membership.

Sutter County peach growers are organizing to bring in sufficient labor to thin their fruit. Work must be done within the next month.

Central California

The Lindsay farm bureau is considering building a cold storage plant.

Monterey County beekeepers report poor honey harvest because of cold season.

The Clovis Boosters' Club will provide quarters for Indian grape pickers this fall.

A road bond issue of \$1,250,000 is proposed by the Stanislaus County board of trade.

A special train of 50 cars of sheep left Coalinga, April 29. Ten days is the time to Chicago.

Claus orchardists say that in spite of late frosts their apricot crops will be the heaviest in years.

Road control on the Doyle and Camp Nelson roads will be established by Tulare County supervisors.

Orange Cove is sending out three carloads of Valencias a day. Tests show frost damage about two per cent.

Farmers of the Central district in Stanislaus County say they will have to pull off a rabbit drive soon if they are to save their crops.

Entries may be made in the Fresno County dried peach contest until the end of May. Information may be secured from farm bureau.

Considerable damage is being done to young cantaloupe vines in northern Kern and southern Tulare Counties by the striped melon bug.

Experimental plantings of cotton will be made at the station of the United States department of agriculture at Shafter, Kern County.

Hearing on petition to create the West San Joaquin district is set for May 26 at Los Banos; Kern County project, June 3 at Bakersfield.

State Labor Commissioner Mathewson announces that the bureau filled 14,889 positions in April. There is talk of establishing bureaus at Bakersfield and Modesto.

The Di Giorgio Farm Company is said to be prepared to spend \$4,000,000 in the Weed Patch district of Kern County. 27,000 acres have already been planted to vineyards and orchards. A packing house is being built at Magunden Station to handle this year's Emperors.

Southern California

Valencia Orange Show, Anaheim, May 23-30.

A sale of 6,134 bales of cotton has just been made by A. M. Shenk of Calexico at 18.32 cents.

A skimming station will be established at San Jacinto by the Milk Producers of Southern California.

The Riverside district has cleaned up the Navel crop. Season's shipments total nearly 2,500 cars.

The Orange County Beekeepers' Club has resolved itself into a unit of the Orange County farm bureau.

Valley Center, San Diego County, expects to get water for irrigation from the proposed Warner's dam.

Water and power act meetings in Los Angeles County at Del Sur, May 24; Littlerock, 25; Tierra Bonita, 26.

The Independent Fruit Growers is a new organization of Yucaipa Valley apple men formed to handle this year's fruit.

Suggestions are offered for joining Coachella Valley to Imperial County because of geographical unity and similarity of interests.

Last year apricots were shipped from Imperial Valley as early as April 26. This season fruit will probably not ripen for a month later.

Horticultural Commissioner Waite of Imperial County reports receipt by planters this spring of 9,499,200 grape cuttings, 355,674 rooted grape vines.

Ventura chamber of commerce is improving the motor park at Seaside Park, installing gas plates and other conveniences for camping motorists.

Los Angeles County farm bureau meetings: Lankershim, June 1; Whittier and San Fernando, 2; Downey and Glendora, 5; Alhambra, 6; Zelzah, 7.

La Puente Valley Walnut Association has joined the walnut department of the Los Angeles County farm bureau, giving that department a membership of 500.

Opening of the paved highway from Los Angeles to Mojave will be celebrated on May 21 at Mojave by barbecue planned by the Antelope Valley, Inyo and Kern Counties Highway Association.

The Coast and General

Grazing permit for 100 buffalo has been granted in Rainier national forest.

Sugar factories at Burley, Twin Falls and Paul, Idaho, will be operated this year.

First watermelons from Mexico brought 12 cents a pound in Los Angeles markets.

Sheep shearers in Yakima Valley of Washington struck for 12½ cents. They were being paid ten.

The Colorado is running bank full at Yuma. The Pescadero cut is taking care of the present flow easily.

Livestock in eastern Oregon has come through the winter in good condition. Feed is short in some sections.

Fruit growers of Spokane County, Washington, are buying cover crop seed and fertilizers through the farm bureau.

Experimental work on cover crops is being carried on by Washington state college in many Yakima orchards.

A sale of 40,000 fleeces has just been made by a Yakima, Washington, sheep grower to a Boston firm for 27½ cents a pound.

The great Northwest apple advertising campaign will be undertaken on basis of ½ cent per box from growers of Washington, Oregon and Idaho.

The Oregon Growers Cooperative Association transacted a business of \$2,000,000 last year. The association handles fresh and dried fruits and berries.

About 250,000 sheep are expected to cross the Prescott forest of Arizona on their way north to summer pasture. The first shipment of lambs begins in July.

Oregon fruit growers are asking the public docks commission to equip municipal terminals at Portland with refrigerating capacity of 5,000 tons capable of being expanded to 30,000 tons.

The Columbia Basin Irrigation League was organized recently at Spokane, Washington by representatives from Oregon, Washington and Idaho. Headquarters will be at Spokane.

Do You Irrigate?

The "Siphon System" saves water, saves money. The water goes over the ditch bank. Eliminates the need of gates or other obstructions.

Irrigating Siphons

Protected by U. S. Patents are light, strong, durable. Easily primed. Easily moved. Shipped ready for use. No cost of installation.

A simple, practical, economical invention. New descriptive book of information and prices on request. Read what old customers say. When writing give full address and location for our field man.

Practical Results with Heaters in Relation to Prosperity

By C. A. Griffith Before Covina Frost Fighting Convention

IT seems to me that in considering the prevention of frost we must look at it from several different angles. Your chairman, Mr. Crawford, has just reminded you of the grower who has lost only two crops in the last 40 years. Perhaps prior to the year 1913 it was a good deal easier to ship frosted fruit from California than it is now, and I imagine in the old days many hundreds of cars were shipped from California that would not pass muster now. In those days we had a shorter crop, and it was not necessary to make such an extensive campaign of selling throughout the East. But now, the man who buys a dozen frosted oranges is not coming back for a second lot until he forgets about the first dozen.

So let us go back, say ten years, and see whether or not we have a real reason for the protection of our orchards. Ten years ago the Navel crop of 1912 was quite seriously affected by a frost, sporadic in its nature, it is true, but it touched many growers. In 1913 we had a heavy frost, a major frost, which seriously affected this district.

In the year 1914 there was also quite a loss; then in 1922 we had a frost equal in severity to that of 1913, but more far reaching. Our trees in 1913 were in better condition to stand low temperatures than they were this year. This year the frost came in a hurry, without warning, while the sap was running freely in the trees and the trees were in proper condition to be affected seriously by cold weather. In 1913, if you remember, before the frost we had several days of cold weather which prepared the trees for the frost that they had later. So it seems quite obvious to me that if we have in ten years' time, four freezes, there is a real reason for intensive study of orchard heating and I think that if a man expects to invest real money in a grove he is not a good business man in every sense of the word unless he goes farther and in some way does his part to protect the fruit he expects to raise.

If we could think of oranges in terms of money we might look at it differently. You may have \$10,000 worth of fruit on your trees and you go to bed trusting to the Lord to keep the frost away, while, if you had \$10,000 in gold lying out in your orchard most of you would have 20 or 30 men with sawed off shotguns watching that \$10,000 to see that no one came and carried it away. We do not realize that oranges are the same as money. So it seems to me that if we expect to stay in to advantage we must protect ourselves against the weather.

If you will pardon a reference to the properties that are under my di-

rection—because I happen to know more about them and the results of our own methods of protection—I want to say a few words about this. I do not want to say anything about the value of one smudge pot over another. That is a matter outside of the question in hand, but I do want to speak to you on behalf of community prosperity and the relation of the smudgepot to that prosperity.

After the season of 1913 our company equipped the groves with an improved type of heater, with a capacity of seven gallons, and we were in good shape to stand most of the freezes. While taking the best care possible of these heaters, however, there has been a considerable amount of depreciation. We cleaned them and painted them each year and watched over them carefully, and yet our equipment is a good deal smaller today. At that time we had 50 or 60 pots to the acre, but this year we were confronted with the problem of spreading our equipment out as thin as we dared, as we failed to put more money into smudge equipment last fall. You can see then that every heater had to be burned to its full capacity if we expected to save our crop during this last heavy frost.

The value of orchard heating is in heating in a large block. The land lying west of Grand Avenue and including our property is nearly all heated, so we have a solid block of 1000 acres, each acre helping the other, and we were greatly helped by all the smudging on our east. We were rather fortunate in realizing that we lived in a cold section, and that we had to fight the frost. But to return to the large block—that is one of the important facts to consider. An isolated ten acres has a hard fight for it has a large expanse of unheated territory proving a menace to its crop. We had a small equipment but a large surface to cover. We have on our property 30 rows in one of our forties that were inter-set three years ago with small trees. The large trees had not been removed but we wanted to replace them. We could not place pots under these trees and we estimated that the crop hanging on the Navels amounted to 3000 field boxes. We were enabled to take out of that 3000, 350 packing boxes of merchantable fruit. The influence of the heat in adjoining groves kept the trees in good shape, but we lost the fruit.

I bring this before you for this reason: It has been said to me a number of times in the past three weeks that we evidently did not have any cold weather because we could not have

saved our fruit or have our trees look like they do if we had experienced the cold that other districts suffered to the north and south of us.

To give you another instance: It is very hard to get comparative temperatures inside the firing zone and outside, but with a thermometer outside of our pots that showed a temperature of 17 degrees you can see that if we had warmth in some parts we certainly had some cold weather down where we were smudging. A man to be successful in orchard heating must work with intelligence, with diligence, perseverance and downright earnestness. He must be willing to sit up nights and watch his property and work hard and long during those night hours on his proposition or he is doomed.

With the present style of pot one of the greatest drawbacks and the hardest work is refilling on the second day. We had one tank wagon to every 960 pots, which is entirely too much to expect of any outfit. We ran our equipment practically all the 24 hours of the day. The night work was easiest—the lighting. We must look forward to a more efficient pot and general improvement in orchard heating. We must go into it very thoroughly, especially, it seems to me, as to the quality of oil we are burning, no matter what pot we are using, because we are satisfied that through experiments we can improve not only the efficiency, but also get rid of a great deal of soot that injures the trees, the gardens, the homes, and also the merchandise in the dry goods and other stores of the community. I think we have years of intensive study and experiment before us. But the time has come when our orchards must have more improved devices for taking care of cold weather.

Perhaps you will be interested in a few figures that I have gotten together as to the result and effects of frost damage:

Many districts on account of high prices will return as much money as in some other better years, but that money is not distributed evenly; it is confined to a few people, therefore it does not contribute to community prosperity. Unless we can get enough to pay us a reasonable return on our investment, we are not getting the prosperity the community deserves and needs to maintain its position. Therefore, even if we return more dollars this year for Navels it is not spelling community prosperity. During the last four years we have compiled figures very carefully, showing that into the trade channels of Covina has

been poured annually \$3,800,000, an enormous sum. That is the money that comes through the Covina Fruit Exchange, the portion of the San Dimas Fruit Exchange that drifts into the business channels of Covina, part of the A. C. G. that comes through here, and an estimate of the other channels. In all, \$3,800,000 coming into the trade channels of Covina. In making a very careful estimate on the value of the recovery this year as represented by packing house figures we get \$600,000 as the total return of the fruit coming to Covina, or a net loss of \$3,200,000, an astounding sum for a community like Covina to have to lose!

We must consider the far reaching effects. Not only has the fruit been lost and the crop perhaps injured for the next year, but the heart of the tree may be injured in many cases, especially in the case of lemons, and so we have not only lost the money that should have been returned for the fruit, but the care of the orchard for the coming year, and instead of having your money come back from the East to help you in caring for your orchard, you have got to dig down in your jeans for that money or borrow the necessary funds to carry on the care of your grove; so you have lost money for your crop and lost the amount necessary to care for the grove. Therefore it seems to me that when we speak of community prosperity, we are on the right track, for it is very evident that we must have a general prosperity. If we expect to stay in the orange and lemon business we must do our part and show a willingness to investigate every means at our disposal and go to the very limit as far as money, efforts, nervous energy and enthusiasm are concerned, or lose our crops and forget the orange business.

In leaving this question I would say this: that there is a very definite reason for the smudging of our oranges or the heating of our orchards; but we must first make up our minds to do the job thoroughly and not, like many this year, make a half hearted attempt to heat the groves and suffer loss of our crops.

The Covina chamber of commerce should be complimented for its concerted action in calling this convention, looking forward to improvement in the heating smudge pot or other heating device. I hope this convention will develop into great good to California, and that the California Fruit Growers Exchange, or some other organization, will continue in a very definite way to look into the development of better heating devices and the better development of an oil that will not subject our orchards and groves to the soot and smoke that they hitherto had to endure.

Quarantine Conventions

ATENTION of all interested is again called to the specific dates of the five important conferences to be held in the California state capitol building, May 29-June 2. Convention of California County Horticultural Commissioners, May 29-30. County Horticultural Commissioners and Nurserymen, June 1. Federal Horticultural Board, May 31. Fourth Annual Conference Western Plant Quarantine Board, June 1-2. Western Directors of Departments of Agriculture, May 29-30. All of the various state and federal officials interested have accepted and 100 per cent attendance is expected.

The Program

MONDAY, MAY 29

Conference of County Horticultural Commissioners (Senate chamber state capitol)—11:00 A. M. Legislative committee report. Appointment of committee. 1:15. G. H. Hecke, introducing L. O. Howard, chief, U. S. bureau of entomology, and Dr. C. L. Marlatt, chairman, federal horticultural board. 2:00. Nematode problem by Dr. W. A. Orton, federal horticultural board. Dis-

cussion, D. G. Milbrath, state department of agriculture. 3:30. Discussion on plant diseases by H. P. Barss, pathologist, Oregon agricultural college. 7:30. Discussion of quarantine problems by Lee Strong, chief, bureau of plant quarantine.

Western Directors and Commissioners of Agriculture (Room 118 state capitol)—2:00 P. M. G. H. Hecke, opening address. 2:30. Organization of conference, election of officers, appointment of committees. 3:30. Agricultural relations between bureau of markets and state departments of agriculture by Lloyd S. Tenny, assistant chief, bureau of markets. 4:30. Agricultural relations between state and federal government by Miles Cannon, commissioner of agriculture, Idaho department of agriculture.

TUESDAY, MAY 30

Conference of County Horticultural Commissioners (Cont.)—9:00 A. M. Report and discussion of committees. Phylloxera report and discussion of committee on nematode problems by Harry S. Smith, chief bureau of pest control. 10:30. Report on vacuum fumigation in Ventura County by A. H.

Call, county horticultural commissioner, Ventura County. 1:15. Discussion of standardization problems by F. W. Read, chief, bureau of standardization. 2:30. Discussion of dust insecticides by Geo. P. Gray, chief, division of chemistry. 3:30. Discussion of rodent and weed control problems by W. C. Jacobsen, in charge, rodent control.

Western Directors and Commissioners of Agriculture (Cont.)—10:00 A. M. Reports of committees on organization, agricultural policies of West, grading, standardization and shipping point inspection, relations between state departments of agriculture and agricultural colleges. 2:00. P. M. Discussion of committee reports, resolutions.

WEDNESDAY, MAY 31

Federal Horticultural Board—Public Quarantine Conference (Assembly Chamber).—Attended by federal horticultural board, directors of western departments of agriculture, plant quarantine officers and entomologists of Western states, Canada, Hawaii and Mexico, county horticultural commissioners of California, and fruit grow-

ers and farmers of the West. 10:00 A. M. Address of Welcome by Gov. Stephens. Response by Dr. C. L. Marlatt, chairman, federal horticultural board. 11:00. Outline of plant quarantine work in California with particular reference to the Mediterranean Fruit Fly by G. H. Hecke, director of agriculture of California. 11:30. Port inspection and the needs of California in plant quarantine work by Lee A. Strong, chief, bureau of plant quarantine. Mediterranean fruit fly, alfalfa weevil, citrus canker, white pine blister rust, Japanese beetle, European corn borer and Mexican bean beetle. 4:30. Importation of fruit stocks under Federal Quarantine No. 37 by Dr. C. L. Marlatt.

THURSDAY, JUNE 1

Fourth Annual Conference Western Plant Quarantine Board (Senate Chamber).—10:00 A. M. Address of Welcome by G. H. Hecke. Response and annual address by Chas. A. Park, chairman, Western Plant Quarantine Board. 11:15. Quarantine problems by C. L. Marlatt, chairman, federal horticultural board. 1:30. Report of quarantine conditions in Arizona by Don C. Mete, state entomologist.

alfalfa meal, cleaning and sterilization
of railway cars, registration of out-of-
state nurserymen, certificates of in-
spection, white pine blister rust.

SATURDAY, JUNE 3

10:00 A. M. Public conference cot-
ton quarantine. G. H. Hecke, presid-
ing. (State Department of Agriculture,
11th and K Streets.)

FERTILIZER CONFERENCE

An invitation is extended to regis-
tered fertilizer manufacturers and
dealers of California to attend a con-
ference at the state capitol, Sacra-
mento, Monday, May 29 at 1:30 P. M.
This conference is called for discus-
sion of matters of general interest to
the fertilizer industry and an exchange
of ideas on how the state fertilizer
law may most effectively serve the
interest of both buyer and seller. No
formal program has been arranged but
the state department of agriculture de-
sires to bring up for discussion care-
less labeling, maintenance of guaran-
tees, potash guarantees, and delivery
of fertilizer without tags pending
analysis.

VALUE OF LAST SEASON'S CROP

Total value fruit and fruit products
on farms in 1921 was \$525,000,000, ac-
cording to estimates made by the
United States department of agricul-
ture. This is a drop from \$744,000,000
in 1920 and from \$755,000,000 in 1919.
The decline in 1921 is attributed to
reduced production as a result of kill-
ing frosts early in the season and to
lower prices of apples, peaches and
other orchard fruits. Cheaper raisins
was also an important factor.

Production of apples in 1921 was
only 96,881,000 bushels as compared
with 223,677,000 bushels in 1920.
Peaches dropped from 45,620,000 bush-
els in 1920 to 32,733,000 bushels in
1921. Pears dropped from 16,805,000
bushels to 10,705,000 bushels. There
was a slight increase in production of
oranges at 30,700,000 boxes.

Values of Orchard Fruits

The estimated values of grapes and
grape products on farms for the three
years, 1919, 1920 and 1921, were \$102,-
500,000, \$105,000,000 and \$68,500,000;
orchard fruits \$463,000,000, \$442,000,-
000 and \$271,000,000; small fruits, \$63,-

000,000, \$69,000,000 and \$74,500,000;
and subtropical fruits, \$84,000,000, \$89,-
000,000 and \$87,000,000, respectively.

The fruit products of farms, for
which estimates are made, are grape
juice, raisins, apple cider, apple cider
vinegar, and dried fruits. Their total
value fell from \$100,000,000 in 1919 to
\$66,000,000 in 1921.

Orchard fruits dominate the other
classes of fruits in value. These are
chiefly apples, apricots, peaches, pears,
plums and prunes. The estimated value
of this class of fruits and products in
1921 was \$271,000,000, or 52 per cent
of the value of all fruits and fruit prod-
ucts. The subtropical fruits, chiefly
oranges, follow in order of value with
\$87,000,000, or 17 per cent of the fruit
total; next are the small fruits, mostly
strawberries and cranberries, the es-
timated value of which for 1921 is \$74,-
500,000, or 14 per cent of the fruit
total; and grapes and grape products
estimated at \$68,500,000, or 13 per cent
of the fruit total.

Apple Leads Other Fruits

"The king of fruits," as the apple has
been called, is by far the leading single
fruit in value. The fresh apple crop
of 1921, a poor year for apples and
some others of the orchard fruits, had
an estimated value of \$163,000,000. Be-
low this value is \$64,000,000 for or-
anges, and in declining order are
peaches valued at \$52,000,000, straw-
berries \$41,000,000, grapes, excluding
grapes used for juice and raisins, \$29,-
500,000, plums and prunes \$20,000,000,
pears \$18,000,000, cranberries \$6,400,-
000, apricots \$5,400,000, figs \$1,400,000,
and, at the foot of the list of individual
fruits for which estimates of value are
made, are olives valued at \$800,000.

CALIFORNIA CROP REPORT—MAY 1, 1922

IN the report issued by the
California Cooperative Crop
Reporting Service relating
to crop and livestock con-
ditions as of May 1, E. E.
Kaufman, Agricultural Statistician,
will make the following comments:

Weather Conditions

Temperatures during April were
slightly below normal and the month
was generally considered an unfavor-
able one from the standpoint of the
fruit men. Frosts occurred in differ-
ent sections of the state on the 9th
and 10th of the month and again on
the 16th and 17th; damage, however,
was rather spotted and not very ser-
ious. Rainfall was very light, there
being practically none the latter part
of the month. The comparatively cool
weather has favored the grain crop,
allowing heads to fill fairly well al-
though moisture was lacking.

Good rains occurred in practically
all parts of the state on May 7 and 8
and will be of some benefit to grain
crops.

Winter Wheat

The area planted to wheat for the
1922 crop was estimated at about 759,-
000 acres. As of May 1, it is estimated

Dusting Sulphur

For mildew on grapes, use ORTHO
DUSTING SULPHUR. Does not ball
or clog. Our improved ventilating
process insures finest dust sulphur
on the market.

Wipe Out Every Rat and Gopher

Amazing New Discovery Quickly Kills Them All. Not a Poison.

Rats, Mice, Gophers — in fact, all Rodents can now be wiped out easily and quickly. Imperial Virus will do it. This new discovery is a fluid, true Virus. Entirely harmless to humans, poultry, stock, pets, etc.

Infects Rodents only. Greedily eaten on bait. Sets up burning fever. The pests communicate it to others, and all die outside, hunting air and water. Imperial Virus is put up in sealed bottles, thus insuring full strength and potency. Only safe, sanitary method to overcome these pests. Protect your Poultry, especially Baby Chicks and Egg Hatches.

YOU CAN GET YOURS FREE

Here's how! Send \$1.00 today (currency, M. O. checks, etc.) and we will give you by return mail, postpaid, two regular, full sized (double strength) \$1.00 bottles of Imperial Virus. Use one to rid your place of these pests, and sell the other to a neighbor, thus getting yours free. Special inducements to represent us.

If more convenient, send no money, just your name and address to Imperial Laboratories, Dept. 435, 2110 Grand Ave., Kansas City, Mo. Pay postman \$1.00 and few cents' postage when two bottles arrive. Guaranteed to do the work to your entire satisfaction within 30 days or your \$1.00 will be cheerfully refunded.

harvested was about 90 per cent of a normal as compared with 80 one year ago and a ten year average of 82. On the assumption that at least average conditions will prevail until harvest, a total production of 12,960,000 bushels is forecasted for the crop of 1922. The final estimate of last year's crop was a production of 8,355,000 bushels from a harvested area of 557,000 acres.

For the United States the condition of winter wheat is about 83.5 per cent of normal, indicating a crop of 584,793,000 bushels from a harvested area of 38,131,000 acres. The production in 1921 (December estimate) was 587,032,000 bushels grown on 42,702,000 acres. Hay

As of May 1, the estimated acreage of tame hay is 1 per cent less than in 1921 with no change in the acreage of wild hay. This would give us an area of tame hay to be harvested of about 2,108,000 acres and of wild hay 167,000 acres. The condition of all hay was estimated to be 86 per cent of a normal as compared with 84 last year and a ten year average of 85.

For the United States the condition of all hay was 90.1 per cent of a normal indicating a crop of about 103,579,000 tons.

Pasture

For the state as a whole the condition of pasture was 82 per cent of a normal as compared with 87 last year and a ten year average of 86.

The past winter was rather unfavorable to the stockman. Early rains gave pasture a good start but extremely cold weather for California the latter part of January and all of February held back the growth of grass and much feeding was necessary in practically all parts of the state. The snowfall in the mountains was very heavy, extending well down into the foothills and contributed to a greater loss than usual among cattle and sheep from exposure. Market conditions have improved considerably since the first of the year and with a lower price for hay and lower cost of handling, conditions the past year have somewhat improved from the stockman's standpoint.

There was but little difference in the losses per thousand from disease than in previous years, but on account of harder winter conditions the losses from exposure were slightly greater. Of horses and mules, 15 per thousand died from disease or about 6,420 for the state. Of cattle, 20 per thousand died from disease and 34 per thousand from exposure, making the total loss about 108,650 compared to 58,000 for the previous year. Of sheep, 22 per thousand died from disease and 37 per thousand from exposure, making the total loss about 144,550 compared to 115,000 for the previous year. The loss of lambs from disease and exposure the past year was estimated at 90 per thousand, compared with 57 per thousand for the previous year. Swine losses were about 43 per thousand as compared with 30 per thousand for the previous year.

Honeybees

The number of working colonies on May 1 this year as compared with same date last year is estimated at 93 per cent.

The winter loss of colonies this year is 9 per cent compared with 7 last year and a five year average of 9.

The condition of honey plants is estimated to be 95 per cent of normal as compared with 75 last year and a six year average of 93. The conditions of colonies this year compared with normal health and strength is 88 per cent as compared with 93 last year and a six year average of 93.

IMPORTANT CONVENTIONS

A series of important conventions having to do with agriculture has been arranged by Director G. H. Hecke as follows:

Convention of California county horticultural commissioners, May 29-30.

County horticultural commissioners and nurserymen, June 1.

Federal horticultural board, May 31. 4th convention western plant quarantine board, June 1-2.

Western directors of department of agriculture, May 29-30.

All of the various state and federal officials interested have accepted and 100 per cent attendance is expected.

ASPINWALL POTATO DIGGER

"The Machine of Quality"
Built to Stand the Wear and Tear

The name "Aspinwall" stands for all that is most desired in Potato Machinery, DURABILITY, SERVICEABILITY, LONG LIFE, LOW UP-KEEP, COST and LIGHTNESS OF DRAFT. The Aspinwall potato digger is recognized as the most economical digger on the market.

In producing this machine every effort was exerted to produce a finely finished durable product. All essential parts are machined. The Aspinwall is built in 6 and 7 foot sizes, either plain or with platform attachment for engine drive— for horses or tractor.

The mechanical construction includes some very important features, such as, long life bronze bearings, special tempered steel chain, carbon steel specially shaped shovel point, 30 inch wheels with 3 inch face gear driven from both sides. High rigid sides and proper pitch rear rack with high clearance. Easy draw bar connection close coupled to truck.

Speed and Dependability in the Hay Harvest

McCormick - Deering - International

HAY machines that bear the above names may always be relied on to put your hay where you want it, the way you want it, in the quickest, most economical manner. *McCormick* and *Deering* mowers can be depended on to cut hay every minute. *International* tedders hasten, and insure, better curing. *McCormick* and *Deering* self-dump rakes are known the whole world over for their quick, clean work and light draft. The *International* combined side-delivery rake and tedder is a saver of time and labor.

Look at the farmer in this picture, pulling two wagons and two *International* loaders with the Titan tractor. He is sure to get his hay out of the way for grain harvest.

International sweep rakes and stackers provide a quick method of getting your hay to the stack.

International power hay presses put the hay in neat tight bales that keep better, are easier to handle, store and feed, and that bring the top price on the market.

CALIFORNIA FRUITS, MAY 1, 1922

By California Cooperative Crop Reporting Service

HE season being from two to four weeks late made it rather difficult to estimate the condition of the various fruit crops as of May 1 as sufficient time had hardly elapsed after the blooming period to note the probable setting of the fruit. Frost occurred April 9 and 10 and again on the 16th and 17th in practically every section of the state, but with the exception of apricots the damage as a whole was rather light.

A light snowfall in Eldorado, Nevada and Placer Counties May 8 caused some concern to the fruit men but reports indicate there was little if any damage from frost.

Almonds

The almond crop seems to be somewhat spotted again this year, reports varying between 50 and 100 per cent of a crop. Butte and Stanislaus Counties report very good crops. Some damage from frost occurred in Yolo and San Joaquin Counties. For the state the condition is 77 per cent of a normal as compared with 58 last year and a ten year average of 69. With average conditions the balance of the growing season, a record production of almonds is indicated this year.

Apricots

Brown rot seriously affected the crop in the Bay counties. Added to this destructive fungus diseases, frosts on the 9th and 10th caused further damage to the "cot" crop, particularly in Alameda and Santa Clara Counties. Southern California, where production has been rapidly increasing, also suffered from frosts, and the prospects in that district are for about 65 per cent of a crop. For the state the condition is about 52 per cent of normal as compared with 45 last year and a ten year average of 68.

Cherries

Early reports indicated a "bumper" crop of cherries. Frost and cool weather have brought about a decreased estimate but prospects still remain fairly good for a larger production than usual. The condition is estimated at 90 per cent normal compared with 66 last year and a five year average of 80.

Oranges

The condition of oranges was estimated to be only 78 per cent of a normal as compared with 92 last year and a ten year average of 93. The bloom was later than usual but apparently about normal on such trees as were in good condition. Those which had been wholly or partially defoliated by the January freeze were putting out leaves and bloom would either be very late or entirely lacking. The condition figure as here given should be construed as indicating conditions at blossom time only.

Lemons

The condition of lemons was estimated as 66 per cent of a normal as compared with 90 last year and a ten year average of 90. Lemon trees in some of the producing districts are in very bad condition on account of the January freeze and no bloom can be expected on trees which were wholly or partially defoliated. The vitality of the trees has been lowered materially and a large production of lemons can hardly be expected this year.

Detailed reports are not generally made until June, but owing to the interest manifested throughout the state in fruit crop conditions a special inquiry has been made as of May 1. No figures are available for comparison for the same date of previous years. All fruit crops have yet to run the gauntlet of the "June drop" and a possible heat wave before July 1. Bugs are not serious at the present time.

Apples

Were reported about 96 per cent of a normal. Practically all districts state that it is too early to definitely report the condition of the crop. Gravensteins in Sonoma County are reported a full crop with late apples somewhat shy.

Peaches

The condition of the peach crop is reported to be 92 per cent of a normal. Sutter, the big cling peach county of

Pomona Manufacturing Co.
POMONA, CAL.

Manufacturers of the

POMONA Irrigation Gates and Valves

the state, reports a full crop. At the present time a record peach crop is indicated for the state as a whole.

Pears

Have suffered only slight damage from frost, and then only in certain sections. The indications are now for 92 per cent of a normal crop.

Plums

The plum crop is a difficult one to size up at the present time. Placer County, which produces more than 30 per cent of the plums reports only 80 per cent of a full crop.

Prunes

Prospects for a prune crop are very good at the present time. The condition for the state as a whole is estimated to be about 95 per cent of a normal.

Final Orange Estimates—1921-22 Crop

Under date of February 23, 1922, this office issued a special citrus report following the January freeze. At the time of the freeze there had been shipped and placed in packing houses a total of about 4,000,000 boxes of oranges, equivalent to 9,000 cars. Since the freeze and up to May 1, there has been shipped 9,408 cars, of which about 1,000 cars were Valencias. The picking of Valencias early indicated that the damage was greater than expected, and as of May 1, it is estimated that the crop had been damaged fully 50 per cent. It now appears that the total orange shipments of the 1921-22 crop will amount to about 29,000 cars. On the basis of 450 boxes to the car the total shipments will amount to 13,050,000 boxes, which is only 58 per cent of the total orange crop, as estimated December 1, 1921.

The loss from December winds was placed at 5,000 cars and the loss directly attributed to the freeze will be about 16,000 cars, or 7,200,000 boxes.—E. E. Kaufman, Agricultural Statistician.

CROP REPORT

N. E. Mathews, Santa Ana, Orange County

There has been quite a diversity of opinion up to the present time of the apricot growers as to the prospective yield but the majority now set it at about 50 per cent of normal.

AIR DRAINAGE

A fact which the experiences of the past winter has more firmly impressed upon us is the importance of air drainage in the orchard. This is not more necessary in mid-winter than at times of early fall or late spring frosts, for while the former affect mainly the citrus orchards, the extreme season or late and early frosts are the only ones that affect deciduous trees.

Many deciduous orchards escape frost injury while those on adjacent, but lower lands suffer from frozen tips in the fall (walnuts) or from frosted blossoms or fruits in late spring (apricots, etc.) The greatest danger lies in still and cloudless nights. The drainage of cold air to the lower lands and the more pronounced air currents higher up have saved many a crop on comparatively higher lands. The lesson to be learned is to avoid planting orchards on low land, especially close to waterways. When a cold winter comes one feels that citrus trees should never be planted on low flat land. It is not a question of elevation above sea level, but of elevation above the lower lands of the immediate vicinity.

The general offices of the California Co-Operative Canneries have been consolidated and are now located on the tenth floor of the Cunard Building on First and Market Streets, San Francisco. The increasing amount of business handled by this cooperative canning company and its large fruit interest in the San Joaquin Valley as well as in Napa and Sonoma Counties required that the business affairs of the company be handled from a central location.

Old residents of the Oroville district claim that the promise for a wheat crop this season is the best for 25 years. Many fields that in former years lost their crops through excessive water are now promising a large yield, due to the mild winter and better drainage now available.

Here's Good Advice: Relieve Your Fatigue With Sleep. Avoid Stimulants

THERE is nothing in the world so reconstructive as sound, refreshing sleep. During sleep the system rids itself of the fatigue poisons that have accumulated during the day. The finished elements in the food are taken up by the various tissues that require rebuilding nutriment.

It is important that you get plenty of health-bringing sleep. Anything that interferes with your sleep hampers and hinders you—mentally and physically.

A common cause of physical weakness and mental depression is the reaction following over-stimulation caused by the drug, caffeine, and other elements found in both coffee and tea.

If you have an idea that coffee or tea drinking may be injurious to your health, why not stop it for a week or so, and drink delicious, fragrant Postum instead.

Postum is a rich, golden-brown, pure cereal beverage. It contains no harmful elements of any kind. You can drink Postum as many times a day as you or the children desire a grateful, refreshing beverage.

Your grocer sells both forms of Postum: Instant Postum (in tins) made instantly in the cup by the addition of boiling water. Postum Cereal (in packages of larger bulk, for those who prefer to make the drink while the meal is being prepared) made by boiling for fully twenty minutes.

Postum for Health "There's a Reason"

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Pinching Back Malagas

I planted some rooted Malaga vines a year ago and got nearly a full stand. Vines are so large that I have put stakes by them this year and have started the one stump system. I have suckered them and left only one straight shoot going up. Would it be all right to pinch it off when it gets to the top of the stake to stop it from growing any longer and set more brush for spurs next year? The way they are growing they will be at the top of the stakes in four to six weeks. My stakes are three feet high.—R. S., Fresno.

Malaga vines such as you describe in your question may be pinched when the growth reaches a little above the top of the stake. This pinching will promote the growth of laterals and will give you a better selection at pruning time next year.—F. K. H.

Pollenizing Prunes

What plum is considered best as pollenizer for Tragedy? How many per acre should be planted for this purpose? Is Climax good?—Subscriber, Porterville.

Clyman is considered the best for the Tragedy and observant orchardists vary in opinion on how to plant the two varieties. Every fifth row is a practice quite common and brings good results if bees are numerous. In studies made by the state university it was found that rows of two varieties next each other bore more fruit than those five rows apart. By all means keep a few bees in the orchard; a hive to every five acres will prove of great benefit. Climax will not pollinate the

Tragedy, as the former is a Japanese plum and the latter a European and they will not cross pollinate. But Climax is best of all for plums of its class and more self fertile.

Curing Bulbs

What garden bulbs in Southern California after flowering should be lifted and dried for the following season? Does the list include ranunculus, narcissus, (Paper White) etc.?—Subscriber, East San Diego.

It is not necessary that any bulb should be removed from the soil each year if soil and climatic conditions are favorable, for all bulbs grow wild somewhere and are never moved. California bulbs and those from similar climates do not need taking up, and especially the lilies. Many of our native lily bulbs, even though of large size and soon replanted, will not flower the first year after being dug. Anemones, ranunculi, yellow callas the writer has found to perish during winter unless the soil may in some way be protected from excessive rains. During warm dry winters such losses are light, but winters like the one just past are very destructive to bulbs. This is not true of narcissi, especially of the large trumpet varieties, which, after several years in same spot have flowered better this spring than ever before. This is also true of the poet's narcissus and Spanish iris. Good drainage is the chief factor in wintering bulbs in the soil.

Dividing Asparagus

I have a few hills of asparagus which has been in the same location several years. I wish to extend the bed. Can I take these up and subdivide? If I do this may I expect any "grass" for use the first year? Is it better to plant seed or new plants?

What time of the year is best for this subdividing of seed?—Subscriber, Los Angeles.

Old clumps may be divided in the fall but it is really better to set out new plants. In either case there should be no cut taken the first year. Seeds may be sown during the spring to make plants for setting out the following winter.—D. F. R.

New Asparagus Bed

Have planted out a new asparagus bed. Should the first sprouts be cut off or let go to seed, and should I put salt on beds in fall? Also should they be covered deep?—Subscriber, Jenner.

Shoots should not be cut from a young asparagus bed the first year. In setting the roots the crown should be covered about 4 inches and allowed to grow without hilling the first season. After cutting off the growth in the fall, cover with a good dressing of stable manure to be leached in during the early winter. In January ridge up so that the crowns will be covered about 8 inches.—D. F. R.

As to salt it is not often used. It is, however, a mild stimulant releasing potassium and having much the same effect on soils as does gypsum. Applied at the rate of say 500 pounds per acre there might be a slight benefit because of chemical action and possibly some benefit as a soil disinfectant.

"June Drop" in May

Will you tell me why my oranges and lemons drop off when they reach the size of hazel nuts? What can I do to save them?—Subscriber, San Luis Obispo.

We don't know. What is worse, there are many practical citrus growers who can give but little better answer. We are exceedingly sorry to have these fruit drop questions begin this early in the season for it indicates the beginning of one of the fruit

growers' perplexing problems. The drop may be due to a fungus or to bacterial action. More probably, it may be due to abnormal weather conditions, or, still more probably, to lack of vigor and vitality in tree. Subtropical trees have been put to severe test during the past few months, and orchardists will be little surprised if there is a shy bloom and, worse, a heavy drop of recently formed fruits. It is fairly definitely established that a vigorous strong growing tree on soil of perfect tilth and content of fertility will hold its fruit more satisfactorily than will the less vigorous tree. So to prevent June drop in 1923 begin on the orchard this week or next and build up right soil conditions by fertilization, irrigation and cultivation. But to answer the question as to the drop for 1922 we are compelled to repeat "We don't know." If there is a subscriber to the Cultivator who can give us the information, send it quick.

Tomato Blight Infection

I have some racks made of lumber and woven wire which I use to hold tomato vines off the ground. Would the germs of tomato blight or any disease of tomatoes remain on these racks and carry to next crop? If so, is there any spray that would disinfect the racks?

Exposed to sun and air as these have been for months it is probable there would be no infection. However, the disease is so deadly that every precaution should be taken and treatment with boiling water or holding in the flame of a brisk fire for an instant might prove wise. A spray or dip of copper sulphate would doubtless prove effective. We have repeatedly said that plants affected with blight cannot be reached by a spray, but this is because of the infection being in the innermost tissues of the plant and of course not reached by any spray. On the frame of a trellis the treatment should prove effective.

Good Butter

Several times parties have asked regarding strong butter or its not keeping.

In saving cream for churning, from day to day, if each day skimming is stirred thoroughly into the whole and kept cool in an earthen crock over which a wet burlap is kept in warm weather, once a week will be often enough to churn.

In churning, just before the butter forms into a chunk or mass, when it resembles fish roe, or as soon as the buttermilk can be drained without losing butter, drain. Fill churn with cold water, 60 degrees, drain again. Fill again, give churn a turn and drain. If water is not clear repeat. Now pour out butter, salt and work. There will be no buttermilk in your butter and it will keep a long time. It is the buttermilk left in butter that gives it the strong flavor.—Cecil Haskell, Venice.

BONDED WAREHOUSES

The department of agriculture is now ready to receive applications for the licensing of warehouses storing agricultural products, as provided for in the California warehouse act, approved June 3, 1921. A study of the act and the rules and regulations thereunder reveals the added safeguards surrounding agricultural products stored in a bonded warehouse and the receipts issued therefor. The depositor readily recognizes the advantages of storing his products in a bonded warehouse, the warehouseman appreciates the added asset of his warehouse being classified as a California bonded warehouse, and the banker readily recognizes the added security afforded by the handling of warehouse receipts issued by a bonded warehouse. The department of agriculture is anxious to place before interested parties complete information for the classification of California bonded warehouses and the advantages of the same.

Address communications relative to this matter to L. M. Jeffers, Chief Grain and Warehouse Inspector, State Department of Agriculture, Sacramento, California.

ONE of our Western dealers reports: "A traveling salesman was in our office a few days ago. He said, 'I like your Fisk Red-Tops. I have three on my car and the next tire I buy will be a Fisk Red-Top. I travel for a wholesale hardware company and they have tires to sell that I can buy at 15% under the wholesale price, but I find it cheaper in the end to buy Fisk Red-Tops at retail.'"

Anyone who puts his tires to hard usage and who values his time and convenience should buy the Fisk Red-Top—the tire made with the extra ply of fabric and the extra heavy, extra tough red tread.

There's a Fisk Tire of extra value in every size, for car, truck or speed wagon.

Household Department

THE PEERLESS FORTY-NINERS

By A. J. Waterhouse

Dame Nature loved this Western land;
Its beauty lured and charmed her;
Its sun-kissed days and pleasant ways
Of Eastern chill disarm her.
Quoth she, "I need some mighty men,
No sluggards or repiners.
To build my State;" then sent us straight
The splendid Forty-niners.

Chorus:

Oh, here's to brain, and here's to brawn,
To deeds that cheer like wine;
To men who wrote in deathless dced
The utmost word in valor's creed,
The men of Forty-nine.

By mountain pass or wilderness,
Their watchword, "Onward ever!"
Their hearts of cheer knew not a fear
Or surcease of endeavor.
The cruel net that lures to death
Was set by red designers,
But still they strode their chosen road,
The matchless Forty-niners.

Chorus:

Fair is our State, e'er unexcelled
In richness and in glory.
Foundations deep they laid to keep
The splendor of our story.
Theirs was the hand that carved and
planned;
We but the late refiners,
So low we bow unto them now,
Our glorious Forty-niners.

Eliminates Carbon—Saves
Gas—Free Trial Offer

Any car owner who is bothered with a
motor which pumps oil, foul spark plugs,
wastes gas or carbonizes badly can stop
these troubles by using a remarkable de-
vice called Warren Transformers, per-
fected by W. H. Warren, a Kansas City
motor expert.

In two minutes a boy can attach War-
ren Transformers. Then you will be
amazed to see your car go whizzing up
hills on high where
you formerly had
to shift gears. You
will also notice a
big increase in your mileage
and instant starting in cold-
est weather. Spark plugs
that formerly fouled and
cylinders that pumped oil
will be clean and dry and
fire with full power.

If you want to save 25 to
50% on fuel and repair bills,
be rid of missing cylinders,
dirty plugs and carbon, have
a quick start in coldest
weather and pep on hills,
write the Warren Mfg. Co.,
203 Gray Building, Kansas
City, Mo., and a set of War-
ren Transformers will be
sent immediately, with the
understanding that they do
not cost you a cent if not entirely satis-
factory.

So confident is the Warren Mfg. Co. that Warren
Transformers will more than delight you that they
offer to send a \$4 set for only \$2. This is a special
introductory offer, good for only a few days, and
readers should take advantage of it immediately.

Send No Money with your order—just your name
and address, name of car and number of cylinders.
Warren Transformers will be sent immediately. When
they arrive merely pay the postman \$2 and postage.
Use them 10 days. If not satisfactory return and your
money will be refunded. Write today. End your
motor troubles. This offer fully guaranteed.

MRS. GRAHAM'S MOTHER

By Ida Charlotte Roberts in Forward

WHEN Mrs. Tate had taken
the last of her possessions
from her trunk and slipped
the last hanger in place,
she shut the door of the
bulging closet and turned to her
daughter with a smile which harbored
not a shadow of weariness. She
had come to spend the winter with
her daughter, Mrs. Judson Graham,
in a bustling Western town where
the young reign supreme and
where the few old folks look on and
marvel. Her daughter expected nothing
else than that her mother would spend
the rest of her days with her.

"Now that you're through with all
this, mother, you'd better rest awhile.
Mrs. Lawrence is giving a tea party
this afternoon, and I'm to take you
without fail. You'll meet most of my
friends there. I do hope you're not too
travel worn to go."

"Travel worn! I'm no invalid, Helen.
Travel always rests me. There's no
place I can rest so well as on a Pullman
or a boat."

"But, mother, though you're not an
invalid, you're not so young as you used
to be, and you must take care of your-
self—or let me do it for you."

At this last statement Mrs. Tate
sniffed and a queer look came into her
eyes. "Bosh! Haven't I taken care of
myself and a few others for more years
than you are old?" she asked.

"Of course you have, you dear, and
that is the reason you should let me
now. I'm going to see that you take
life easier. You need a good rest. See
that you begin by lying down this very
minute," she commanded laughingly
as she left the room.

"If she thinks I'm going to sit around
and be coddled, she's likely to have a
change of mind. Haven't I been presi-
dent of the Benevolent Society of First
Church, president of the Wessington
Woman's Club for two years, and sec-
retary of three clubs, and wasn't I
chairman of the knitting department of
the Red Cross all through the War?
And with all that, didn't I manage my
home and do forty-seven other things?
I'm not going to rest on my oars now,
I'll have that child know," she
grumbled.

Instead of resting she wrote three
letters, read a chapter in the book that
one of her clubs was studying, and
mended a pair of gloves. Then she
dressed herself for the tea.

You look like a different woman,
mother," her daughter said as the two
drove off to pick up a friend to take
with them. "Rest is what you need."

"I'm so glad to meet your mother,
Helen," Mrs. Jensen, the friend, re-
marked on being introduced to Mrs.
Tate. Isn't it delightful for you to have
her with you? I quite envy you." She
addressed all her remarks to Helen,
not to Helen's mother.

"We are going to have a beautiful
time this winter. I'm going to make
her take care of herself. She's an ab-
surdly strenuous person and has worn
herself completely out in Wessington,"
Mrs. Graham said.

That's all in Helen's imagination,"
sniffed her mother. "I'm stronger than
she is this minute and have twice her
endurance."

At the tea Mrs. Tate was introduced
right and left as Mrs. Graham's mother.
"I'm delighted to meet Mrs. Graham's
mother," was the gist of the greeting
given her. "I admire your daughter
tremendously."

Toward the end of the afternoon a
little woman stepped up to Mrs. Tate
and said: "I'm Mrs. Hart. You can't
possibly remember all our names, and
I just wouldn't try. I confess I don't
remember yours, but I know you are
Mrs. Graham's mother and I'll think of
you as her mother."

"Tate is my name," flared the owner
of that name.

"Why, to be sure! I'm just a prodigy
of stupidity," admitted Mrs. Hart.
"Please give me another chance."

At home that evening after mother
and daughter had changed their gowns
and were talking over Mrs. Tate's first
venture into Springfield society, Mrs.
Graham asked her mother how she had
enjoyed herself.

Purity

Air, dust, dirt and all that goes with
them—these are the enemies of choc-
olate purity. And these are locked out
of Ghirardelli's by "locking" the
chocolate in the tin. It is the tin that
enables Ghirardelli's Ground Choc-
olate to reach your table as pure,
clean and flavor-fresh as the hour it
leaves our factory. Ask for Ghirar-
delli's at the store where you trade
and send for recipe booklet.

Say "Gear-ar-delly"

"Oh well enough! I should have liked it better if only people had got my name straight. Most of them didn't try at all; they called me 'Mrs. Graham's mother.' Tate is the easiest name in the world."

"We think so, but to strangers it may seem a poser. Everyone knows me so well that it is natural they should call you my mother. They simply adore you and said enough pretty things about you to turn your head. I'm sure you made the hit of the season."

"That's just because I'm your mother," she said with an effort to laugh.

"Back home I'm known as your daughter, but here you're quite likely to be known as my mother. But you're tired now and need a rest."

"I'm weary of that word," scoffed the mother, as she picked up a magazine and sat down to read.

There was many a social function in the weeks that followed and at all of them Mrs. Tate was introduced as Mrs. Graham's mother. She was petted and praised and made most welcome by her daughter's friends. Still, Mrs. Tate

noticed that the conversation was always directed to Helen, not to her. It made her feel like a piece of furniture in a corner being talked over.

At the meeting of the various clubs of which her daughter was a member, Mrs. Tate became a regular attendant. She was only a lay figure, however. Never was she asked to take part, that is, not for a long time.

One morning toward spring Mrs. Burton called at Mrs. Graham's home.

"I'm in a peck of trouble," she announced before she had taken a seat. "Mrs. Denny, you know, was to have had a paper on 'The Influence of Modern Novelists' and she's been called to California. Her substitute is down with quinsy. We have simply got to have a good program for the president of the federation is to be our guest. Can't you come to my rescue, Helen?"

"Can't possibly. I'm to have a talk at the Fortnightly Club the day after the West Side Club meeting, and I'd be sure to get my material into a jumble if I tried to do both. If I were not trying to have mother rest I might sug-

gest that you ask her. But she really ought not to undertake it."

Just then Mrs. Tate appeared from a walk, looking hale and hearty.

"Dear Mrs. Tate, don't you want to be a good Samaritan and help me out of a predicament?" Mrs. Burton asked, hardly taking time to say good morning.

Mrs. Tate's eyes brightened. She felt like doing anything for a person who called her "Mrs. Tate."

"I'll be glad to help you. What is the nature of the deed you want me to commit?"

"Just write a paper on 'The Influence of Modern Novelists' for the West Side Club a week from Thursday."

"Even though I've not made a special study of modern novelists, I shall be delighted to make an attempt at the subject."

Mrs. Burton was profuse in her thanks and went on her way rejoicing.

As soon as she had gone, Mrs. Graham began to regret having allowed her mother to undertake the paper.

"But, mother, you were to rest and

get away from all thought of paper and talks and such things," she urged.

"That was all your idea, not mine. Anyhow, I can't refuse to do a favor for one of your friends. Besides, I don't want to get out of practice."

Glad to have something definite to do, Mrs. Tate lost no time in beginning her paper. She delved into her daughter's bookshelves and for days haunted the public library. She labored so zealously that her daughter felt impelled to charge her mother not to overdo, to the evident disgust of that same mother.

On the day of the West Side Club meeting the room was filled because of the visit of the president of the federation. The club president announced that the club would have the rare pleasure of listening to a paper by the mother of one of its own members, Mrs. Graham. "She will now give a paper on 'The Influence of Modern Novelists.' I cannot recall her name, but what does it matter? She's Mrs. Graham's mother to us."

Mrs. Tate flushed uncomfortably under this introduction. She had been thinking that surely her name would be used on this occasion instead of the monotonous "Mrs. Graham's mother." Nevertheless, she arose to read her paper and did it to the admiration of her daughter and to the surprise of her hearers. After the program Mrs. Burton found her way to Mrs. Tate.

(Continued next week)

HOUSEHOLD QUERIES

Strawberry Clabber

Can you tell me how to make strawberry clabber. My father says it is one of the best things he remembers that they had on the farm back East. Maybe it tastes better than it sounds. At any rate I would like to know how to make it for him.—Subscriber, Orange.

Take milk that is just at the point of turning sour and set in the sun or a warm place where it will quickly complete souring. It should get the consistency of baked custard. Set on the ice until wanted. Place cleaned strawberries on serving plates, sprinkle with sugar and cover with the cold clabber.

Coddled Eggs

Are coddled eggs different from soft boiled eggs? I always thought they were the same thing.—Subscriber, Los Angeles.

Coddled eggs are not boiled, but are cooked by pouring boiling water over them, covering tightly and letting stand till both white and yolk are jellied. The ordinary rule is a quart of boiling water to 2 eggs, let stand in warm place closely covered ten minutes. Yolk and white are of an even jellied consistency and the yolk does not run—a feature of the soft boiled egg unpleasant to many people. By the way, eggs poached in this way are far superior to the ordinary "boiled" poached egg.

Easy Way to Wash Windows

Is there an easy way to wash windows? I can get through the rest of the housework, but the windows always seem the last straw.

The easiest way we know is to use wood alcohol. Dampen small cloth and go over windows quickly. No second rubbing or polishing is needed. A little kerosene in clear water is also used by many housekeepers. Where there is dust on outside of windows, wipe off with dry cloth before washing. If kitchen windows are "greasy" rub off first with soft crumpled newspaper.

French Berry Pie

I would like to know how to make the French berry pies served in our cafeterias. They always taste better than mine.—Subscriber, Long Beach.

Bring to a boil three cups sugar and one cup water, remove scum and add 1 quart clean bright berries. Cook four minutes and add one tablespoon cornstarch dissolved in a little cold water, cook until clear, but not long enough for the berries to break or lose color.

Electric Power—

A Servant for the Farmer's Wife

POWER LINES operated by the Pacific Gas and Electric Company, and spreading web-like over much of the state, bring to thousands of farmers' wives the same efficient service that lightens the labors of their city sisters.

Electricity is now the servant of housewives every-

where. Electric washing machines alone have relieved them of a heavy burden. Manufacturers sell these machines on payment plans that are as easy to meet as laundry bills. The power used by an electric washing machine is very low.

What farmer's wife can afford to continue heavy drudgery over wash tubs when such an efficient servant is at hand? What husband would want her to?

Put an electric servant to turning a washing machine for you before the hot months of summer come.

PACIFIC GAS AND ELECTRIC COMPANY

P · G · and E ·
"PACIFIC SERVICE"

Cool slightly and pour into baked pie shells. Pile whipped cream on top if liked.

"The Friend"

Would it be asking too much of the Cultivator to reprint "The Friend," a poem which appeared in your columns several years ago? I'm sorry I can't locate it more definitely, but I do want so much to use it right now and it would be a great favor if you could publish it again.—Subscriber, Watsonville.

THE FRIEND

By Charlton Lawrence Edholm

It's not that he's obligin';
Good lookin' or a saint;
Dear God (who made him out of mud)
Knows well that's what he ain't.

He never lent me money;
He never saved my life;
An' he don't like the brand I smoke,
An' I don't like his wife.

He's not so quick an' clever—
That is, not as a rule;
At times (the times we disagree)
He seems a sort of fool.

But still it somehow thrills me
To grip his hearty hand.
I guess the thing that makes us stick
Is that we understand.

I understand the varmint;
Sometimes he savvies me.
An' that's what makes a man your pal
As far as I can see

OUR BABY COLUMN

By Mrs. M. S. Sirdevan

Weighing the child is of the greatest importance, for nothing tells so accurately how well it is thriving." A child should be weighed every week during the first six months and every two weeks during the last six months of the first year; once a month during the second year.

A child should gain from four to eight ounces a week during the first six months. From then until 12 months the gain is less, usually two to four ounces a week. The first week it is apt to lose from four to eight ounces.

Most children gain steadily the first year, although there are periods when no gain is made. This is usually between the seventh and tenth month, when most children are cutting teeth.

A child that gains rapidly in weight, is not always thriving normally, for the prepared infant foods increase rapidly in weight, but not in strength, nor in development in other respects.

A child should hold its head up during the fourth month, and often if the body is supported the head can be held erect during the third month.

A healthy child is usually able to sit erect and support the body at seven or eight months; at the ninth and tenth, to bear the weight upon the feet; and at 11 or 12 months, most children can stand with assistance. The average child is able to run alone at 15 or 16 months. Never urge a child to walk, for just as soon as his muscles and bones are strong enough he is willing to do so.

I am going to give a table showing the average weight, and height, for healthy boys. Girls are about one pound less than boys, but the same in height.

	Weight Pounds	Height Inches
At birth	7½	20½
One year	21	29½
Two years	27	34
Three years	32	37½
Four years	36	40½
Five years	40	43
Six years	46	45½
Seven years	51	47½
Eight years	56	49½
Nine years	61	51½
Ten years	66½	53½

The weights for the first five years are without clothes, and from six years and over are with ordinary house clothes.

HINTS FROM HOUSEKEEPERS

Stewed Rhubarb—Baked Squash

Stewed Rhubarb.—Wash and trim off ends of two pounds tender rhubarb; do not peel. Cut rhubarb in one inch pieces. Put into baking dish and sprinkle generously with sugar, add just enough water to prevent rhubarb from burning. Cover and bake in oven very slowly until tender but not broken. (Slow cooking preserves its color.) One cup of raisins may be cooked with rhubarb. They must, however, be first picked over, stems removed, then covered with boiling

water, drained, then covered again with boiling water and cooked until soft. Arrange a layer of rhubarb in baking dish, then a sprinkle of raisins and sugar and thus continue until all

are used. Finish cooking as directed in the foregoing. Serve very cold.

Baked Squash.—Cut Hubbard squash in pieces for serving. Remove seeds and stringy portion. Put half teaspoon

molasses in each and sprinkle with salt and pepper. Bake in hot oven till tender. Put piece of butter on each portion and serve in shell.—Mrs. W. G. Miller, McFarland.

Bark and Enamel

WHEN you cultivate a young orchard, you take particular care not to scrape the bark off the trees. For when the bark is scratched or broken insects and plant diseases can enter to destroy or decay the tender tissue beneath.

The enamel of your teeth—the outer covering—protects the soft part in much the same way as bark protects the tree. Care should be taken not to damage the enamel by "scratching" or "scouring" it with a harsh, gritty tooth paste. The U. S. Public Health Service recommends using a dentifrice which is free from harsh grit.

COLGATE'S

Cleans Teeth the Right Way

"Washes" and Polishes—
Doesn't Scratch or Scour

Colgate's contains a specially prepared fine chalk. It has no harsh grit, no strong drugs or chemicals. The refreshing, delicious flavor makes tooth brushing a pleasure after each meal.

More dentists recommend Colgate's Ribbon Dental Cream than any other dentifrice. Since 1806 Colgate has made reliable products which every farm family likes.

OUTLOOK FOR LIVESTOCK INDUSTRY

(Continued from Page 543.)

Nebraska, Kansas, Illinois, Oklahoma, South Dakota, California, and Colorado, ranking in the order named.

With a shortage of beef animals that is ever increasing instead of diminishing I believe that I am safe in saying that fat cattle have entered definitely into a profit period. For the experienced stockman who knows how to buy feeders and knows how to feed economically and to the best advantage the present situation is at least as favorable as the average. The faith of the producers in the future of the livestock industry is shown by their active demand for breeding animals. Reports from the West and the Southwest as well as from the Middle West and the Northwest show that the breeding stock of the ranges has been seriously depleted. The outlook for purebred livestock is extremely favorable and especially for those who plan to stay in the game permanently. The day is not far distant when breeders will find it difficult to fill all of their orders. Many of the depleted herds of England, France, Germany, and Belgium and other nations in Europe will have to be replenished from this country. South America, Canada, Australia and other countries likewise are drawing upon our best breeding herds of purebred livestock rather heavily and will continue to do so for sometime in the future.

A striking proof of the reviving confidence and interest in the cattle business is shown by the free movement of stockers and feeders. The March purchases of stockers at the nine principal livestock markets in the United States were 17.20 per cent heavier than for last year. The first three months of 1922 showed a gain of 29.41 per cent. The Kansas City, Omaha and Denver cattle movements indicate that restocking is being carried out on an extensive scale in the territory west of the Missouri River. Recent reports indicate a heavy shortage of yearlings in the Plains Section of North Texas this year and a corresponding shortage of two year olds and three year olds next year and the following year. This is due to the fact that fully two-thirds of last year's calf crop has already been shipped out of that country, and a large number of these were heifers which will further complicate the Texas situation.

Better plans for marketing livestock are being worked out that will prevent gluts and shortages in livestock centers. Our present market system is costly and inefficient. Some zoning system and some method of equalizing receipts over the days, weeks, and months of the year must be worked out and enforced that will stabilize market prices from one season to another. These problems must be solved before the farmer can get a square deal. However, there is encouragement in the fact that the farm bloc in congress and other influences at Washington and elsewhere are working harder than ever before on these problems, and no doubt some very tangible results will soon be apparent.

Considered from every angle it seems to me that the livestock situation is full of promise for a satisfactory and profitable future. So far as I can see the signs of the time point to an increasingly profitable livestock industry that will bring about a widespread and gradual improvement in the nation's agricultural and general trade conditions.

By J. R. Howard, President American Farm Bureau Federation

I have your letter of March 15 in which you refer to the distress and discouragement of the people engaged in the livestock industry, particularly those who are in the beef and hog business. This is hardly the reaction which we are finding in the corn belt states. The prices on hogs have been higher during the past year in relation to the price of corn than they have ever been before. It is safe to count on a one to 12 ratio in the hog feeding game, that is, 12 bushels of corn will produce and usually equal in value 100 pounds of pork. Under favorable conditions it would not take the full 12 bushels.

Corn was down to 25 and 30 cents in the corn belt a few months ago, but at no time were good hogs under \$6.

Always Ready
Always Dependable

Harvester Hay Tools

Money can't buy better hay tools than those which carry the "Harvester" trade mark. Extra strong, easier to work with and always dependable — they'll stand twice the wear of ordinary kinds. All styles, sizes and types to fit every need and requirement. Nine different types of hay carriers to run on steel, wood or cable track, whichever you prefer. Many other exclusive features which assure uninterrupted service and lowest upkeep cost. Write for catalog.

H. H. Gable Esparto, Cal.

Now corn is up to around 50 cents while hog quotations have been \$11 for the bulk of sales. They are off some now, \$10 per hundred catching the average run on the present markets. The result of this has been the disposition on the part of farmers to keep as many brood sows as possible and with good luck and good weather at farrowing time it is possible that we will have more hogs a year from now than corn. There are some things, however, which make it probable that we can absorb more than the average amount of pork during the next year or two. Statistics show that both beef and mutton are apt to be short. European demand for pork products such as lard and bacon is exceedingly good. They have not yet caught up over there on their fat supplies since the war. The American people seem to be again consuming more meat than they did at any time since the meatless day propaganda of the war.

I am conducting my own personal affairs along regular normal lines with regard to livestock, that is, raising all the corn I can and feeding it all out to livestock on the farm and sometimes buying additional corn. I believe the farmer who is properly equipped to handle livestock and who has the proper appreciation for animals will do well to engage moderately in the enterprise. I say moderately because the great losses have been in the people plunging beyond their resources, and by resources I mean not only financial resources, but the resources of their natural ability as well. The livestock game should never be considered as a get-rich-quick proposition but one which must be consistently pursued year in and year out if success is to be attained.

By John E. Robert, Secretary Zone Five California Cattlemen's Association

Referring to your letter of March 15 will say that there is every reason to encourage any one to go into the livestock business. At the present time there are many reasons for this. You are probably aware of the fact that the number of beef cattle has been decreasing at an alarming rate. For a good many years we have noted a great underproduction. We must realize that the prices that are now being paid for livestock are away below the average exchange level for other food commodities. This simply means that the prices for livestock will either hold their own or go up.

Lambs are at the pre war prices now.

Hogs are up 40 per cent from the low level.

Cattle have not advanced in proportion.

I should be glad to take this matter up with you personally, or if you refer anyone to us personally. The California Cattlemen's Association has accurate and reliable information upon most phases of the industry, and we are willing and glad to furnish this to any member.

By W. H. Walker, President California Farm Bureau Federation

It is difficult to be optimistic relative to the livestock industry. The tremendous loss suffered by livestock producers during the past few years cannot be continued long if the industry is to survive. People must have food and during depressed times producers are driven to the best methods of stock raising, better feeding methods, and more economy in marketing. The last cooperative marketing plans should afford considerable relief if adopted by a large percentage of stock raisers. If the stock raiser in the past two years had received a more reasonable proportion of the price paid by the consumer of milk, meats, or leather, the industry would have a happier memory and a more hopeful outlook.

By Fred H. Bixby, President American National Livestock Association

Your letter of March 15 at hand upon my return from Texas, Colorado and New Mexico. Relative to your inquiry concerning the livestock business, and more especially cattle and hogs, I have only this to say.

1st. If I were not already in the cattle and hog business I would start

in right now.

2nd. If there ever was a necessary industry in the world, it is the cattle and hog industry.

3rd. Without a doubt within the next two years there will be what might commonly be termed a beef cattle famine even in California where ordinarily 25 per cent of the beef killed is "she" stuff. During 1921, 40 per cent of the beef killed was "she" stuff. Great numbers of calves have been slaughtered, in fact all over the United States about the only thing that was saleable was a veal calf. Therefore calves have been sold continually for the last year and a half, that ordinarily would have been grown until two or three years of age before selling. Forced liquidation has caused this unheard of selling of calves and cows.

4th. It is possible now through the activities of the war finance corporation for a man entering the cattle business to borrow money at 7½ per cent; formerly he had to pay from 10 to 12 per cent.

Anyone wishing to begin the cattle business today, if he can show to the inspector that he has feed for cattle, can borrow 80 per cent of the money necessary to invest in the cattle themselves. In short, he needs first to provide feed and pasture, second to advance 20 per cent of the amount of money necessary for the purchase of cattle, and he can borrow the balance at 7½ per cent for a term of three years.

5th. Relative to conditions in California, I have only to point out the fact that the California cattle owners for the last two and a half years have received more money for their cattle than any other cattle owners in the United States.

6th. Relative to the hog business I will say that there is a great shortage of hogs in California. Trainloads have been shipped in from outside states in order to supply pork and pork products to the consumers in California in the last year. Prior to 1921, most of the pork was shipped in, salted.

The hog business if properly run is the surest money maker that I know of in the state of California today.

I am not advising anyone to enter what is commonly called farming with the expectation of making any money, but I am advising the entrance of any economical, thrifty individual into the

cattle or hog business, provided he farms only enough for his own use, and provided that he runs his farming and livestock operations on an economical businesslike basis.

Livestock News Notes

LIVESTOCK SALE CALENDAR

Holsteins
May 23-24, J. S. Gibson Estate, Williams.
June 1 and 2, Burr Farm, Los Angeles.
Shorthorns
May 25, Caledonia Farms, West Sacramento.
Sheep
June 15-16, Annual Ram Sale, California Woolgrowers' Association, Davis.

Mention has been made in these columns recently of the wonderful transmitting qualities of the great Holstein bull, Toyon Fayne Valdessa, who is at the head of the Agee Brothers herd at Rivera. Bred to an indiscriminate herd of females his daughters are exceptionally uniform as to type and all good ones. They are beginning to freshen with their second calves and are showing great uniformity in production also. Five junior three year olds have been tested recently and all have milked over 525 pounds in seven days and made over 21 pounds butter. All are out of untested dams. Paragon Aaggie of Rock made 30.1 pounds butter from 526 pounds milk in 7 days and 121.6 pounds from 2370.9 pounds milk in 30 days. Paragon Ormsby Segis Valdessa, who is a half sister to Hartsook's three times world's record heifer, made 28.9 pounds butter from 549.7 pounds milk in seven days. Paragon Ormsby Valdessa made 552.5 pounds milk and 24.9 pounds butter in seven days and 103.75 pounds butter from 2367 pounds milk in 30 days.

Riverside is rapidly becoming a center of the Guernsey industry. W. H. Dupee, former owner of the biggest Guernsey breeding establishment in the state at Santee, in San Diego County, is assembling a small but exceedingly choice herd at his new home, Rosemoor Farm, near Riverside. G. T. Drinkwater, another well known dairyman of San Diego County, is planning to move his fine herd of Guernseys to the same vicinity. Within a radius of a few miles are the

herds of Wessels & Mahoney at Chino, W. Rapson at Corona, the Italian Vineyard Company at Guasti, W. P. Hodge at San Bernardino and Geo. De Vries at Redlands. It is rumored that two or three other well known dairymen of the same vicinity are planning to join these men in the Guernsey business and help to make the district the "Waukesha County" of California.

Peter B. Kyne's Sierra Vista Ranch at Perris, which is now being managed by B. H. Wilkinson, is going right ahead with the Holsteins. A recent deal has increased the breeding females to 24 and taken the last bull calf the ranch had for sale. A majority of the cows have excellent official records, and a junior two year old, Rosamaines Fair Tolia, has just finished a seven day record of 20.44 pounds butter from 419.4 pounds milk. These animals were used in the dairy demonstration at the Riverside farm bureau picnic held on the ranch, May 12.

D. J. Bastanchury of the Bastanchury Ranch, near La Habra, and the chamber of commerce will entertain the Southern California Pure Bred Association at the May meeting at La Habra on Saturday, May 27. Quite elaborate preparations are being made for this meeting. The livestock department of the Orange County farm bureau under the direction of Assistant Farm Adviser Floyd Scott is looking forward with much interest to this meeting, and all breeders or prospective breeders of the county are urged to attend. A general invitation is being extended by Secretary W. W. Van Pelt, and those, in addition to the membership, who are interested in pure bred livestock breeding are urged to signify their intention of attending to either W. W. Van Pelt or Mr. Scott, and accommodations will be reserved.

Kenneth Abbott of the Burr farm reports considerable interest in the big herd of Holsteins which will be dispersed June 1-2 at the Burr farm. One of the features of this sale will be nine head of open yearling females, sired by such bulls as Sir Vee-man Korndyke Pontiac, who sired Earl Graham's world record heifer, and King Korndyke Pontiac 20th. This bunch of babies would make someone the finest foundation herd imaginable.

THE HOLSTEIN SALE OF THE SEASON

Burr Farm

Dispersal

JUNE 1st and 2nd

SELLING ON

Burr Farm, Los Angeles

140 REGISTERED HOLSTEINS

Besides being a dispersal of one of California's foremost herds, this is the last opportunity of the spring season to buy tuberculin tested Holsteins, and in a season when very few tuberculin tested cattle have been offered.

SIX DAUGHTERS OF KING KORNDYKE PONTIAC 20th, a beautiful group of heifers good enough to add quality to any herd.

FOURTEEN DAUGHTERS OF SIR VEEMAN KORNDYKE PONTIAC, a wonderful group of daughters of one of California's greatest proven young sires.

THIRTEEN DAUGHTERS OF KING PEARL SEGIS PONTIAC, a 30 lb. son of King Segis Pontiac, another splendid group.

SIX DAUGHTERS OF THE 35 LB. BULL, KING SADIE VALE IDYL SEGIS, who already has a 25 lb. junior 2 year old daughter.

FIVE DAUGHTERS OF KING DIAMO, a 29 pound son of Colantha Johanna Champion.

THREE DAUGHTERS OF KING KORNDYKE BESS WREN, out of a yearly record daughter of Sir Pieter Ormsby Mercedes and by a son of a 1235 lb. yearly record daughter of the same sire.

THREE DAUGHTERS OF COLANTHA KING ABBEKERK, a son of Tidy Abbekerk King and a daughter of King Fayne Segis.

TWO THREE-QUARTER SISTERS TO THE NEW WORLD'S RECORD 32 LB. 2 YEAR OLD, PIETERTJE ORMSBY MERCEDES FRISBY.

FOUR DAUGHTERS OF THE 1000 POUND BULL, SIR MANUEL HENGVERVELD, out of good dams.

Besides the foregoing groups a wonderful list of sires is represented by daughters in this sale, including: Matador Segis Walker, King Mead of Riverside, Prince Riverside Walker, Sir Aaggie De Kol Acme, King Pontiac Netherland Segis 3rd, King Korndyke Pontiac, Prince Hiske Walker, Segis Pontiac Crane De Kol, Cedar Lawn Sir Hengerveld Johanna, and others of high quality.

THE REAL STAR!

KING KORNDYKE PONTIAC 20TH, the famous \$12,000.00 son of Miss Valley Mead De Kol Walker will sell. The breeder or group of breeders fortunate enough to take him home from this sale will own one of the best young sires of the breed.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested by a Deputy State Veterinarian and sold subject to retest by the buyer except as announced in sale ring. WRITE FOR CATALOG NOW

RIVERSIDE COUNTY FARM BUREAU PICNIC AT SIERRA VISTA RANCH

Over 200 members of the Riverside County farm bureau attended the picnic held at Captain Peter B. Kyne's Sierra Vista Ranch at Perris on Friday. A majority of them were enthusiastic livestock men and women, and the principal feature was a judging contest open to all. Over 50 entered this contest. Each one was required to judge a pen of Duroc gilts owned by the Sierra Vista Ranch, a pen of Hampshire gilts owned by F. A. Langdon, a pen of Berkshire gilts owned by Hall Bros., a class of Holstein yearling females and one of cows, all owned by Sierra Vista Ranch, a class of Jerseys owned by T. N. Watts, one of Shorthorn heifers owned by Hall Bros. and F. A. Langdon and two classes of horses, one of work stock owned by H. B. Martin and the other of pure bred Percheron mares owned by Hall Bros. The animals used in the classes were all owned in the neighborhood and were supplied by some of the best known men in the different breeds.

The most striking class was that of the Holstein cows. It was typical of the herd the Kyne ranch is building up, and it was a fine sight from show ring standpoint alone. The animals were closely matched and it was with difficulty that the amateur judges placed them. All five of the cows had seven day records of considerable merit and four of them have lately finished yearly records. It is seldom that in a small herd one will find so many good individuals of such high records. At the head of the class was placed Juliana Canary Mercedes who made 27 pounds in seven days and 1024.34 pounds from 2621.5 pounds milk in 365 days as a junior three year old. This was the first cow put on test on the ranch and her record would be a credit to any breeder no matter how long he had been in business. The others in the class were Dorothy Pontiac with 30.04 pounds butter in seven days and 1038.32 in a year as a four year old, Rosamaines Novena Netherland, a junior two year old with 22.53 in seven days and 852.31 pounds in a year, Rosamaines Nancy Spofford, a 20 pound two year old who made 813.33 in a year and Aralia Rose, a junior three year old with a 26 pound seven day record. Jack Shillcock, well known Holstein booster and representative of the Globe Mills, placed this class as it should be after the crowd had finished. Harry Nelson, formerly with the Gossard Breeding Estates, judged the horses. A youngster about 14 who proved to be a son of Ed Stalder, the well known Holstein breeder, was the high man and was awarded a Duroc gilt sired by Royal I Am, the boar with which the Kyne ranch carried off every championship in California and at Portland, last year. Another little fellow named E. Pitney was second and was awarded \$2.50 in cash. In the ladies contest Mrs. Kepner of Perris was first and Mrs. Cole of Riverside was second.

After the judging there were speeches by Noel Negley of the U. of C., J. E. Wherrell of Riverside, Harry Nelson, C. W. Lothrop and others.

THOMAS JERSEYS SELL WELL

For the first time in some years the Jersey fanciers of Southern California had a chance to buy pure bred females of their favorite breed at auction when George W. Thomas of Riverside sold his entire milking herd at Hynes on May 9. Mr. Thomas is an old and established breeder and his herd included many choice individuals. A large portion of the offering was made up of first and second calf daughters of Sir Watkins Noble's Raleigh, a grandson of the great Noble of Oaklands and out of the cow Sir Watkins Convent Lass who has a Register of Merit record of 482 pounds butter fat in a year. It was no trouble to sell these heifers as practically all have very fine records, either in the Register of Merit or in the Riverside County cow testing association. Mr. Thomas has never milked his test cows under any other than herd conditions and only twice a day. The average of the herd at the time of the sale was about 40 pounds butter fat a month.

The herd was composed very largely of the big, American type of Jerseys,

but even so it has been quite successful in the show ring during the past years, and last fall Mr. Thomas won the most coveted prizes, breeders young herd and get of sire, defeating such breeders as J. E. Wherrell and Jim Thorpe at the Southern California Fair.

Another feature that aided the sale was the fact that in years of testing for tuberculosis there has not been a reactor in the herd.

F. R. Bain, president of the Southern Counties Gas Companies, who has a farm at Palms, just outside Los Angeles proper, was the heaviest buyer and took 11 animals including the top of the sale and the three next high ones. The top at \$525 was a beautiful first calf heifer, Noble's Fern of Golden Glen, who is by Sir Watkins Noble's Raleigh and out of Petite Fern who has made 315 pounds fat in 6 months. Her dam and her paternal half sister, brought \$500 each. Mr. Bain has established a fine herd of the yellow cows and at the head has a young bull, Gamboe's Majesty Falcon, one of the best bred males in the West. His purchases in this sale will go far toward rounding out his herd.

George E. Clayton of Glendale and J. E. Wherrell, the premier Jersey breeder of Riverside County, were both large buyers. Ten head of good ones went to various men from Orange County where high testing milk is in demand.

The total for the 45 females was \$11,995 at an average of \$266.50 each. In view of the fact that a heavy rain fell all the night before and during the morning, this was a very good average. Unquestionably, had the weather been fine, there would have been double the number of buyers and the prices would have been correspondingly higher.

The sale was in charge of the old reliable sales firm, the California Breeders Sales and Pedigree Company, with C. L. Hughes, the secretary, as pedigree man and Rhoades and Rhoades as the auctioneers. Given a good offering of cattle this combination never fails to bring the highest returns.

A detailed list of the sale offering follows:

Purchased by F. R. Bain, Palms
Queen Wayno, \$410.
Noble's Vilda, \$500.
Petite Fern, \$500.
Noble's Fern of Golden Glen, \$525.

The goat show at the Southern California fair this year promises to be the biggest and best ever held anywhere. The fair officials are going to do a little more enlarging of the goat pavilion, and after that it will be a case of showing only goats of highest quality. Entries are coming in now, and it is understood that quite a number of animals from the East will be on hand.

You Don't Pay For a De Laval It Pays For Itself

A truer statement was never made. Ask any one of the millions of De Laval users and they will invariably reply, "My De Laval doesn't owe me a cent. It paid for itself in less than a year, and ever since has been making me money."

Why? Because the minute you start using a De Laval you get something to sell for cash—cream; and in addition you get skim-milk to grow into another crop of calves, pigs and chickens. Two sources of profit, and a steady cash income every day.

Even if you don't own a De Laval you are probably paying for one anyway—especially if you are using a cheap, inferior or badly worn separator, or are skimming by hand—in the cream that is being lost. No other method of separating cream from milk is so efficient, easy and economical in the long run as the De Laval.

There is a De Laval Separator just right for you, no matter if you have one or a thousand cows. Furnished with hand, power, electric or steam turbine drive. See your De Laval Agent now or write us about getting one.

**Sooner or later you will use a
De Laval
Cream Separator and Milker**

Sir Aaggie De Kol Mead

Bred in the richest Aaggie Acme-De Kol of Valley Mead cross, he should be one of the greatest young sires of the breed.

Five of his seven nearest dams average:

Butter	2 Years.....	2,040.97 Pounds
Milk	2 Years.....	41,547.20 Pounds
Butter	1 Year.....	1,130.66 Pounds
Milk	1 Year.....	23,096.60 Pounds

His seven nearest dams average:

Butter	7 Days.....	30.47 Pounds
Milk	7 Days.....	627.60 Pounds

His calves are just what we could expect from a long succession of great sires and dams, and in their present state of development fulfill every promise in the pedigree of their great sire.

Good business judgment will eventually prompt you to place at the head of your herd a bull of Aaggie Acme-De Kol of Valley Mead breeding.

SEEDS AND PLANTS

SUDAN GRASS SEED

(The Great New Hay Crop)
First Introduced in the United States 1909 from Sudan, Africa. Culture. Strictly an annual, may be drilled or broadcasted, 15 to 25 lbs. per acre, grows 8 to 10 ft. high, yields 3 to 10 tons per acre, two to four cuttings. Pasture. It will yield food for six times as much stock as any other forage with out irrigation. For milk cows and horses there is no better and more abundant pasture than Sudan. It will solve the hay proposition as nothing else can will do in this climate. This seed grown on our farm and is free from John son Grass.

Price—5 lbs. \$1, 10 lbs. \$1.50; 50 lbs. \$7. 100 lbs. \$8; 500 lbs. \$35; 1000 lbs. \$50.

BOWMAN'S HDWE & IMP. CO.

721 J St. Sacramento, Cal.

A Big Crowd Attends Los Angeles County Dairy Picnic

By Jack Klein

ALTHOUGH nothing much is said about the dairy business in Los Angeles County it is way up among the leaders of the state in this industry. The big city of Los Angeles provides the best whole milk market in the West and it is almost impossible to get enough milk from the immediate neighborhood to supply the demand. In consequence dairying is in the hands of men of education and refinement and men who are eager to adopt any method that will improve the industry. The cow testing association of Los Angeles County is one of the largest in the whole country and one of the best. It continually preaches breeding, weeding and feeding and every year many non-productive cows are sent to the butcher through its efforts. This has tended to raise the average of production per cow and will continue to do so. It also preaches the use of the pure bred sire, not the pure bred because he has registration papers but pure bred because he has a long line of great ancestors and because he is out of a high record cow. With prices as they are now it is possible to buy a high record bull calf for what would have been paid for a scrub a year or so ago, and there is no excuse for any dairymen having a poor bull.

The Los Angeles County Cow Testing Association each year carries on a contest among its members and twice a year a picnic is held at which the results are announced and the monthly or yearly prizes are passed out. The picnic commemorating the end of the first half of the 1921-22 contest was held recently at the Adohr Stock Farm at Van Nuys. This is the place where over 400 grade and a few pure bred Guernsey cows are producing certified milk, and it is the only place in the world where milk grading 100 per cent in a contest has been produced. The 200 or more members of the farm bureau present were augmented by the traveling farm bureau congress made up of the farm advisors from all over the state, and quite a crowd was the result.

Assistant Farm Advisor G. E. Gordon who is in charge of the dairy division presented a number of concrete examples of the use of better sires through groups of animals. He first of all attempted to prove to the crowd

that one cannot pick the best dairy cow by looking at her. He had seven cows lined up with a printed record of the seven over their heads. The catch was that the record did not disclose which cow had made the 200 pounds nor which had made over 600. This was a part of the guessing contest. In a contest like this usually the worst looking cow is the best milker and most profitable one to have but this time the best looking cow was the best milker and nearly everyone got the first place right. Almost none was right on the second choice. The Babcock test combined with weighed milk is the only way in the world that the seven cows could have been given their proper rating on production.

The most interesting group was of four generations of females starting with an old imported pure bred female who in her best year on test made 164 pounds butter fat. Her pure bred daughter stood next to her, the result of a breeding to only a fair Guernsey bull, and she in her best year had made 298 pounds butter fat. Both of these records were made as mature cows. Next to this one was her daughter by a wonderful bull and her record as a two year old was 404 pounds fat and more than three times as much milk as her granddam had given. The last one of the group was this heifer's yearling heifer also by a wonderful bull, whose production is of course an enigma but there is every reason to believe it will be good. Not such a high percentage of increase perhaps because the higher up the record goes the harder each extra pound is to make. The advancement in refinement, individuality and conformation from the old cow to the heifer was so apparent that but little comment was necessary. Other smaller groups were shown to emphasize the same idea.

One of the frequent questions asked through the crowd was why the Adohr Stock Farm after years in the cow testing association would keep a cow whose best year netted only 164 pounds butter fat. First of all that is just about the average production of all the dairy cows of California and while it looks small in a herd where many of the cows average over 500 pounds it is pretty good when compared with others. However, that is not the reason she is there. The demand for the product of this farm is so great that a cow producing only that much can do so at a profit when her milk is sold at 28 cents a quart, and she can feed a number of babies in a year. Guernseys for this herd have come from all over the Union and more are in demand. There is no animal in the herd which has reacted and none from herds where there are more than ten per cent reactors. It is easy to see that cows of this kind are hard to get. It is only a question of time until the herd will be big enough to supply the demand and then culling can begin. Using the great bulls they have the daughters cannot fail to be good ones.

Four of the herd sires for this grade herd were brought out for inspection. At the head of the line was Inspiration of Edgemoor, a well known show bull, whose two nearest dams average 865 pounds butter fat in a year. His grandsire was grand champion of the last National Dairy Show and his dam was first prize A. R. cow in the same show. Incidentally she has a record of 796 pounds butter fat at three years of age. Another good one in the line was Reuben King of Hollow-Hill Farm who was a sensation at all the fairs in 1920 and whose dam is the state champion cow in her class with 747 pounds fat in a year. The average record of the dams of the four bulls was over 650 pounds in a year. There are few pure bred herds that can say as much.

One of the most interesting exhibits was the window full of silver cups which will be given out at the end of the present contest. These cups are the donations of various business enterprises which seek to foster the work of dairying and breeding.

After the barbecued lunch which was a wonder, President Rosecrantz of the farm bureau awarded the ribbons

for work done in the first six months of the year. Fred Hartsook has the most first prizes to date with the Maxwell Farms a close second. The Adohr Stock Farm, Harry White, Pellissier, L. A. County Farm and Agee Bros. are also well in the running. The Santa Monica Dairy Company which won the herd prize last year for herds of over 150 head has already won this honor six times this year.

Following the presentation of the

ribbons Superintendent Harriman of the Los Angeles County Farm, who is chairman of the cow testing association, made his semi-annual report in which he said in part:

"It is now four years since the organization of the cow testing association in this county. At that time one tester was employed and the members' herds numbered approximately 900 head. Today three men are constantly (Continued on Page 563.)

VIKING

PUMPS

SOME pumps convert only 40% of the power supplied into useful work—others more, some less. The VIKING utilizes over 60%. That is why it keeps power bills down.

The Viking represents the highest development of the Rotary Principle. It is positive in action—each revolution of the impeller draws in a definite quantity of water, passes it through the pump and FORCES it out the discharge—no churning of water in the pump casing—no unnecessary waste of power.

Sizes: 10, 20, 35, 90, 450 and 1050 gallons a minute.

Our Descriptive Catalog is full of useful Pump Information. Mailed upon request.

De Laval Pacific Co., San Francisco

You Can Plow Out Your Corners With THE GLADIATOR

It Turns Down the Next Row in Vineyards Without Cutting Vines—Nine Feet Outside Turning Radius

The Gladiator is REALLY DIFFERENT. It is the shortest turning machine of its size and power known, making it supreme for the orchardist and vineyardist who say it meets their conditions requiring power and turning ability.

The Gladiator tractor that turns on the inside of a nine foot circle.

- Best tractor engine in the world.
- 4 cylinder engine, governor built in.
- Valve in the head.
- High tension magneto, Impulse starter.
- Implements handled by hydraulic system from seat by driver.
- Handles 3 14-inch plows.
- Power take off on engine.

Poultry Queries

Conducted by Jean A. Koethen

Cholera

I have lost hundreds of chicken with cholera since we came to California, in spite of keeping everything clean. Last night I found my big Barred Rock rooster drooping. Droppings of

older fowl are green and white and those of young birds white. We feed whole barley cooked till it bursts open; cannot afford high priced feeds. The young birds have whole wheat. Is castor oil good for the sick ones?—Subscriber, Corning.

Unquestionably it is that diet of cooked barley exclusively that is upsetting the digestion of the birds. Some hard grain is necessary to keep

the digestive organs in condition, and this must be balanced with some ground grain. If a regular laying mash seems too expensive buy a sack of bran and keep a box of it before the hens, adding a handful or so of beef scrap once in a while. Cook up your potato skins, apple parings, pumpkin rinds, carrot and turnip parings, and all kinds of kitchen refuse, and thicken with bran. Feed this once a day at any hour you prefer. Then for grain it would be better to sprout the barley for a time and feed milo or wheat or cracked corn or wheat with either milo or corn. Two grains are always better than one. Your young birds also should have bran. If you possibly can, add a little coarse cornmeal. Corn is an important part of the ration of growing stock. Equal parts bran and cornmeal with 10 to 15 per cent beef scrap added is what they ought to have, but if they are on range they will do pretty well without the beef scrap. If this is really cholera the only remedy is to clean and disinfect the premises thoroughly and add 1-5000 bichloride of mercury to the drinking water, but I believe if you give your birds a balanced ration, with grit to grind it and as much green feed as they will eat, they will get well without other treatment. Castor oil is all right if you change the ration but of little use as long as you continue to feed the wrong food.

Poultry Wanted

A subscriber wishes to know who has Partridge or Buff Rocks.

Ammonia Odor

On several occasions at various intervals perfectly fresh eggs have strong smell of ammonia when boiled. We gather all eggs every day at houses and yards are kept clean and well ventilated with plenty of sunshine.—Subscriber, Mountain View.

Such an odor can get into the egg in one of two ways. Either it is from something the bird ate before the egg was laid or has been taken in through the pores from contact with or proximity to some object with that odor after it was laid. It is generally believed that fish, onions, garlic and other strongly flavored foods flavor the eggs when eaten in large quantities by the hens. Keeping eggs in close cupboard or cellar where such odorous things were stored might have a similar effect. It seems to me possible that an egg might acquire the odor of ammonia by lying for several hours in a warm nest in which there was hen manure. Scratching in horse manure might conceivably, though not very probably, have the same effect. Keeping them in a cupboard which had been cleaned with strong ammonia solution might produce such a flavor.

Thin Shelled Eggs

One of my turkeys lays a white thin shelled egg. Last year she laid a normal egg. Grit and shell are before her and she is on range. Shell is too thin to handle.—Subscriber, Kneeland.

I wonder if she is not fatter than she should be. Overfat hens frequently lay soft shelled eggs. If you are feeding corn, barley or other fattening grain better change to wheat bran and oats.

Do Not Hatch

When I set my Buff duck eggs under hens the ducklings die in the shell. I set 15 duck and goose eggs under a goose and the ducklings died in the shell, also one gosling. The shell seemed to be too hard for them to break.—Subscriber, Stockton.

Both goose and duck eggs need to be sprinkled often with warm water during incubation. When the duck or the goose is sitting under normal conditions she leaves her nest every day to swim, and when she comes back the eggs are wet by her feathers. Eggs under a hen or under a goose which has no chance to swim miss this wetting, and the caretaker must sprinkle them when the sitter is off. They should be sprinkled at least every other day at first and every day the last week of incubation.

About Turkeys

Which is best for young turkeys, eggs or cottage cheese? How old should turkey hens and toms be when mated? When is a hen too old to be a profitable layer?—Subscriber, Covina.

Hard boiled egg is more generally used as a nursery feed than cottage cheese, possibly because egg would seem to be the natural food for young fowls. I met a turkey breeder of long experience recently who uses both egg and cottage cheese in her nursery mixture. Others feed the egg, mixed with stale bread or cereal and young onions or onion and alfalfa, but keep sour milk before the poults. At the Rhode Island station the egg mixture is fed at first but cottage cheese or curdled milk is set before the poults after ten days. The mating of yearling hens with two year old toms is favored by many breeders. If young toms are used they should be mated to two year old hens. Hens are not generally kept after two years. The breeder referred to above markets every hen the first of June and depends entirely on yearling hens for breeders, but she uses no young toms.

Construction Notes

- Belt driven Heads.
- Direct motor-driven Heads.
- Combination belt and motor-driven Heads.
- Special bearing construction.
- Capacities—180 to 4500 G. P. M.
- Installations to any depth.
- For 10" wells or larger.
- No pit necessary.
- Full floating shaft.
- Sand-protected bearings.
- Perfectly-balanced runners.
- Patented lubricating system.
- Bowls can be lowered to reach receded water level if necessary.

REQUEST LITERATURE

You Pay for a LAYNE & BOWLER Pump whether you own one or not

Pumping equipment is too important to experiment with. As an Irrigator you are paying in the end for a good pump so why not have one? A cheap pump costs more to operate and keep in repair than a Layne & Bowler. Our records prove it; your neighbor's pump proves it; the judgment of Consulting Engineers concedes this fact. By selecting a Layne & Bowler Pump you have assurance of steady, faithful, year-'round service, low operating costs, immediate factory service and the protection of the manufacturers. You remove the hazard of water shortage. Get protected. The initial cost will be returned many times over in increased crop profits. Consult with us.

Layne & Bowler Corporation
900 Santa Fe Ave. Los Angeles

STORRS EGG LAYING CONTEST

Storrs, Connecticut, May 2, 1922.—The hens in the egg laying contest at Storrs have now finished the first half of the year and according to the records which have accumulated in the past contests the birds should lay about 44 per cent of their total production for the year during the first six months. Using this as a basis the hens in the present contest, if they continue to lay as heretofore, should have a total production at the end of the contest of 172,552 eggs or an average of 172 eggs per bird. The total to date for the birds in the present contest is 75,923 eggs, or a yield of 41 per cent. The total production for the week was 4,650 eggs, or a yield of more than 66 per cent. This is 74 eggs more than last week and 186 eggs more than the seven year average and the total to date is 6,608 eggs more than the expected yield for the first six months.

The best pen in the contest for this week is a pen of Barred Rocks owned by Merritt M. Clark, Brookfield Center, Connecticut. These birds laid a grand total of 63 eggs.

The four leading pens in each of the principal breeds are as follows:

Plymouth Rocks

Harry G. Culver (Barred), 1,032; S. Bradford Allyn (White), 966; Seven Hills (Barred), 956; Purdue University (Barred), 936.

White Wyandottes

Frank P. Matteson, 1,140; Woodbridge Orchards, 1,135; Clemens J. Diemand, 1,022; Walter Bradbury, 1,006.

Rhode Island Reds

The Orchards, 1,002; Applecrest Farm, 1,001; F. S. Chapin, 967; F. H. Sampson, 962.

White Leghorns

Goshen Poultry Club, 996; J. Frank Dubois, 963; Hollywood Farm, 947; L. E. Ingoldsby, 907.

NEW YORK BRANCH OF PACIFIC EGG PRODUCERS

The New York branch of the Pacific Egg Producers is now established at 139 Reade Street, New York City, an excellent location on one of the best streets in the butter and egg trade district of New York. We occupy there the main store floor, and basement, with ample office accommodations and a large refrigerator compartment which will hold five carloads of eggs.

Earl W. Benjamin, who has been engaged as manager of the New York branch, was formerly professor of marketing in the poultry husbandry department of the New York state college of agriculture and in that capacity made a thorough scientific study of the production and distribution of eggs and other poultry products. For some years he engaged in practical egg business during the long summer vacations while still connected with the college, and a year ago was engaged to manage the egg department of M. Augenblick & Bro., one of the largest egg houses in the East, becoming recently the manager of their New York branch. Mr. Benjamin is a young man of pleasing and vigorous personality. He is popular with the New York egg trade and is recognized as having considerable business and executive ability, while his industry and integrity are unquestioned. A small but sufficient office and sales force has been engaged to assist Mr. Benjamin in handling the business. This will be added to whenever the business requires it. All employees in responsible positions are being placed under bonds.

Just now the business of the New York branch is confined to the shipments of our own association, because the Oregon association will not be free from its present contract in New York until June 1 and the Washington association not until November 1. The Los Angeles and San Diego associations are free to ship to the agency, but they are making no shipments at this time of year, as all their surplus eggs are going into storage.

Figuring, however, on the probable amount of business that will be handled this year by the New York branch for each association during the time that each will be shipping, it is estimated that there will be a saving of at least \$20,000 over the best commission proposition that was offered

Rid Hens and Chicks of Lice and Mites

A Few Drops of Wonderful New Remedy In Drinking Water Does It—No Dusting, Spraying or Greasing

Any poultry raiser can easily and quickly clean out Lice and Mites by using a new Remedy recently discovered by a Kansas City chemist and called Imperial Lice and Mite Remedy.

All that is necessary is to occasionally put a few drops of this amazing remedy in the fowl's drinking water. It renders them immune from the attack of all blood-sucking parasites, as these pests positively will not stay on a fowl taking this remedy.

It also acts as a splendid Tonic and Blood Purifier, as well as increasing egg production and growth, for with these pests eliminated, hens lay better and young stock grows faster. It is positively guaranteed not to affect the meat or eggs.

The manufacturers of Imperial Lice and Mite Remedy are anxious to get it quickly introduced among poultry raisers everywhere, and make this Special Introductory Offer. Send no money, just your name and address to the Imperial Laboratories, Room 568, 2110 Grand Ave., Kansas City, Mo., and they will send you a regular full sized \$1.00 bottle and will also send you free a big full sized (double strength) \$1.00 package of Imperial White Diarrhoea Remedy, the standard, time-tested remedy. Pay the postman only \$1 and a few cents postage when both packages are delivered. Any time within 30 days, if you are not satisfied with results, just say so and your money will be cheerfully refunded.

Tangerines: Market firm, 8@10 lb.

HONEY

Winter loss for the state as a whole is estimated at 5-10 per cent, largely resulting from the severe freeze early in the spring which injured brood as well as bees. Prospects continue favorable for a good crop of honey with normal weather conditions. The new crop is being delayed by the late spring. Few large sales have been made during the past two weeks, as supplies are said to be limited to scattered holdings. In addition to selling practically all of the 1921 crop, a large holdover from the 1920 crop has been disposed of. Rather extensive exporting during recent months has accounted for part of the movement.

HAY

Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats 20.00@26.00

California Valencia Orange Show

Anaheim, May 23-30, Inc.

The greatest Exposition of the Valencia Orange ever conceived.

A wonderful display of features, a treat to those who love the beautiful.

A great instructive display of Valencia prize winners, avocados and other citrus fruits.

An industrial exhibit showing every kind of machinery and accessories used in orange culture.

A child welfare department—radio demonstrations—vaudeville, orchestras—automobile display—art display, etc.

More than 100,000 feet under canvas.

Open daily from 10 a. m. to 10:30 p. m.

Allis-Chalmers 6-12 Tractors

A universal tractor for California orchards, vineyards and fields.

Priced right.

H. V. Carter Motor Co. 52 Beale St. San Francisco

(Also distributors of Beeman Tractors, Warner Drag Saws, McKay Disc Plows, Lawn Mowers.)

Dusting of Trees, Vines, Etc. Bleaching, Etc.

ANCHOR BRAND SUB-LIMED VELVET FLOWERS OF SULPHUR, also EAGLE BRAND and FLEUR DE SOUFRE, packed in double sacks, are the FLUFFIEST and PUREST sulphurs that money can buy.

The fine light SNOW-FLAKE-LIKE particles float to every surface and crevice of the plant.

Do not adulterate these sulphurs with any inert material such as lime or Kaolin, etc. Coating the sulphur particles with an inert material PREVENTS the FUMING ACTION caused by the sun's rays.

Send for Circulars 6, 8 and 10 about our "Toro" Brand Agricultural Compound and booklet, "The Truth About Sublimed Sulphur," also price list.

San Francisco Sulphur Co. 624 California St. San Francisco, Cal.

A BIG CROWD ATTENDS LOS ANGELES COUNTY DAIRY PICNIC

(Continued from Page 559.)

in the field and we hope to have another after July 1. The 47 member herds include over 4300 cows, the number actually milking and tested last month being 3631. At the beginning the average production was 28.5 pounds fat per cow per month. Now it is a third higher, which means that by advanced methods this number of cows is now being made to produce \$400,000 per year more than when this work was begun.

"This association is now probably the largest in the country and the production attained in members herds has attracted national attention. Our members won a large proportion of the monthly and yearly awards in the state dairy cow competition and have been quoted regularly in the western branch, dairy division of the U. S. department of agriculture for the high association, herd average, or individual production compared with all other such associations west of the Rockies. Some months ago we had the pleasure of reporting to the department of agriculture the five highest producing cows ever reported by one association in a single month. These cows averaged 112 pounds fat each for the month. During the past month we have again exceeded this figure with five cows making a total of 577.4 pounds fat. During the month of April, 1183 cows have exceeded 40 pounds fat, 207 made over 60 pounds, and 4 over 100 each, or more than double the proportion of high producers in other large associations.

"In order to furnish permanent records of this work the records of the monthly tests on each cow are entered and signed by the tester in a loose leaf book, each leaf being made in the form of a certificate of production. It has been proven that such records have a very substantial value in selling the stock, the certificate being transferred to the new owner as absolute proof of the quality of his purchase. This form of record, which was devised for our own use, has proven so well suited to the purpose that it is being widely copied throughout this state and elsewhere.

"During the past year this department has also held a number of meetings at different dairies for the discussion of subjects important to the industry. Improved methods and equipment were studied and cattle judging contests and other demonstrations given. Exceedingly practical programs were provided covering feeding, production of clean milk, tuberculosis con-

trol, sterility and abortion by men who were competent authorities. The meetings were well attended and the interest shown was very gratifying.

"In our study of dairymen's problems we have not neglected the conservation of the farm's most important product, our boys and girls. In cooperation with the Holstein Breeders Association and the county club leader our committee has assisted in judging entries in the calf club contest and in preparing the rules under which the contest will be conducted. The calf club members were also guests at the Annual Guaranty Sale of Holstein cattle and the two day sight-seeing trip which followed. They have been supplied with reading matter which should further their interest in good cattle and help them in feeding and care of their entries. We try to make them feel our very real interest in each of them. We sincerely believe in the value of this kind of work."

STALDER HOLSTEINS GO AT BARGAINS

May 11 was bargain day for Holsteins in Southern California when Ed Stalder dispersed his herd. Many of the animals had faced the auctioneer before and brought much higher prices than they did this time. Also there were a number of young calves and about 20 young bulls which brought the average down. The fact that the herd was sold without being subject to the tuberculin test was a prominent factor in keeping the price down.

The high cow was Partheneia Netherland Pontiac who has a record of 27.5 pounds butter in seven days, who brought \$330.

GUARANTY SALE COW BREAKS ALL STATE RECORDS

Norma Korndyke Cornucopia, the 38.42 pound cow bought by Fred Hartsook in the last Guaranty sale, has just finished a seven day record in which she made 42.8 pounds butter from 886 pounds milk. She was bred at the time of the sale to Sir Aaggie Mead, the great bull owned by W. J. Higdon and F. S. Borror and Son and dropped a fine bull calf. This is the second cow in the Hartsook herd to make over 40 pounds and they did this less than six weeks apart. Norma's performance breaks all records in the state for seven days butter and is thought to be the second highest for milk.

CALIFORNIA VALENCIA ORANGE SHOW

Anaheim is ready for the Valencia Orange Show which will open its gates, May 23, remaining open to visitors till and including May 30. In addition to competing displays of Valencia oranges there will be grapefruit, lemons and avocados in both commercial and feature exhibits.

PACIFIC EGG PRODUCERS

(Continued from Page 561.)

us. Besides this, with our own people in New York working for us, directly under our instruction and supervision, we shall be able to get a marketing service such as no commission house could be expected to give. We shall also be kept much more closely informed on eastern market conditions than has been possible hitherto.

Personally, I believe that this is the most important step that has been taken since our association was first organized. It is a step that we have been looking forward to for some time, and it is now taken under circumstances which give it every promise of success.—J. H. Barber, General Manager.

The fourth vessel to leave Los Angeles harbor loaded with food and clothing for starving Armenian children is scheduled to depart next week. Thursday, May 25, is "Bundle Day," and everyone who can do so is invited to send something for these unfortunates to the nearest "bundle station" or notify some boy scout or mail by parcel post to Relief Warehouse, 510 South Molino Street, Los Angeles.

Already it is getting late to thin apricots. Some of them need it, and badly. Better get busy.

"what's on the tag is in the bag"

Net Weight 100 lbs.
Surelay Egg Mash
Manufactured by
SPERRY FLOUR CO.
STOCKTON, CALIFORNIA

Contains: Flour, Middlings, Shorts, Bran, Mill run,
Corn Grits, Corn Middlings, Meat Meal, Whale Meat,
Charcoal, Coconut Meal, Soya Bean Meal, Ground
Barley, Ground Rye, Ground Rice.

Minimum per centum of Crude Protein	20.00
Minimum per centum of Crude Fat	4.00
Maximum per centum of Crude Fiber	7.00
Maximum per centum of Crude Ash	10.00

ON EVERY bag of Sperry Feed is a tell-tale tag. This tag tells you plain-as-day what's inside. Yet the most important "ingredient" in this sack of feed—the thing that makes all the other ingredients count—is not to be found on this tag. For this all-important ingredient is CONFIDENCE.

- confidence in our practical, hard-pan knowledge of poultry problems.
- confidence in the Sperry formula and the seasoned experience back of it.
- confidence in our daily laboratory tests that make each batch of feed measure up in net feeding value.
- confidence in our ability to produce, at the lowest manufacturing cost, a prime quality feed that does what it's made to do.

You can never go wrong on SURELAY because we make it our business to see that everything goes right in the blending. We take guess-work out of your feeding by keeping it out of the feed.

SURELAY is always the same—always uniform. That's why you should always specify SURELAY in the yellow-striped bag when ordering from your dealer. Then you'll never be in doubt as to how the feed will turn out; for "what's on the tag is in the bag"—always!

The new edition of our guide-book to poultry profits—"Makes Hens Happy"—tells why Sperry Feeds mean more eggs and more dollars to every poultryman. Send for it today—mail the coupon now!

In Flanders' Fields

(The Veterans of Foreign Wars and the American War Mothers have requested that all will wear on Memorial Day the Flanders Poppy, the Inter-Allied Memorial Flower.)

In Flanders' fields, the poppies grow
Between the crosses, row on row
That mark our place; and in the sky
The larks, still bravely singing, fly,
Scarce heard amid the guns below.
We are the dead. Short days ago
We lived, felt dawn, saw sunset glow,
Loved and were loved, and now we lie
In Flanders' fields.

Take up our quarrel with the foe!
To you, from falling hands, we throw
The torch. Be yours to lift it high!
If ye break faith with us who die
We shall not sleep, though poppies grow
In Flanders' fields.—Lieutenant-Colonel John McCrae.

Memorial Day

THERE is no other day in all the world like our own Memorial Day. No other people has set apart a day of remembrance on which the whole nation goes forth to beautify with the blossoms of spring the graves of the men who gave or risked their lives in battle for their country. That may be because no other modern nation has until now faced, as the United States faced half a century ago, an armed threat against its very existence; it may be because there is among Americans a vein of sentiment that expresses itself with unusual frankness and spontaneity. For there is no misjudgment more grotesque than that which accuses America of materialism. There are materialists among us, as there are in every country; but beneath and beyond all we are incurable idealists. We have never followed any leader who did not feel and nobly express the spiritual aspirations of a free democracy. We have never fought willingly except in defense of those aspirations.

For Memorial Day has always been an occasion not only for memories but for consecration. To the gray-haired men, every year fewer in number, who actually bore the heat and burden of our war of reunion it is perhaps chiefly a day of memories. But for the rest of us it cannot be that; if it is to have vital meaning for us, it must have root in our own experience and in our own present needs. The sight of the bent and aged men who in their youth and strength made it possible for this republic to come forth from its travail free and undivided and great, the simple and beautiful commemoration service, the half-masted flags, and the graves heaped with flowers—these things touch with momentary feeling even the most thoughtless. But if that is all, the day has failed of its noblest mission. If it does not rouse in us all—men, women and little children—a fresh understanding of all that our country means to us, if it does not kindle anew our devotion not only to our native land itself but to all the principles of human liberty on which our government is founded, if it does not make us glow with a living desire to be of service each in his own way to the cause of freedom and justice among mankind, then we have lost the message that the patriots who instituted the day meant it to carry.

If we have, some of us, taken this day too lightly, if we have thought of it rather as a welcome holiday than as a solemn day of consecration to the nobler ideals of national life, let us not make that mistake this year of all years. The world is being remade about us; it is not too much to hope that, in Lincoln's mighty phrase, all mankind is under God to have a new birth of freedom. In this great crisis of the race America is to have a part. On this most hallowed of days let us pledge ourselves and all we have to making that part not only honorable but glorious. Let each of us see to it that through him the republic is not hindered in the path of service.—Youth's Companion.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

Nothing more beautiful than California poppies can be used in memory of our soldier dead. Returned overseas service men are united, however, with British, French, and others of our allies in choosing Flanders poppies to be used in official observance of Memorial Day. We believe the idea is that all over the world where the heroes of the World War lie buried the Flanders poppy shall be used.

In order to supply the flower little grown in this country artificials are being recommended for this year. Headquarters at Washington sends this information: "The poppies used in the official observance of Poppy Day are made by our own disabled soldiers or shipped direct from France, the handiwork of the women of the devastated areas. The proceeds of the Poppy Day sales will be used by the Veterans of Foreign Wars as a relief fund for ex-servicemen to meet especially the distress occasioned by the present economic crisis."

The older "boys" in blue or veter-

ans of '60-'65, for whom Memorial Day was first designated, will so far as they are still with us unite in observance of the day by placing small flags and masses of all kinds of flowers on the graves of Civil War veterans. Beside the boys of the Civil War and the boys of the World War there are also many graves of the veterans of the Spanish American War. None will be forgotten, for even in most remote sections Memorial Day will be observed.

Modern life becomes more and more complex. If our pioneers of tallow candle days could look in and see us using electric lights, telephones, phonographs, radiophones, and other necessities of modern life they might well wonder as to whether we are of their same race. Take the matter of insurance. 'Tis but a few years since vessel owners gathered together and agreed to protect each other in case one of their vessels went down. From marine insurance was developed fire insurance, and at first this was classed with the lightning rod as a needless addition to the ways of spending money. Later came life insurance, and now we insure our feet, our fingers and thumbs, our eyes, even our future income.

We insure our automobiles against loss by fire, by theft; we protect ourselves against loss which the other driver may inflict upon us and against the injury which we may do by driving our machines into others. So because of these numerous protections required the various premiums we are compelled to pay are becoming exceedingly burdensome. For the protection against fire we have had the burden lightened somewhat through cooperation. Mutual companies have solved the question only in part. Under the present state law certain classified favorable risks may be gathered together in one pool, and after a period of 25 years trial it has been found that the people who can agree to protect themselves can do so at about one-half the cost which is made necessary by insurance in the "old-line companies." Further, in California it has been proven that the protection is even stronger than in the companies which carry large cash reserve.

The mutual companies are, however, in addition to the personality of their membership, adding other protection in a small reserve. This does not in any way lessen the security given by the assessing power which is made possible under the state law.

Fire and life insurance are much simpler, at least the problems have been better worked out, than those of automobile accident insurance. Some change in state laws will be necessary before a satisfactory plan can be evolved. However, those of us who are carrying full auto insurance are hoping for relief as soon as possible.

Next week will be a busy one in Sacramento. County, state and federal officials are gathering and will discuss cooperation in protection from the introduction of insect or fungous pests. Quarantine officials from the seven coast and mountain states will attend.

Regarding this service Director Hecke writes: "A cooperative agreement between the federal horticultural board of the U. S. department of agriculture and the California state

department of agriculture is maintained and has been in force since the passage of the federal plant quarantine act of August 20, 1912, in order that quarantine orders promulgated under this act might be carried out at California ports of entry. At that time the federal authorities recognized the efficiency of the California quarantine service and appointed our men as their collaborators to enforce the federal quarantines rather than to send separate officers into the state to duplicate the work. In this way California is better protected from the entrance of insect pests and plant diseases at our ports of entry because of the added authority given by this cooperation. A cooperative service is maintained by the bureau of entomology of the U. S. department of agriculture through the appointment of Harry S. Smith, chief of the bureau of pest control of the California state department of agriculture, as collaborator in certain work carried on in California by that bureau."

DAYS OF '49

California's capital is declared to be "the center of a human vortex" this week. Everybody is wearing whiskers, but those who have seen them declare "they ain't much" although "they say" there are at least two real sets of whiskers there. These are some seven or eleven feet long—according to reports. In any case there were great doings in the "digin's," and the celebration extended all the way from Coloma, Placerville and other old time placer sections down to Fort Sutter.

STOCKYARDS

We are now assured that the stockyards will soon become a fact in Los Angeles. Small stockmen seem to smile and accept the situation with a fair degree of grace. The larger, especially the big cattle owners, are objecting most strenuously. The California Cattlemen's Association is opposing it with all its power. Secretary Hagen writes:

"The California Cattlemen's Association can see no good reason why the livestock producers of California should be forced to change their system of marketing to their disadvantage, and with no beneficial result to the consumer. California livestock producers have enjoyed the best market in the United States during the past 13 months, and livestock producers in the Midwest are endeavoring to avoid making purchases and sales at stockyards, which system of centralized marketing decreases the return to the seller and increases the cost to the buyer, which increased expense must naturally be borne by the consumer."

To us it appears the smaller cattleman has cause for rejoicing in the coming of the yards.

NURSERYMEN'S ANNUAL

The 12th annual convention of the California Association of Nurserymen will be held in Sacramento Thursday, Friday and Saturday of next week, June 1-3. Thursday's forenoon and afternoon sessions will be given up to the usual reports of officers and committees, the forenoon at the Travelers Hotel, the afternoon at the assembly chamber of the state capitol. The afternoon session will be a joint conference between the nurserymen and the county horticultural commissioners. The evening session will begin at 6:30, at which time dinner will be served at the Del Paso Country Club.

Friday's topics are florists, seedmen, grading of fruit trees, sub-trop-

ical fruits, especially bud selection; landscaping, credits and credit principles. Saturday morning's session will be to an extent executive and that time election of officers will take place, and final reports be made. Saturday afternoon will be given up to "doing" Sacramento by automobile.

THE VALENCIA SHOW

One of the prettiest little shows ever staged is on the boards at Anaheim this week. The number of feature exhibits is not as great as last year. This is due in part, perhaps, to weather conditions of this season. The communities which have installed exhibits have done themselves proud and there is a showing of beauty of features as well as of quality in the commercial pack. The most striking view inside the first great tent meet one as he enters. The manager has arranged the main entrance so that everyone coming in is compelled to walk up an incline to an elevation which gives a magnificent view down the entire length of the tent. The tents spread over 100,000 square feet and under them are displayed not only the oranges, lemons, avocado and other sub-tropical fruits but a fine art exhibit, merchandise, orchard implements, power machinery, and an automobile and truck exhibit which for size and attractiveness is equal to that of many automobile shows.

TURNING BACKWARD

In one respect it seems to us that the country, even California, is failing to advance its development as it should. This is in the matter of transportation from remote districts. We have voted millions for improving our highways in order that transportation may be facilitated. The state railway commission is, however, taking the position that highways should not be permitted to jeopardize the investment of railways. While it is true that the development of this country has been made possible because of the railways, and while they should be protected in their investment as far as possible without jeopardizing the country's advancement, we still believe that the denying of permits for truck transportation will result most seriously in the development of some districts.

Commenting on this the Yucaipa News has said:

"The campaign being waged by the railroads against competing motor lines, with the public utility commissions of the various states is beginning to bear fruit, and a recent decision by the public utilities commission of Colorado denying the application to operate an auto truck and bus line enunciates principles which carried to their logical conclusions will seriously hamper, if not entirely prevent, the further development of the country. Not only this, but by inference these principles would do inestimable harm to such communities as Yucaipa which are entirely dependent upon truck and bus transportation. Public utility commissions should recognize that railroads have practically ceased to build new lines, and that unless the state has been developed to its fullest extent, care should be exercised not to prevent the development of other means of transportation, for transportation is the life of any country and without it no development can take place. Moreover, the burden of transportation on agriculture is one of the causes of business depression throughout the country. When transportation costs are so high that farm products are left to decay in the fields it can hardly be said that the transportation facilities of that particular farm community are "adequate" from the standpoint of the shipper or consumer.

WITH the effects of the January freeze still in evidence all around us and a good many of the citrus growers wondering just how they are going to properly care for their groves until another crop is ready for market, or perhaps still wondering whether they will even be fortunate enough to have a crop in 1923, we naturally hear all kinds of arguments regarding the merits of the different methods of frost fighting.

Those who escaped serious injury either through being in locations where the cold did not strike or where the strong air currents carried the frost away, are not so much interested now and are inclined to advise their less fortunate neighbors to move to warmer localities or plant crops that are not susceptible to extreme cold weather. However, those of us who have watched frost conditions in Southern California for the past 30 or 35 years know that there are very few absolutely frostless sections here, and while certain locations escape more often than others there are hardly any but that get some damage now and then. In these favored localities the danger of severe cold is perhaps so slight that growers would not be justified in going to the expense of installing expensive frost fighting equipment, but from the experience of the past winter it would seem that these favored localities are becoming more limited, and we are beginning to think that the advice given by a certain authority shortly after the 1913 freeze, when he recommended 100 fire pots to the acre in ordinary locations and 200 to the acre in so-called frostless sections, was about right. It is true that citrus trees in these favored locations will not stand as much cold as those growing in colder sections, and therefore need more protection when a cold snap does come. This is due to the fact that those growing in sections where the temperature during the late fall and early winter often drops to or almost to the freezing point, become more nearly dormant, while the

Frost Fighting

By W. R. Wood

higher temperature in the more protected locations tends to keep the trees in a growing condition and therefore much more tender.

That nearly all of the citrus growing sections need more or less frost protection I think is admitted by most growers after the experience of the past winter, especially those who also experienced the effects of the 1913 freeze.

The question now, as in 1913, is how best to protect the grove. The writer remembers quite well the first attempts made along these lines when it was thought that a heavy smudge was the all important factor in preventing frost damage, but of late years we find that while smudging may be of some advantage in light frosts it will not save either the fruit or trees after the temperature drops below a certain point. During extreme low temperatures there must be sufficient heat created to warm the air strata throughout the grove, and as the tendency is for the warm air to rise and the colder air to settle toward the earth, we have the problem as we have often heard, "of trying to warm up all out doors." At certain times when there is some slight movement of the air it is not difficult to keep the heat well distributed through the grove, but unfortunately our coldest weather usually comes when there seems to be absolutely no movement of the air and it is difficult to keep the heat where it is needed. This condition prevailed in most sections during the January freeze, and no doubt accounts for the unsatisfactory results obtained from the fire pots in some sections. There seems to have been more lack of uniformity in results from heating during the past winter than during the 1913 freeze, at least

the results were not what they should have been or what was expected from the improved fire pots. In the writer's opinion this was due largely to air conditions, and the next freeze (which we hope will not come for some time at least) may, and very likely will, upset all the theories and lessons deduced from the experiences of the past.

It would seem that the question of whether it was best to use "tall stacks" or "low stacks" or no stacks at all, is a matter dependent on air conditions at the time of or during the freeze, and as that is an unknown quantity it remains for some inventive genius to construct a fire pot with a stack that can be adjusted to meet the air conditions during the time the pot is in use or to devise some means of creating an artificial current of air throughout the grove that will hold the heat where it is needed.

At the present time there are all kinds of suggestions and some devices being offered to try and overcome the unsatisfactory results obtained the past season.

In looking over the Cultivator files for the year 1913 it is surprising to note how similar the articles on frost fighting at that time were to those being offered at the present. Especially is that true with regard to the necessity of some method of frost control, and as a result, we find that the factories manufacturing fire pots were hardly able to meet the demand in time for the winter of 1913-14. A few mild winters, however, caused growers to soon forget the danger, and excepting in the more exposed localities the fire pots were either discarded or not put in the groves during the winter, and we again hear the idea advanced that cost of fire pots,

oil, storage and equipment is so heavy a carrying charge that the growers could better afford to lose a crop now and then rather than maintain this expensive equipment. This no doubt was, and still is true in some localities and perhaps in others where the equipment was not properly cared for and allowed to rust out either in the fields or in the storage sheds. However, there is no excuse for this rapid deterioration if the owner will take the proper care of his fire pots the same as he would or should of any other farm implements.

Once more we are talking frost protection fully as sincerely and even more determinedly than in 1913. Will we forget it again as the effect of the past winter gradually dims in our memories? We certainly should not; at least there should be some concerted movement by the growers, either through the California Fruit Growers' Exchange or otherwise, to establish experimental heating plants at different points, these plants to be under the supervision of competent men who will test out the different heating devices that give promise of having some merit. These tests should be carried over a series of years so as to determine the action of the devices under the different air conditions. In this way the reason for the failure of certain devices or equipment to give satisfactory results could be quite definitely determined, also equipment best suited to the conditions prevailing in the different sections. It would seem that information thus obtained would be of immense value to the citrus industry in seasons like the one just passed, and the expense would hardly be felt if assessed against the entire output of fruit. A fraction of a cent per box each season would raise sufficient funds to carry on quite extensive experiments, and who is there among the orange and lemon growers who would not give a quarter or half a cent per box on their output to gain some definite information on this all important subject.

Problems Which the Avocado Industry Must Meet

AN INDUSTRY can look forward to an indefinite period of prosperity without maintaining a department for systematic research. This is especially true of horticulture. It is not desirable or even possible for any horticultural industry to remain permanently in any definite and fixed condition. The horticulturist is continually meeting new and increasingly complex problems. The improvement of varieties, the maintenance of soil fertility, the study of plant diseases, insect pests and injurious fungi, and the adjustment of conditions to ameliorate the hazards due to climatic changes must always occupy a prominent place in any successful horticultural industry. Continuous and systematic research is the only means whereby such problems can be successfully met and solved. The time has arrived when this industry should be operated on a strictly scientific and business basis.

One of the most important problems with which horticulturists are concerned is the improvement of varieties. No field offers greater opportunity for scientific research and no field has yielded more interesting and valuable results. An immense amount of work has been done to improve other fruits and vegetables, and remarkable results have been obtained. In the case of the avocado, however, one of the most important foods in the world, practically no effort has been made to improve the existing varieties. This work will be undertaken some time, and it seems to me that our association should inaugurate its movement now. It is in line with its progressive policy.

In order to improve the avocado here are many points to be consid-

By W. L. Hardin, President California Avocado Growers' Association. Annual Report

ered, such as the size, shape and color of the fruit; nature of the skin; condition of the pulp; size and condition of the seed; character, precociousness and prolificness of the tree; keeping qualities of the fruit after being picked; length of time the fruit hangs on the tree; susceptibility of the fruit and tree to soil and climatic conditions; and the chemical composition of the edible portion.

The improvement of the chemical composition of the avocado is one of the subjects to which I desire to call your special attention today. As an example of the change in the chemical composition of an agricultural product by long systematic work, reference might be made to the sugar beet. Nearly a century ago a German chemist analyzed the ordinary garden beet and found that it contained from 4 to 5 per cent of sugar. By a long process of careful analysis of beets and selection of seeds, the percentage of sugar was gradually increased till in 1918 the sugar beets of Southern California averaged about 19 per cent sugar. In other words the sugar content of the beet has been increased four fold, and the whole beet sugar industry has been made possible by this scientific work on changing the chemical composition of the beet.

Analysis of the avocado shows it to be rich in fat, protein and mineral salts. The fat content in the better varieties is all that can be desired. On the other hand, it is especially desirable to increase the content of protein which is also one of the essential articles of diet.

The comparatively few analyses which have been made of the avocado by Mr. Chace and Professor Jaffa show a wide variation in protein content, not only in different varieties, but in different fruits of the same variety, as shown in the following table:

Variety	% Protein
Sharpless	1.13 to 1.92
Spinks	1.50 to 2.70
Fuerte	1.25 to 2.32
Puebla	1.62 to 2.30
Lyon	2.12 to 4.37

Other varieties show similar results. The maximum variation in these few analyses amounts to nearly 400 per cent, while the maximum variation in any one variety is more than 100 per cent.

The question arises as to how the protein content may be increased. Bud selection is the most feasible and the quickest method. There is no doubt that the size and condition of seeds, as well as the size and quality and the chemical composition of fruits and vegetables can be controlled to a large extent by bud selection.

In regard to the avocado there is abundant evidence of bud variation. The variations in the shape of the fruit, size of the seed and condition of the pulp in any variety are probably due in a measure to bud variation. The large variations in the protein content of any variety as well as large variations in the fat content are probably influenced by bud variation. Mr. Rideout reports a Ganter tree which always bears fruit black in color on one of its limbs. This is evidently a true bud mutation.

A very careful and exhaustive investigation should be made of the avocados in Southern California to determine the extent of bud variation and to determine how far these variations are due to environmental conditions and to what extent the variations are inherited, in order that some comprehensive plan for the improvement of the avocado may be inaugurated. If these investigations show that the variations in the chemical composition are due to bud variations and that these variations can be reproduced by bud selection, then the U. S. department of agriculture should provide a competent chemist to accompany Mr. Wilson Popenoe to points in Mexico and Central and South America where the better varieties of avocados are to be found, in order that similar investigations may be made at these points.

This suggestion is not made with a view of criticising in any manner what has already been done. Mr. Popenoe's explorations represent a magnificent and colossal piece of work, which will be of inestimable value to the avocado industry in Southern California. It would have been unwise to undertake a systematic and extensive chemical investigation of avocados in these countries until the better varieties had been definitely located. In order to reap the full benefit of Mr. Popenoe's extensive work by bud selection, however, it may be necessary, not only to analyze the different varieties, but to analyze the fruit from different branches of the same tree. The most desirable strains of the different varieties can be determined only by such investigations.

Before leaving the subject of increasing the protein content of the

(Continued on Page 587.)

Agricultural News Notes of the Pacific Coast

Northern California

Shasta County expects the largest prune crop in years.

The first carload of 1922 cherries was sent east last week.

The Sutter Basin Company is planting asparagus near Hinsdale.

Price of San Quentin grain bags was raised from 7½ to 8 cents May 22.

The recent farm federation picnic at Ahl grove in Colusa County reports attendance of 3,500.

Cherry crop this year is light, estimated by California Fruit Distributors at 65 per cent of normal.

Dr. Barrows has resigned as president of the state university. The regents have not yet selected his successor.

Canners and driers are both cleaned up on fruit stocks so that demand from these sources will this year cut down Eastern shipments of fresh fruit.

The first Western Sonoma-Marin Dairy Cattle Show will be held at Valley Ford, June 10-11. There will also be exhibits of other livestock and poultry.

Sutter County now has 10,500 acres planted to peaches, mostly canning varieties. 2,467 additional acres were planted in the first three months of 1922.

County Horticultural Commissioner Harney of Yuba County says peaches and prunes will run 110 per cent of normal this season; apricots, 65 per cent.

Florin, Sacramento County, will soon be sending out carload shipments of strawberries. Strawberry root worm has been giving some trouble to growers.

The class in citriculture from the state college of agriculture visited groves in the Fair Oaks and Orangevale districts of Sacramento County this week.

Contract has been let by the state highway commission for the section of the Tahoe-Ukiah highway between Upper Lake and the west boundary of Lake County.

The Eden Township Farm Products Show will this year be housed in its own buildings if plans launched at a recent boosters meeting at Hayward are carried out.

The highest testing cow in the Petaluma unit of the Sonoma County cow testing association for April is owned by L. Petersen. Her record was 79.2 pounds butterfat.

Practically all wool in the Livermore and Stockton districts has been sold at prices ranging from 31 to 36 cents. Heavy shipments of sheep also are being made.

Dr. E. H. Walker of Willows, Glenn County, president of the California farm bureau federation; has been made general manager of the California Farm Bureau Exchange.

A pigeon branch of the Alameda County farm bureau is proposed. Hayward claims to produce one-third of the squab output of the United States during the fall and winter months.

Articles of incorporation of the California Prune and Apricot Growers' Association, marking the completion of the organization under the new seven year contracts executed with grower members a year ago, were filed at San Jose, May 3.

Central California

Kern County agricultural fair at Bakersfield, October 2-7.

Work is being pushed on the Knights Ferry-Yosemite highway.

The three creameries in the Tulare district paid out \$117,000 for April butterfat.

Stock feed in Tulare County is said to be better than since 1906 because of rainy season.

The Monterey Pomona Grange will hold basket picnic at Sherwood Park, Salinas, May 27.

Vineyardists of McFarland appraise damage to Thompson Seedless from ten to 20 per cent.

A collection of date palms will be planted at the Shafter experiment farm in Kern County.

Farm center meetings in Kern County: Shafter, May 22; Arvin, 26; directors, Bakersfield, 27.

The Wawona road from Yosemite to the big trees at Wawona was officially declared open to automobiles May 14.

Horticultural Commissioner Brann of Tulare County says, apples, berries, figs and pomegranates will be a normal crop; prunes and grapes, 95 per cent.

Farm home department meetings in Kern County: Kern Delta, May 22; Edison-Fairfax, 23; Wasco, 29; Delano, 31; Arvin, June 1; project leaders, 2.

Members of the California Growers & Shippers Protective League met at Fresno, May 16, to initiate a campaign in the San Joaquin Valley for lower rail freight rates.

Members of the Tulare County Cooperative Poultry Association will receive 23 cents per dozen for No. 1 eggs for April. The month's egg shipments totalled \$12,400; poultry, \$4,000.

Organization of the Richgrove Jasmine Citrus Association has been completed. Frank Daybell has been chosen president; O. T. Stephens, vice-president; E. G. Washington, secretary-treasurer.

A number of small stockmen near O'Neals in Madera County have for two years cooperated in handling their cattle on summer pasture in the Sierra and are now planning to purchase winter feed together.

The Kern River Livestock Association held its annual meeting at Isabella the first week in May and planned an extensive squirrel poisoning campaign in cooperation with the horticultural commission.

The All American Fruit & Berry Growers Exchange has been incorporated by farmers in the Arcade, Del Paso and Hagginwood sections. The association will market through the California Fruit Exchange.

Kern County cow testing association tested 883 cows during April. 151 produced more than 40 pounds fat. The average was 29.5. Highest record made by Guernsey owned by P. Catani of Bakersfield, 67.8 pounds fat.

Secretary Miot of the Tulare County board of trade reports crops for 1921 valued at \$32,153,123, citrus leading with \$9,783,330 value, raisins second with over \$6,000,000, shipping grapes third with nearly \$4,000,000. Poultry and eggs nearly reached the million mark.

Southern California

Blythe, Riverside County, is making carload shipments of lettuce.

Many ranchers at Indio Heights are setting out grapefruit orchards.

Escondido expects to receive irrigation water from the proposed Warner's dam.

R. B. Peters says San Bernardino County's crop of peaches and apricots will easily reach 50,000 tons.

Apple growers of Yucaipa Valley have concluded that practically no damage was done to setting fruits by the frosts. Stone fruits suffered.

R. L. Wilson of Beaumont has been appointed a member of the pear and apple marketing committee of the Southern California farm bureaus.

The Southern California Purebred Livestock Association will hold a meeting at La Habra, May 27, in connection with the chamber of commerce and farm bureau.

Ventura County had 70,000 acres planted to beans in 1921; production, 630,000 bags; average yield per acre, 9 bags; value, \$3,528,000; average value per acre, \$50.40.

Bee Inspector De Sellem of Los Angeles County says that strong colonies are not getting over 25 per cent of nectar they should normally because of cold and retarded season.

Potato growers of the Los Angeles County farm bureau are making plans for their annual field day in June at which particular attention will be given to the nematode problem.

A. C. Hardison of Santa Paula has been appointed by Governor Stephens a member of the Committee on Agricultural Education to fill vacancy left by the death of G. Harold Powell.

The parent Navel orange tree in the grounds of the Mission Inn at Riverside has died and will be removed. The other parent tree at the head of Magnolia Avenue is in good condition.

At the annual meeting of the Yucaipa Apple Growers Association the secretary reported the year's sales totaled \$225,247.63. F. H. Gilmore was elected president, C. H. Smith vice-president.

Planting of Lima beans is nearly completed; Baby Limas, still being seeded. The association estimates the coming crop of Limas at 1,350,000 bags as compared with 700 to 800 thousand the past two years.

Riverside bee men say yield of orange honey will be very short because of injury to orange trees and also because of heavy sage bloom many beekeepers will not move stands to the orange groves.

This year's date output from the Coachella Valley is estimated at between 100 and 125 tons. The Valley Packing Association is making plans to pack its fruit in El Monte, Los Angeles County, in order to secure more stable labor conditions.

At a meeting of irrigation interests of Southern California at Santa Ana, May 4, Mayor Evans of Riverside, Bacon of San Diego, Stark of Anaheim, Coulter of Fullerton, Cuff of Brawley and Mitchell of Santa Ana were appointed committee to assure sending of delegates to Washington to a hearing on the Boulder dam project.

The Coast and General

Shipments of Mexican tomatoes totaled to May 1, 964 cars.

Experimental work with cover crops is being carried on by Washington agricultural college in several Yakima orchards.

Some 1,000 acres of potatoes in Canyon County, Idaho, have been pooled and the crop will be marketed through the farm bureau.

The Oregon Cooperative Hay Growers has joined other producers and consumers of hay in complaint filed against high rates for transporting hay.

Nyssa, Oregon, reports sale of 160,000 pounds of pooled wool for 35 cents a pound. Sales from 32 to 38 cents are reported from various parts of the state.

There is a movement to induce all cooperative marketing associations in the Rio Grande Valley, 28 in number, to amalgamate with the Texas Farm Bureau Federation.

The fruit yield of the Yakima Valley of Washington is estimated at over 18,000 cars by Northern Pacific officials. Apples are the largest shippers, placed at 13,000 cars, pears next at 2,500.

Honey crop said to be much lighter than last year in Porto Rico but good in Cuba. Heavy shipments extracted continue to Holland from Cuba at 53 cents per gallon, including cost and freight.

The Pacific Wool Growers Cooperative Association will pool again at Portland, Oregon, and ship by way of the Panama Canal to Boston. Many of the state associations are reducing their handling charges a quarter of a cent.

At the annual meeting of the Oregon Growers Cooperative Association held at Salem, April 25, Kenneth Miller of Sheridan was elected president. General Manager Paulus reported that the association in 1921 transacted nearly a \$2,000,000 business.

The Columbia Basin Irrigation League was formed last week at Pasco, Washington, of representatives from Oregon, Washington and Idaho to secure federal development of the Columbia Basin project as recommended by Gen. Goethals.

That the ranges of Idaho, Oregon and Washington contain fewer sheep than at any time in 10 years is the statement of Miles Cannon, Idaho commissioner of agriculture, who predicts that it will take a number of years for the sheep industry to get back to where it was in these states 10 years ago.

Most of the sour oranges exported from Seville and Cordoba Provinces in Spain go to England for marmalade, but because of uncertainty of sugar prices this season there will be less marmalade made, much of the fruit being retained in Spain and made into orange pulp. Pulp export to the United States is steadily increasing.

The state wool pools of Iowa, Kansas, South Dakota and Illinois have recently renewed their contracts for the cooperative marketing of the 1922 pools with the National Wool Warehouse & Storage Company, a growers selling agency. This selling agency is owned and controlled by about 700 wool growers and operates on a cooperative plan.

HAVE just read the report of the committee of the Los Angeles chamber of commerce published in your issue of April 8 relative to a central livestock market. I am very much averse to entering into any controversy with anyone through the press, but I cannot refrain from calling to your attention some of the erroneous statements made in that report.

To begin with, the insinuation to the effect that the big cattlemen are opposed to union stockyards, and the smaller producers are anxious for them is not so. I am enclosing resolution passed on March 25, 1922 at a convention of the beef cattle producers of Southern California which is self explanatory. This resolution was carried unanimously. Not a single vote or a single word was recorded for the stockyards.

The stockyards committee, which is a sub-committee of the committee of agriculture of the chamber of commerce of Los Angeles which handed you this report, consisted of Dr. Clement, Mr. Platt, and Mr. Nicholls. Dr. Clement is not a meat producer, Mr. Platt is a dairyman, and Mr. Nicholls is a member of a hay, grain and feed firm. I might say right here that I have respectfully suggested to the president of the chamber of commerce that it would be advisable in any livestock matters to appoint on committees men in the livestock business.

The report states that the market conditions are unsatisfactory. In refutation of this I wish to state that for over two years the California cattle producers have received more money for their cattle than cattle producers have received in any other state in the Union, also that for the last several months fat hogs have brought in the neighborhood of 11 cents in California. Trainloads of hogs have been shipped in from Kansas City, Fort Worth, and even Chicago, and these trainloads of hogs were bought at a price to enable the packer to lay them down in Los Angeles and San Francisco in the neighborhood of 11 cents. Therefore

Why Stockyards?

By Fred H. Bixby

it is a fact that the hog producers of California have received more money for hogs in the last several months than hog producers have received in any other state in the Union.

I wish to call to your attention the fact that every week the California Cattlemen's Association mails a market report to every member of the association, giving them all the details of the market conditions, and therefore there is no more ignorance of the situation among the members of the State Cattlemen's Association. I am of the opinion that the hog associations are contemplating the inauguration of a similar plan of informing the hog producers of California of the actual market conditions.

Why should the livestock producers of California saddle themselves with the conditions existing in other states, which conditions are known to be onerous, unfair and almost unbearable.

Why should the chamber of commerce of Los Angeles insist upon boosting for stockyards when they know that this proposition has been tried three times before, and in each case the result was absolute failure?

When the livestock men of California want any assistance in the handling of their business, they will ask for it, and as yet we are not asking for any philanthropic aid from outside interests, and especially we suggest that philanthropy by people having an axe to grind is not very beneficial to the recipient.

Resolution

Whereas, the matter of stockyards in California has repeatedly been brought up before the California Cattlemen's Association for consideration, and on date of February 11, 1922, the

subject of stockyards for Los Angeles has again been brought up for consideration by the Los Angeles chamber of commerce in the following resolution:

"Whereas, the chamber of commerce after an exhaustive study of the subject found that a centralized marketing plan for livestock, properly organized and operated, would be of great economic value to Southern California and the city of Los Angeles, and

"Whereas, it now comes to the notice of the chamber of commerce that some movement has been started in opposition to the working out of such a plan without knowledge of those who are conducting such opposition as to the merits of the proposed plan,

"Be it resolved, that this committee appoint a representative of the chamber of commerce to confer with the executive committee of the California Cattlemen's Association, duly advising said committee of the findings of the chamber of commerce after giving the fullest consideration of the best interests of the livestock producers, and to request that judgment be suspended and adverse action avoided at least until the principals of the marketing plan have had an opportunity to perfect and present their plans and views for the consideration of the members of the association, and further expressing the conviction of the chamber of commerce that the subject is in the hands of competent persons in whom the chamber has full confidence to believe will safeguard in every way the interests of the livestock producers."

And whereas, complying with the request contained in the above resolution, asking for a conference with the executive committee of the California Cattlemen's Association, and

Whereas, such a meeting was ar-

ranged for March 8 and canceled by the Los Angeles chamber of commerce on date of March 7, and a second proposed meeting for March 24 was canceled by the Los Angeles chamber of commerce on March 11, and

Whereas, for the last several years the California Cattlemen's Association has been investigating the marketing problem and has thoroughly and carefully studied the advisability of establishing stockyards, and since it has been insinuated that stockyards have been largely opposed by a few large cattlemen for selfish reasons, and since the California Cattlemen's Association, which is composed of approximately 2,500 cattlemen of California owning an average of 200 head of cattle each, still remains strongly opposed to the establishment of stockyards, therefore

Be it resolved, by the California Cattlemen's Association in convention assembled in the city of Los Angeles on March 25, 1922, that we are opposed to stockyards for the following reasons:

1. Conditions governing the marketing of livestock on the Pacific Coast are not comparable with conditions at eastern points, where stockyards are established and where livestock may be diverted in transit, or after arrival, from one market to another if conditions are not satisfactory at the market to which livestock is originally consigned, thereby enabling the shipper to take advantage of several large markets without any material increase in shipping charges.

2. California market points are on dead ends of transportation lines and do not provide the producer with the opportunity of taking advantage of more than one market point. For example, the Los Angeles market has the ocean on the west, the desert on the east, and must confine its purchases to the demand for immediate consumption, since there is no possibility of developing an export trade because it is impossible to compete with the source of supply from South American and Australia.

3. There is no feeding territory im-

(Continued on Page 580.)

White Coal on the Farm

By J. Howard Blake

LIGHT and power are as essential on the successful farm as hard work and good seed.

If any farmer doubts that let him forsake his power plant and go back to the days of hand milking when all of the barn work was done by the aid of lanterns swinging haz- ardously from the ceiling rafters. He will soon be convinced, and his conviction will be shared equally by his wife who would be just as unwilling to revert to the dark kitchen, the hand churn and all of the numerous household appliances that now start by the touch of a button.

It has been largely this relief from numerous and laborious operations that has established white coal on the farm so universally and rapidly. But out of the total number of farmers who have invested in power plants of one kind or another during the past few years there are a few who are dissatisfied with the return on their investment and blame the equipment for much that is really their own fault. Too many have made their investment under the false impression that "a lighting system" was all that they wanted. In most cases that was what they ordered. No previous plan, including the primary essential of required power, was made, or if so, it was left too much in the hands of an agent or salesman whose first interest was to sell some particular type of equipment.

There are still other homes in all parts of the country where economy was too much of a factor when the lighting equipment was bought. When the salesman was at the farm the only thought was lighting, and the power

requirement was figured on the basis of so many lights in so many buildings with possibly enough surplus to run the pump back in the shed for water supply. After it was installed a hundred and one uses for white coal appeared and the equipment was overloaded, resulting either in serious damage to the generator or batteries or to the temper and disposition of the farmer.

In such cases, instead of blaming the system, the buyer ought, really, to blame himself for not having made a proper estimate of the capacity of the system needed before ordering.

Experience gleaned from a large number of farms has taught the wisdom of installing equipment large enough to take care of any reasonable demand that might be put upon it. To tax it beyond its theoretical limit will result in damage nine times out of ten, and then the repair bills will more than equal the original expense of installing a larger system.

Lights, of course, are one of the primary uses of white coal on the farm, next comes the heavier power such as the operation of water systems, and then, in order, comes a long list of accessories some of which are now considered essential and others are still in the luxury class. Using this chronology the power required for operation may be tabulated about as follows:

	Hours per Day	*Watts	Hours Watt
Residence lights..	4	600	2,400
Barn lights	3	1,500	4,500
*Water system	5	256	1,250

*Average load from October to April when lights are needed.

The energy required for the above uses is approximately ten k. w. hours per day.

To this must be added the following equipment which is usually desired on most farms:

	Hours per Week	Watt Hours
Washing machine	5	1,280
Electric iron	10	6,000
Vacuum cleaner	4	512

There is, therefore, added to the first mentioned standard equipment more than seven k. w. hours per day, which is usually overlooked when original plans for a lighting system are made.

Some complaint has also been brought against lighting systems because of trouble with the storage batteries. In most of these cases the trouble has been the almost inevitable result of lack of information as to giving batteries proper care. While it is true that batteries have been developed during the last few years to a remarkable degree of efficiency, it does not follow that they will run along indefinitely without attention. There are all sorts of conditions that can wreck the best battery made in a comparatively short time. Overcharging them is one; letting them run along without water is another. And it would pay any buyer to spend what time is needed in studying the operations and requirements of his batteries before actually operating his system.

Proximity of the batteries to the power plant is of much less importance than having them placed where the temperature variations are within the proper range. A battery should be neither too hot nor too cold. If placed in a frame shed which is unheated they cannot do their best work, especially in winter when the temperature will probably get much below freezing at frequent intervals. The cellar of the average house is usually as good a place as any for the batteries, it being cold enough there and yet not often below freezing.

As to type and cell size, many farmers have been led into trouble by unscrupulous salesmen whose first in-

terest is to sell their own particular type. Opinions of experts differ as to actual requirements, but it is of interest here to note findings recently made. It has been found that, as a rule, increasing the cell size increases the convenience to the owner and prolongs the life of the battery to an amount which warrants the higher cost. With a larger battery, danger of injury through overcharging is lessened, the load on the battery is more easily carried and the engine and generator operate less frequently.

Since most farm requirements are measured in terms of horsepower the following table will be helpful in translating horsepower into watts and lightage:

H. P. of Motor	Corre- sponding No. of Watts	Correspond- ing No. of 25 Watt Lamps
1/8	93	4
1/4	186	7
3/8	373	15
1/2	559	22
3/4	746	30

Note—1,000 watts equal one kilowatt, i. e., a 1 1/2 k. w. outfit is 1,500 watts.

From this it may be seen that a one-half horsepower motor draws from the battery 373 watts or the same power as do 15 25 watt lamps. With small batteries it is unsafe to operate any motor of over 1/4 h. p. or an appliance of over 186 watts unless the engine and generator are running. This is especially true in overloading, for it is possible to tax a motor or an appliance so that it uses many more watts than is indicated on the name plates.

A little care in installing systems with particular attention to the kind and type of battery used, being careful to use the advertised makes, will overcome most of the objections brought against power on the farm. The great majority of systems are doing their work well and have demonstrated to thousands of farmers in every section of the country that farming with white coal is a much more pleasurable and profitable job than farming by hand.

Susceptibility of Avocados to Frost Injury

Of all those who are enthusiastic in the culture of avocados none have given the same study and investigation to the results of the recent cold weather as Wm. Hertrich, manager of the San Marino Ranch of Henry E. Huntington. After the freeze Mr. Hertrich spent weeks in going from one avocado section to another and studying results on various varieties and conditions in different sections. These investigations were summarized in a report made at the annual of the California Avocado Association. We regret that we are unable to give it entire. We quote this week from Mr. Hertrich's report that portion referring to his work on the San Marino Ranch.

Wm. Hertrich

First of all I will give you the experience I had with a ten acre avocado orchard at San Marino Ranch, located in the city of San Marino, along

the eastern city limits of Pasadena, elevation 520 feet. These ten acres were planted under my supervision in 1910, the stock being Mexican seedlings. The distance between trees was 25 feet.

In 1911 I budded them to large fruiting varieties with good results, and after nursing them for two years carefully, the buds had grown to trees from four to six feet in height.

The cold weather of 1913 destroyed every one back to and including the bud union. After this my interest in growing avocados was somewhat checked. However, the root stocks of the Mexican seedlings began to sprout out again very vigorously and by 1917 most of them were big trees having from two to five stems three to four inches in diameter.

In the spring of 1917 I top worked the whole orchard to the following varieties: Fuerte, Spinks, Sharpless, Taft, Lyon, Dickinson, Murietta, Knight, Linda, Queen, Reys and some

others which looked promising at that time. Most of them had made a wonderful growth by 1922. Some had tops ten to 15 feet in height by as many feet in width. The cold spell of 1922, when the temperature at the ranch dropped to 22 degrees on January 20; 24 on January 21; and 26 on January 22, left very little of 12 years of patient work.

The following varieties were killed back to the trunks: Taft, Sharpless, Lyon, Dickinson, Knight, Linda, Queen, Reys, Murietta. The Spinks appeared to be harder than any just mentioned. Most of the wood and some of the foliage on a few tall trees was retained, the Fuerte proving the hardiest of the collection. Some trees in the lowest part of the orchard lost their leaves entirely but others retained most of them, except along the young tender growth which froze back all over the orchard. In this connection I would say, there are some seedlings planted on the lowest and coldest end of the orchard which proved to be considerably harder than the Fuertes planted next to them. The seedlings

appear to be natural hybrids between the Mexican thin skinned and some larger thick skinned varieties, of which, however, I have no record as to their parentage. The few fruit that ripened on them last year in March are of a rich and nutty flavor, weight 14 ounces. The skin was less than one-sixteenth of an inch thick but leathery.

Seedlings

In another plot were planted about 25 seedlings, the seeds of which were put in in May 1920. The plants stood from four to five feet high.

The varieties from which seeds came were Linda, Knight, Queen, Fuerte, Lyon, Spinks, Sharpless and other large fruited non-named varieties. Among the 25 were five which were practically not affected by the cold at all, even in their young sappy stage.

In another section I had planted ten seedlings in a row, four of which came from the United States department of agriculture. These four, I understand, were grown from seed sent in by Wilson Popenoe from Guatemala for propagating purposes. Having an over supply, the department distributed the rest to different growers to plant and see what they could get out of them. Two of the seedlings were from Queen, two from Linda and one from Fuerte. The Queen and Linda came from Mr. Knight's place, the Fuerte from Mr. Wheedon's, all of which were planted in 1919, except the Guatemalan, which I think were older.

The cold weather killed all of the seedlings grown from seed sent in by Mr. Popenoe from Guatemala. Two of the Knight varieties were frozen severely, two others only back to the trunk. On the Fuerte seedling, only the tender leaves were affected. This in my mind proves that a large number of the so-called thick skinned varieties are hybridized through some source with the Mexican harder type, and a certain percentage of the hybrid seedlings retain the hardness of the Mexican parent. In a good many cases the foliage will indicate this presumption so far as being hybrids is concerned.

Perhaps it would be in order to mention at this time a few words in regard to "water-logged" soil. The summer irrigation which was practiced in this last orchard of young trees was the basin system; the size of the basins was about 10 feet in diameter with about three inches of mulch on top to save hoeing the basins after each irrigation. The nature of the soil was heavy loam (ideal avocado soil in my opinion). However, there was not sufficient drainage in some places on account of heavy clay subsoil. I neglected to break up the basins before the heavy winter rains began last December, consequently the basins that had impoverished subsoil held the water too long, which most likely soured the soil and the trees died very quickly. In ordinary winters this might not have affected them so quickly as was the case of the two weeks continuous rain of last December.

Mr. Hertrich follows the above with reports of findings in other communities from San Diego to Santa Barbara. These were so extended it is impossible to give. The report closes with the following summarization:

* * *

I would like to say a few words to express my honest opinion about the future of the avocado industry in California.

The California Avocado Association should at once educate all of its members who have not had the sad experience some of us had during last January but who are intending to plant avocados in the near future, along the following lines:

All of the varieties recommended by the California Avocado Association, as well as all of the promising varieties, some of which have been on the recommended list as well as some that would have gone on the recommended list in the near future, cannot be planted with safety below the frost line unless the orchard can be equipped with a sufficient quantity of first class orchard heaters.

For those of you who have established orchards in the less protected localities the orchard heater will be the only salvation. Those of you who are intending to purchase land for avocado planting, I would advise to

(Continued on Page 587.)

The New Model "F" Cletrac

REG. U. S. PAT. OFF.

\$675 Delivered in California

Does All Farm Work

HERE is a tractor so far in advance of any tractor you have seen that it will make you figure power farming all over again.

Until we actually saw Cletrac F at work and learned its price, we did not believe it was possible to build a crawler-type tractor with chrome steel for every part subject to severe wear and sell it for so low a price.

Cletrac F is the value of the hour. Its power is ample to pull two 12 inch bottoms—to turn under 6 to 8 acres a day. In the same proportion it speeds up all other farm work—discing, seeding, haying, harvesting, hauling, belt work.

Lays its own tracks anywhere and everywhere you want it to go—automatically lubricated—all working parts accessible—handles any job on the farm—and its low price will meet your means today.

Remember this—here is a tractor against which old methods of farming cannot compete. We'll be glad to put it through any test or demonstration—without obligation to you—and stake our reputation on the result.

Model 32 "Caterpillar" Combined Harvester

A 2 Man, 6 to 10 Horse
Harvesting Outfit

Now—even though you have no more than 100 acres in grain—you can own a *real* Holt Harvester

No longer need you be dependent on the custom outfit to harvest your grain. No longer need you pay another man a profit for cutting and threshing your crop. No longer must you be satisfied with work that isn't done quite as well as you would do it yourself. No longer need you envy the grain grower who has big enough acreage to warrant the ownership of one of the big Holt harvesting outfits. Now you can have *your own* outfit, cutting full 12 feet, requiring only 6 to 10 horses (or equivalent tractor power) to pull it, and only two men to operate it. And it's a real Holt Harvester in every respect.

A real Holt Harvester! Model 32 has exactly the same separator design as the larger Holt machines, possesses the same splendid grain-saving and grain-cleaning qualities. In addition, it's the lightest running harvester ever built—Hyatt Roller Bearings are used throughout. It is light weight, too—weighs less than 7000 pounds. The separator is of all-steel construction. Lubrication is by the positive, efficient Alemite Sys-

tem. A powerful motor provides power direct to the threshing cylinder. Safety sprockets eliminate breakage. Model 32 is built for a lifetime of service—offered to meet the demand for a *real* combined harvester of small size.

Think of having a real harvester that two men can handle and that can be pulled by a small tractor or a few horses! Think of the convenience, the saving of time, and—best of all—the economy of handling your grain harvest the Holt way. Then place your order at once for one of these machines for 1922 delivery, or mail the coupon for complete information. You owe it to yourself to be fully informed about this profit-making little machine.

CANNING OLIVES COMING BACK

By A. L. Spellmeyer

B. McKELVY who visited the south from the Fresno district in the organization of the new California Olive Growers Association was surprised to find less than 100 acres of cannling variety olives between Los Angeles and Saugus, outside of the Sylmar grove.

Some of the same men who made the peach and raisin industry profitable are interesting themselves in olives. It is stated that there are less than 20,000 acres of budded canning olives in this state, that California has a monopoly of two products, the sun dried fruit and ripe olives.

The varieties are Missions and Manzanillos, the stable canning olives; Sevillanos and Ascolanos, the very large Queen olive canning type. Yield per acre seems to vary. One district reports half a ton to the acre. One canning record shows over 1½ tons to the acre. Some small acreages show as high as four tons to the acre.

An olive grove from planting to bearing time will cost in the San Fernando valley \$1,500 or more, and anywhere in the state from \$700 to \$1,500 an acre. Orchard care runs to some \$45 per acre yearly, picking from \$20 to \$30 per ton, taxes and interest some \$100 per acre on good land. A group of olive men recently figured \$180 a ton as average crop cost in a good year, with a crop probable seven out of ten years. For the past two years olive prices have not in many instances covered picking costs.

Trees were uprooted. No one wanted an olive grove. They were worse than raw land, as a constant expense with no return. The condition in the olive industry was identical with that prevalent when men could not sell their peach crops, and when men dug up their vineyards, previous to organization of the raisin and peach associations.

Some men up around Fresno looked around and said, "The olive industry is in a bad way" and started to examine it. McKelvy was one of them,

Glass another, and some leading lights in the raisin, peach and fig worlds also took a look. To their surprise they found less than 20,000 acres of canning olives, budded, and bearing. 5,000 or more of these acres are in the Tulare district. They figured the olive was just the easiest thing on the whole list of California products to organize and would show the best profit, so they started to it.

A cost plus basis is the aim of the new organization, and this will mean apparently \$250 per ton for the average canning olive. The other difficulty to be met is a standard form of pack so that every can of every olive factory meets a size and quality standard.

At the present time the same ray of hope that has reached the canning olive men doesn't help the oil olive men. With 35 to 40 gallons from a ton of olives, and this oil for the best grade wholesaling now at \$3.40 per gallon, part of other grades go to \$2 per gallon wholesale for olive oil and the residue oil for soap as low as 80 cents per gallon. The tariff is not

sufficiently protective. The oil olive men have a chance to work for a tariff that is protective and wait a better price or tear out their trees. There is nothing in \$50 per ton oil olives of a \$30 picking cost.

INCREASED DUTY ON OLIVE OIL

The duties on olive oil as now operative in the emergency tariff bill are 40 and 50 cents a gallon, according to whether the imports are in bulk or in packages. The new rates secured through the senate amendment are 50 and 60 cents a gallon.

The Fordney bill as it passed the House carried rates of 49 and 57 cents per gallon but the senate finance committee cut these to 40 and 50 cents. Thereupon the California olive industry, through the California Olive Association, began a vigorous fight to get the rates back to where they would be really protective of the domestic olive industry, with the result that the senate on Monday of this week adopted the amendment providing for duties of 50 and 60 cents a gallon.

FROST DAMAGE TO FIGS

As to frost damage to figs I. J. Condit, horticulturist of the California Peach and Fig Growers, says in the Associated Grower:

"The cumulative effect of frost damage occurring in 1921 is just beginning to be appreciated in bearing fig orchards. Calimyrna, Adriatic and Mission fig trees in full bearing have shown very serious effects this spring. Sunburned branches, dead tops and dried out limbs are unexpectedly appearing in trees widely scattered throughout both the San Joaquin and Sacramento Valleys. Heavy pruning and cutting back are being practiced in many such cases in order to reduce the bearing surface of the tree and to renew the top.

Caprifig Situation

"The cold weather of April 9 and 16 has caused considerable damage to the profichi crop of caprifig trees in some sections. It is doubtful whether any injury has resulted to the mamme crop. Even the leaves and terminal buds of all varieties have suffered considerably and will undoubtedly result in a partial or total loss of crop in certain orchards."

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When queries are wished in Cultivator address query to 317 Central Ave., Los Angeles.

Purchase on Contract

I bought a machine on installment contract, have made part of the payments, but by change in business do not desire to keep up the contract. The parties from whom I purchased state they will sue for the balance. Can I be held to the contract?—Subscriber, Auburn.

There is very little use in having contracts if people cannot be required to comply with them. It is optional with the vendor in such a matter whether he will re-take the machine or sue for the balance. In such action he can affirm the contract and attach the machine.

Starting Grocery

What steps should I take to start a grocery store on my own property outside the city?—Subscriber, Alameda.

Unless there is some particular county ordinance dealing with the matter it is suggested that the necessary requirements are to build a store, put in a stock of groceries, and induce people to buy them from you.

Community—Separate Property.

I was possessed of some cash, furniture and household fittings at the time of marriage. By a former marriage I had a son. The money was used in various household expenses. Since that time my husband and I have invested in property held in the names of both. Can I will to my son the cash

First to establish the \$10.90 price—"Usco"

THE makers of U.S. Tires made this announcement last November—

"Hereafter the price of the 30 x 3½ 'Usco' is \$10.90."

The lowest price ever quoted on a tire of quality reputation and standard performance.

* * *

And now, with the opening of Spring, there seem to be quite a number of "New and Special tires" coming into the market in the \$10.90 price range.

Perhaps you are wondering just what there can be either "new" or "special" about these tires.

It can't be the \$10.90 price—"Usco" established that five months ago.

Nor quality reputation and standard performance—for it takes more than one full season for any new tire to demonstrate where it stands in quality and value.

With so many tires rushing into this \$10.90 price field (now that the season promises business from the American car-owner), it is worth remembering that "Usco" showed its good faith by announcing this price last fall.

The same intent to serve that has made "Usco" a standard value for years.

The "Usco" Tire was never better than it is today—with its established quality, its time-tested performance, and its price closely figured in tune with the times.

are solving the pumping problems for many users during the period of low water levels. They will lift the water to the surface, and, if desired, deliver it to high elevations above ground and at lower power cost than any other system of pumping water.

Pomona Manufacturing Co.
POMONA, CAL.
Manufacturers of the
POMONA Irrigation Gates and Valves

sofar as the late investment in real property is concerned the presumption arises from the fact that it is held in the names of both parties that each have an undivided interest in the whole. In such respect this undivided interest in the whole. In such respect this undivided one-half interest might be subject to will. On the other hand it might be subject to proof on the part of the husband that it was community property. Those matters depend upon the circumstances. It would probably be safe under the circumstances to make a will covering the one-half interest. Insofar as community property is concerned, upon the death of the wife all community property goes to the husband without administration and the wife has no interest in community property as such, which is subject to will.

Bought Sight Unseen

If I made an exchange for property which I have not seen, is such a transaction legal? If after looking over the land I find it has been misrepresented, can I rescind and obtain my original property?—Subscriber, Sonora.

There is no requirement of law whatsoever that a party see property before purchasing it. In the absence of fraud the contract is perfectly legal and binding. If the land was misrepresented and if these misrepresentations were material, you are entitled to either of two actions. You may rescind the contract, return to the other party all you have received thereunder and demand the return of your property. If this is refused you may bring action in rescission, providing, however, that you act promptly in the matter. The other remedy is to affirm the contract and bring action for the difference between the value of the property as it is and the value which it would have had if it had been as represented.

Taxes on Estate

Real estate is left to heirs who cannot agree as to its management. The taxes are becoming delinquent. Would one heir have a right to pay these taxes and other liens against the property, and, if so, could he require the others to repay to him their share? Subscriber, Nipomo.

Any one of the heirs certainly would have the right to pay these liens and could require the other heirs to repay their proportion. In fact, he would have a lien on the shares of the other heirs for the amounts which he had paid, together with legal interest. He cannot, however, acquire any right by paying off these liens other than the right to require the repayment of the moneys paid.

Closing Road

Upon taking possession of property recently purchased I find that a road leaves the officially surveyed line for the purpose of going around a hill, and cuts into my property. This has been used by the public for nine years and been repaired and graded by the county. If I desire to keep the public from cutting through my property may I plow up the road or fence it?—Subscriber, Terra Bella.

It would be necessary to go back to the original method under which this detour was made. If the viewers in opening the road and locating it as it now stands made a mistake it would seem that the former owner had acquiesced in this mistake. There are decisions which hold that a road as laid out and opened by the viewers, used and travelled as a public road, graded and kept in repair by the road overseer, becomes a part of the public highway, and the legal presumption arises that the owners of the land abandoned possession of the land for the road, and thus established it. If you should plow up the road and be found in error it might entail considerable expense upon you to replace the road in the original condition. In order to test the matter it would be well probably for you to extend your fence across the road as it stands and have the matter settled by an action in trespass against the road overseer when he comes and seeks to remove the obstructions. As frequently stated these matters of roads are so dependent upon the exact history that it is difficult to give a definite statement.

Los Angeles

Gentlemen:

Replying to your inquiry of the 18th, as far as we are determined now we are satisfied that your preparation will kill red scale.

We have already had an inquiry as to results obtained.

Yours truly
Charters-Davis Co.
A. J. Davis
Manager

At Last an Effective Spray!

In another year we will be able to present those growers of Southern California who may doubt our claims as to the effectiveness of Fumi-Spray, with convincing testimonials from well known growers (like the above) who have put it to a practical test. Remember, Fumi-Spray is just out—but it is winning its way over all opposition. We stand ready to prove our claims by any test you may name—a bad case of purple scale, for instance. We honestly believe Fumi-Spray to be more effective than fumigation—and less costly, less work, less danger. We challenge you to challenge us to prove this!

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Sweet Potatoes

Will you please advise me as to kind of sweet potatoes you consider best for the market and how far apart are the plants set in the rows?—Subscriber, San Dimas.

The Nancy Hall is probably the best variety and is the earliest. For late the yellow Jersey leads as it is the better keeper. Yellow Nansemond is also grown by many. The usual planting is 18 inches in the row and rows 36 inches apart. Some plant in the row but a foot apart.

Saving the Moisture

I have several thousand grape cuttings set out in nursery rows in very

sandy soil. I have been wondering if it is necessary to cultivate often in such soil to keep ground moist, as you would in heavy soil. From the little experience I have had so far with cultivation twice a week the soil seems dry for about three inches down, but from there down it is quite moist. Do you think it would be more moist on top if not cultivated?—Subscriber, Pasadena.

As a rule growers believe that frequent shallow cultivation, keeping a dry dust mulch on the surface aids in preserving moisture in the soil. If one does deep cultivation the moist lower soil is thrown up to the surface and a large content of its moisture is lost through evaporation. Many prefer to follow irrigation with deep cultivation and then give shallow cultivation a few days later. Others will go over the field with light hand tools or hoes, cutting weeds here and there and dis-

turbing lower soil as little as possible. Light straw or manure mulch aids in holding moisture in loose sandy soils.

Prices for Team Work

Is there any regulation in this state in regard to prices for team work in orchards? I should very much like to know what Los Angeles County is charging. In Porterville we are paying \$7 a day for our plowing and that was the wartime price. Has there been no reduction? I see no reason for such high prices now.—Subscriber, Berkeley.

There is no legal provision as to prices which may be asked for team work, and if no teamster may be had at less than \$7 per day, which is twice what we could secure good team work for some years ago and that for ten good full hours, then the \$7 must be paid. In fact Porterville is a whole lot better off than is the city of Los Angeles. We have vivid recollection of one piece of work done a few weeks ago where the owner of a piece of land

wanted a little dirt moved so he engaged a teamster with one helper and a scraper. Instead of the anticipated two or three hours the job was hardly finished at noon so the teamster and helper came back and worked a short time after luncheon. This necessitated a charge for two half days. All told, less than six hours of time was put in for the work. The teamster made a charge of \$12, with \$5 additional for the helper, or \$17 total. Of course it is impossible to farm where such prices are paid, and for the small farmer either cooperative ownership of team or tractor is made necessary.

Whitewash for Almonds Affected by Frost

I have a young almond grove three years old. Last year the blossoms or young nuts all froze. This year most of them froze, but the peaches, which were but a little later about blooming escaped. I am told that Prof. Whitten of the U. C. advocates whitewashing the trees to delay the blossoming and so lessening the danger from frost. I would like to hear from some one who has tried this plan, as to what results were obtained; also, if the results were good, as to how much of the tree was whitewashed—just the trunk and big limbs or the whole tree, buds and all. I think if we could delay the blossoming for two weeks it would often save the crop that would otherwise freeze. I hope that someone who has had experience in this matter will kindly give same through your columns, and believe it will be of great interest to many of your readers.—Subscriber, Paso Robles.

We would refer our inquirer to comment on "Whitewash Retarding Blossoming" written by W. R. McLean on page 7 of our issue of January 7, 1922.

Argentine Ant

The little red ant is here. Will you give description of the Argentine ant? It seems to have driven off the black ant.—Subscriber, East San Diego.

There are three distinct forms of adults, workers, males and queens. The workers gather the food and attend to the labors of the community and are simply imperfect females with no reproductive capacity. They greatly outnumber the other forms and are the ones most commonly met. The males, always winged, are the drones of the colony and have only one function, that of fertilizing the queen. The queens are the reproducing females and for a short time during the mating period are winged. They remain in the nest most of the time, but occasionally may be found out in the trails—a characteristic of this species.

SUN-MAID GROWERS OPEN OFFICES IN ORIENT

The Sun-Maid Growers has established headquarters at Shanghai to handle the oriental trade. Branch sales offices will be opened at various commercial points. The territory covered will include China, Japan, Dutch East Indies, Straits Settlements and Northwestern Siberia. C. S. Beatty has been named general manager and will be assisted by Thomas M. Knight and K. Nakamoto.

MARKING CAPRIFIG TREES

The California Peach and Fig Growers is cooperating with the State Nurserymen's Bud Selection Association in placing permanent labels on all caprifig trees in the valley.

COTTON CONFERENCE

A public conference will be held at state department of agriculture, Eleventh and K Streets, Sacramento, June 3 at 10 a. m. All persons interested in the protection of California's cotton industry are invited to be present at the conference and be heard, either in person or by attorney.

Nuevo, Riverside County, estimates its apricot crop at 400 or 500 tons.

Closed Car Comforts for All Seasons

No previous closed car standard prepares you for the quality you find in the Essex Coach.

That is what gives such emphasis to its low price. Buyers accustomed to pay far more for like advantages, must see the Coach to gain a fair conception of what is offered.

And These Values are Lasting

The Coach gives all the utility, protection and comforts of the closed car. By quantity production the essential closed car advantages are made possible at this price.

And remember you get these closed car qualities on the famous Essex chassis, which holds more distinguished contest and service records

than any light car in the world. The Coach stays in condition. It has the lively performance of an open car, and its riding ease makes light of country travel. All season protection, reliability, and a large carrying capacity in the rear locker make it ideal for country service.

See This Important Money-Saving

It gives hundreds the closed car they want at from \$500 to \$1000 less than they expected to pay.

And those who planned to get an open car, find the Coach fills their wants more completely, and at even less cost than any open car of comparable quality. You should see the Coach, too. It may be the very car you want.

MAN'S WORST ENEMY

By O. S. Pinckney

I'd been working hard in the field all day, in the blistering sunshine, pitching hay, and glad I was when the night had come, and I shouldered my fork and started home:

Home to the supper, waiting for me, in the cooling shade of the maple tree.

I had milked the cow and the stock I'd fed,

And brought the wood in from the shed, And then, at last, had sat me down, To fried potatoes and biscuits brown; Bread and butter and layer cake, And other good things Mollie makes.

Then, after supper, the paper read, I wended my weary way to bed, And soon was sunk in slumber deep, Dreaming I owned ten thousand sheep; Wool at a dollar—and then a shock— 'Twas the rattle-te-bang of the darned alarm clock.

MRS. GRAHAM'S MOTHER

an admirable paper," she said.

"I haven't been in club work all these years for nothing," Mrs. Tate replied after thanking her.

"You were a dear to help us out, and I know Helen must be bursting with pride. The president of the federation said yours was the finest paper she had heard in her travels. She wants to meet you."

Not long after this event a huge festival was projected to make money for a community house. Helen Graham was to have charge of the refreshment booth, and she began at once to enlist her friends to help her. Her own mother she did not ask, to that active woman's displeasure. When the plans were in shape and Mrs. Tate could stand it no longer, she made a few remarks to her daughter.

"If this were back in Wessington I'd be at the head of the whole thing. Here I'm of no use whatever."

"Why, mother," gasped her daughter, "what a remark to make! You know you've done your duty many times over, besides bearing other people's burdens. You've worn yourself out in good works for Wessington, and you deserve the vacation I'm trying to have you take. You are helping me by just being here. You shouldn't undertake hard tasks now. We younger women should take up your work. It's our turn now."

"I'm not objecting to your working. What I don't like is not being allowed to work myself. There is plenty of work for both old and young."

"Yes, but we have to take a rest sometimes and this is your time. If you don't stop once in a while you'll have to stop altogether."

"Fiddlesticks! It's you, not work, that makes me weary."

"Now, mother. Just cuddle down in this chair before the fire and read that new novel. I'm off to a committee meeting and am due this minute."

"A novel," sniffed Mrs. Tate, "when there are dozens of improving books I want to read!" And before Helen reached the sidewalk her mother was on her way to her room, where she wrote the paper for her club at home, for which she had been gathering material.

The whole of the day before the community festival took place Helen Graham spent in arranging her refreshment booth. In the middle of the morning Mrs. Tate went to the building with a package of decorations which her daughter had forgotten. In her heart was a faint hope that she might be given some part in the work of preparation.

"You're a jewel, mother, to bring me all this stuff. I was wondering what I had done with it. Just look around and see what is going on in this bustling place, but don't you dare to take a hand in the work or you'll be too tired to come tomorrow."

"How about yourself? It strikes me that you may be slightly weary by that time."

"Of course I shall be tired to death, but I have to come, and you don't."

While they were talking, Mrs. Benson came running over to them from the other end of the building.

"Isn't it too exasperating? Mrs. Haines has been called to Chicago to meet her old uncle who is going to leave her his money, and her chief assistant is home with her sick baby. We had expected the flower booth to be the best paying of all, and now it will have to be left out unless we can find some one to take hold of it. Everyone is too busy even to suggest some person to take it," she said gloomily.

Just then the arrival of two huge boxes at the refreshment booth required Mrs. Graham's attention, and Mrs. Tate and Mrs. Benson moved away toward the booth in question. Mrs. Benson stopped every few steps to try to enlist the services of some one, and Mrs. Tate sauntered along alone. She came to the space for the flower booth just as two men, hidden by the immense palms they were carrying, stopped her to ask where their burdens should be put.

"Put them up there," directed Mrs. Tate, pointing to some wide shelves she had just discovered.

The rest of the morning she spent

in arranging the plants that came. She was not disturbed in her labors.

Mrs. Benson had asked various women to manage the booth and, when she happened to look in the direction of the flower booth and saw work going on there, she returned to her own booth.

Mrs. Graham, occupied with her own plans, supposed her mother had gone home.

At luncheon time Mrs. Tate slipped out without a word to her daughter and ate her noonday meal at a near-by tea room.

In the afternoon the flower booth developed into a fairy dell under the skillful management of Mrs. Tate and two helpers whom she had picked up at luncheon. By dinner time everything was ready for the next day. The cut flowers were not expected before morning. She went home tired but happier than she had felt for many a day. She put on a fresh gown and was sitting on the davenport reading the evening paper when her daughter appeared and dropped at once into a chair.

"I can hardly take another step. I simply must go to bed. Kate can bring me some dinner. I'm so thankful you were not mixed up in this tiresome business. I've had no end of trouble and disappointment."

Mrs. Tate followed her daughter to her room, helped her to undress, and gave orders for her diner.

"You look so calm and restful, mother. I wish I felt as you look," her daughter said as she stretched herself out on her bed.

Mrs. Tate laughed merrily and went to the dining room to eat dinner with her son-in-law.

The next morning the last finishing touches were added to the booths. Fortunately, the refreshment and flower booths were at opposite ends of the building. With her helpers, Mrs. Tate had everything ready before noon, when she went home, read awhile, and then dressed in her most becoming gown. Mrs. Graham hurried in just in time for luncheon, tired, flustered, and out of breath.

(Continued next week.)

HOUSEHOLD QUERIES

Mint Sauce

Will you kindly tell me how to prepare mint sauce for serving with meat? Thanking you in advance for the favor.—A Subscriber, Waitsburg, Washington.

Cut fine with sharp knife fresh green leaves and tender tips of mint. Add vinegar and sugar to taste, just enough in quantity to cover the minced leaves. Some cooks use a little salt and very little sugar and let the sauce stand for several hours before using, but many prefer to use as soon as cut. One tablespoon to a serving is the usual proportion.

Rose Potpourri

I have been looking for directions for making old-fashioned rose jar or potpourri. I wonder if you would print the rules in your column soon.—Subscriber, Fillmore.

Gather petals of most fragrant roses (the red ones usually are the sweetest). Spread thinly over sheets

of paper and dry for several days, turning occasionally to make sure that all are evenly dried to a crisp state. Old formulas tell us to dry them in the sun but I have found it better to dry in the house where the petals dry more evenly and slowly and where there is no wind to blow them off the drying sheets. Perhaps our California sun is hotter—we know our air is dryer—than in the Eastern states or in England whence hail our grandmother's potpourri recipes. The floor of an unused room would be the most satisfactory as rose petals would be undisturbed by motion of coming and going and would not accumulate dust. Besides the fragrance is unpleasantly heavy to many people in living rooms. Rose geranium leaves, orange blossoms, lemon verbena, sweet marjoram, honeysuckle, lavender or other sweet-scented herbs or flowers may be added. Thoroughly mix with the dried petals the following potpourri spice and place in rose jar:

Ground cinnamon, 1 teaspoon; cloves, 1 teaspoon; attar of roses, 3 drops; glycerine, 9 drops; pure alcohol, 1 tablespoon; oil of lavender, 6 drops; rosemary, 6 drops; powdered orris root, 2 ounces. Sift dry ingredients together and bottle with glycerine and alcohol till ready for use.

Or, dried petals may be well peppered with orris root, cinnamon and salt (about 1 tablespoon for ordinary rose jar). Place in jar, then add 20 drops each oil of cloves and lavender, 10 drops oil of cinnamon and as much oil of musk as you wish to afford. Keep jar in dry place and covered except for a few minutes when it may perfume the room. Stir every day for first 2 years. The fragrance will grow more delightful with the passing years.

Here is another: 3 handfuls orange blossoms, 3 of clove pinks or stock, 3 of rose leaves, 1 each of sweet marjoram, rosemary and lavender, ½ handful mint leaves, rind of 1 lemon, 6 bay leaves, ¼ ounce cloves. Chop finely all together and thoroughly mix. Spread in layers in jar with handful bay salt between each two layers.

Boiled Cake

What in the world is a boiled cake? I have just seen several references to boiled cake as being so good and inexpensive. Can you tell me how to make it?—Subscriber, Los Angeles.

Here is a recipe for a "boiled" spice cake. It's not so different from ginger bread after all and not a bit mysterious—but delicious, is moist, keeps well and is not too rich to be eaten heartily. One cup sugar, one-half package raisins, half cup walnut meats broken in small pieces, one tablespoon lard, pinch salt, one teaspoon each cinnamon, cloves and allspice, sprinkle of nutmeg, one and one-half cups coffee. Boil together and let get cold, then add one teaspoon soda in a little water and enough flour to make stiff. Bake in a slow oven about one hour.

Pickled Limes

I am a subscriber to your paper, from which I get a great deal of information of very practical use. I should like the best recipe you have for pickling limes.—Subscriber, National City.

Wash limes, cut out stem ends and stems, pack in jar, sprinkle thickly with salt, cover and let stand for one week. For stuffing take 3 ounces chiles, 4 ounces garlic, 4 ounces turmeric, pound together and add 3 ounces green ginger sliced, adding just enough vinegar to make a paste. (For any quantity take in proportions given, doubling or halving as required.) Stuff this into the limes, tie them together and stand in glass or stone jars for one month, when they will be ready for use.

Hard Soap

Have directions for making soft soap, but can you tell me how to make the hard kind?—Subscriber.

Clarify fat thoroughly, melting and adding water, bringing to a boil, and allowing to cool. The fat will form a solid cake on top of the water and the impurities will sink to the bottom and may easily be removed. Melt fat again and heat until all water has evaporated, till bubbling stops. Then slice a medium sized potato into it and

It's here at Last!

A Revolutionizing Invention

The SUPERFEX Burner that cooks as fast as gas and is absolutely reliable

What you get in this new stove—See it NOW at your dealer's.

1. Cookingspeed of the giant gas burner—in the Giant SUPERFEX Burner. Cooking speed of the standard gas burner—in the standard size SUPERFEX burner.
2. Abundant heat that is absolutely clean and odorless.
3. Greater economy and reliability of cooking with all grades of kerosene oil.
4. Operating convenience, cleanliness and new time saving features.
5. Handsome, sturdy, long-lived stove with higher and bigger Aladdin Quality Porcelain Enameled Cooking Top, and new base shelf for utensils.
6. One Giant and 3 Standard SUPERFEX burners.
7. A new (more beautiful) Gray Enamel finish on all chimneys.

THE world's largest makers of oil stoves and ranges have crowned their achievements with the production of an oil stove that cooks as fast as gas and is absolutely reliable.

Its speed and success are all in the New SUPERFEX Burner, a new and revolutionizing invention, which adds quickness and absolute heat control to the remarkable cleanliness and sturdy virtues of the world-famous New Perfection Oil Cook Stove—now used by more than 4,000,000 housewives.

To accommodate the SUPERFEX Burners and the Giant SUPERFEX, we have constructed a stove that for beauty, strength, smartness, convenience, completeness and all-around satisfaction, sets a new standard. Now on exhibition for the first time—America over. Visit your dealer.

This new "300 line" of New Perfection Stoves with SUPERFEX Burners, is additional to the long-established "Blue Chimney" New Perfection Stove, famous and favored the world over and still the most popular oil stove made at its price.

Wipe Out Every Rat and Gopher

Amazing New Discovery Quickly Kills Them All. Not a Poison.

Rats, Mice, Gophers — in fact, all Rodents can now be wiped out easily and quickly. Imperial Virus will do it. This new discovery is a fluid, true Virus. Entirely harmless to humans, poultry, stock, pets, etc.

Infects Rodents only. Greedily eaten on bait. Sets up burning fever. The pests communicate it to others, and all die outside, hunting air and water. Imperial Virus is put up in sealed bottles, thus insuring full strength and potency. Only safe, sanitary method to overcome these pests. Protect your Poultry, especially Baby Chicks and Egg Hatches.

YOU CAN GET YOURS FREE

Here's how! Send \$1.00 today (currency, M. O. checks, etc.) and we will give you by return mail, postpaid, two regular, full sized (double strength) \$1.00 bottles of Imperial Virus. Use one to rid your place of these pests, and sell the other to a neighbor, thus getting your free. Special inducements to represent us.

If more convenient, send no money, just your name and address to Imperial Laboratories, Dept. 435, 2110 Grand Ave., Kansas City, Mo. Pay postman \$1.00 and five cents' postage when two bottles arrive. Guaranteed to do the work to your entire satisfaction within 30 days or your \$1.00 will be cheerfully refunded.

EMPIRE ICE-LESS COOLER

PLAN now to prevent food from spoiling during the hot summer months. New, sanitary, all-metal, rust-proof cooler, keeps food cool, fresh and sweet without the use of ice, chemicals or electricity. Costs nothing to operate; will last a life-time.

strain through a dry piece of cheese-cloth.

To each five pounds of lukewarm grease use one small can lye, one quart cold water, one-half cup hot water, three tablespoons borax, one-fourth cup household ammonia, two tablespoons sugar, one teaspoon salt. Mix lye and cold water, let stand till cold, stirring occasionally. Mix one-half cup hot water with three tablespoons borax. Let this cool and add one-fourth cup household ammonia, two tablespoons sugar and one teaspoon salt. Pour lye into grease slowly, stirring continually with a wooden spoon or spatula. Add other mixture, stir until light and thick. Pour into an enameled pan lined with paraffin paper. Crease before soap gets cold.

Canning Chicken

Could you kindly let me know in your columns, which we so much appreciate and know the value of, why we can't put up canned chicken like fruit and vegetables. We sell our broilers and hens at such a low price. I know there will be many more who will appreciate such a recipe.—Subscriber, Petaluma.

Here is where possession of a steam pressure cooker simplifies matters. If you have a pressure cooker it is only necessary to sterilize in cans 30 minutes at 15 pounds steam pressure, 250 degrees Fahrenheit. Otherwise it is necessary to boil for three successive days for 1½ hours each day.

Meat should be cooked as desired for use on table, fried or boiled until almost done. Pack hot cooked meat in cans, fill with boiling hot gravy, tomato sauce or broth. A gelatin broth made by boiling unflavored gelatin in meat broth or water is often added. This sets to a jelly in the jar after sterilization. Two or three ripe olives added to each jar will improve flavor. Place in boiler, bring water to boil and boil hard for 1½ hours on three successive days.

Or the acidified brine method may be used. To the liquor from cooking add 1 ounce (2 tablespoons) lemon juice or strong vinegar per quart and mix well. Pack meat in jars or cans. Add boiling hot liquid and boil hard four hours.

HINTS FROM HOUSEKEEPERS

Fig Marmalade

Here is a recipe for fig marmalade and I think if once used you will never go back to the old way of preserving figs:

To 9 cups figs ground through food chopper, use 6 cups sugar, 1 large lemon or 2 small ones ground. Mix well together and cook in covered granite or aluminum pan in the oven just long enough to thoroughly sterilize it, for too long cooking destroys the delicious flavor so characteristic of this marmalade.—Mrs. Clara Schrack, Valley Springs.

OUR BABY COLUMN

By Mrs. M. S. Sirdevan

Does the nervous condition of the mother affect the milk?

The failure of the modern mother as a nurse is due to anxiety, loss of sleep, fatigue, worry, household cares, and social dissipation; and uncontrolled emotions, excitement, grief, or fright, may cause milk to disagree with the child.

A nursing infant that is well nourished has good color, sleeps two or three hours after nursing, or, if awake, is good natured, comfortable and happy. It gains weight steadily, and has normal movements of the bowels.

If it is not getting enough, it does not gain and may even lose in weight. It no longer shows energy or playfulness, but is cross, fretful, and irritable, and sleeps poorly. Some babies nurse a long time, when the milk is scanty, and others for only a few minutes, and then turn away in utter disgust. The only sure way of telling how much a child is getting is to weigh it before and after nursing four or five times a day; it need not be undressed.

Most doctors insist upon a mother nursing her child, even if it does not get more than a teaspoon and is given a substitute bottle after each nursing. A small amount of good breast milk greatly improves the child's nutrition. The trouble is nearly always with the milk, not with the child.

When Hungry Little Muscles Say, "Please Help Me"

DID you ever stop to think who it really is that's talking, when childish voices raise a clamor, "Mother, I'm hungry?"

It's really muscles and bones and nerves and cells worn in the stress and strain of play—that are calling for rebuilding material.

What kind of an answer? The *right* thing, or just *anything*? It makes a big difference.

Grape-Nuts, so deliciously crisp and appetizing to taste, and so quick and convenient to serve, is a splendid food for rebuilding young bodies. All the wonderful nutriment put in wheat and barley by Nature, including the vital mineral elements, is there—and Grape-Nuts digests easily, quickly and completely. Served with cream or milk, Grape-Nuts is exceptionally nourishing.

"That's splendid!" says appetite. "That's just the need!" say the hungry muscles, nerves and bones.

Ready to serve right from the package—always crisp and fresh. A favorite dish with all the family. Sold by grocers.

CHAFFEY JUNIOR FAIR A BIG SUCCESS

By Jack Klein

VER 100 high school lads who have been training in the agricultural departments of 18 schools of Southern California accepted the invitation of the Chaffey Junior farm bureau to attend the fair held at the school grounds in Ontario on May 19-20.

This junior farm bureau which is affiliated with the San Bernardino County farm bureau is one of the first junior organizations in the West and is apparently more active than most adult farm bureau centers.

The fair this year completely eclipsed the one held last year in number and quality of the exhibits. Only members of the clubs in the district were eligible for prizes on their exhibits, but there were plenty of them. In the pig department there were over 100 entries. In the chicken show there were nearly 200 birds, and the rabbits and pigeons ran them a close race for numbers. The calf club boys had a number of entries, and a few mature cows which have been used in various projects were also on hand.

Displays of school work in lines of agriculture other than livestock were numerous and educational. The girls had a large exhibit showing their efficiency in sewing, cooking, housekeeping and nursing. A number of girls were also exhibitors in the livestock classes.

On Saturday judging teams from Holtville, San Bernardino, Lancaster, Brawley, Riverside, Pasadena, Pomona, George Junior Republic, Owensmouth, Hemet, Long Beach, Chaffey, Van Nuys, Citrus Union, Gardena and from Jefferson, Franklin and Manual Arts in Los Angeles entered the big contest in livestock judging. They were required to place a class of horses, sheep, hogs, beef cattle and dairy cattle. Professors True, Howell, Thompson and Hughes from Davis, assisted by Mr. Wilson and Mr. Thomas, were in charge of the judging.

The contest was divided into three classes. Class A was for the judging teams and was won by the boys from Van Nuys. George Junior Republic was second, Lancaster third, Riverside fourth and Pasadena fifth. In this class John Ritter of Lancaster was high man.

Classes B and C were for individuals and were equal, the division being made on account of the large number of boys.

Class A—1, Glenmore Inbeck, Van Nuys. 2, Virgil Stalder, Riverside. 3, Harry Adams, Van Nuys. 4, Karl Kelsey, Riverside. 5, Cecil Stalder, Riverside.

Class B—1, Robert Shaffer, Owensmouth. 2, Albert King, Pomona. 3, James Powers, Lancaster. 4, Burl Hancock, Long Beach. 5, Wm. Sawyer, Lancaster.

Animals for the judging classes were furnished by the breeders of the neighborhood. The Italian Vineyard Co. of Guasti showed Berkshire swine, Wessels and Mahoney of Chino, Guernsey cows and Hall Brothers of Perris, Shorthorns. All of the animals were of the highest quality and it was somewhat of a task for the professors to place them to their own satisfaction after the boys had finished.

The men from Davis were highly pleased with the work of the boys. With the swine and two cattle classes they showed exceptional knowledge, but most of them were a bit at sea with the horses and sheep. As Mr. Wilson said afterward they had not expected much knowledge of sheep from boys in Southern California where sheep are not plentiful, and they tried not to smile when mention was made of the sheep's hams and its fur and hair. His speech to the boys after the judging was very comprehensive and pointed out their faults so carefully that in the future many of them will score much higher on sheep judging.

The exhibits made by the boys were judged by Messrs. Gordon and Ralston of the university extension department.

Twelve thousand cuttings of the athel tree or tamarisk articulata are being set out by the Fontana Farms Company. These trees, similar to a pine though not of the conifer family, are famous for their prodigious growth

and dense foliage. They will be used at Fontana to fortify the existing border tree and windbreak system which now contains over 400 miles of fully grown eucalyptus trees. It is estimated that there are cuttings sufficient to plant a row from 13 to 15 miles in length. The cuttings are placed directly in the groves midway between eucalyptus rows, the soil having first been thoroughly wet. During the grove irrigating season they will receive water every 21 days. Judging from the experience in Coachella Valley and other sections where tamarisks have been planted it will be but a very few years before these trees are fully grown.

Sharp practices will not cure dull times.—Ashville Times.

VIKING

High efficiency and slow speed keep power and repair bills down. Viking pumps operate at 60% to 65% efficiency and maintain a constant high efficiency under varying heads (impossible with the ordinary centrifugal type).

Sizes: 10, 20, 35, 90, 300, 450, 1050 and 1600 gallons a minute.

Viking catalog mailed upon request.

Livestock News Notes

LIVESTOCK SALE CALENDAR

Holsteins
June 1 and 2, Burr Farm, Los Angeles.
Sheep
June 15-16, Annual Ram Sale, California Woolgrowers' Association, Davis.

The Berylwood Stock Farm at Hueneme is continuing to make good records with its Holsteins. Queen Butter Cup Pontiac, a granddaughter of Pontiac Korndyke, has just finished a 7 day record of 30.4 pounds butter from 480 pounds milk; Arcula Alcartra Burke, a junior two year old, made 20.75 pounds butter from 491 pounds milk in 7 days, and Korndyke Canary Brightest made 19.66 pounds butter in

milk and 29.3 pounds fat. 182 cows in the association made over 40 pounds fat during the month. The high cow was a registered Jersey owned by D. F. Conant of Modesto which produced 87.3 pounds fat from 930 pounds milk. The Stanislaus County testing department is doing a splendid work and new members are constantly being added. Twenty cows were culled from the herd of the association last month on account of not being up to the standard set by the association.

F. L. Hogue and A. F. Walker, two prominent Holstein breeders of Stanislaus County, have entered into partnership and are establishing an excellent herd of Holsteins at Ripon.

BOVINE "CONTAGIOUS" ABORTION

This is a collective term applied to miscarriage or premature birth produced by the existence of some abnormal condition in the bodies of pregnant animals. Abortion is not in itself a disease but is the result of a disease.

Since the term contagious abortion

is somewhat misleading and is usually applied in cases where a single animal slluks her calf two or more times or where several animals in a herd abort, a more general term such as abortion disease would be considered more appropriate in referring to such conditions, especially when the exact cause of miscarriages is not known.

The disease in most cases is regarded as being infectious, and until more light is shed on the subject by scientific investigators, every precaution should be taken to prevent cattle intended for breeding purposes from coming in contact with the infectious germs. In a large measure this may be accomplished by breeding your own animals through careful selections within the herd, and handling every cow with as much care as though she were known to be infected. Provide separate sanitary quarters for calving and for the isolation of cows showing symptoms of abortion. The afterbirth of each aborting cow and the dead calves should be burned and the premises thoroughly disinfected.

Before introducing a new animal into the herd the history of that in-

dividual animal and the herd from which it came should show that there was no possibility of exposure to the disease. The safest plan is to purchase healthy animals from healthy herds. Cattle should be given clean wholesome feed and water from sources where abortions have not occurred and they should be provided with sanitary surroundings. All cases of abortion occurring in a herd should be regarded as contagious until otherwise determined.

There is no known prevention or cure for abortion disease other than the exercising of prevention against the entrance of the disease into a herd. Various products are on the market which the producers claim will prevent abortion disease. At the present time there is no known prevention aside from exercising precaution against exposure of cattle to the disease.

The wise procedure is proper care and management of the herd. Medicine will not cure the disease!—J. P. Iverson, chief division of animal industry, state department of agriculture.

COMING EVENTS

(Corrections and Additions Requested.)

Western Directors Departments of Agriculture, Sacramento, May 29-30.

Oregon State Fair, Salem, September 25-30.

Arizona State Fair, Phoenix, October 30-November 3.

7 days, eight months after calving. This cow will make almost 1000 pounds butter in 365 days.

The Poland China swine breeders of Riverside County have formed a local association which is very active, and they are out to let people know that there are quite a few Polands in that neighborhood, and good ones too. They expect to have a large exhibit at the next Southern California Fair.

Guernsey guaranteed milk from the Windemere ranch at Chino is to be sold in some of the Los Angeles cafeterias. This will add to the present supply being delivered by the Adohr, Brant and others. The demand is so great that there is room for a lot more milk of the same kind at prices above the market.

The April report of the Stanislaus County farm bureau cow testing department shows 1,225 cows tested, the average production being 781 pounds

How to choose An ENSILAGE CUTTER

THERE ARE A GREAT MANY WAYS of deciding upon what ensilage cutter to buy—from flipping a coin to choosing from a catalog. But the common sense way is to **EXAMINE A NUMBER OF CUTTERS**, then compare them as to construction, convenience, service, up-keep and price.

That is the way we would like you to form your opinion of the Papec—by actual comparison with other cutters, not by glowing descriptions and pretty phrases. The coupon will bring you complete information regarding the Papec.

You can decide upon a silo by the same system of careful comparison of one against another. Agricultural experts have pronounced the Simplex Silo "scientifically correct." Mail the coupon, and we will tell you how the Simplex meets the scientific requirements of what a silo should be. Then compare this silo with others.

Santa Fe Lumber Co.

18 California Street - San Francisco, Calif.

Santa Fe Lumber Company,
18 California St., San Francisco.

Please send me complete information regarding the Papec Ensilage Cutter and the scientifically correct Simplex Silo.

market, as in the case of market points in the Middle West. The nearest feeding grounds of any appreciable size are 200 miles distant from Los Angeles, and there is no possibility of development of feeder grounds nearer it, because of the intensive development in the fruit and citrus industry. The shipping cost from the market point to feeding areas and the back haul to market point eliminates the possibility of profit in such feeding operations.

4. Our present methods of marketing cattle in California permit the buyer to select the quality of cattle which he wishes for immediate slaughter, shipping only those desired and permit the producer to hold unfinished cattle at a minimum expense on his range.

5. There is little possibility of the development of California into a great feeding state because California does not produce a surplus of feed, as do the Middle Western states, particularly those in the corn belt, where the surplus of feed is marketed in the form of livestock.

6. The experience of livestock feeders in the corn belt states is that feeder cattle can be more economically purchased and shipped direct from the range to the feed lots, avoiding going through stockyards, with the result of less shrinkage to the cattle and avoiding the payment of feeding and commission charges, thus making the cost to the buyer less and the price received by the seller higher.

7. The California Cattlemen's Association is convinced that from the producers standpoint the proper place to sell, grade and weigh cattle under western conditions, is at the range or shipping point.

8. Under the stockyards plan of marketing cattle, it is impossible to control the receipts of cattle at yards, with the result that unavoidable heavy receipts would depress the market and because violent fluctuations and vari-

ations in the price paid as now occurs at eastern market points, which fluctuations are disastrous to the producer. The price received by California producers remains steady, with few and gradual fluctuations because only the supply needed is bought by the packer.

9. With the present plan of marketing cattle in California, producers have enjoyed the best market in the United States during the past two years. The California producer has received more for his cattle in California markets without stockyards than producers elsewhere in the United States have received at their markets under the stockyards system.

10. While it has been suggested that stockyards might be organized on a cooperative plan to handle only the livestock of members of an organization, it would be impossible and illegal to refuse any livestock shipped to such a stockyard. Thus, even a cooperative plan would not enable the producer to control the receipts at the stockyards.

11. During 1921 a national committee studied the problem of marketing livestock, hoping to avoid some of the evils of marketing through stockyards. At the end of nearly a year's work they were without a solution to the problem and the only recommendation which they had to offer was that some system of more orderly marketing should be devised. They were unable, however, to suggest a plan which would make for and insure satisfactory, orderly marketing at Middle Western or Eastern points. California has the most orderly marketing of any state in the nation.

12. The California Cattlemen's Association is opposed to concentrating the slaughter of livestock at a few central points because such concentration would destroy the industry now existing and the investments in smaller towns throughout the state. Local slaughterers in small towns throughout the state kill 40 per cent

of the livestock consumed in California. Their investments and their activities should be encouraged and maintained.

13. This local slaughter in small towns takes care of a class of cattle which would depress the market at large central points.

14. Small local killing plants scattered over the state take care of the small producer with less than carload lots of livestock, which small lots are expensive to ship to central or distant market points.

15. Central stockyards would necessitate additional switching charges from such yards to packing plants, a cost which would be considered by the packer as deductible from the price paid to the producer.

16. Sale and handling charges in stockyards would cost producers approximately \$450,000 annually on the Los Angeles market alone, which cost is not now necessary and which is an added burden to the producer.

17. We deem it especially undesirable to establish stockyards until there has been an opportunity to study the results of the operation of the packer and stockyards administration, which has been recently instituted by the United States department of agriculture.

ANOTHER GREAT HOLSTEIN HERD COMES TO CALIFORNIA

We have been waiting for the past two or three years to be able to announce the arrival of the great Schroeder herd of Ormsbys in California, and now it has come to pass. E. C. Schroeder who has formerly held forth at Moorhead, Minnesota, but who has usually spent his winters in this golden state looking about for a place to locate his herd permanently, has formed a combination with Chas. W. Anderson of Burbank, one of the best known Holstein men of the state. The new firm, known as the E. C. Schroeder Farms Company, has taken over Edgemont Farm and combined the herd of Mr. Anderson, which is headed by a son of Pontiac Korndyke, with that of Mr. Schroeder at the head of which is Sir Pietertje Ormsby Mercedes 37.

Ed Schroeder has achieved greatness in Holstein circles of the world mainly through the performance of the great bull Sir Pietertje Ormsby Mercedes who was in the minds of many people, the greatest bull the breed has ever developed and his death was a great loss. He was a consistent sire of show ring winners and great long distance producers. Fifteen of his daughters have achieved over 1,000 pounds of butter in a year. It is through his sons that he is best known. In this state Sir Pietertje Ormsby Canary, so long at the head of the herd at the McCloud River Lumber Company and later at Toyon Farm; Sir Pieterje Ormsby Mercedes 43 at the Toyon Farm; and Major Pieterje Ormsby Mercedes at the head of the Maxwell herd; have served to bring him into prominence. Another boost for the old bull was showing made by his grandsons and granddaughters in the Maxwell herd on the last fair circuit. These were sired by Tritomia Pieterje Ormsby who was himself the grand champion of the National Dairy show. Fred Hartsook now owns 16 daughters and a son of Tritomia.

Sir Pietertje Ormsby Mercedes 37 who comes to head the combination herd is a tried bull and six of his daughters have made over 1,000 pounds of butter in a year and all in heifer form.

Mr. Schroeder is bringing out 75 animals. Fifteen of these are daughters of Sir Piet himself. One is by Sir Piet and out of Spring Brook Bess Burke 2nd. The rest are mainly the daughters "of the 37th." There are 22 cows in the herd with over 1,000 pounds of butter in a year.

Bob Melin who has been in charge of the Moorhead farm has been invited to be superintendent of the new place and after a short visit here has decided to accept. A few days in California after a Minnesota winter was enough to settle the matter for Bob. He will attempt to fix up a nice show herd for this fall but his main efforts will be toward making yearly records. Now the new test barn on the Anderson place is explained.

The way to Big farm returns

PRODUCTIVENESS of the average farm depends on the availability of water. That is why a Byron Jackson deepwell turbine is the ear-mark of a prosperous farm for it places unlimited quantities of water at the owner's command.

The accompanying photograph of an installation in the San Joaquin Valley tells its own story of dependability, economy and efficiency—a worthy successor of its line, the first deepwell turbine to be built.

The Byron Jackson name plate on a pump is a guarantee of correct installation and an assurance of complete field service throughout the years of its operation.

This is a Deepwell Turbine year.

EDGEMOOR GUERNSEYS IN DEMAND

The dispersal sale of the big Guernsey herd at Edgemoor Farm formerly owned by W. H. Dupee and now the property of G. L. Strobeck, which was held at Hynes on May 17 was well attended and 21 buyers took the offering. It is seldom that so many buyers appear at a sale of this size but all were enthusiastic and many of them were careful pickers.

As is the case in all dispersal sales there was a great variety in the offering. It ranged from tiny calves, that a breeder who was to remain in the business would never trust to the mercies of an auction crowd, to old matrons who have almost outlived their usefulness. Also there were 14 bulls of various ages which were more or less a drag on the sale. There has been an awful lot of bulls of the various breeds offered for sale in the past few months, and it is a wonder that the market can soak them up at any price.

Most of the females of breeding age were in calf to Masterpiece of Edgemoor who is probably the best bred Guernsey bull alive today. He carries all of the most popular blood lines and is backed up by extremely high production. His dam's record of 748.32 pounds fat as a senior two year old is the second highest of the breed. The cows and heifers of popular breeding which were backed up by records were in high demand and brought good prices. The top of the sale was Dene King of Hollow-Hill Farm, a second calf heifer, who has lately finished a record of 521.07 pounds fat as a two year old. She was finally knocked down to G. T. Drinkwater of Lakeside, San Diego County, for \$925. She could have brought \$500 more and been well within her value. Professor Gordon True of the university farm was also bidding on her because the farm owns her dam, Imp. Dene Jewel, the great show cow.

Topping the bred heifers and second only to her dam was the daughter of this fine young cow, Dene Langdon of Hollow-Hill Farm, who sold to C. A. Bullis of Brawley for \$700.

This heifer is a daughter of the King of Hollow-Hill now owned by the Italian Vineyard Company at Guasti. Four daughters of this good bull appeared in this sale, and the average for the four, none of which was more than a senior yearling, was \$504. They were beautiful individuals and evidenced the results of the careful breeding carried on at Hollow-Hill Farm for a number of years. Practically all of them were backed up by good records on both sides for a number of generations.

The California Breeders Sales and Pedigree Company which handled the sale and Rhoades and Rhoades, the auctioneers, gave very good satisfaction.

A list of the animals and buyers follows:

FEMALES

Imp. Angerosa III, J. A. Brown, Capitola, \$385.
Azucena Langdon of Hollow-Hill Farm, Italian Vineyard Co., Guasti, \$460.

(Continued on Page 583.)

New Low Price Same High Quality

The price of the new SHARPLES SUCTION FEED SEPARATOR has been cut to a figure below the pre-war price but the quality remains the same—with the same dependable features that have built a world-wide reputation for SHARPLES (over one million in use).

Any one can operate a SHARPLES because it skims clean at any speed. Knee low supply tank saves heavy lifting yet suction feed supplies the correct quantity of milk at all speeds. There are no discs to clean with a Sharples, only the patented tubular bowl. Friction ball bearing makes easy turning while oil tight gear case requires oil only once a month.

You can depend upon SHARPLES to deliver cream of the same unchanging density at all times—not thick today and thin tomorrow—and that a minimum of butter fat (1/100 of 1 per cent) will be left in your skim milk.

What SHARPLES is doing for over a million users it will do for you. You can't afford to be without one at the new low price.

Winsor Ranch Jerseys—Bull calves with production behind them, at reasonable prices. **BONITA**, CALIFORNIA.

Registered Herefords—Anxiety IV strain. Breeding stock for sale. **Chas. Rule**, Duncans Mills, California.

SEEDS AND PLANTS

SUDAN GRASS SEED
(The Great New Hay Crop)
First introduced in the United States 1909 from Sudan, Africa.
Culture. Strictly an annual, may be drilled or broadcasted, 15 to 25 lbs. per acre, it grows 8 to 10 ft. high, yields 3 to 10 tons per acre, two to four cuttings.
Pasture. It will yield food for six times as much stock as any other forage without irrigation. For milk cows and hogs there is no better and more abundant pasture than sudan. It will solve the hay proposition as nothing else can or will do in this climate. This seed is grown on our farm and is free from Johnson Grass.

Price—5 lbs. \$1, 10 lbs. \$1.50; 50 lbs. \$8 100 lbs. \$8; 500 lbs. \$35; 1000 lbs. \$50.
BOWMAN'S HDWE & IMP. CO.

Mammoth White Pekin Duck Eggs for hatching \$1.00 per dozen; \$8.00 per hundred. **A. Surtman**, Petaluma, California.

NEW AVOCADO BULLETIN

Announcement was made by a government official at the avocado convention, that a bulletin on the avocado would soon be published and sent out from headquarters at Washington, D. C.

Goat Island in San Francisco bay, for many years site of a naval training station, has been abandoned, congress not having made appropriation for its support. Men in training there are transferred to the San Diego base.

Farmers of Polk County, Oregon, have signed up 300 acres for flax growing.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Grub in the Head

I have an eight year old horse that goes along all right but at times throws his head down and acts as if there was something in his nostrils: Will go along like an old cow at times then all of a sudden he will bolt. About six months ago he discharged from the nose and I was told that he had distemper. What is wrong with him?—Subscriber, Tucson, Arizona.

It acts like grub in the head, the same as sheep have. Horses are not supposed to have grubs in the head but we do not know any reason why they should not. The symptoms would be such as you describe. Would not know what to do for it.

Canker in the Ear

What will cure a little Fox terrier of canker of the ear? She has it very badly. It is filled with what looks like sand and blood. It annoys her very much. I wash it out with salt and warm water.—Subscriber, Burbank.

Canker of the ear is almost incurable. Try dropping a few drops of kerosene in the ear every day or two.

Founder

I have a mare of race stock that has very bad feet. She hobbles around at times as if stiff. She is worse after even a short drive. The frogs are shrinking away and scaling off in large scales. What can I do for her? Also please describe canker of the foot.—Subscriber, Santa Rosa.

It is inflammation of the lamina of the feet; also called laminitis. The lamina of the foot is the soft part between the hoof and the bone of the foot. Anything that may cause inflammation of the lamina stops the growth of the hoof which will shrink and bind the parts and cause pain. Once it is established it usually becomes chronic and is hard to cure. Soaking the feet in cold water for an hour or two every day will in time relieve it. Canker of the foot is due to a germ and rots away the frog and sole. It keeps the parts wet and is very offensive to the smell. Turpentine may dry it up.

Hard Swelling

I have a horse that was kicked on the outside of the hock joint about four months ago, causing the leg to swell badly, and there appears to be a hard bunch there that does not go away when the horse is exercised. It does not cause lameness and is not tender. Can you advise me through the Cultivator of anything that will remove it without a hard blister? If not what would be a good blister for it?—Subscriber, Hughson.

As you say it does not cause lame-

ness you better not do too much with it. Rubbing it frequently with a round stick like a hammer handle may soften it up and in time it will disappear. A blister might cause a scar and that would make it more noticeable.

The 37th annual convention of the Holstein-Friesian Association of America and Heart of America Dairy Show will be held at Kansas City, June 5-10.

LIMAS ARE GROWING

It now appears the acreage of Lima beans this season will be larger than in most former years. Sugar beet growers have received such an unsatisfactory return that many a beet field has been turned into a bean field this year. The big crop which is possible creates a situation which is causing the growers to ask "What are we going to do about it?" They are answering their own question by getting busy with plans for stronger cooperative effort. Commenting on the situation Chas. C. Teague tells the bean growers:

"It has always seemed to me that the Lima bean growers should be able through cooperation to control the market and secure exceedingly favorable results, better results than the growers of most any other agricultural produce, because the growing of Lima beans is confined to a very limited strip of land, along the coast of Southern California, and the California Lima has no competition elsewhere in this country. This is a most favorable state of affairs and the growers should make the most of it by 100 per cent cooperation."

SHOWING VALUE OF RIPE OLIVES

With free demonstrations of ripe olives in leading retail grocery stores, intensive sales work among retailers and jobbers and educational methods being used in domestic science departments of schools, the California Olive Association is carrying on now in Kansas City and other Middle Western cities a campaign designed to finally re-establish the ripe olive in Eastern markets.

At the rate truck orders are coming in to the manufacturers of commercial vehicles, 1922 sales are going to be more than 200 per cent of 1921's. This will mean that over a quarter of a million new trucks will go into service this year in the United States.

QUALITY IS AT THE PEAK PRICES ARE AT BEDROCK

Year after year the quality of Goodyear Tires has been going up and up.

Veteran users say Goodyear Tires today give more than twice the mileage they did ten years ago.

In the meantime, there has been no slackening in our effort to push Goodyear prices down.

Today these prices are at bedrock—the lowest they have ever been.

Look at the figures listed below.

They represent an average decrease in Goodyear prices since 1910 of more than 60 per cent.

Remember—Goodyear quality is at its peak.

These prices, divided by your speedometer reading, tell the story.

Now is the time to buy.

THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

HURLEYS
NEW

GOOSE NECK Cultivator

The Best Furrowing and Leveling Machine on the Market—
Built for Horses, also Largest and Smallest Tractors.

M. N. HURLEY, Manufacturer

This is the lightest weight efficient Cultivator and Furrower on the market. Its construction of spring steel gives it a crossbar that yields to sudden strains and it springs back. Detach the shovels and wheels and you have THE BEST LEVELER YOU CAN BUY.

Patented reinforced spring steel draw-bar 5 in. x ¾ in. with bar below 5 in. by ¾ in. reinforced on two edges with angle iron. Shanks diamond shape 1¼ in. or 1½ in. Hitches for all tractors or horses. 6 ft. size only \$110 with 1¼ in. shanks. 6 ft. with 1½ in. shanks \$105. Made in 6, 7 and 8 ft. sizes. Horse drawn cultivator has front truck. Over 300 in use and all giving best of satisfaction. Order direct. You can go any depth from 5 in. above the ground to 15 in. deep, setting the teeth to prevent cutting the roots.

138 So. Comstock, Whittier, Calif.

Golden Gate Weed Cutter

One of the handiest Farm Tools on the market. Kills the weeds completely, cutting them off under the surface, close to the roots. At the same time it

THOROUGHLY PULVERIZES THE SOIL

No need to plow after using this tool, for it leaves the soil in a perfect mulch. Here is the cheapest and best solution to the weed problem. Cuts 7 feet or less in width and adjustable to any depth. Weight, 230 lbs. Constructed of steel throughout.

SEND FOR CIRCULAR which tells you all about this handy tool and what users think about it.

Eggs as Poultry Feed

By M. A. Schofield

THE waste eggs from hatcheries when boiled hard become rubbery and difficult to handle. They must however be thoroughly sterilized, because the feeding of raw eggs to some animals and all poultry has not been satisfactory. We have therefore hit upon this plan: Take a wooden pail or tub and fill one-half with eggs; then pour boiling water until the pail or tub is nearly full. Throw a blanket or some other covering over and around the vessel so as to retain the heat. It will be better to keep covered for several hours. This method will thoroughly sterilize the eggs and will leave the white of a consistency almost like milk. They may then be readily mixed with any kind of ground feed. Usually they are fed shell and all, as the semi-organic ash of the shell is valuable to growing animals and to fowls which are laying.

Fed to Broilers

From time to time broilers are raised for some special market. After experimenting with feeding eggs, it is my belief that no other feed produces broiler sized chickens at a younger age, or flesh of so fine a quality. As to rapid growth it is not unusual to find Leghorn cockerels weighing 2 to 2½ pounds at 10 weeks of age where they have been fed eggs judiciously. Ten to twelve eggs a day for 100 broilers is about as much as they can assimilate.

To Laying Hens

Some years ago we set aside 120 Leghorn pullets and fed them with the idea of determining how many eggs a flock of pullets could be induced to produce and still keep in reasonably good health. In this test we made use freely of waste eggs. It became evident early in the test that they would not be able to consume any large amount of this material. An egg a day per pullet was entirely too much, and we finally determined that one-half egg per day for six days a week was about right. Now as to the results: On three separate days these pullets, numbering 120, laid 108 eggs. For three months their average was a little in excess of 90 eggs per day. The mortality was not unusual; but

the egg production the second season was disappointing. This test would indicate that the eggs fed in this quantity were somewhat stimulating as well as supplying a feed which was highly digestible.

To Laying Ducks

The most remarkable results which egg feeding has given us have been with laying ducks. All those who have attempted to hatch large quantities of duck eggs realize how disappointing the fertility and hatchability are apt to be. In fact, early in the spring duck eggs seldom hatch well when fed the ordinary ration. Time after time we have recommended the feeding of eggs where there was trouble with the hatchability. The laying duck will stand one egg per day for a time and will stand three-fourths of an egg a day for a long period. Where ducks have reasonably good care it is nothing unusual for their eggs to hatch from 70 to 75 ducklings per 100 eggs set; in some instances as high as 85 per cent. So far as my experience goes no other feed will secure such hatchability when duck eggs are incubated artificially in large quantities. Laying ducks fed a reasonable number of waste eggs will usually produce hatchable eggs in December and January, which is rather unusual for our section of the country.

The effect on the hatchability of geese and turkeys is very similar. Not only is the hatchability better when judiciously fed, but the number of eggs produced by both geese and turkeys is greatly increased by the careful feeding of this material. However, with these fowls, feed very sparingly.

To Pigs

A few years ago the boys of the Gardena high school entered into a pig fattening contest. Those pigs which were fed eggs, age and size considered, made far greater gains than did any of the other pigs in the contest.

The same will be found true in feeding calves; so altogether we find that when eggs are properly sterilized they furnish some necessary elements for nutrition not usually found in the grains and mill feeds fed to poultry and livestock.

Poultry Queries

Conducted by Jean A. Koethen

No Gizzardless Ducks

In your article in last week's Cultivator you say a duck "has no gizzard." Then what do you call the part of its internal workings which very much resembles the gizzard of a chicken? Perhaps you were misquoted.—Subscriber, Van Nuys.

No, I was not misquoted. I wrote gizzard when I should have written crop, that was all. The duck has no distinct crop, like the chicken, and hence must have its feed softened beforehand. Thank you for the correction.

Fall Hatching

What is the objection to hatching chicks in summer and fall? I am thinking of buying chicks in May and later in July and September.—Subscriber, San Leandro.

Leghorns hatched in May, if they have clean ground to run on, shade and an abundance of green feed, are often ready for the laying house by October. The objections to May hatching are: the cheap price cockerels bring in midsummer; heat and parasites which are liable to stunt the growth of the birds unless every precaution is employed to keep them away; scarcity of green feed in summer; the fact that the later hatches nearly always have to run on ground fouled by previous flocks; in the case

of heavier breeds the almost certainty that they will not begin laying before January. There is nothing whatever to be said in favor of hatching in July. Pullets will not lay before January and may not lay before March weather is hot and parasites are rampant. September is one of the best months in the year for hatching, and most poultrymen who are unable to get out all the chicks they want before the middle of April wait and get out another hatch in September. September chicks bring top prices as broilers and fryers, and pullets invariably lay in March, but they lay small eggs. That is the only objection to September hatching.

Houdans

Please tell me where I can get a setting of Houdan eggs.—Subscriber, Escondido.

Who has these rather rare but excellent birds? If any one has them or knows of any will they kindly let us know.

Limberneck

When our Leghorn chicks are about a week old their heads draw back and they topple over and die. Can you tell us the cause?—Subscriber, Domino.

Your chicks have limberneck, or wryneck, due to severe indigestion or

Rid Hens and Chicks of Lice and Mites

A Few Drops of Wonderful New Remedy
In Drinking Water Does It—No
Dusting, Spraying or Greasing

Any poultry raiser can easily and quickly clean out Lice and Mites by using a new Remedy recently discovered by a Kansas City chemist and called Imperial Lice and Mite Remedy.

All that is necessary is to occasionally put a few drops of this amazing remedy in the fowl's drinking water. It renders them immune from the attack of all blood-sucking parasites, as these pests positively will not stay on a fowl taking this remedy.

It also acts as a splendid Tonic and Blood Purifier, as well as increasing egg production and growth, for with these pests eliminated, hens lay better and young stock grows faster. It is positively guaranteed not to affect the meat or eggs.

The manufacturers of Imperial Lice and Mite Remedy are anxious to get it quickly introduced among poultry raisers everywhere, and make this Special Introductory Offer. Send no money, just your name and address to the Imperial Laboratories, Room 550, 2110 Grand Ave., Kansas City, Mo., and they will send you a regular full sized \$1.00 bottle and will also send you free a big full sized (double strength) \$1.00 package of Imperial White Diarrhoea Remedy, the standard, time-tested remedy. Pay the postman only \$1 and a few cents postage when both packages are delivered. Any time within 30 days, if you are not satisfied with results, just say so and your money will be cheerfully refunded.

Baby Chicks

We incubate 250,000 eggs every three weeks; the largest and finest equipped electric hatchery in the Southwest. All popular breeds: Rhode Island Reds, Barred Rocks, Black Minorcas, Anconas, etc. Also our famous Oregon-Corvallis White Leghorns. Order now for immediate or future delivery of Baby Chicks, Pekin, Muscovy or Indian Runner Ducklings, Mammoth Bronze baby turkeys. All kinds of pullets supplied—anytime. Incubators and brooders. Careful attention to every order, large or small. Send today for prices.

REDWING HATCHERY

LEE'S LICE KILLER

Kills lice, mites, bed bugs, etc., affecting poultry. Spray or dust on roosts, etc. Get body lice on chickens, too. Works while they sleep. No dusting, dipping, greasing or banding. Does lot of unpleasant work. At most towns, at stores handling live fowls. Write for information and FREE Book.
GEO. H. LEE CO., Dept. F-30. OMAHA, NEBR.

poisoning. You should examine their feed very carefully and make sure that there is no mold in it. In such young chicks the trouble is more likely to be due to moldy or heated grain than to any other cause. Perfectly sweet, clean feed is the only cure, though a liberal amount of sour milk may help to get them back into condition after the cause is removed.

ELEVENTH NATIONAL EGG LAYING CONTEST

The 300 hens in the eleventh National egg laying contest laid 6,663 eggs during April, or an average of 22.21 eggs per hen. Pen 47, S. C. Rhode Island Reds, owned by Cream Ridge Poultry Yards, New Egypt, New Jersey, won the cup for April by laying 139 eggs during the month.

The number of eggs laid by the different breeds for the month and to date are: Wyandottes, 1086 in April, 5497 to date; miscellaneous varieties, 1122 in April, 5385 to date; Plymouth Rocks, 1151 in April, 5339 to date; Leghorns, 1105 in April, 5258 to date; Anconas, 1151 in April, 4893 to date; Rhode Island Reds, 1048 in April, 4765 to date.

The ten leading pens for April are: S. C. Reds, New Jersey, 139 eggs; White Wyandottes, England, 138 eggs; Barred Rocks, Missouri, 135 eggs; R. C. Rhode Island Whites, Missouri, 134 eggs; S. C. White Leghorns, Washington, 132 eggs; Barred Rocks, Missouri, 132 eggs; S. C. Anconas, Missouri, 131 eggs; White Wyandottes, England, 130 eggs; R. C. Rhode Island Whites, Illinois, 130 eggs; Barred Rocks, New Jersey, 129 eggs.

The ten leading pens to date are: White Wyandottes, England, 681 eggs; S. C. White Leghorns, England, 653 eggs; S. C. White Leghorns, Washington, 644 eggs; White Wyandottes, England, 640 eggs; S. C. White Leghorns, England, 633 eggs; Barred Rocks, Missouri, 625 eggs; R. C. Rhode Island Whites, Missouri, 624 eggs; White Wyandottes, Missouri, 623 eggs; Barred Rocks, New Jersey, 617 eggs; R. C. Rhode Island Whites, Missouri, 597 eggs.

"STRICTLY FRESH" EGGS AND OTHERS

A fresh egg contains highly nutritious properties which are demonstrated by the development of the chick within the shell. Since hen eggs are used extensively as human food, it becomes necessary to classify them with regard to quality.

In the new world we recognize three classes, as follows: Fresh eggs, stale eggs, and others which have undergone changes sufficient to classify them as inedible. Some of the Orientals apparently have not as yet been able to decide when an egg is to be regarded as spoiled as long as the shell remains intact.

In the United States the processes of refrigeration have been developed to a very high degree, thereby making it possible to preserve perishable, edible products for a long period. Sometimes, however, refrigeration fails to retain in certain products the properties desired by the consumers, due either to inefficiency of the refrigerating equipment, carelessness on the part of those in charge of it, or on account of the stored product deteriorating with age.

This is true regarding the cold storage of eggs. While it must be admitted that cold storage has worked wonders in the handling of this product, nevertheless there are limits to the time a fresh egg will remain fresh under the most ideal cold storage conditions. Occasionally, in some parts of this country, eggs from cold storage are found to be labeled and sold as "strictly fresh" when in reality they have reposed in cold storage until they have lost considerable of their freshness. Most people can detect this condition by taste and smell when such eggs are served to them as food. While it is true that a rather ancient cold storage egg may contain considerable nourishment, it is also true that it is not as "strictly fresh" as it is sometimes labeled.

There is a very simple method known as candling which will indicate when an egg ceases to be regarded as strictly fresh even before the shell is broken. Such information may be obtained by permitting rays of light to pass through the egg and noting the various changes which have taken place with regard to position or shrinkage of the white and the yolk or from the action of micro-organisms within the shell.

CAMPUS PLAN AT DAVIS

The new campus plan which is to govern the future growth of the Branch of the College of Agriculture at Davis and which has been adopted by the board of regents as the official plan for that institution, has just been completed by Professor John William Gregg, landscape architect, and is now on display in the director's office at Davis, where it is attracting a great deal of attention and receiving much favorable comment from all who are interested in the development of a greater institution for agricultural instruction and research.

The plan itself is approximately five by seven feet in size and beautifully rendered in color to bring out the details of the main scheme which shows a practical but aesthetic grouping of buildings around a large central quadrangle which is balanced on Second Street of the town of Davis as a secondary axis and with a broad main roadway from the state highway on the north determining the main axis.

The detailed arrangement of buildings is such as to eventually form group units with secondary quadrangles which are called for by the style of architecture which is to prevail and which is being worked out by William C. Hays, architect of San Francisco.

Such utilitarian factors as convenience, accessibility, centralization of special and general types of instruction and research, comfort, and health have all been considered of prime importance in the study and preparation of the plan, which as it develops will gain great architectural and landscape beauty.

Already two new buildings, the Dairy Industries Building and the Horticultural Building, are being erected according to this plan, and new sidewalks, curbs and roads are now under construction along new lines with the result that the plan is already beginning to furnish a visible suggestion of the future institution.

A 2-month-old cockerel a few hours after being attacked by head and neck lice. Both baby chicks and grown fowls are killed in great numbers by this type of louse.

MINERALIZED WATER ROUTS CHICKEN LICE

A new scientific discovery makes it easy to rid poultry of lice and mites. Simply dissolve in the fowls' drinking water the

The body louse of chickens.

harmless mineral tablets known as Paratabs. Soon after the fowls drink the mineralized water, all lice and mites leave them. Chicks that drink the water never will be troubled by vermin.

Paratabs do away with the bother of greasing, dusting, spraying and other unsuccessful methods of fighting lice. They are warranted to impart no odor to flesh or eggs. They cost only a trifle and are sold under a money-back guarantee. Thousands of poultry raisers are using them with complete success.

The head and neck louse of chickens.

What Users Say

Paratabs are the best thing for chickens I ever used. They clean the hens and make them lay, and I don't find any lice, mites or fleas on any of my young chicks. Paratabs are a good tonic for all chickens.—Mrs. W. A. G., Jacksonville, Fla.

Paratabs are fine. My chickens have no more lice. Before using Paratabs I had 20 loafers on the roosts, but now they are out.—A. F., Keeseville, N. Y.

I never saw anything like the work of Paratabs. It reminds me of the fairy story of the magic wand. Early this year I was getting 14 to 16 eggs a day. Then, without visible cause, the number dropped to 5 to 7 a day. I began using Paratabs as directed and in 2 or 3 days there was a difference of 1 or 2 eggs a day. On the fifth day I got 17 eggs and on the seventh I got 23. I heartily recommend Paratabs.—Mrs. E. H., Centralia, Ill.

I received the Paratabs all right and my hens seem to be laying better already.—Mrs. W. S. C., Monticello, Ark.

I am giving Paratabs water to my chickens and am having better luck this year than ever before. I haven't had a little chick to be a bit sick. It is the greatest medicine we ever used for young chickens.—Mrs. M. N., Pulaski, Ky.

Send No Money

LET US TAKE ALL THE RISK

Anyone can try Paratabs without risking a penny. We are so confident this new scientific discovery will free your flock of lice and mites that, to introduce Paratabs, we will send two full \$1 packages—enough for 200 gallons of water—for only \$1. BUT SEND NO MONEY. On delivery, pay the postman \$1 and postage, and if your flock is not free from lice and mites in 10 days, your money will be refunded without question. Don't let vermin kill your fowls and steal your profits. Write for the Paratabs today.

HAY AND FEEDSTUFF

A. W. Scott Co. reports under date May 20:

Receipts past week 897 tons as compared with 571 previous week. Seaport and shipping have been in fair volume.

Interior trading continues extremely quiet and has been badly upset by the show-ers of rain. Large areas, particularly volunteer, have been cut. Standing hay and grain has profited by the moisture.

Several sections are baling first cutting alfalfa. A few sales in small quantities have been reported through the week at prices ranging from \$10 to \$13. A little Nevada hay continues to go into some of the more remote sections, but it will soon be displaced by the first cutting California crop.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

that deliveries be made at least two weeks in advance of contract dates, in order to maintain a killing number. There is no surplus beef in the state. Buyers undoubtedly will hold off buying and kill the last fed steer before buying grass cattle, in order to reduce the price of grass-fat stuff to the lowest possible point.

Feed conditions in the San Joaquin Valley and coast counties are reported good, and considerably improved by recent rain. This will enable cattlemen to hold and market only prime cattle.

Orderly marketing will stabilize the price. Sell only f. o. b. ranch. Top your herd and sell only prime beef. Forcing half-fat cattle onto the market will break the price. Report sales to your Association Secretary promptly.

A bill has been introduced into congress and has passed the senate almost unanimously, extending the life of the War Finance Corporation for one year. This bill, if passed, will enable cattlemen to secure loans on cattle until July 1, 1923.—R. M. Hagen, Secretary.

PROBLEMS WHICH THE AVOCADO INDUSTRY MUST MEET

(Continued from Page 567.)

avocado, I want to quote from an article published in Science, January 20, 1922, by A. F. Woods of the University of Maryland. He says, "there has never been a time when the need for agricultural research of the first order was as great as it is today." He emphasized the fact that, under the present conditions of population, it is not only essential to make two ears of corn grow where only one grew before, but that it is just as essential to increase the nutritive value of the products produced.

Having defined what should be done, the next question is who should undertake the work. A careful investigation of the existing varieties in this state and in different countries where the better varieties of avocados are to be found, will be an important step in such an undertaking. Our own association can do much, and we can rely upon the county farm bureau, the state university and the U. S. department of agriculture for valuable assistance, but inasmuch as there are many other problems of great importance to be investigated and inasmuch as the expense of establishing and operating the plant and organization necessary to make such work permanent, will be of considerable magnitude, it seems to me that the most feasible plan would be to undertake the work through either a state or a national experiment station.

There is great need for an experiment station to study the subtropical fruits which are being introduced into Southern California in large numbers. Among the problems which such an experiment station, with the assistance of this association, the farm bureau, the state university and the U. S. department of agriculture, should investigate, are:

The improvement of the existing varieties of avocados through bud selection.

The introduction of larger and more satisfactory varieties of the Mexican race of avocados.

The development of new varieties of avocados from seeds,—especially hybrids of Mexican and Guatemalan varieties.

Diseases of the avocado, injurious insects and fungi.

Irrigation problems. a. The maximum drouth which the different varieties of avocados will stand in different soils without injury should be determined. b. The effect of excessive irrigation on the trees and on the production and quality of the fruit should be determined. c. The importance of allowing the trees to dry out in the fall should be emphasized. It is thought by many growers that trees are rendered less hardy by irrigation in the fall on account of the new foliage which is produced. Recent investigations on hardiness, however, show that the drying out process has a tendency to produce certain colloid materials in the tree which greatly increase its hardiness.

The falling of fruit before it matures.

Influence of climatic conditions: a. The effect of humidity on the different varieties of avocados should be determined. b. An effort should be made to lessen the hazards due to cold weather by encouraging the development of hill land, and by the devising of more efficient and more economical orchard heaters or other ap-

paratus for the protection of orchards.

The keeping qualities at the ordinary temperature and the effect of cold storage on the different varieties of avocados.

Possibilities of by-products.

Vitamine content and nutritive value of the avocado.

The physical condition of the soil best adapted to the growing of avocados.

The maintenance of soil fertility.

The maintenance of soil fertility is one of the most important and one of the least understood problems with which horticulturists are concerned. In this connection I want to quote again from the address of Raymond A. Pearson at the President's Conference. He said that soil fertility is the most important of our national resources and emphasized the importance of its conservation, and added that we gather crops very much as we harvest lumber. We make use of what we find without much reference to the needs of future generations.

Avocados remove much larger quantities of mineral matter and nitrogenous matter from the soil than do other fruits. These materials must not only be returned to the soil from year to year, but must be in a condition to be assimilated by the trees. Practically no attempt has been made to solve the fertilizer problem for avocados. It is more than likely that the tendency of avocados to bear in alternate years and the tendency of the unripe fruit to fall at times are due, in a measure, to the fact that the tree is undernourished. Fruit trees have stored in them each fall a certain amount of reserve material for their growth in the spring, but this reserve material has not been shown to contain any large amount of available nitrogen. It is very doubtful if avocado trees in ordinary soil and with ordinary treatment can fully recuperate from year to year the large amounts of mineral and nitrogenous matter which are removed with the fruit. Its failure to produce fruit in any year may represent the normal performance of an undernourished tree. Furthermore, an undernourished tree is an easy prey for all the enemies of the horticultural world.

A study should be made of the influence of various fertilizers on the resisting power of avocados to cold weather. It is well known that some fertilizers make trees more hardy, while others produce the opposite effect. An exhaustive investigation should be made of this subject.

It has also been shown that the protein content of some agricultural products can be increased by the addition of certain fertilizers at the proper time.

These are some of the problems which the avocado industry must meet. As these problems are solved, the quality of the avocado will be improved and its nutritive value increased; and the avocado tree will become more hardy and more prolific. The influence of this work will be felt in all countries where the avocado is grown, and the avocado will

become more and more important as a factor in increasing and perpetuating the food supply of the world. If the California Avocado Association takes the initiative in solving these important problems, and becomes instrumental in the establishment of either a state or national experiment station in Southern California where research on subtropical fruits may be permanently established, it will have performed an important service to this state and to the world; and the avocado industry in Southern California will become a permanent and profitable industry in the face of ever increasing obstacles.

SUSCEPTIBILITY OF AVOCADOS

(Continued from Page 570.)

pay the extra price and get above the frost line.

The frost line however, is very difficult to designate. It appears that most of the steep hillsides, as well as the tablelands with plenty of air drainage on one or more sides, are well adapted to avocado culture so far as frost protection is concerned.

There are a number of orchards in the lowlands which escaped remarkably well during the last freeze. This however, is no indication that avocados can be grown safely at all times in those places, because Jack Frost is not always visiting the same localities with the same degree of severity.

Some sections which were affected very much in 1913 escaped practically unharmed in 1922. On the other hand sections which were hit severely last January experienced very little damage in 1913.

Orchard heating is not only expensive; it is a constant worry during the winter months and a very unpleasant occupation. The expense of equipping an acre with modern heaters is \$500 more or less, according to the kind of heaters selected. My recommendation to the persons located in the most exposed places would be at

least 80 seven to nine gallon cast iron pots to the acre.

As far as the avocado industry is concerned in a general way it is well to say the freeze came in time to serve as a warning. Five or ten years from now the planted area of tender varieties would have been much larger and naturally the damage corresponding.

CROP REPORT

Sutter County Farmer, Yuba City, Sutter County

Almonds, 85 per cent. Apples, fair. Apricots, full crop. Cherries, 90 per cent. Peaches, full crop. Pears, fair. Prunes, 65 to 75 per cent. Grapes, full crop present outlook.

J. B. Hickman, Horticultural Commissioner, Monterey County

Apples, 110 per cent. Apricots, 10 per cent. Cherries, few trees. Peaches, 90 per cent. Pears, 100 per cent. Prunes, 100 per cent.

New Superior Model Breaking All Sales Records of Standard Fully Equipped Cars

This leadership has come only from sheer superiority in value per dollar of price. Price, operation and maintenance considered, your dollar buys the most transportation in a Chevrolet.

Equipment and accessories considered, Chevrolet is the lowest priced car made.

You buy it all at one time, because Chevrolet is *ALL THERE* as sold—nothing more to buy but the license, gasoline and oil.

Chevrolet Invites Comparison Because Comparisons Sell Chevrolets

Consider What Chevrolet Equipment Means:

Standard Rear Axle Construction. The new Superior Chevrolet has the strong, quiet Spiral Bevel Gear Axle that "stands the gaff" without breaking.

Standard Transmission—three speeds forward and one reverse.

Standard Braking System—foot service brake, hand emergency brake.

Standard Electrical System—Starter, storage battery, Remy ignition, electric lights front and rear, on battery circuit.

Standard Water System—pump circulation, large, honey-comb radiator and fan. This means a cool, efficient engine, saving gasoline and oil and ensuring driving comfort.

Standard Doors—two on roadster and coupe, and light delivery, four on touring and sedan.

Standard Instrument Board—containing speedometer, ammeter, oil pressure gauge, lighting and starting switch, and choke pull.

Standard Type of Carburetor, with exhaust heater—one reason why you get most miles per gallon of gasoline with a Chevrolet.

Powerful, Valve-In-Head Motor—the same type as used in successful cars selling at much higher prices.

Demountable Rims—extra rim on rear. No trouble to change tires on a Chevrolet.

Many Other Advantages which will be noticed on inspection, comparison and demonstration.

No matter what car you own or think of buying, see the New Superior Model Chevrolet.

Making Hay in the Shadows of Snow Clad Mountains

THE · NATION'S · SERVICE · TRUCK

Your Choice of the "Red Baby's" Brothers · \$1500

The famous "Red Baby" Speed Trucks of the McCormick-Deering dealers are making millions of people sit up and take notice this summer. They are brightening up the landscapes throughout the country, flitting everywhere, covering many miles in few minutes, delivering machines and service, and helping to speed up Prosperity. The dealer's red speed truck is the most useful live wire in the community. It has earned the title, "Nation's Service Truck."

This International Speed Truck, which is putting new life into the implement industry, is the ideal truck for any farmer and business man who wants fast, dependable haulage at low cost. Ask the McCormick-Deering dealer about the "Red

Baby's" brothers. For \$1500, f.o.b. factory, you can get an International Speed Truck complete with any one of twelve different body and cab combinations, and with tires, power tire pump, electric lights and starter, fenders, etc. Liberal terms if you haven't the ready cash.

Flag the McCormick-Deering dealer as his swift "Red Baby" comes along, or go to his store to pick out the truck and body style you need for your work. The closer you investigate this speed truck, the better you will like it. If your hauling is on a larger scale, remember that the International Motor Truck line is made in eleven sizes from the 1500-lb. speed truck to the 10,000-lb. heavy-duty unit. Write for catalog.

One Dollar Yearly

Stage Coaches, Whiskers and Hoopskirts Revived

WHISKERS are winners. Hoopskirts are plentiful along Sacramento streets, and, if we leave out the real fat ladies, are more or less attractive. But Sacramento whiskers are awful and will certainly drive self respecting people to drink or at least to commit something dreadful. Some of the boys have become frightened and have shaved. This has stopped several divorce proceedings and is lessening crime—in Mining Town. Some of the wearers of whiskers, "Whiskerinos," are most brazen, but others have a hunted look and glance at those they meet as if they would like to stop and explain.

But, seriously, the "Whisker Parade" or "Whiskerino Pageant" has proved the principal feature of the "Days of '49" celebration which is closing as I write. Further, it has proven one of the cleverest and most successful advertising stunts ever pulled off. Coast people and papers are talking about it—I mean them—and many of the "Nationals" amongst the magazines are giving out a fund of information and publicity—which California likes—and all because of this event.

So, "whiskers are winners" and all California will receive the benefit.

Financially it's a success. Nearly a hundred thousand has been spent. Over a hundred thousand has been taken in by Mining Town.

"Mining Town," occupies several blocks near the Southern Pacific Depot. Its entrance is by a tunnel

Editorial Correspondence

Days of '49

Snapped on the streets of Sacramento during the celebration last week. Upper: Contrast of old and new stages. Lower: Old prairie schooner.

through a range of home made mountains. Coming down from the mountains is a stream or ditch which pours its waters over the old time water wheel operating a mill (which is a

duplicate of one formerly near Knights Landing. This "grist mill" is fitted with old time mill stones, elevators and all complete as in olden time. A prominent sign announces "Gold dust

taken for flour" also that "grists" on toll plan are accepted.

This mill is actually operated by the overshot water wheel. It is mentioned as an example of some of the worth while exhibits. It is erected by the Sperry Flour Co. and is in charge of a pioneer who has been with Sperrys for 39 years.

Even more educational are the historical and museum exhibits made by various counties, cities and societies. Tuolumne County is one of these. It played up Bret Harte and Mark Twain and their connection with the county. Bret Harte was quoted: "There was commotion in Roaring Camp. It could not have been a fight, for in 1850 that was not enough to have called together the entire settlement. * * Deaths were by no means uncommon in Roaring Camp but a birth was a new thing. Hence the excitement. Cherokee Sal was sinking fast etc." Other quotations were featured by illustrations and otherwise. California will read more of its own classics because of "Days of '49."

Tours are arranged to Coloma, the Marshall mill site, Placerville and other placer mining points. One old time church in Sacramento is open day and night, giving each evening lectures and addresses and lantern exhibits reviewing historical events and renewing interest in California by Californians.

It is not all booze and burnside.

Report of Committee on Registration and Classification of Avocado Varieties

Read at the Seventh Annual Meeting of the California Avocado Association at Pasadena

WE are glad to have new varieties to mention from year to year, particularly when they give promise of commercial value. There is always the possibility of the discovery among them of something even better for commercial purposes than the superior kinds we already have. None of us will deny that these in themselves are a sufficient foundation for our industry to become a great one but that the ideal commercial avocado for California conditions is still to be found. None also will deny the great value and important place in our industry of those which have been or may still be imported from abroad. What has been done by individuals and by the government in this respect has given us some of our best kinds and assisted in giving us a foundation on which to build towards our ideal fruit. But in view of the hardness we seek it seems more and more probable that such a fruit is most likely to be obtained in a cross between the Guatemalan and Mexican types in a California grown seedling.

Natural crosses of the kind have occurred and will occur, and a few growers are doing some intentional hybridizing. It would be very desirable for the future of our industry if the state or national government would undertake this work on strictly scientific lines.

A natural enthusiasm over his product exists in a grower who produces a new and good fruit, and a very common desire is to urge its immediate use by the industry. He needs frequently to be reminded that this is unreasonable and that a combination of many different values is needed in an avocado qualified to take place as a leader in the market and that it takes years to find if they are present. No fruit when first produced, however good it may be in itself, can be known to possess them in proper proportion. Hardiness against cold and wind, ease of propagation, strength and healthy growth of young trees in nursery and orchard, season of maturity of the fruit, length of time from bloom to maturity, beauty of appearance, inside and out, size of fruit and of seed, keeping and shipping qualities, beside quality and flavor, must be considered, and, as the basis of all else, whether the tree is precocious and productive. However good the fruit may be, a tree is of little worth that does not yield a good crop. Also our knowledge is not complete until we know the young budded trees

are exempt from the weakness in the bud union that caused the discarding of the fine Colorado variety and others. To acquire all this knowledge takes much time, even five years is not too much, and several should be given to results with budded trees.

During the past season the committee has as usual examined trees and tested fruits of old and new varieties.

(Full report of varieties tested will be given in next week's issue.)

There are special uses for certain kinds of avocados for Californians who have homes in orange growing sections, even when they have only doorway space, and where it is too cold for our Guatemalan type of tree. We can tell them they are not barred out from growing at their own door a tree or two of the Mexican type to afford their own table and by their own growing an abundance of this wholesome and delicious fruit. Good varieties of this type are available, such as the Northrup, Ganter and others that will stand all the cold which an orange will. They bloom in the spring and mature their crop in

the fall. The Ganter is a good grower, usually a good bearer, with fruit averaging half a pound in weight, free of fibre, moderate in size of seed and of excellent flavor. A frequent defect at the blossom end interferes with its market value, but not with its use at the home table.

Another special use is provided by a variety grown at Highland, called the Tiger. The tree is a hardy, upright grower, productive and bears an attractive looking purple, pear shaped fruit, averaging three quarters of a pound in weight, with a thick skin, large seed and maturing during the latter part of the winter, extending into the spring. It does not have a high flavor, in fact a decidedly neutral one, still agreeable. Its value is that it stands the dry air of the interior valleys better than any other kind so far tested, and seems adapted for growth in such places.

For another special purpose we can utilize our exceptionally and especially frost free locations. The damage done to them by last winter's cold had apparently demonstrated that we can grow safely only in such places some of our choicest varieties. Among others are the Linda, Queen, Knight, Nimloh, Panchoy, Sherman Seedling No. 1 and Victory—all large, fine looking fruit of good flavor and most beautiful clear yellow flesh when cut open.

(Continued on Page 599.)

Agricultural News Notes of the Pacific Coast

Northern California

Grass Valley reports prospects for fruit crops in Nevada County excellent, no material damage being done by recent storms.

Acreage of rice land signed in the California Rice Growers Association is 220,000 in both Sacramento and San Joaquin Valleys.

An extermination campaign will be waged against rats at Willows, Glenn County, where they have recently become a serious pest.

The California Canning Peach Growers has named prices to canneries. No. one cling, \$60; No. two, \$30. Lowell freestone, \$45; other frees, \$40.

At the recent meeting of the Glenn County Holstein-Friesian Club at Willows the need for a teacher of agriculture in the high school was pointed out.

A reclamation district has been organized on Tubbs Island between Sonoma and Toley creeks in Sonoma County. There are 3,000 acres on the island.

The irrigation field laboratory at the university farm at Davis will soon be in operation. Special work will be done on orchard irrigation practice and equipment.

Hayward and surrounding districts in Alameda County are being canvassed to secure \$50,000 for permanent building and equipment for the Farm Products Show.

Sutter County farm bureau is planning to take complete fruit census of the county; acreage, age of trees, tonnage in 1921 of the different varieties will be recorded.

Ranchers of Rio Oso, Sutter County, report herds of 10 to 20 deer feeding on the first cutting alfalfa. The deer make their homes in the dense growth along the Bear River.

The Santa Clara County Walnut Growers Association held its annual meeting at Santa Clara on May 8, electing J. P. Martin, president; C. J. Parks, secretary-treasurer.

Rice growers of Colusa, Yuba and Sutter Counties are signing petitions to congress asking that emergency tariff of 2 cents on imported rice be retained in tariff bill now forming.

Sonoma County Gravensteins are expected to be ready for market between July 10 and 15, a week or two later than usual. It is reported that opening prices will be around \$2.25 per box.

Rice millers are refusing to pay prices asked by the California Rice Growers and mills are idle. Growers say there is not enough rice for local consumption and millers are merely sparring for time.

Wool growers of Yuba, Placer, Sutter, Sacramento, El Dorado and Nevada Counties have organized the Marysville District Woolgrowers Association. A. T. Spencer of Cranmore, Sutter County, was chosen president and William S. Carter, Wheatland, secretary.

The San Joaquin County Cherry Growers Association was recently formed at Stockton to affiliate with the California Cherry Growers Association. A. B. Haslacher of Farmington is president; F. A. McCan, Stockton, vice-president; F. B. Winchel, Farmington, secretary.

Central California

Early date crop at Yuma, Arizona, will be small owing to cool weather when setting.

Packinghouse of the American Fruit Growers Exchange at Sanger was destroyed by fire last week.

Terra Bella Valencia shippers are happy over the prices their fruit is bringing in Eastern markets.

Frank Gill of Success, Tulare County, shipped to Sacramento one day last week nine carloads of beef cattle.

This week ended spinach pack at Oakdale; cannery is now working on peas grown in the Empire district.

Weed Patch, Kern County, will hold a community fair on September 2. Rio Bravo follows suit on September 9.

Turlock is making plans for revival of Melon Day in combination with Pork Day in a two day carnival to be held in August.

The opening of Sequoia national park has been postponed beyond the announced date of May 24. Late snow fall is the reason assigned for the delay.

San Benito County farm bureau held its second annual picnic on May 13, on Tres Pinos Creek, ten miles southwest of Hollister. Twelve hundred people attended.

The survey of a road from Madera to the Wawona grove of big trees, authorized by the state legislature at the last session will be undertaken at once by the state engineering department.

Grain farmers of the Newman, Stanislaus County, district have organized the West Side Fire Protective Association. A committee will urge stockmen to plow fire breaks between hill ranges and grain fields.

The Fresno city commission has made it a misdemeanor to throw lighted cigar or cigarette stumps out of windows of office buildings. The ordinance was passed at the recommendation of the city fire commission.

At the organization meeting of the California Ripe Olive Growers Association at Fresno, H. T. Miller of Bakersfield was elected president and Mrs. U. Stewart of Highland, San Bernardino County, secretary. Headquarters will be at Fresno.

Twenty-nine Fresno County banks had an aggregate deposit of 47 1/2 millions dollars at the close of 1921, according to figures compiled at the Fresno County chamber of commerce. The gain in deposits for semi-annual periods was over five millions.

Record shipments of spring lambs were made from the west side, Fresno County, during April. More than 1000 lambs and sheep were shipped every day of that month from Coalinga section. It was estimated that fully half a million sheep were raised on the west side plains this year.

Valley wide sentiment for establishment by the federal government of a veterans' hospital in the Sierra foothills will be shown through a mass meeting to be held in Fresno this week. It was proposed that the hospital accommodate 250 patients and will very probably relieve all former service men afflicted with tuberculosis and gas.

Southern California

A date packing plant will be located at Riverside.

Peaches and plums will yield heavily in Yucaipa Valley.

Twelve big combined harvesters are busy at Calipatria.

Will Wilde of Ventura is to be secretary of the county fair association.

Associated chambers of commerce of Riverside County held all day meet at Elsinore, May 23.

Beaumont is making plans for its annual cherry festival to be held at height of the season.

Laborers are coming to Brawley, El Centro and Calexico for the cantaloupe harvest. Hundreds are arriving daily.

San Dimas dam is nearing completion. The dam is 140 feet high, 115 feet wide at the base, 11 feet at the top.

Work will soon be started on diversion of a portion of Whitewater which will be carried to Banning for irrigation.

Vern Detar has been named assistant farm adviser for Imperial County. He will give most of his time to dairy work.

The California Growers Association cannery at Elsinore will run to full capacity this season, beginning about July 1.

The town of Ripley and several thousand acres of crop lands were inundated by flood waters from the Colorado.

The road boosters of San Diego and Imperial Counties met in Sentenac Canyon, May 28 to inspect work being done.

A receiving station of the Poultry Producers of Southern California has been established at Escondido, San Diego County.

T. J. West of Imperial has offered to lease the cotton compress at Los Angeles Harbor and pay the city 25 cents for each bale handled.

Francis Cuttle, who has been head of the Tri-Counties Reforestation Committee for the 15 years of its existence, has tendered his resignation.

The Associated chambers of commerce of Imperial Valley has launched united effort to back Congressman Swing in passage of the Boulder Canyon dam bill.

A citrus institute will be held in Pomona, July 14-15. Walnut, Spadra and Pomona farm bureau centers will be hosts to the growers from other southern counties.

The new \$50,000 ferry approach at Blythe, Riverside County, was dedicated May 17. Governor Stephens and acting Governor Hall of Arizona took part in the ceremonies.

Cantaloupe growers, distributors and railroad officials met at El Centro, May 18 to make preliminary arrangements for handling melons, freight rates, icing facilities, inspection, etc.

A state quarantine inspector is needed at Blythe, Riverside County, now that it has become a port of entry by the recent opening of the ferry over the Colorado, according to County Horticultural Commissioner Bottel.

Mill Creek Road to Big Bear Valley opened May 27. Controls will be established. Road crews are said to have moved snow drifts ten and twelve feet deep to open the road.

The Coast and General

Hood River Valley apple growers report very heavy bloom on apple trees.

Broccoli is being packed for the first time by cannery at Roseburg, Oregon.

Clarke County, Oregon, prune growers say their fruit this year will bring them \$2,000,000.

Pineapple shipments from Cuba are now at their apex and an excellent season is promised.

Western Washington shipped 250 cars of eggs to New York and other eastern markets from November 1 to April 3.

Florida's early tomato production is estimated at 10,992 cars; 1921 harvest was 6829 cars. Texas will this year ship about 4500.

The Clarkston, Washington, cherry pool has set prices on 1922 cherries: Bing & Lambert, 10 cents; Republican and Tartarian, 8 cents.

Several new buildings have been completed on fair grounds at Dallas, Oregon, in preparation for the Polk County fair, October 5-7.

Whatcom County, Washington, berry growers have organized a marketing association and will establish a receiving station at Bellingham.

Poultrymen of Stevens County, Washington, are organizing a cooperative marketing association. There are more than 100,000 poultry in the county.

Damage to truck crops in Maryland and Delaware by April frosts made necessary much replanting, especially of beans and tomatoes. Peaches were severely injured.

W. L. Close, district horticultural inspector, has forecast the 1922 fruit crop of Yakima and Kittitas Counties at 14,675 carloads. He estimated the potato production at 7000 cars.

The Pacific Cooperative Poultry Producers announces consolidation of the Oregon and Idaho egg pools and closing of the Caldwell, Idaho, offices. This will effect a saving of at least \$800 per month.

The orange yield in Cuba is reported "too heavy for shipment and the oranges are rotting in the plantations. An excellent opportunity seems at hand for establishment in Cuba of modern fruit and vegetable canneries."

Canners are making contracts with growers of berries in the Woodburn district of Oregon at three and one-half cents for loganberries, four and one-half for gooseberries, seven for red and black raspberries. Cherries are bringing four and one-half.

Secretary Fall of the Interior has notified all reclamation project managers that they may not refuse water to entrymen or land owners pending decision for extension of time on payments. This decision was made in a test case on Miaidoka project in Idaho.

The first annual farm bureau picnic of Yuma County, Arizona, was held at Gadsden, May 6. 700 farmers with well filled baskets enjoyed the day. Speakers were President Bridge of the county farm bureau, President Brown of state farm bureau, President Spillsbury of the Arizona Industrial Congress and J. P. Doyle of Douglas.

SOME three years and a half ago an infestation of a European snail, *Helix pisana*, was reported from La Jolla, San Diego County, and an inspection of the infested area was made by the writer, acting for the horticultural commission.

Through Dr. L. O. Howard of the U. S. bureau of entomology and our then state commission of horticulture, our attention was drawn to the dangerous character of this snail and to its evil repute in countries bordering on the Mediterranean. It is said to be a particularly important pest in Sicily where it is recorded as destroying the buds and blossoms of lemons, olives, loquats and other orchard and field crops. A Sicilian naturalist, De Stefani, mentions the damage done to the flowers and young fruit of the lemon and says further, "it gnaws and injures the bark of the twigs, completely denuding them for long distances."

Dr. Howard further called our attention to the fact that no other infestation was known in the United States.

The degree of infestation found at La Jolla was literally astonishing, although strangely enough the area affected was comparatively limited, covering not more than three or four city blocks all told. The infested area was rather rough and divided by a deep canyon running down to the sea. With the exception of where a few scattered buildings stood it was covered with wild oats, buckwheat, salt-bush, sagebrush, sumac, etc.

Snails were gathered on these bushes in enormous numbers, in some instances bunching and massing together in such quantities as to bend some plants to the ground. On one small buckwheat plant not over two feet in diameter and 18 inches in height the writer counted 798 snails in all stages of growth, from those not over an eighth of an inch up to full grown specimens of three-quarters of an inch in diameter. Sign boards, leaves of the agave, bamboo shoots and even cement curbs were literally festooned with groups and bunches of snails. Many had crawled up on the walls of houses and buildings in the vicinity, apparently with no regard for the hot sun, as quanti-

ties were found exposed to its direct rays on the south side of buildings. This disregard of the sun and heat is one of the peculiar characteristics of this snail and is emphasized by the fact that many of the largest bunches or masses were found where there was

A Pest of Snails
Upper photo: *Helix pisana*, showing bunching habit on wild growth during summer. Photo taken during fall of 1918 by R. R. McLean. Lower photo: New infestation of *H. pisana* two years after almost complete eradication. Photo taken April, 1922, by R. R. McLean.

the least shade. As is well known, our common western snail, *Helix aspersa*, has a strong antipathy for light and heat and is a night feeder entirely.

Although in locations that are hot

and dry, as was most of the area in question, *Helix pisana* appears, as a rule, to remain dormant most of the summer, cementing itself to bushes, rocks, boards, cement curbs or even to other snails, there is every reason to believe that those found in irrigated gardens were actively feeding and that in even exposed situations many continued to feed through the summer.

The omnivorous appetite of this mollusc is illustrated by an amusing instance that occurred preparatory to burning over the infested area, one control measure adopted with considerable success. With the cooperation of the proper authorities, printed notices were posted on the several properties affected requiring that they be cleared of brush, etc., within ten days. By the time this period had elapsed, snails had eaten practically all the notices, leaving very little but the bare frames to which they had been tacked.

Control measures undertaken were as thorough as possible under the circumstances, the then Commissioner Gorton securing a gang from the county jail and burning over the entire area capable of being so treated and having garden spots sprayed with solutions of alum and copper sulphate. This work was kept up for several months, until about two years ago it seemed that eradication had been almost entirely accomplished.

However, an inspection made by the writer this past month develops the disturbing fact that in spite of all this, *Helix pisana* has staged a strong comeback and is again to be found in large numbers, and throughout quite as large an area as before. The ability of this snail to persist and multiply in the face of severe eradication measures points to what we may yet have to contend with if it ever becomes an escape from La Jolla and deals with our orchard and field crops as it is reported to do in southern Europe.

It is true that it has not done an appreciable amount of damage around La Jolla and has confined itself largely to the wild growth there, but its reputation is such that we can afford to take no chances with it. That it has not yet spread beyond La Jolla is probably due to its being in a somewhat out of the way place and to there being no commercial orchards or vegetable gardens near by.

How *Helix pisana* came to La Jolla we do not know, but it seems probable it was either brought in on plants imported from southern Europe or else colonized there by someone with a taste for snails and who wished to maintain a source of supply. According to records at the Scripps Biological Institute its occurrence there has been known to conchologists since 1914, but they appear to have had no knowledge of, or at least interest in its economic possibilities and consequently made no report of it to the proper authorities.

The history of this mollusc under California climatic conditions has not been sufficiently studied to warrant definite conclusions, but it is certain from our observations at La Jolla that eggs are not laid until the ground becomes softened by the winter rains. In irrigated gardens egg laying was observed much earlier than in dryer locations, and it may be possible that under such conditions there is more than one generation. As observed by the writer, eggs were laid anywhere, either in shaded spots or places exposed to the sun, the main consideration apparently being that the ground be soft and moist. A moist sandy soil seems to be an ideal location for egg laying, some 10 or 12 to 30 or 40 eggs being deposited in a mass about an inch under the surface of the ground.

There being a vacancy in the office of horticultural commissioner in San Diego County at the present time, the bureau of pest control of the state department of agriculture has been notified by the writer of the present status of *Helix pisana* at La Jolla and is expected to take prompt action. Mr. Smith, its chief, has instructed H. M. Armitage, in charge of the Whittier insectary, to make an immediate investigation.

This Month in the Ornamental Garden

Southern California

By Ernest Branton

JUNE is an unsafe month in which to set out any but plants of a hardy nature and even so they must have unusual care. Annuals, even when moved with soil about the roots, suffer severely from shifting. Those with many roots and lots of soil will pull through hot weather but if soil drops away in handling no amount of watering, sprinkling etc., will save them during hot days. Therefore June is not a planting month.

But "with proviso and exception" as Shakespeare says. The present spring has been cool in the southern end of the state and followed an unusually cold winter. Cannas, ginger lilies, dahlias, elephants ears and many other things from the tropics may still be planted or transplanted. Owing to lack of spring heat usually present these plants did not start growth in

the writer's garden before May 15. They will move easily early in June. Gladiolus bulbs may still be planted but should go in at once; bulbs planted later bring no good flowers except bulbs have been kept in cold storage, this being now a common practice with some growers.

Geraniums, palargoniums and fleshy tropical plants root quickly from cuttings in hottest weather. The writer once rooted 2,000 geranium cuttings in June with very ordinary care. They were put in coarse sand three inches deep and watered freely. In garden soil do not have cutting more than one inch in soil and do not keep wet. Seeds of many kinds may be sown, preferably where plants are to remain: balsams cosmos. centaurea. coreopsis, cockscomb, hollyhock snapdragon and zinnia. All these fairly revel in hot weather. The late varieties of chrysanthemum may also be propagated from cuttings in early June.

Sweet peas are still in bloom and

run to seeds very quickly and heavily if mature blooms are not closely picked, and no more flowers will come. As the vines are grown for nothing but flowers it will pay to keep them closely picked. It is such work as this that should engage the attention of the gardener, for care only is generally necessary during the hot months. Watering is the greatest factor in retention of plant vigor but it should be used with judgment. It will be noted that weeds grow fastest in hot weather and you must hold "a continual pull."

Many varieties of roses have bloomed abundantly on long barren stems containing no leaf buds. These should be cut away as they drain the plant vitality, especially if dried flowers are left on the terminals. Mildew will also be present in some localities and with some varieties. Those badly affected year after year should be discarded. For the others there still is nothing more simple in its application nor more effective in hot

weather than sulphur lightly dusted over the foliage. If the soil is dry under the bushes sprinkle some sulphur on the ground on the sunny side. If sun hits it the fumes generate far more quickly and in greater volume than if scattered on the foliage. But remember that sulphur does not "fume" except with heat so that all that scattered in the shade is lost except for the small fertilizing value it has.

Northern California

By A. R. Gould

NOW that the summer is here there should be an abundance of flowers. Cultivating and watering will be the two most important things to attend to this month. The planting of fall flowers will be in order. There appears to be general complaint regarding the destruction caused by snails, slugs and cutworms, owing no doubt to the extended wet (Continued on Page 600.)

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

These are hay making days. The clatter of the mower and the fragrance of the new mown hay are in the air, and more wealth will soon be in the pocket of the haymaker. Prices are fair—just fair—in some sections. In others freight rates prevent the grower from getting a living wage, much less his share of profit. It is immaterial how much his investment may be or what his labor costs are, but it is very material that the freight rate on his products shall make full interest and large salaries for those more favored.

Up in the valley, The Great Valley of California, the hay makers are more than busy. Both alfalfa and grain hay are going down and putting up. Both are high quality. Grain hay is proving a bigger crop than anticipated. On the other hand it will prove a year of rather high hay production because the last rain of the season was sufficient to make grain fields of many which would have been hay fields without that rain. It will be a big grain year.

Rivers are pouring the floods down from the snow clad peaks and running bank full down the valleys to the bay and to the ocean. The other day we were riding along the banks of the Tuolumne and some one remarked: "See the smoke rising yonder; must be a mountain fire." It proved quite the contrary for as we came nearer and out on a promontory or "inspiration point," the "smoke" proved to be a mist of waters falling over the great La Grange dam.

* * *

The waters, clear and green,—sometimes nearly nine feet deep over the crest—take their mighty plunge and create a scene of grandeur but arouse a twinge of regret for there is no place to use that wealth of water at this time of the year, and there are no reservoirs for storing till we can use. Hence portions of the valleys are flooded and crops destroyed.

* * *

The daily papers of a few days since carried "Kings County Ranchers Face Gigantic Loss" and similar head lines. Many breaks in levees actually did

One cooperating force which has not filled a large place in the public eye, but has in economies made possible to farmers of California, met in Turlock last week and conferred and discussed as to how to better serve the state's economic interests. Fire insurance is only one of the many types of insurance necessary these days, but it is the most necessary. There are in California 22 county mutual companies which are carrying something over a hundred millions in insurance, mostly on farm property. The cost of this insurance is approximately one-half that of the "old line" companies. Some of these companies are now more than a quarter of a century old and there is yet to be reported the first default or loss which has not been met. The money which is stored is stored and used in this state, more, in the county. Some of the problems discussed at the 21st annual convention of the State Association of County Mutual Fire Insurance Companies at Tulare will be touched upon next week.

* * *

Cotton is getting to be king or

encouraging to Western producers. The feeling has at times prevailed that the coast and mountain states have received hardly the attention which has been given to east of Missouri producers. Especially has this been true as to the activities of the bureau of markets. Assurances by Assistant Chief Tenny of the bureau of markets in effect that new powers delegated to the bureau will enable more complete service in the future. The increased powers are not backed by any increase of appropriation—which is a bit embarrassing. There is hope, however, that a way will be made and the desert and mountains will be bridged and greater service rendered to producers on the coast. In any case the question is fully discussed at Sacramento this week.

DATES ON THE MAP

There is a new world geography out. It is edited by J. Russell Smith of Columbia University. Of course California is in it for California is always on the map. Still better, this new geography touches upon some things little known to easterners as to California production. The book is called "Human Geography" and is in two volumes touching upon "Peoples and Countries" and "Regions and Trade." The author has made the discovery that all dates do not come from Algeria or Arabia but that way out on the Pacific Coast in a little valley called The Coachella the finest dates on earth are grown. Illustrations of the date gardens are features of the new book.

AVOCADO COMMITTEE REPORT

On account of lack of space in last week's issue, we were unable to publish the committee report on Registration and Classification of Varieties of Avocados, fully expecting to give our readers the full report in this issue but find it necessary to only print the main part, leaving the description of the different varieties tested by the committee for a later issue. Those interested in avocado culture, who did not have the pleasure of attending the Pasadena meeting, should not fail to read this very interesting report.

SNAILS

From the report of Robert R. McLean of San Diego it would seem that the old saying "slower than a snail" will have to be discarded, especially with respect to the new variety "Helix pisana" which does not seem to be so slow when it comes to eating. If this pest is as serious as Mr. McLean's report would indicate, it is high time some concerted effort was being made by the horticultural authorities to eradicate it before it spreads to the more thickly planted sections of the state, as any pest that has sufficient appetite and nerve enough to devour a horticultural commissioner's notice might prove to be quite a serious menace if it once got established in our orchards and garden lands.

A popular song writer says it is a mystery to him how he does it. But we cannot accept that as an explanation. Ignorance of the law is no excuse.—St. Paul Pioneer Press.

Automobiles wouldn't be dangerous if the horsepower of the engine were proportioned to the horse sense of the driver.—Marion Star.

Sometimes it is better to forget than to remember.

IMPORTANT AGRICULTURAL CONFERENCES AT SACRAMENTO

Questions affecting agriculture are more complex; every day becoming more difficult to answer. Research and experimental work solves one problem only to find it necessary to begin another. World wide traffic with ever increasing transportation facilities, brings products of all climes even many "perishable" fruits to every door.

With the products there sometimes come the native pests and diseases. At least they came. Can we prevent them from coming in the future?

That is the big question before a series of agricultural conferences which are convening at Sacramento as we go to press. The Cultivator Editor is there. He wires:—

"Conference assuming even greater proportions than anticipated. Dr. Marlatt, chairman of federal horticultural board; Dr. L. O. Howard, chief U. S. Bureau of entomology; Lloyd S. Tenny, assistant chief of bureau of markets; Geo. B. Sudworth, member of horticultural board, and others of U. S. D. A. all here. Secretaries of agriculture or engaged in important agricultural work here are: Mote, Arizona; Lyne, British Columbia; List, Colorado; Whitney, Honolulu; Wicks, Idaho; Pratt, Lower California; Shovell, Montana; Records, Nevada; Park, Oregon; Webb, Utah; Robinson, Washington; Nelson, Wyoming. Strong represents California but Director Hecke and nearly his whole staff are on the job and rendering service.

"California county horticultural commissioners in session."

Later Wire.—"Prettiest scrap is between states rights folks from Idaho, Utah and Washington and Chief Tenny. They desire establishment of grades and standards which must be accepted by bureau of markets. State sovereignty must not be violated by bureau assuming authority to establish grades or standards not adopted by state. Resolution condemning federal interference carried three to two.

"Fertilizer control and companies in harmonious meeting. Horticultural commissioners, also quarantine board, have full attendance. Nurserymen gathering for opening session Thursday."

occur, much damage was done and homes were deserted. Fortunately Old Sol tempered his heat for a few days, the snows melted less rapidly and the papers were saved the necessity of chronicling a disaster of first magnitude. The people of California are studying and understanding more of the magnificent resources of the Sierra Nevada, the Sierra Madre and even the Coast Range and "Store the Floods, Stop Destruction, Irrigate the Valleys. Add to the Comforts of Our Homes is becoming more popular"

* * *

Another week we will tell just a bit of the story of one of the rivers which flows out of the Sierra Nevada—the Tuolumne. Clear and green as an emerald it leaps over the boulders till it is slowed up by the La Grange dam where it is diverted to two canals, one on the north bank, carrying the water to Modesto irrigation district, the other on the south bank, taking waters to a still larger, the Turlock irrigation district. A few miles above the La Grange is another and greater in the making, the Don Pedro, and still farther in the mountains is Hetch Hetchy, the project now so far along that its completion is promised in February 1923—But we are anticipating the story we have promised later.

queen or president, or at least something, of crops in several sections of California. Imperial has planted this year over 100,000 acres, and "over the line" has 50,000 more; Palo Verde 18,000 acres; Perris—a comparatively new district in Riverside County—10,000 acres. And large plantings have been made in the San Joaquin. Tariff protection seems to be well supported but another protection is demanded. We should awake to the boll weevil menace.

* * *

The Santa Fe Trail and other good roads have been made better. Bridges over the Colorado at Yuma and Needles are supplemented by ferries. One now operating at Ehrenburg near Blythe is carrying to California literally thousands of autos, many of them direct from cotton boll weevil sections. Some of these have amongst luggage possible carriers of the weevil. Imperial and Riverside Counties are asking for help in quarantine protection. Presumably the Cotton Conference at Sacramento on Saturday will discuss the question and it is hoped some protection may be planned.

The large number of representatives of the federal department of agriculture who are attending the conferences at Sacramento is most en-

Deciduous Fruit Troubles

By Ernest Branton

DURING the week of May 22—27 the agricultural extension service of Los Angeles County held a series of ten meetings to demonstrate the proper methods of dealing with deciduous fruit trees. V. F. Blanchard of the farm advisors staff conducted the meetings and Prof. E. L. Overholser of the state university was the lecturer and demonstrator.

January is a good time to plant throughout the state. After years of experiment and observation it has been found best to cut back young trees at time of planting. Some claim that in this way moisture is lost from the young tree and that the wound dries up, leaving a dead stub. The little moisture lost lasts but a week or so and the stub does not dry more than a quarter inch. If not cut back too many light thin leaves develop and make a big pull on the young plant through excessive transpiration.

Do not head young trees too low, for a good distribution of the leaders or "scaffold" branches cannot be had. If headed low the branches have to spring from practically the same point. This makes a nest or pocket for lodgment of leaves and trash, and heart rot is often induced. It also makes a weak crotch, for as main limbs grow the trunk at this point is absorbed by them and as they crowd each has but a wedge shaped base pointing to a common center, like the segments of an orange. With main limbs distributed up the stem several inches apart and on different sides of the tree, each may develop naturally without crowding or competition. Head at 24 inches and leave three main branches ranging from eight inches or more above the soil to the top of the trunk. Choose the stronger, well distributed, and the lower one preferably on the south side so its foliage will shade the trunk. In building the tree a fine distribution of fruiting area is the main point to consider.

Sun scald begins in winter, on the southwest side. Due to the dark color of the bark the temperature on a sunny day is 30 or 35 degrees higher than that of the surrounding air. Thermometers properly placed showed an air temperature of 80 and a bark temperature of 110. Therefore white-wash as soon as planted. While the dark bark absorbs heat the whitewash reflects or repels it. Prof. Overholser said Benjamin Franklin spread two large cloths over two inches of freshly fallen snow, on a sunny day, one white cloth, the other black. At sundown they were removed. Under the white cloth the snow was intact; under the black cloth the ground was bare! The snow had melted! Sometimes hot days are followed by freezing nights; the range of temperature is too great for good of the tree. In the spring the scalded portion dries out, leading some to think the injury was done at that time. This side of the tree, in neither trunk nor branches, will develop like the northeast side.

As the trees leaf out pinch the terminals on all but the three leaders, back to short spurs. These will furnish rosettes of leaves to shade the trunk and manufacture plant food. Also the evaporation through the foliage cools the air and keeps the whole tree from becoming unduly warm. If the leaves were stripped from a young tree the temperature would at once rise about 30 degrees.

In pruning time, fall or winter, cut the three leaders to about same height and cut off lower spurs left on the

trunk. The second spring when pinching back select two leaders on each of the three left the previous spring, and these six constitute the permanent leaders which must never be cut back except some change takes place which renders such action justifiable. After this the long pruning is followed that has several times been outlined in the Cultivator. It consists principally of thinning. On the long pruned the leaves and fruits are better distributed, the leaves are thicker, darker colored and therefore better for manufacture of food. The short pruned tree has leaves and fruits in clusters, the leaves are pale and thin, do not manufacture plant food and are a drain on the tree, pulling moisture from tree and fruit. Two such branches, with fruit and leaves may be given this trial: Take them indoors, pull the fruit from one, not from the other. The leaves on the one denuded of fruit wilt more quickly for after the leaves have exhausted the moisture in the branch they begin to pull that from the fruits. It pays to thin fruits on all trees well loaded. Slip a piece of old garden hose over a bamboo or light pole and strike the branches with the rubber "flopper." It will not injure the tree and you may quickly reduce the number of fruits.

Brown rot, a fungous disease, is prevalent in all parts of the state and is spreading. It enters at the blossom and follows through the stem into the branch and also attacks fruit, especially that in clusters. It is mainly in evidence through copious exudations of gum on the outer branches. Shade increases it, therefore thin both foliage and fruit. Sprays are good at any and all times. Best use a strong Bordeaux mixture—seven and a half pounds of copper sulphate, eight pounds of lime and 50 gallons of water. This may at times slightly burn foliage but results in no permanent injury. Spray first when flowers are pushing open. Spray again when in full bloom so inside of flower will be coated. This has not been found to interfere with natural pollination or the activities of bees as it is not poisonous and dries quickly. Prune out infected branches; The spray will control the disease. One may use lime-sulphur, mixing one part of the commercial mixture to nine parts of water, but this spray often injures foliage and fruit.

COURSE ON CHERRY CULTURE

Starting with the first carload of cherries shipped out of California in 1885, the amount has continually grown until in 1921 the shipments numbered 665 cars. Because of the continued increase in importance of this fruit and the demand for information on the best cultural methods the University of California college of agriculture is now offering a 12 lesson correspondence course on cherry culture.

Both commercial cherry growers and owners of home fruit orchard should find this course of great practical value in either making new plantings or in securing good crops from present plantings. Persons interested in cherry culture should apply to the Division of Agricultural Education, University of California, Berkeley, for further information.

PRICES SET ON CANNING PEACHES

California Canning Peach Growers has set prices on canning peaches for this season. All clings: \$60 per ton for No. 1; \$30 per ton for No. 2. Free-stones: Lovells, \$45; all other free-stones \$40.

SUTTER COUNTY PEACH DAY

Today is Peach Day in Sutter County when orchardists will gather at Yuba City. The day has been planned by the farm bureau to demonstrate the great development of the cling peach industry in Sutter County. The program of entertainment includes tours through orchards of the county.

Save 39%

on Fuel Alone

This Remarkable Booklet Tells How to Make Many Savings

Between the covers of this little booklet is information that may mean the saving of many dollars to any man who wants a good tractor. It is the most important booklet ever written, we believe, upon the subject of cheap farm power.

Shows how you can save money on fuel; on upkeep; on depreciation; how you can add to your profits year after year.

OILPULL

"The Cheapest Farm Power"

Get the **FREE BOOKLET**. Learn how the Rumely Oil Pull has won all principal Fuel Economy Tests for the past ten years; how owners' reports of upkeep cost average only 50% of government figures on all tractors; how a close investigation of hundreds of Oil Pull Tractors **PROVES** that average Oil Pull life is more than 10 years; how Triple Heat Control, the scientific system of oil-burning, solves the problem of getting the power out of kerosene.

Many California owners burn stove tops and distillate, effecting still greater reduction in fuel costs.

Mail the coupon for booklet today.

Phylloxera Resistant Stocks

No pest of the vine has had more thorough investigation than phylloxera. Its deadly work was first observed in Europe after its introduction from America. One of the most thorough investigators has been the University of California. Especially has it done good work in finding resistant stock. This work has been summarized in "Phylloxera Resistant Stocks" by Frederick T. Bioletti, F. C. H. Flossfeder and A. E. Way. It is Bulletin 331 of the Agricultural Experiment Station, Berkeley. The authors say:

"The phylloxera is a minute insect, allied to the scales and aphids, which lives on all species of vines except *V. rotundifolia* and *V. munsoniana* of the southern states. It attacks both the leaves and roots of other American vines, but usually without doing serious injury. It attacks all vinifera varieties, usually only the roots, and finally destroys them. The only method of combating this pest that is

twenty-six as being largely planted. Since that time the number of varieties used widely or that can be strongly recommended has decreased.

We commenced planting resistant vines in California nearly 20 years after the French and were spared much of the uncertainty of the first stages of experimentation. Owing to the great differences in soil and climate, however, we can accept the French conclusions only in a general way and as a guide for our own tests.

At first we made many of the mistakes of the French. We planted inferior and unselected stocks. We placed them indifferently in any soil and in any climate. We grafted them with any variety. And, finally, our methods of handling were usually defective. During the last 15 years our varieties and methods have been fairly satisfactory, but there are still many instances of partial or total failure and it is probable that in but few instances are the best possible results being obtained.

WHERE THE GOLDEN ORANGE GROWS

On your terraced hills the orange groves are growing,
From the flumes and weirs the mountain streams are flowing,
Rippling silver, orange gold, land of promised wealth untold,
California, where the golden orange grows.

of general application is the use of resistant vines. All resistant vines are varieties of American species, or hybrids of these species with vinifera varieties. Although the insect attacks the roots of these vines, the injury done is usually slight and not sufficient to interfere with their profitable cultivation.

The phylloxera is a native of the United States and was introduced into Europe with rooted American vines. When vines were first found to be dying under the attacks of this pest it was noted that American varieties remained apparently uninjured. This led to the planting of American vines to replace the vinifera varieties that had died. The results were disappointing. The best of the American vines weakened or died and those which survived yielded poor crops of inferior fruit.

The next step was to graft the old French vinifera varieties on to the American vines which had maintained vigorous growth in spite of the presence of the insect. The results were varied. In some instances the vines died after bearing a few crops, showing that the resistance was insufficient to maintain a vine producing heavy crops. In other instances the vines lived, but were small and weak. In still other instances the results were satisfactory.

After 50 years of experimentation and experience, the causes of these variations are fairly well understood. It is now known that the American vines vary in their degree of resistance to phylloxera, their adaptation to different kinds of soil, moisture, and weather conditions, the perfection and durability of the unions they make with vinifera scions, and in the vigor and fruitfulness of the vines they support.

Of the thousands of varieties which have been tested, only a few have been retained in general use. L. Ravaz, in "Les Vignes américaines," published in 1902, describes over six hundred varieties, but P. Gervais in his report to the International Congress of Viticulture in 1900 mentions only

AUTRALIAN ORANGES IN LONDON

Referring to the "Mantua" shipment of 3,353 cases of South Australian oranges to London last season, "The Fruitgrower," London, states: "We consider the oranges for quality amongst the best available at this period of the year. A brisk demand is assured. Those in the Californian box carried best. We expect big shipments next season. We have always contended that there is a big trade to be built up in Australian oranges in Great Britain, for the simple reason that they can arrive here when most needed, that is, in the summer and early autumn months and when the market is more or less depleted of supplies of really high class oranges from other sources. If the quality and grade of this first consignment can be maintained there is an almost unlimited demand for such fruit at remunerative prices during July, August, September, and probably on to Christmas, if the shipments can be maintained over that period.

"The difficulties in the past with regard to shipping space for Australian apples has always been principally due to the fact that these shipments range only over a comparatively short period, and for this reason the shipping space which has been occupied during the other nine or ten months of the year by other produce or materials has had to give way to make room for the fruit over a temporary period. This particularly applied in the past to New Zealand. The shipment of oranges to arrive here during the summer months (presumably following the apples, which commence to arrive early in April and finish about the end of June) would seem to point to the possibility that, with a few other items added, a regular service of ships to be devoted to the fruit trade traffic entirely, and fitted with refrigerators or cool chambers, could be initiated and maintained throughout the year, so that the fruit shipping trade from the Antipodes would not then be dependent on the favor of space allotted by shippers who are exporting throughout the whole year freight not connected with the fruit trade."

June 3, 1922

GRAFTING POLLENIZERS

By Claud D. Tribble

In your issue of May 6 I note advice given by a correspondent at Whittier in regard to grafting for the pollination of plums. I have followed this work very closely for many years and wish to say that my experiences are the opposite of the writers.

One of the best examples of grafting in a limb on a tree I have seen for pollination is in the R. J. Coggeshall orchards on Grand Island. In this orchard the owner has grafted in each tree of Tragedy a Clyman scion. There are several hundred trees thus treated, and Mr. Coggeshall gets from 30 to 50 per cent more fruit than his neighbors (trees same age), even those that have certain trees throughout the orchard grafted to the Clyman. This season Mr. Coggeshall has over 4,000 limbs in different varieties grafted for pollination. In this lot are German prune trees 50 years old.

It takes only a very few flowers to pollinate a tree, and a graft placed in a large tree will not grow very fast and will produce an exceptionally large crop of flowers because of its being rather undernourished. In the case of your subscriber it would be better to graft a whole tree than to dig it out and wait for a young tree to grow as it is very difficult to get a young tree started in an old orchard. We have found the Santa Rosa better for pollinating the Wickson than the Climax.

I have adopted a method of working over a tree without cutting off the tree for one or two years and yet get a fine growth and not lose a crop of fruit. I do this by taking a saw and cutting diagonally across the limbs, just above where the tree branches, then using a half circle harness knife to cut the cleft. I then insert the scion, wax over, and in most instances the first season will give a growth of several feet per scion. This diagonal cut gives the scion a great portion of the sap and this gives a very rapid growth. This method could be used if a person wanted a rapid growing, vigorous limb for pollination.

BRIDGE GRAFTING CITRUS

Farm Advisor Hodgson of Los Angeles County during 1921 did much bridge grafting on oranges and lemons in about 25 orchards in various parts of the county. The treated trees were either girdled by gophers or gum disease, though in one instance a large orange tree was completely bark-killed through spilling smudge pot oil around the crown.

A tour of inspection is made every 60 days, in some cases more often. On one of these the injured trees were all bridge grafted or inarched with yearling sour stock seedlings, by the method described in previous issues of the Cultivator. A few of these were killed by frost, but of those not frosted not one had failed to live and form a union with the old bark. Mr. Hodgson says the process is a very simple one and can be performed by anyone.

On this tour of inspection and attention many examples of top-working were examined and treated. Buds were last year inserted on old trunks and branches. Some time after the bark was girdled two or three inches above the bud, some branches were completely cut off. Now (in May) the final cuts were made on trees where the buds have made heavy growth. The large branches are cut on a slope,

close to the bud, with the bud on upper side of slope, flush with the top. The wound is then brushed over with a corrosive sublimate solution (1 to 1,000) and in a few minutes, when dry, the stub is waxed over with hot grafting wax. The tops of the buds are then cut back to start a branching top. This is the last operation necessary for a year to come.

CALIFORNIA FIRST IN VALUE OF NURSERY STOCK

There are 51,453 acres of the best soil of the United States used in growing nursery trees, and the leading state is New York, with 5288 acres, according to the census report. The next is California with 4080. The comparative values of the acreage in New York and in California are vividly shown in the financial returns. While New York's 5000 acres bring in a total of nursery stock to the value of \$2,310,253, California's 4000 produce stock valued at practically three million dollars, or to be exact, \$2,920,458.

In number of nurseries California also leads, with 540 against 359 for New York. There are only six states producing nursery stock exceeding in

value a million dollars. These are in the order named: California, New York, Ohio, New Jersey, Missouri and Pennsylvania. In seed production no state in the union approaches California.

KELSEY'S KADOTAS

The five acre Kadota fig orchard of Fred W. Kelsey, two miles west of El Monte, is believed to be the biggest orchard of that variety in Los Angeles County. It is now three years old, of spreading, low branched trees not over three feet high, yet some trees have borne heavy crops.

As the trees were small, set about 20 feet apart, and grow more slowly than some other deciduous fruit trees it was thought advisable to interplant with some crop yielding an immediate income. The trees were set in February-March and in April rhubarb was interset. Although Mr. Kelsey had just retired from the practice of law and knew nothing of agriculture, in just a year he had sold rhubarb stalks to the value of \$1,661.41, and 60 days later sold \$2,205.13 worth of roots, giving a financial return for three acres of \$3,-

866.54. Mr. Kelsey says he thinks that pretty good farming for a health broken lawyer. After this crop was harvested, for fear of depletion of plant food, he invested \$353 in 40 loads of stable manure.

GRAPES AND PERSIMMONS

In talking with three growers of nursery stock in the San Gabriel valley it was found that all had sold their complete stock of all varieties of persimmons and that the demand is heavier than ever before. All Black Monnukka grape cuttings were early sold and more asked for. One grower is specializing on Eastern Concord grapes and has thousands of rooted cuttings now in the nursery rows, though a small per cent were killed by frost just as the top bud was leafing out. Nearly all so injured are now green from lower buds. The demand for "the real Eastern Concord" is very strong.

Advertising clubs of the world will meet June 11-15 at Milwaukee and will be addressed by Hon. R. S. McKelvie, Secretary Wallace, Hon. Eug. Meyer, chairman finance corporation, Hon. Arthur Capper and Hon. E. T. Meredith on farm papers.

Four Lee Tires that went 8400 miles on their original air.

LEE Smile at Miles

LEE Puncture Proof Tires

Jno. L. Dabbs, E. I. DuPont de Nemours Co., Charlotte, N. C., reports: his Cadillac Coupe with Lee Cord Puncture-Proofs ran 8,800 miles the first 18 months on the original air in the front tires. After 8,400 miles the rear tires were retreaded, but up to that time had never been flat.

SHOD with Lee Puncture-proofs, you can forget your tires, except to see that correct air pressure is maintained.

A three-ply flexible armor of steel discs permanently vulcanized into the carcass of the tire gives extra strength without loss of resiliency.

This non-puncture feature makes Lee Tires especially desirable for automotive equipment on the farm. It eliminates a long list of tire troubles—punctures, blowouts, tire changing, inner tube and casing repairs, loss of time. It insures greater non-stop mileage in passenger car and truck service.

The Lee Dealer will prove to you that Lee Tires are actually puncture-proof. He will confirm our cash-refund guarantee against puncture.

Cut Dirt Moving Costs

With the Automatic Hitch You Save Half or More of the Expense

Farmers, contractors and tractor users everywhere endorse the Perfection Automatic Scraper Hitch. The power of the tractor is used to SET, LOAD, and DUMP the scraper, enabling one man to do what it formerly required two or more to do.

The Perfection Automatic Scraper Hitch
(Manufactured under Reynolds Patent No. 1,368,838)

Actual tests proved ordinary dirt moving, leveling and grading could be done with light tractor power for ONLY 15 CENTS PER CUBIC YARD, with the Perfection Automatic Hitch, as against a cost of from 30 CENTS TO 50 CENTS per cubic yard, using the ordinary scraper.

You cannot afford to be without this labor saving economical device. It fits any Fresno, Sidney or Royal Buck Scraper, can be attached in 30 minutes, and one man can operate tractor and scraper and keep going. No waiting for the scraper holder. The tractor power on the hitch holds the scraper at any angle when leveling. The operator fills the scraper by pulling the rope, and dumps by releasing the trip lever.

This is the lowest priced scraping outfit on the market and with the Perfection Hitch it pays for itself in a very short time. Over 1,000 in use.

Ask your nearest dealer for the Perfection Automatic Scraper Hitch or write for full information to

Fordson Owners!

**TWO IN ONE
REVERSIBLE GROUSERS
FOR FORDSON AND ALL WHEEL TRACTORS**

When One Point
is Worn or Broken
Turn Over Like
This →

STOP THE SLIP THAT STEALS POWER

Cut Your Up-Keep Cost of Grousers in Half

Two in One reversible, interchangeable grousers have two wearing surfaces. When one becomes worn or broken take out one bolt, reverse the grouser and you have a brand new wearing face.

Two in One grousers are made from special alloyed electric castings with wearing faces chilled, making them thoroughly resistant to wear. They are made with 30 degree pitch, taking hold with a forward pull, they keep hold longer, lifting vertically out of the soil instead of prying up the dirt. They do not clog.

If your tractor is consuming an excessive amount of fuel—if it does not cover the acreage you expect it to—if your repair bills are excessive, your oil consumption high—your power low—WATCH YOUR DRIVE WHEELS! THEY ARE SLIPPING.

Fordson Set 56 Grousers. Price 75c. Each.

Not the highest priced—not the lowest priced.

But the CHEAPEST in the long run.

Fancher Creek Nurseries of Fresno announces the appointment of S. A. Gebhart (formerly general superintendent of the company and other Roeding interests) as manager of the Fancher Creek Nurseries, to fill the vacancy caused by the resignation of E. W. Horton. Of Mr. Gebhart President Roeding writes: "He has been connected with the Fancher Creek Nurseries for many years during which time he has creditably filled every position to which he has been assigned. Mr. Gebhart's modesty prevents our elaborating on his experience and ability. Suffice it to say, however, that it would be difficult to find a safer authority on the growing and care of trees and vines."

A Central California citrus institute will be held at Lindsay early in the fall. It is hoped to make this an annual event.

REPORT OF COMMITTEE ON REGIS-
TRATION AND CLASSIFICATION
OF VARIETIES

(Continued from Page 591.)

The Linda produces the largest fruit we have, approached in size by the Nimlioh, Panchoy, Sherman Seedling No. 1 and the Victory. The largest Linda weighed over four pounds. Such extreme sizes become more moderate with older trees and full crops. An interesting development last season is the very long period during which this fruit ripened with good quality maintained by the latest to ripen. Beginning at the end of spring the Linda fruit continued to mature throughout the year. A sample sent the committee on January 12, 1922, weighed 19 ounces.

The severe cold of last winter was the worst experienced in nine years and brought disaster to the citrus industry and to our own. While it was a present misfortune, it will in the end be a gain by giving us knowledge of the limitations as well as advantages of different varieties. This information, only partially available today, will become better known and understood during the current year and will put our membership in a position at the next annual meeting to make a wiser, more acceptable and more useful revision of our preferred list than could be done now. Opinions at present, both as to contraction and enlargement, are in a fluid and unsettled state.

In view of the existing uncertainty of opinion it would seem the part of wisdom to now merely divide the list into two parts, letting the list say what the frost says, namely,—that the Fuerte and Puebla stand by themselves, leaving the adoption of a revised list to the next annual meeting.

To assist in a study during the year of varieties which by their previous position in the industry would be entitled to consideration in forming a future list we give a short description, based on the vicinity of Los Angeles and on latest information, mentioning the names of a few others already described, without prejudice to the consideration of any others that may seem worthy of adoption.

The Fuerte and Puebla both are strong, vigorous trees, proven this winter the hardiest of our commercial varieties and are also leaders in oil content, quality and flavor. The Fuerte, of a dull green color, averages three quarters of a pound to a pound in weight, with a medium sized seed, and matures its fruit from January to April. It sometimes has a good many undersized fruit and a good many non-pollenized fruit. The Puebla bears a glossy, handsome, pear shaped fruit maturing in November and December and requiring only about eight months from bloom to maturity. The fruit is small, averaging only half a pound, with a proportionately large seed. Oil content respectively, by Chase analysis of 1920, 29.6 and 26.5.

The Sharpless is well known for its handsome, large, purple fruit. It averages a pound to a pound and a half in weight, with a comparatively small seed. It has high quality and flavor and a desirable ripening period in the late fall. The fruit requires a year and a half from blossom to maturity and the young budded trees for the first few years do not stand up well against our trade winds, requiring more than usual care and attention. Oil content by Chase analysis in 1921, 18.4.

The Spinks is a strong growing tree and a good bearer. The handsome fruit of a purple black color has a long ripening period from early in the spring until October. Weight a pound to a pound and a half and seed large. Fat content, Chase report, 18.5.

The Dickinson tree is good and fruit of good quality and flavor, averages three quarters of a pound to a pound in weight, with a moderate sized seed, and matures in the summer. An outstanding feature is its very thick, granular, warty skin, which be-

comes a handsome purple color and identifies the variety. Some of the fruit have shown a pink color and some bitterness in the flesh. Oil content, Chase report, 14.4.

The Taft tree is vigorous and beautiful, somewhat more tender than the average. Fruit green in color, a pound or more in weight, is one of the very best we have in all respects, but the tree is so slow in coming into bearing that its planting is very limited for that reason. Oil content, 18.9.

The Lyon tree by its upright, slender growth and comparatively dwarf size is the kind best adapted for interplanting or close planting. The green fruit averages a pound in weight with a moderate sized seed and matures in the spring, and is of good quality and flavor. Fat content, Chase analysis, 26.9. The shriveling of the fruit sometimes noticeable, and a good deal of drying before maturity showing at times in some places has been found in other varieties and is now believed to be caused by a temporary tree condition and not by a disease. The weakness and death at one time of young Lyon trees when planted out in the orchard was very great and caused much loss to many planters, but it is claimed that trees of healthy growth are now being produced. They are being planted in large enough quantities to give a wide spread test this year. Should it prove possible to grow as healthy young trees of the Lyon as well as other kinds, the value of the Lyon for early fruiting and very great and regular crop production is well known. An early fruiting young tree should surely have the crop removed for the first year or two to keep it healthy and extra heavy crops should be thinned continuously.

The Blakeman is a vigorous tree of too spreading growth which is easily controlled by proper pruning when the tree is young. The fruit is glossy green, a pound or more in weight, with a comparatively small seed, clear yellow flesh without fiber and quality and flavor of the best.

Other varieties previously described,

—Dickey A. Thompson, Dorothea Prince and Billingsley.

In a future list it should be emphatically stated that the relative hardness of the different varieties is of primary importance, and explanation ought to be given that true Guatemalans should be considered for planting only in places exceptionally safe for lemons and adequately protected with orchard heaters, where lemons require such protection.—Committee: Chas. D. Adams, chairman, T. U. Barber, Wm. Hertrich, C. F. Kinman.

SODA POP FROM SURPLUS FRUIT

Carbonated beverages prepared from surplus berries, grapes, apples, and pomegranates, and superior in every respect to commercial imitations, are promised at a cost of 1½ cents per bottle by W. V. Cruess and J. H. Irish of the University of California. Recent experiments conducted in the university laboratories bear out their findings in the use of surplus fruit.

"The American public consumes over 300,000,000 gallons of soda pop annually," says Professor Cruess. "Most of it is now prepared synthetically from artificial color, citric acid, sugar, and artificial flavor."

RAINFALL CHART

The Security Trust and Savings Bank of Los Angeles has just issued its 1922 edition of rainfall and climatic chart of Southern California. It has the usual brilliant red columns to visualize total rainfall of years as far back as 1877. Also averages in several Southern California communities, and then the main part of the chart is given up to monthly precipitation for each year from 1906 down to the present, at least as far as April 15, 1922. In addition there is a monthly average sunshine chart. Without looking on this chart we guess that nine-tenths

of us would guess wrong as to which is the most sunshiny month of the year. The chart proves it to be October with a showing of 89 per cent sunshine, with November second and May third. The least sunshine of the year is in the month of August, with only 61 per cent.

We believe the Security people will send this chart to any Cultivator reader who will send them a two cent stamp.

TO DEVELOP LOCAL MARKET

Because of the large eastern apple crop, R. B. Peters of the Apple and Pear Growers Committee of Sixteen of Southern California districts advises no attempt at eastern marketing this year. The committee agreed in stating that the only profitable sales last year were made in the local territory and that the proper development and exploitation of this great market is the chief hope of the apple industry of this part of the state. Growers contemplating signing up crops are advised to wait until the final report of the committee.

NINE THOUSAND FOR BUD SELECTION

Appropriation of \$9,000 for bud selection work on deciduous fruits is included in bill just signed by President Harding.

Field demonstrations in pruning of citrus trees will be held in Los Angeles County, June 12-26 at Roscoe, La Canada, Alhambra, Covina, Pasadena, Sierra Madre, Monrovia, Azusa, Baldwin Park, San Dimas, North Whittier Heights, Spadra, Pomona, La Verne, Rivera, Whittier, Downey, San Fernando, and Owensmouth. Exact dates may be secured from farm bureau officials.

The California Lima Bean Growers Association is beginning a campaign for increasing membership and strengthening the organization.

U. S. MOTORS

Can Be Counted Upon to Give Years of Extra Service

We could build U. S. Motors a good deal cheaper if profit was all we were after. We could use cheaper materials and cheaper workmanship—but the reputation we have been building for sixteen years would crumble. Our idea of motor building is to strive to build a better product, confident that the reward will follow in increased sales. Our sales during the past twelve months have made tremendous gains.

THIS MONTH IN ORNAMENTAL GARDEN IN NORTHERN CALIFORNIA

(Continued from Page 593.)

season. There are such things as lime and slug shot which may be used on the flower beds, but the most effective way is to watch for them very carefully, find their hiding places by day and use a lantern or flashlight at night as this is when they work. These pests are very fond of the young zinnias, asters, delphiniums and sweet peas. The diabrotica, or squash bug, will soon be getting busy also, destroying choice blooms. These can often be hand picked. Foliage being attacked can be sprayed with arsenate of lead or Paris green. Aphids will also need spraying. Constant attention to watering must be given from now on, especially to all newly planted trees and shrubs.

Climbers

All new growth on these must be tied in, and most of the roses will have made good growth which should be used to good purpose in covering pillars and arches. An excellent quick growing climber is Cobaea scandens which can be used to good effect in covering trellis or fence, while certain ipomeas or convolvulus are also useful for a season.

Begonias

These should be given a shady position and planted in their flowering quarters in good soil mixed with leaf soil. They may be secured in various shades of pink, scarlet, yellow and orange, also white, double, single or frilled.

Liliums

Those planted a few months ago

will now be ready for staking, and a little stimulant such as liquid manure will work wonders applied once a week.

Sweet Peas

To have a long blooming period it will be necessary to keep these well supplied with water, and soot water, also liquid manure, will help these greatly and increase the size of the flowers. To secure early fall flowers which will also continue on into Christmas it is essential that trenches be prepared at once with manure well mixed and seeds sown at the end of the month.

Dahlias

Seedlings of these should now be large enough to plant out in their flowering quarters, and those planted from tubers should be staked and as the buds appear later on should be disbudded. Those of the pompom type should be given less water than the others.

Early Flowering Shrubs

Lilacs, etc., should be pruned back to encourage fresh growth and may be mulched with manure to advantage.

Seeds to Sow Now

For the fall flower display sow at once stock, godetia, clarkia, nemesia, linaria and mignonette.

Chrysanthemums

Rooted cuttings of these should be planted out where they are to flower in rows or groups at least 18 inches apart in good rich soil.

Hydrangeas and Rhododendrons

These should now be coming into flower and will need plenty of water and a mulching of manure. They will repay for extra care and require a moist semi-shaded position.

Lawns

These should be sprinkled regularly and weeds kept out, especially in new lawns.

This Month in the Vegetable Garden

Northern California

By A. R. Gould

MATERING, cultivating and weeding will be first and foremost this month, and extended plantings may also be made of corn, squash, melons, etc. Where it is desired to save seed of peas and broad beans these may be collected and stored in a dry place. Plots on which the peas and beans were grown may be well trenched and prepared for a crop of beets or lettuce later on.

Corn

Make a further sowing of Country Gentleman and Golden Bantam in rows three feet apart each way. Keep the hoe busy between the plants as this will help conserve the moisture.

Beans

Make successional sowing of Golden Wax, Kentucky Wonder, Refugee and Stringless Green Pod. Davis White Wax is also a good late bean and useful as a shelled bean for winter use. Aphids may become very troublesome and should be sprayed with black leaf 40. The aphids usually are found on the young tips. Cultivate frequently between the rows of the early crop.

Turnips

Sow early Snowball and White Egg as thinly as possible in rows 18 inches apart.

Beets

Sow Detroit Blood Red which will be valuable for winter storing. Swiss

chard or Sea Kale beet may also be sown for use as greens.

Potatoes

These should be hoed frequently and the soil drawn up to the plants in the rows. Any plants showing signs of being diseased should be promptly removed. A good late crop variety such as Gold Coin may be planted now where water is available to irrigate liberally.

Tomatoes

Hoe around the plants, and those grown on the single stem system should have all the axil shoots pinched out. Spray for black aphids with liquid nicotine.

Squash, Melons and Cucumbers

Still time to plant a few of the above if sown at once, three or four seeds to a mound. Sow squash, Early White Bush, Scallop and Perfect Gem; muskmelon, Honeydew; watermelon, Chillian and Georgia Rattlesnake; cucumber, White Spine and Long Green.

Parsnips

More of this useful vegetable should be sown as it has a high food value. Sow Hollow Crown variety in rows 18 inches apart. It is easily stored for winter use so look ahead. One quarter of an ounce will sow a 100 foot row.

Leeks and Celery

These may now be planted in trenches which have been well prepared with manure. Set 9 inches apart.

Cauliflower

Sow Early Snowball and Autumn Giant in a small seedbed, and in the meantime prepare your plot by trenching with manure.

Onions

These should be thoroughly well cultivated between the rows and a dressing of soot or wood ashes applied.

Carrots

Towards the end of the month a successional sowing of Danvers Half Long and Oxheart may be made on good rich soil.

Berries

Irrigate these at least twice this month and cultivate thoroughly.

Southern California

By D. F. Reichard

HOSE who started their garden early in the spring are beginning to bring in fresh vegetables. Notwithstanding the cold backward spring the hardy vegetables are coming on in fine shape, and the more tender things are doing well since the weather has warmed up. Keep the ground moist and well cultivated to insure good tender stuff.

Where there is room prepare the ground for planting summer growing stuff. June is particularly timely for starting winter squashes. The Hubbard is the standard, but for texture and flavor Pike's Peak or Sibley and Banana or Fence Post can not be surpassed. Plant Early White Bush and Fordhook squash, Davis Perfect cucumbers, muskmelons and watermelons, casabas, sweet corn, and string beans for late summer use.

Plants of peppers, tomatoes and egg plant, sweet potatoes, roselle and other vegetables may be set the early part of this month. Be sure to wet

Do You Want Duty-Free POTASH?

Recently a United States Senator, who is actively engaged in trying to defeat the "joker" in the Free List which puts a 100 per cent duty on agricultural Potash, asked why the farmers were not represented at the hearings before the Senate Finance Committee when the subject was under consideration. A man, who attended these hearings, called the Senator's attention to the fact that three owners of farms had appeared, representing New Jersey, Missouri and Indiana; that the New Jersey Federation of County Boards of Agriculture, and the Representative of the New Jersey State Grange appeared; that the Representative of the National Grange made a statement; that the National Farm Bureau Federation and the Representative of the National Bureau of Farm Organizations had been actively working for free Potash, and that the Washington Representatives of these Agricultural Organizations represented millions of real farmers, who paid good money to belong to these organizations and to support their representation in Washington, upon whom they depended to look after legislation affecting farmers' interests.

Later on it developed that other Senators had this same thought—that the farmers were not asking that Potash remain on the Free List. There can be no question that all farmers most strongly object to paying two dollars for a dollar's worth of Potash.

Ten people, representing farmers, fertilizer manufacturers, producers of imported potash, and former producers of American potash, appeared before the Senate Finance Committee, or filed briefs on the subject.

Of these, nine asked that Potash remain on the Free List and one asked for the duty.

Why then have the Senators come to believe that farmers are indifferent about the matter?

The explanation is to be found in the fact that

the "United States Potash Producers' Association" maintains in Washington an organization which is very active in urging a duty on the farmers' Potash. At the hearing their propagandist shouted: "Where was the American farmer yesterday? Where was the farmer of the South, who uses more Potash than any other farmer in the country? . . . Where was the American Farm Bureau Federation, which has its offices in Washington? Where was the National Bureau of Farm Organizations, representing thousands of farmers?"

This was clear bluff, for these organizations were represented and they have taken their stand squarely for Free Potash.

But the bluff, constantly repeated, seems to have made an impression that will be costly to the consumers of Potash, unless immediate steps are taken to show the Senators that farmers are very much in earnest about the matter. The farmers' representatives in Washington must be supported by the farmers at home.

The only effective way to do this is for farmers to write to both of their United States Senators at Washington, urging them to see that the "joker" at the end of Paragraph 1635 be struck out and that Potash used in fertilizers remain on the Free List, where it always has been.

The Senate is now considering the Tariff Bill. Write your Senators today.

During the time when foreign Potash could not be obtained, Potash sold at more than ten times the prewar or the present prices. Then the American producers, some of whom are called the "Borax Brigade", had the opportunity of profiteering to the limit, and of selling at very high prices Potash of an inferior, and sometimes injurious kind.

Now they ask for "protection" in the form of one of the most excessive duties in the whole Tariff Act. Unless the farmers act promptly, they are likely to get it.

SOIL AND CROP SERVICE, POTASH SYNDICATE

H. A. HUSTON, Manager

New York

42 Broadway

the ground around each plant well after planting to settle the dirt around the roots. All of these things will require water to carry them on to maturity. The ground should be well soaked before it is worked and planted. Be sure that the seed are in damp ground when planted so that they will be well up before they need watering. Always cultivate after irrigating so that your ground does not dry out.

Apply fertilizer to backward plants. Spray with Bordeaux mixture when there are any signs of rust, mildew or blight; with Black Leaf 40 for aphids and thrips; and with arsenate of lead for chewing insects; for red spider dust with sulphur.

Southern Arizona

By M. E. Bemis

JUNE is another month of preparation, and if the signs are an indication one may not injure his reputation as a prophet by prognosticating an unusual interest in fall gardens. Already some are planning to plant land to cow peas that will in late August or early September be turned under and made ready for lettuce. This will be the practice of some of the larger lettuce growers. It is a good practice for the small gardener, and the humus and the nitrogen added by the cow peas will help other succeeding crops just as much as the lettuce.

Probably there is no better preparation for the fall garden than the clearing up of weeds and planting to cow peas. Plowing and manuring is of course also a good preparation. Chicken yards are better for being cleaned, corrals also and all accumulations that will make manure can and should be gathered up now and put on the land where it will do good. Compost heaps may be made, but water will have to be added as here there is not enough rain to rot the vegetable matter that is usually a part of compost heaps.

June is a good month to make the first plantings of Mexican June corn. This, as I have had occasion to say several times, is probably our most valuable corn for roasting ears as well as for a general field crop for silage or for grain. There is certainly no other variety that one year with another will do as well.

July is the month for planting the general corn crop, also some beans should be planted, and plans should be made now for the corn and beans to be planted next month. Vacant places in field or garden which for one reason or another one does not care to plant to cow peas may be planted to any of the summer crops, such as milo, kafir, or the new grain sorghum hegari, which is taking the place largely of milo in the Salt River valley. Sudan grass is a valuable forage crop, and where summer green feed for poultry is desired, I do not know of anything that grows much faster in the summer, and that all things considered is any better to supply a steady supply of green feed at a time when the refuse from the garden such as lettuce, cabbage, etc., is getting scarce. A corner of the garden may be profitably devoted to the growing of a little Sudan. Fertilizer may be spread on the grass from time to time, and irrigated, thus preparing the land for planting in the fall when the grass has served its purpose. The rank and rapid growth of Sudan, like cow peas, has a tendency to smother out weeds.

DON'T CUT ASPARAGUS TOO CLOSE

By W. H. Payne, Montecito

In your advice to Subscriber, Santa Barbara, regarding the cutting of an asparagus bed I fail to see any scientific reason for depriving the asparagus roots of their life-giving foliage for so long a period as the cutting season lasts, which as a general rule runs to June 1 and in some cases longer.

It certainly seems to me that the system you advise only means the weakening of the plant itself. All nature is more active in the spring time than at any other season of the year and no plant can live for any length of time if it is deprived of its foliage.

Every plant takes most of its sustenance through its foliage.

In your reply to Subscriber you say to cut the tops back in August. This gives less than three months for the plant to recover from the strain it has been under by the cutting process.

It appears to me that a treatment of this kind must naturally shorten the life of the bed, whereas there is no reason why an asparagus bed should not last for 30 or more years.

One fine bed of asparagus I know of was cut your way but after some years the grass was becoming smaller and smaller. My opinion was asked and I gave my system of growing asparagus at which I have been very successful. This was to let some of the grass grow from the time the bed started, in other words to continue treating the plants just the same as I treat a bed from its first planting, and I have seen no authority who does not advise cutting a bed sparingly until it is four years old. If then it is an injury to heavily cut a young bed, in the same ratio it stands only to reason that it must be detrimental to older plants to deprive them of the one essential thing that the young plant needs for the growth of the roots.

In the fall I allow the tops to grow as long as they will except that I cut out any of the seed bearing grass before the seed ripens and falls to the ground and grows as the young ones are not needed and become also a detriment. If rust appears of course I would cut it down on its first appearance.

I think you must admit that in the event of having to cut the tops on account of rust earlier than ordinary under my system the bed would suffer less than under yours.

My advice was taken regarding the bed mentioned above and in a couple of years the bed came back to normal and improved right along.

I am always open to conviction and should be glad to stand corrected if you can give any scientific reason for cutting "everything from the bed during the cutting season."

WILT RESISTANT TOMATOES DEVELOPED

The only successful means of controlling tomato wilt is through the development of resistant varieties, says the United States department of agriculture. The wilt fungus lives in the soil and invades the tomato plant through its roots. Spraying the plant has no effect on the disease, and no important results have been obtained in the control of the trouble through soil treatment.

Four varieties of tomatoes have been developed which will produce heavy crops of excellent fruit on land so badly infested by wilt that ordinary tomatoes can not be grown upon it. They are selections from the Greater Baltimore, Stone, and Merveille des Marches, (Marvel of the Market), three of the best commercial varieties grown. They possess, in addition to wilt resistance, all the good qualities of their parent varieties. Extensive field tests have shown them to be well adapted to all parts of the United States in which tomato wilt is present. The work done in connection with the development of these varieties is described in a new department bulletin, No. 1015, Development of Wilt Resistant Tomatoes, by F. J. Pritchard, physiologist, which may be obtained upon application to the United States Department of Agriculture, Washington, D. C.

An unbroken record in the hands of the American farmer since 1864

SLOWLY circling lower and lower, all of a sudden Mr. Chicken-Hawk swoops swiftly downward, but—Bang! Caught in mid-air. That accurate, hard-hitting Stevens was too quick for him.

For 58 years Stevens has built for the American farmer shotguns of unsurpassed accuracy and endurance.

It's easy to prove the accuracy of a Stevens

Here's the test for a full choke: on a piece of paper draw a circle 30 inches in diameter; measure off 40 yards and fire into it. Your Stevens will throw an even pattern of 70% of the pellets into that circle.

A Stevens modified choke will throw an even pattern of 50%. And a Stevens cylinder bore will throw an even pattern of 40%. Try it. Only a perfectly bored gun will meet this test.

Remember this: when you buy a Stevens you get the last word in accuracy; you get a gun that will last a lifetime; and you get that gun at an exceptionally low price.

Stevens manufactures a complete line of small bore rifles and shotguns of every description. Ask at your dealer's or write for the interesting catalog describing in detail the complete Stevens line. Address:

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Bermuda Pest

I had a small patch of Bermuda or Johnson grass along the wheel track of one of those roads which are donated, 20 feet by each owner, just a few square feet. I was not aware of it till last fall. I aimed to wait till it was dry and burn the long tendrils, shake out the roots and try to smother it by burning off the top every time it grew up green. But two neighbors while it was wet forked it against my levee, leaving a mass of short rootlets

and burying the long tendrils which soon became nicely rooted. Then others against my advice disked it thoroughly and used the road drag with the result that it became thickly scattered. I've been over it numerous times with a fork and springtooth but there are still thousands of nicely rooted sprouts for some distance along the road, some close to my levee which by the way is two or three feet back from the line. Can these men continue this practice of disk and putting the road drag on this road, and how rid the roadbed of it? Are they liable for damage or must I continue my efforts to check it, and what is the best way?—A Woman Rancher, Hughson.

No. Refer the matter to your county horticultural commissioner who has authority to compel abating of the nuisance. Meanwhile on your own land continue use of the springtooth and when the weather gets good and hot the killing of Bermuda is comparatively easy when the cultivator is persistently used.

Catching Pigeons

A subscriber asks how to catch stray pigeons. I have caught them by making a square frame 18 inches each way and covering with chicken wire. Use a figure 4 trap and bait the trigger with a piece of bread fastened firmly. Or prop the front on a center stick to which is attached a string. Lead the birds in with wheat and pull out the prop, or set the wire box flat on the ground and dig a trench under one side large enough for the birds to walk through as they eat the trail of wheat. When they get in they will try to get out the top. I have caught pigeons, quail and doves by all three methods.—Subscriber, Oilfields.

Peach Leaf Curl

Will you please advise me as to what to do to cure leaf curl on peach trees?—Subscriber, La Crescenta.

Turn time backwards in its flight and spray just before the leaves come out or before the blossom buds swell with Bordeaux or lime-sulphur mixture. Or better, jot down on next year's calendar some similar memorandum so that in February spraying may save next year's leaves. As to this year spray with weak solution of Bordeaux. This will help prevent further spread of the disease. However, the season is now so far advanced that there will be but little trouble with the new leaves.

Mildew on Peas

Am enclosing stalk of sweet pea. The vines have grown very rank and thrifty until lately when they seem to blight. Vines look pinched at ends and blossoms are small and blighted. Have tried dry sulphur without results. Sweet peas I had last year were affected in the same manner and they soon quit blooming and died.—Subscriber, Hemet.

The warmer weather will prove beneficial but in any case it will be well to scatter liberally high quality sulphur over the vines.

Trees Dying

Some of my prune trees come out in full bloom and then die. Some put out a few leaves which turn brown around the edges. I examined the roots and found some with root knot and others apparently all right. My peaches are about the same; prune trees that were affected with red spider are the worst. Can I get expert inspection of my orchard? To whom should I go?—Subscriber, Porterville.

Perhaps this trouble may be due to the complete girdling of the tree by crown gall or it may have been occasioned by lack of moisture after crop was removed last fall. Thousands of trees die every year in California from causes which are not definitely known, but presumably some of them because of lack of thorough irrigation and tilth of the soil in the fall. Too many believe that when the fruit is removed the draft on the tree is ended and no further moisture will be needed until next spring's growing period. On the other hand, it is a fact that the completion of the summer's growth, the storing of sufficient starch and other nutrients are necessary if the tree is to have sufficient food material to start the next spring's growth. Keep the trees growing this

coming fall though of course good judgment is demanded not to crowd them until there is danger of frost. If the fall season is very warm and excessively heavy irrigations are continued, tender growth may be secured which will not stand the nippy nights which sometimes come in November. Your county horticultural commissioner or farm adviser at Visalia can give you expert information or direct you to some one in your vicinity with whom you can get in personal touch.

Pruning Watermelons

How are watermelon vines pruned? I have 20 acres planted this year.—Subscriber, Fresno.

As a rule they are not pruned at all. Some have felt, however that where growth is very rank, going through the field and cutting off tips of the longest runners with a sharp spade has resulted in more fruit and less leaf growth.

June Drop in May

If San Luis Obispo subscriber who inquired in our issue of May 20, page 550, will send his name and address we will be glad to give it to one of our contributors who is interested in the same question and believes the answer, or at least a part of the answer, to June drop may be had in soil conditions. June drop subscriber please send address.

Feed Pumpkin Seeds

Will you please tell me if feeding seeds with pumpkins will decrease the cow's milk.—Subscriber, Lankershim.

Pumpkin seeds contain much more nutrition for dairy cows than does the pulp or flesh. The question of injury from feeding seed has been up for many years and various experiment stations have given thorough test and there has never been any injurious effect noted. We believe all dairymen are now saving this valuable food.

Getting Rid of Weeds

Please tell me what will kill out malva weeds? I have tried for three years pulling out and plowing but they come up fresh every spring.—Subscriber, Delano.

The quickest relief in a case like this may be had through crop rotation. Plant corn, beans, beets, or any row crop which will permit of thorough and clean culture of the soil. The hoeing and cultivation required for those crops will clean up almost any land.

Killing Stumps

How can I kill eucalyptus stumps?—Subscriber, Arcadia.

We repeat answer to a similar question given in a former Cultivator:

"Arsenate sprayed over the leaves will perhaps end their existence, but why go to such great expense? A man with either an ax or mattock will kill or at least discourage the growth on these stumps much faster and cheaper than can be done with chemicals. If the stumps are attacked before the growth becomes larger and woody and while the old stump is struggling to get sufficient leaves to support life, it is a serious shock to have these few leaves quickly removed. Of course they will start again but a similar operation a few weeks later takes but a minute or two to each stump. As to saltpeter we think it would have but little value in killing the stump, but if large hole is bored down in the top of it and this filled with the saltpeter it permeates the

wood and makes it combustible so that later when the stump is entirely dead a fire built alongside of it will sometimes consume to the ends of the larger roots.

Pumping for Irrigation

In using walking beam in pumping water for irrigation if water stands 12 feet from top of ground and I place a six inch cylinder 30 feet from top of ground and four feet higher so water will run in reservoir, should the water get as low as 30 feet in well, making extreme lift 34 feet, how large a windmill would I need to operate two wells? About how many gallons per minute could I expect with a 16 inch stroke with a medium wind, say 20 or 30 miles per hour? Is there a double acting pump in the market that would give same amount of water, using only one well?—Subscriber, Rosamond.

The pumps mentioned could not be satisfactorily driven by a windmill. If the pumps made 25 strokes per minute they would require about two horsepower and would pump about 6,000 gallons per hour with pumps in good condition. Wind wheels give cheap power while the wind blows but cannot be depended on for irrigation. Then too a small amount of sand in the water will cause frequent renewals of valves. A small centrifugal pump with a capacity of 10 miners inches placed in a pit as low as it is possible to get it, with a three horsepower gas engine, will be much more dependable and satisfactory. A triple pump, that is with three plungers on one shaft, will be better than a double acting single cylinder pump, but the trouble with valves will remain.—J.B.N.

Radio Instruction

I see by issue of May 6, Page 483, your comments on radio. Are there any instruction books for the beginner to learn about radio?—Subscriber, Satcoy.

There are now several publications on radio. One in particular which may prove of value to you is "The A. B. C. of Radio," by Waldemar Kaempfert, published by Martin H. Ray, 165 Broadway, New York, at 25 cents. Or we believe it can be had from any book store or dealer in radiophone supplies.

Budding Apricots

I planted several thousand apricot pits last year, from which grew good seedlings. These trees should have been budded this last fall but was unable to get buds and budder. I pruned back and suckered them to one stem. They are doing very well and am wondering if they would make A-1 trees if they were budded this next month. Could they be sold?—Reader, Earlimart.

Your chief difficulty now would be in getting good buds. If you can secure buds of apricot which have been kept in cold storage the season is good enough for the work. The only alternative for the present (or June) budding would be to secure buds from the earliest apricots and take the basal buds, though we fear these will prove rather soft. Failing in this you would have to wait until fall and put in dormant buds. If you are successful in getting buds "to take" at present time there is no reason why they should not make good trees.

Dead Walnut

A young English walnut, set out this spring developed young branches to the length of five or six inches, when the little leaflets began to turn black at the tips and soon not only the leaflets but the whole leaf dropped off. Even the coming buds dropped away. The young shoots do not seem to be much affected but seem inclined

to wilt or show lack of vitality. The tree near by seems not to be affected in any way. What is the trouble and the remedy?—Subscriber, East San Diego.

Your young walnut tree is no doubt dead by this time. It simply did not grow except in the top; the roots did not start. Enough sap was in the tree to start leaf growth, but as the roots did not act your tree is now dead or dying, due perhaps to lack of good roots when planted. There is no doubt no disease, hence no remedy.

Prunes Gumming

Could you please tell me what causes the sap to run out on the prune trees and what could I do for it?—Subscriber, Gridley.

Sap or gum runs from plum or prune trees with less provocation than from any other trees. Yours may have lacked water last fall before rains came or they may now be suf-

fering from too much water. Examine the cambium or inner white bark. If this is not affected the trouble is probably at the roots, as suggested above, and may be removed by corrected treatment. If the inner bark or cambium is discolored you may have brown rot, the treatment for which is to cut out worst affected branches and spray with a Bordeaux mixture of seven and a half pounds copper sulphate and eight pounds lime to 50 gallons of water. Then spray again in spring just as flowers are opening.

EXCLUSIVE WAVE LENGTH FOR WEATHER, CROP AND MARKET REPORTS

All weather, crop, and market reports broadcast by radio by private broadcasting stations, including stations operated by state agricultural colleges and state bureaus of markets, are now broadcast on a wave

length of 485 meters. The United States department of commerce, which is charged with licensing operators and stations and with assigning wave lengths, believes that the exclusive use of 485 meters wave length for broadcasting weather, crop, and market reports will eliminate much of the interference heretofore encountered by persons receiving the reports. The wave length of 360 meters for general broadcasting of entertainment programs and the like has not been changed.

The assignment of these wave lengths, while only temporary, will be in effect pending the passage of federal legislation relating to radio broadcasting. A list of radio stations that regularly broadcast weather, crop, and market reports can be had upon application to United States Department of Agriculture, Washington, D. C.

Louis Lichtenberger, Editor

HORSE GIVES CHEAPEST POWER ON FARM

Only 45c. Per Day Cost of Feeding Horse on Average Farm---Reports U.S. Dept. of Agri.

It has been apparent for sometime that a new day has dawned for the horse. Experience has proved his all-around superiority over other forms of power. The most economical power unit on the farm—whether for plowing, discing, harrowing, sowing, cultivating, harvesting or trucking—is the horse. The national average cost of feeding a horse is approximately 45c per day—and less when you grow your own feed. This cost alone is less than the cost of depreciation for a power machine. The horse is the age-long friend of man. He deserves good harness.

Brood Mares Earn Farmers Extra Profits

Every healthy brood mare pays the farmer cash dividends. The average yield is said to be two colts every three years. For example, F. L. Hall of Peris, breeder of registered draft Percherons, in recent correspondence states he has one mare that has given six colts in nine years, receiving over \$6,000 return. Good, well-cared-for mares will provide cheap power for the farm and furnish replacements at a profit.

Horse Outclasses Mechanical Power

Good horses are long-lived and require no repairs; weather conditions do not affect their efficiency; they give most economical power on hilly or level ground; they return fertility to the soil and consume the cheapest fuel—the feed that the farmer grows. Horses are never second-hand, nor do they depreciate quickly.

Superior Brand Harness Gives Longer Wear

This type of harness embodies reserve strength; is carefully proportioned to permit proper fit and adjustment and is sewed with heavy linen cord processed with insulating wax making it impervious to moisture and sweat. The set pictured above is Style 382, Chain Trace Type. If your dealer cannot supply you, get in touch with us.

THE CARELESS SMOKER

By Harris A. Reynolds

(Apologies to Kipling)

A fool there was and his pipe he lit,
(Even as you and I),
On a forest trail where the leaves were fit
To become a blaze from the smallest bit
Of spark—and the fool he furnished it.
The day was windy and dry.

The forest was burned to its very roots,
Even beneath the ground,
With the flowers, the birds and the poor
dumb brutes,
Old hoary oaks and the tender shoots
Which might have made logs but for such
galoots
Allowed to wander around.

The lumberjack has now passed on,
His payday comes no more;
And the screech owls haunt the camp at
dawn
Where the cook's tin pan woke the men
of brawn.
But the mill is silent, the trees are gone,
The soil and the forest floor.

A deadly sight are those hills of rocks,
Which once were beds of green;
No hope for human, no food for flocks,
The floods must be held by expensive
locks.
And the harbor is silted to the docks,
The ships no more are seen.

But the fool smokes on in the forest still.
Leaves campfires burning, too,
While the patient public pays the bill
And the Nation's wealth is destroyed for
nil.
If the law doesn't get him, Old Satan will
When his smoking days are through.
—From the "Open Road."

JAMS, JELLIES AND PRESERVES

By Mrs. Belle De Graf, Domestic
Science Director, California Prune
and Apricot Growers
Association

 HIS is just the beginning of the jellymaking season. Currants and loganberries will soon be plentiful and the thoughtful housewife will want to make jellies and jams. The addition of sugar to cooked fruit increases the nutritive value, and the cooking of the sugar at a high temperature, combined with the acid of the fruit, causes the inversion of the sugar, which is the first step in its digestion. For this reason jellies, jams and marmalades are considered one of the most wholesome forms in which to eat sugar. Children crave sweets and this desire may be gratified in wholesome jellies, jams and marmalade. Unless combined with sugar, the actual food value of fruit is low; but the acids and salts in contains are most important. They are needed to keep the blood pure. There is nothing more wholesome for children and no food the average child enjoys more than bread and jelly or marmalade.

In securing fruits for making jelly, always procure those which are somewhat underripe. The jellymaking constituent in fruit is known as pectin and is present when the fruit is either ripe or just turning ripe. If the fruit is overripe the pectin disappears, and it will be impossible to make satisfactory jelly. This pectin is somewhat like gelatin, as it dissolves in boiling liquid and stiffens upon cooling. The fruits best suited for jelly making are currants, loganberries, plums, quinces, crabapples, grapes and apples. These fruits will make a perfect jelly if not used overripe. Fruits in which pectin is lacking must be combined with those rich in this jelly making quality. The novice in housekeeping usually shrinks from jelly making, but if rules are carefully studied and only a small quantity attempted at one time the process will be found very simple and the results satisfactory.

Good Jelly Should Retain Shape of Mold

A good jelly should be bright in color, and clear. When removed from the glass it should retain the shape of the mold and be tender enough to quiver without breaking.

When making currant jelly use from two to four quarts of fruit for one utensil. A greater quantity takes too long to bring to the right heat and both the color and flavor of the jelly will be impaired. Wash fruit well, remove stems and discard all that is imperfect. With watery fruits, such as grapes, loganberries and currants, use no water. Cut hard fruits into small pieces and use about three cups of water to each pound of fruit. Cook the fruit slowly until the juice begins to flow, then crush with a wooden potato masher.

As soon as the fruit is tender remove from the fire and pour into a jellybag to drain. A pointed three cornered bag is best, as it lets the juice drain from the corner with the pressure of the bulk of the fruit on the small end. Hang the bag so the juice may drip. When nearly all the juice has been strained through the bag may be squeezed. This last juice which has been squeezed through the jellybag should be kept by itself, as the jelly made from this juice will not be quite as clear as that which has been allowed to drip. If the fruit is overcooked it will produce a cloudy jelly.

Long Cooking Tends to Destroy Pectin

Measure the juice, and for each cup allow three-fourths cup sugar. The sugar should be placed on shallow pans and warmed slightly in the oven. Reheat the fruit juice, and when it reaches the boiling point add the sugar immediately. Cook rapidly about five minutes, removing scum as it appears. Long cooking will darken the jelly and tends to destroy the pectin, which will cause the finished product to be less firm.

To determine when the jelly has cooked sufficiently, drop a teaspoon of the syrup on a cold plate. If the jelly stage is reached the syrup will thicken slightly in a few seconds. Remove from the fire at once and pour into hot, sterilized jelly glasses and set aside to cool. Cool as rapidly as possible to avoid dust, which will cause mold. When cold, pour melted paraffin over the top, cover, store in a cool, dark, dry place.

Jelly Deteriorates if Stored Too Long

Jelly deteriorates in color, texture and flavor if stored for too long a period. When jelly is soft and syrupy, too much sugar has been used, or the syrup has not been cooked long enough after sugar was added. If tough or stringy too little sugar has been used or the syrup was boiled after the jelly stage had been reached.

The cleaner the fruit, that is, of stems or leaves, the brighter and clearer the jelly will be. Prepare glasses before making the jelly. After washing well, place glasses in a pan of cold water, set over the fire and, when boiling point is reached, allow to boil fifteen minutes. Just before filling glasses with the boiling syrup, set them upright in a pan of hot water, placing a thick pad of cloth in the bottom of the pan. This method of handling glasses will prevent breakage.

Currant or Loganberry Jelly

Pick over currants, stem and wash, discarding all the imperfect fruit. Place in a preserving kettle, crushing slightly. Cook slowly until fruit is tender. Pour into the jellybag and strain. Measure juice and reheat. When boiling point is reached add

heated sugar, three-fourths cup to each cup of juice, and cook rapidly about five minutes, when the syrup may be tested by dropping a spoonful on a cold plate. If the jelly stage is reached, remove from the fire at once and pour into hot jelly glasses. Cool, pour melted paraffin over the top, cover and store in a cool, dry place.

Grape Jelly

Remove the grapes from the stems, wash and put in a preserving kettle over a slow fire and allow to simmer until the fruit is tender; then pour into a bag and drain off all the juice. For each cup of juice allow three-fourths cup of sugar. Heat sugar in the oven. Bring grape juice to the boiling point, then add heated sugar and let boil until a little of the syrup will jelly when dropped on a cold plate. Pour into hot glasses and cool; pour melted paraffin over the top, cover and store in a cool, dry place.

Currant and Raspberry Jelly

Use two-thirds currants to one-third raspberries and proceed as for currant jelly.

Plum Jelly

Select underripe plums; wash and cover with boiling water and cook until tender; pour into jellybag and drain. Measure three-fourths cup sugar for each cup juice, finishing as for other jellies.

Gooseberry Jam

Steam and wash gooseberries, mash and cook very slowly until fruit is tender. Add equal parts sugar and fruit and simmer until thick. This fruit contains so much acid that it requires an equal weight of sugar.

Strawberry Jam

Wash and hull berries; allow three-fourths pound of sugar for each pound of hulled fruit. Place fruit in a kettle and mash. Set over a slow fire and cook slowly, stirring and mashing fruit until it is thoroughly cooked. Then add sugar and cook very slowly until thick. Watch carefully and stir frequently to avoid burning. An asbestos mat will lessen the chance of burning. It is not advisable to make a quantity of jam at any one time. Even if you have a quantity of berries needing immediate attention it will be found much easier to make the jam in small amounts. Several small kettles of fruit can be cooked at one time more quickly than when cooked in one large utensil. Raspberry and loganberry jam are made in the same manner.

Plum Butter

Use plum pulp left after drawing juice for jelly. Press through a coarse strainer. Use half as much sugar as plum pulp and simmer until sugar is dissolved.

Fig Jam

Plunge figs in boiling water then in cold water. The peel can then easily be removed. Cut in half, add three-fourths measure sugar for each measure of fruit. Simmer until thick. A little lemon juice can be added for flavor.

Bar-le-duc Currants or Gooseberries

Use only firm fruit. Currants should be large. After fruit is stemmed and washed, measure and for each measure of fruit allow an equal amount of strained honey. Heat the honey then add the fruit. Simmer about five minutes then remove fruit with a skimmer. Cook syrup slowly until it becomes very thick. Add fruit and pour in sterilized jelly glasses. Cool and seal.

PACKERS OF AIR LINE HONEY

Strawberry and Gooseberry Preserves

Use three parts strawberries to one part of green gooseberries. Measure fruit but do not mix, allow an equal quantity of sugar. Put gooseberries in a kettle and add one cup of hot water for each quart of fruit. Cook gooseberries slowly, about five minutes, add sugar and when it is dissolved add the strawberries and cook slowly about 20 minutes, taking care not to break the fruit. Pour into sterilized jars, cool and seal.

Spiced Cherries, Currants or Gooseberries

4 cups prepared fruit, 1/2 cup cider vinegar, 2 cups brown sugar, 1 teaspoon whole cloves, 3 inch sticks cinnamon. Add sugar and spices to vinegar; bring to the boiling point then add fruit. Cook slowly until fruit is tender but not broken. Skim out the fruit and boil down syrup until thick. Add fruit and pour into sterilized glasses and seal at once.

Cherry and Currant Jam

Equal quantities of pitted cherries and stemmed currants. Measure and add three-fourths as much sugar as fruit. Mix all ingredients. Cook very slowly until mixture is thick. Pour into sterilized jars, cool and seal.

Seedless Raspberry or Blackberry Jam

Wash and prepare fruit. Mash with a wooden potato masher. Set over the lowest possible fire to become thoroughly heated, then press through a fine sieve. Use the potato masher or a small press that comes for this purpose. Add a small quantity of boiling water to pulp remaining in sieve in order to extract all the pulp possible. Measure and add three-fourths as much sugar as fruit. Heat to the boiling point, pour in sterilized jars and seal.

Rhubarb Jam

Wash, remove ends but do not peel fruit, cut into inch slices. Measure and add an equal quantity of sugar and let stand several hours, over night if desired. Add grated rind and juice of one lemon for each quart of rhubarb. Let cook over a low fire and bring to the boiling point then simmer slowly until mixture is thick. Pour into sterilized glasses and seal.

French Conserve

Take equal quantities of strawberries, rhubarb and pineapple. Cut rhubarb in inch lengths without peeling. Remove peel from pineapple, cut in slices and then in pieces about the size of the rhubarb. Place rhubarb and pineapple over a low fire and cook gently until fruit is quite soft. Add no water. When fruit is cooked add the strawberries and cook slowly until fruit can be mashed. Measure and add three-fourths as much sugar as fruit. Also add one cup of blanched shredded almonds. Cook slowly until very thick then pour into sterilized glasses; cool and seal.

Rhubarb Marmalade

Wash, remove ends from rhubarb but do not peel, cut in one-half inch slices. Wash orange, and grate a small portion of the peel then cut off peel with a sharp knife removing all the white portion and cut in thin slices, then cut each slice in quarters. For each cup of sliced rhubarb allow one sliced orange, 2 teaspoons of grated orange rind, one tablespoon of lemon juice and one-half cup of blanched shredded almonds. Mix fruit, sugar, grated rind and lemon juice. Let stand an hour or more until sugar is dissolved. Place over a slow fire and cook until thick; add almonds and pour into sterilized glasses and seal.

MRS. GRAHAM'S MOTHER

(Concluded.)

"Such a harrowing time!" she exclaimed. "So many things went wrong and there was so much extra work that we hadn't counted on! I'll never take charge of a booth again."

She had to dress hurriedly after she had eaten in haste. But for her mother's assistance she would not have been ready for the opening hour.

"What would I do without you, mother? I'm so glad you don't have to work at this festival."

In spite of all the vexations that usually precede such an event, the festival was a huge financial success, even if most of the women in charge spent the next day in bed.

The flower booth was the most profitable of all, and the strange part of it was that no one appeared to know just who had managed it. Everyone spoke of how charming Mrs. Graham's mother looked and what an addition she was to the booth. When finally it did leak out that Mrs. Tate had been the mainspring of that booth, everyone was amazed.

"Here I've been supposing Mrs. Graham's mother was next door to invalidism," said Mrs. Benson. "Her years do not seem to take away her ability to do things. She has surely made the rest of us sit up and take notice."

Helen could hardly believe her ears when she heard of her mother's escapade.

"I've had the best time doing that booth that I've had since I came to Springfield," her mother said.

"But you've worn yourself out."

"What if I have? It isn't the first time I've been guilty of that offense. You would make a good-for-naught of your mother if she listened to you."

The daily paper reported the success of the community festival in glowing terms, enlarging especially on the beauties of the flower booth under the direction of Mrs. Pate, Mrs. Graham's mother and guest.

Mrs. Tate groaned when she read it.

"Pate! As if Mrs. Graham's mother' was not bad enough. It's a wonder they didn't make it Fate. If I'd die tomorrow I suppose my obituary would list me as Mrs. Graham's mother."

A few days later Mrs. Tate returned from a walk to catch the last of a telephone conversation.

"Mother is here to rest and take life easy and I can't allow her to take hold of a church fair. Yes. I know her ability, but she isn't strong enough. Yes, she did make a success of that flower booth, but I knew nothing about it until it was over. I'm sorry to refuse you the loan of my only mother, and I'm sure she would be even more sorry. I know she'll appreciate your asking her more than my refusal."

When Helen had explained the matter to her mother, Mrs. Tate looked as piqued as a spoiled child.

"You won't let me do anything, Helen. People will think I haven't sense enough to do anything."

"Nonsense! They understand that I want you to rest and have a good time."

At that Mrs. Tate hurried off to her room and did not appear again until dinner was ready. All evening she wore a nettled look.

The next morning Mrs. Graham and her husband drove off to a neighboring town, she to a conference, he to attend business.

"I wish I might take you," Mrs. Graham apologized, "but it will be a tiresome day."

chocolate strength

Say
"Gear-ar-delly"

Pack ground chocolate in bulk [which we don't] and it loses strength every minute. Pack it in cans [which we do] and every bit of chocolate strength is saved and stored for the moment of use. The uniform chocolate strength characteristic of Ghirardelli's is a matter of blending. Keeping this chocolate strength uniform is a matter of packing. That's why Ghirardelli's is never sold in bulk but in cans only. Send for recipe booklet.

With troubled wrinkles on her brow, Mrs. Tate sat down to think.

"It's plain my daughter thinks my work in the world is done. Back home people don't think so. When I came here I supposed I might fit into some chink and do something useful. If only I could have helped at that church fair! I wish I'd never left Wessington. There I had a place in the village life. It makes me homesick to think of all the things I did there. I know what's the matter with me—I'm homesick for

work. I'm going home this very day. If I don't go now, I never will get away."

She went to packing her suitcase. Her trunk was in the storeroom and she laboriously carried her belongings to it rather than call anyone to move it for her. At noon she went to buy her tickets. Lest the cook should hear her if she telephoned, she engaged a taxicab and baggage man while down town. She wrote a note to her daughter and left it on the hall table. Long before train time she was ready.

The next morning she alighted from the train at Wessington and was greeted by various people at the station. The welcome they gave her was music in her ears. One by one her neighbors ran in to greet her.

"What a surprise you gave us, Mrs. Tate! If you had let us know, we might have opened your house and had it ready for you."

"I didn't know it myself. By the way, it sounds good to hear my name again."

"Hear your name again! What do you mean?"

"Oh, I've been called 'Mrs. Graham's mother' until I have almost forgotten the sound of my own name!"

"You wouldn't if you'd heard us wishing you back to help with the big church meeting next week, and to help us plan the work for the Improvement League, and the district federation which comes next month. We didn't see how we were going to get along without you."

"I'm glad that you won't have to. The sooner I can get to work the better. And when the Journal announces my arrival, I know I shall not be called 'Mrs. Graham's mother.'"

EDUCATION IN ECONOMY

"Education in Economy" by C. A. Spooler, Pomona. Published by the author at \$1.

The book is written by a practical butcher who has studied the food values of meat and gives his readers in clear statements the benefit of his findings. He says: "From an economical standpoint, meat is the one item which must be watched more than any other article used in the house, unless it is fuel. If the husband or father has been working hard all day he must have good wholesome meat for his meals, and with the proper knowledge of how to buy and what to buy he may always have a good variety at a very low cost. Please keep in mind that the fore quarter is for quality, the hind quarter for quality and price; sirloin steak is 25 and 28 cents a pound, skirt steak is 12 1-2 to 15. There is more real food value in meat than in any other form of food you may buy. Study the cheaper cuts, use the fireless cooker and judge for yourself. I guarantee you a saving of 50 per cent on your meat bill if you follow instructions in my book."

The book has 22 colored plates illustrating points made as to different cuts of meat, time tables for cooking and for use of fireless cooker, with more than 200 practical recipes, 40 pages of practical, well balanced menus and numberless hints furnished by Mrs. Spooler on successful economy in cooking.

Mr. Spooler is now giving daily demonstrations on meat buying and preparation at Barker Bros. auditorium in Los Angeles. With carcass before him he gives actual demonstration of cutting of meat and explanation of different parts. As he states it, his purpose is "to educate the public so that they may know a bargain when they

see one without taking the word of the butcher."

"Often inferior or cheaper cuts of meat are attractively rolled or arranged on trays and sold at higher price than they are worth. For instance in buying prime rib roast don't buy rolled plate boiling meat which may look just as attractive as prime rib when rolled. The best way to distinguish the difference between the two is by the layer of fat covering the prime rib cut while the plate boiling meat has reddish colored dry flesh on outside.

"Economy is selecting meat in different seasons is important. During hot summer months the demand for steaks and chops and other frying and broiling meat is great and larger cuts of boiling and roasting meat are therefore cheaper. Often 20 per cent reduction in price is result. Besides advantage of economy in buying these large cuts of meat the left over roast is always attractive when sliced and served cold in summertime.

"Tender meat can always be known by its rich color and fine compact fiber. Flesh should not be coarse and stringy. Many times a tough piece of meat may be made just as juicy and tender as very choice expensive piece. On the other hand, a fine tender cut may be just as easily spoiled if not correctly prepared and cooked.

"If it seems necessary to clean meat before cooking never wash under running water but wipe off with damp cloth. This will not open pores of meat and allow juice to escape.

"The main idea in roasting meat is to sear both sides of the piece by placing in pan with hot fat. After both are well seared the crust formed holds in all juice.

"In broiling steaks, the heat applied from above does not allow the juice to rise and evaporate so readily as when fried on top of flame. Season steaks just before removing from pan because salt tends to draw the juice from the meat. Larger pieces of meat should not be seasoned until two-thirds done.

"Suitable utensils and stove equipment are great help in saving time and labor."

From his long experience as a retail butcher Mr. Spooler has come in contact with many famous French and Italian chefs and from them has learned the trick of many a delicious meat dish or sauce which he passes on to his readers in his book. Nor does he confine himself to meats for he gives also some of Mrs. Spooler's best recipes for cakes and pies and salads, with other recipes collected from this neighbor and that for "Mothers Boston Baked Beans," tomato catsup, tamales, enchiladas. "Economy Salad." German dressing, tongue mince meat, egg nog, noodles, dumplings that won't fall, a super extra cake icing—in fact, it's a thoroughly practical, delightful helper for any housewife.

We would like to give many of the recipes, but just for this one time we can't refrain from giving:

One-Egg Icing

Break white of one egg into large platter. Break white and scatter over platter by giving 8 or 10 strokes of spoon. Place one full cup sugar in shallow pan. Add two-thirds cup water. Place over fire. Let come to boiling point but do not allow to boil. Remove from fire, add one-third teaspoon cream of tartar, and one-half teaspoon baking powder. Place on fire and simmer. Do not boil. Take one large spoon of syrup and beat into egg white with a flat wire beater. Continue to add syrup a little at a time until all used. Add flavoring. This fluffs up and makes plenty of icing for a three layer cake.

The Cultivator Patterns

3100. Set of Infant's Clothes.—Cut In One Size: It will require 2 1/2 yards of 36 inch material for the Dress, 2 1/4 yards of 27 inch material for the Petticoat and 2 yards of embroidery for the ruffles. The slippers require 1/2 yard of 18 inch material and the Harem cap 1/2 yard of 27 inch material for Band, and 1 yard 40 inches wide for Skirt. Price 10c.

3943. Child's Bonnets.—Cut In 3 Sizes: 6 months, 1 year, 2 and 4 years. A one year size will require 1/2 yard for No. 1 of 36 inch material, 1 1/2 yard for No. 2, of 20 inch material, and 1/2 yard of 20 inch material for No. 3. Price 10c.

3743. Child's Coat and Cap.—Cut In 4 Sizes: 6 months, 1 year, 2 and 4 years. A 2 year size will require 2 1/2 yards of 27 inch material for the coat and 1/2 yard for the cap. Price 10c.

3441. A Set of "Short Clothes."—Cut In 5 Sizes: 6 months, 1 year, 2, 3 and 4 years. A 2 year size will require 3 1/2 yards of 27 inch material for the Dress, 1 1/2 yard for the Slip, and 1 yard for the Drawers. Price 10c.

HOUSEHOLD QUERIES

Maud Muller

Will you please publish the original poem Maud Muller?—Subscriber, Co-vina.

MAUD MULLER

By John Greenleaf Whittier

Maud Muller on a summer's day
Raked the meadow sweet with hay.

Beneath her torn hat glowed the wealth
Of simple beauty and rustic health.

Singing, she wrought, and her merry glee
The mock-bird echoed from his tree.

But when she glanced to the far-off town,
White from its hill-slope looking down,

The sweet song died, and a vague unrest
And a nameless longing filled her breast,

A wish that she hardly dared to own,
For something better than she had known.

The Judge rode slowly down the lane,
Smoothing his horse's chestnut mane.

He drew his bridle in the shade
Of the apple trees, to greet the maid.

And asked a draught from the spring that
flowed,
Thru the meadow across the road.

She stooped where the cool spring bubbled
up,
And filled for him her small tin cup,

And blushed as she gave it, looking down
On her feet so bare, and her tattered
gown.

"Thanks!"—said the Judge; "a sweeter
draught
From a fairer hand was never quaffed."

He spoke of the grass and flowers and
trees,
Of the singing birds and the humming
bees;

Then talked of the haying, and wondered
whether,
The cloud in the west would bring foul
weather.

And Maud forgot her brier-torn gown,
And her graceful ankles bare and brown;

And listened, while a pleased surprise
Looked from her long-lashed hazel eyes.

At last, like one who for delay,
Seeks a vain excuse, he rode away.

Maud Muller looked and sighed: "Ah me!
That I the Judge's bride might be!

"He would dress me up in silks so fine,
And praise and toast me at his wine.

"My father should wear a broadcloth
coat;
My brother should sail a painted boat.

"I'd dress my mother so grand and gay,
And the baby should have a new toy each
day.

"And I'd feed the hungry and clothe the
poor,
And all should bless me who left our
door."

The Judge looked back as he climbed the
hill,
And saw Maud Muller standing still.

"A form more fair, a face more sweet,
Ne'er hath it been my lot to meet.

"And her modest answer and graceful air
Show her wise and good as she is fair.

"Would she were mine, and I today,
Like her, a harvester of hay.

"No doubtful balance of rights and
wrongs,
Nor weary lawyers with endless tongues,

"But low of cattle and song of birds,
And health and quiet and loving words."

But he thought of his sisters, proud and
cold,
And his mother, vain of her rank and
gold.

So, closing his heart, the Judge rode on,
And Maud was left in the field alone.

But the lawyers smiled that afternoon,
When he hummed in court an old love
tune;

And the young girl mused beside the well
Till the rain on the unraked clover fell.

He wedded a wife of richest dower,
Who lived for fashion as he for power.

Yet oft, in his marble hearth's bright
glow,
He watched a picture come and go.

And sweet Maud Muller's hazel eyes
Looked out in their innocent surprise.

Oft, when the wine in his glass was red
He longed for the wayside well instead.

And closed his eyes on his garnished
rooms,
To dream of meadows and clover-blooms.

And the proud man sighed, with a secret
pain,
"Ah, that I were free again!

"Free as when I rode that day,
Where the barefoot maiden raked her
hay."

She wedded a man unlearned and poor,
And many children played round her door.

But care and sorrow, and childbirth pain,
Left their traces on heart and brain.

And oft, when the summer sun shone hot
On the new-mown hay in the meadow lot.

And she heard the little spring brook fall
Over the roadside, through the wall,

In the shade of the apple tree again
She saw a rider draw his rein.

And gazing down with timid grace,
She felt his pleased eyes read her face.

Sometimes her narrow kitchen walls,
Stretched away into stately halls.

The weary wheel to a spinnet turned,
The tallow candle an astral burned,

And for him who sat by the chimney lug,
Dozing and grumbling o'er pipe and mug.

A manly form at her side she saw,
And joy was duty and love was law.

Then she took up her burden of life again,
Saying only, "It might have been."

Alas for maiden, alas for Judge,
For rich repiner and household drudge!

God pity them both! and pity us all,
Who vainly the dreams of youth recall.

For of all sad words of tongue or pen,
The saddest are these: "It might have
been!"

Ah, well! for all some sweet hope lies
Deeply buried from human eyes.

And, in the hereafter, angels may
Roll the stone from its grave away!

Cowboy Songs

Would you please print the words
in the next Cultivator of "For I'm a
Tough Cowboy." I am not sure whether
or not this is the name of the song.
The chorus starts:
:"Don't bury me in the lone piairie
Where the cyotes howl o'er me."

Please print any other cowboy songs
you have on hand.—E. and F., Elsi-
nore.

We are mailing these inquirers copy
of the Cultivator of March 25 which
contained cowboy songs.

"Rock Me to Sleep, Mother"

Will you please publish Rock Me To
Sleep, Mother. I am very anxious to
get the poem and come to you for
help.—A Subscriber, Huntington
Beach.

"Rock Me to Sleep, Mother"

Backward, turn backward, O Time in
your flight,
Make me a child again, just for tonight;
Mother, come back from the echoless
shore,
Take me again to your heart as of
yore;
Kiss from my forehead the furrows of
care,
Smooth the few silver threads out of
my hair;
Over my slumbers your loving watch
keep;
Rock me to sleep, mother,—rock me
to sleep!

Backward, flow backward, O tide of
the years!
I am so weary of toil and of tears;
Toil without recompense, tears all in
vain;
Take them and give me my childhood
again!
I have grown weary of dust and decay,
Weary of flinging my soul-wealth
away;
Weary of sowing for others to reap;—
Rock me to sleep, mother,—rock me
to sleep!

Tired of the hollow, the base, the un-
true,
Mother, O Mother, my heart calls for
you!
Many a summer the grass has grown
green,
Blossomed and faded, our faces be-
tween;
Yet with strong yearning and passion-
ate pain,
Long I tonight for your presence again.
Come from the silence so long and so
deep;—
Rock me to sleep, mother,—rock me
to sleep!

Over my heart in the days that are
flown,
No love like mother love ever has
shone;
No other worship abides and endures,
Faithful, unselfish, and patient like
yours;
None like a mother can charm away
pain
From the sick soul and the world
weary brain.
Slumber's soft calms o'er my heavy lids
creep;
Rock me to sleep, mother,—rock me
to sleep!

Come, let your brown hair, just lighted
with gold,
Fall on your shoulders again, as of old;
Let it drop over my forehead tonight,
Shading my faint eyes away from the
light,
For with its sunny edged shadows once
more,
Haply will throng the sweet visions of
yore;
Lovingly, softly, its bright billows
sweep;—
Rock me to sleep, mother,—rock me to
sleep!

Mother, dear mother, the years have
been long
Since I last listened your lullaby song;

Sing, then, and unto my soul it shall
seem
Womanhood's years have been only a
dream;
Clasped to your heart in a loving em-
brace,
With your light lashes just sweeping
my face,
Never hereafter to wake or to weep;—
Rock me to sleep, mother,—rock me
to sleep!

Easy Way to Wash Windows

If the housewives who dread window
cleaning—and it is some task in the
ordinary way—will use a piece of
chamois—a whole chamois skin is best,
wrung out of clear cold water, and
simply wipe the windows off when
needed, they can be kept bright and
clean with little effort. If windows
are greasy they should first be washed
clean and then wiped with the chamois
which should be wrung out as dry as
possible before using.—Subscriber,
Del Mar.

**PRUNE GRIDDLE CAKES—AND
OTHERS**

Prune griddle cakes! Sound par-
ticularly fascinating, don't they? More-
over, they taste that way. And prune
squares for breakfast! In addition to
these two new recipes we give prune
pudding and prune soufflé. All four
should be tried and then added to your
Cultivator recipe book.

Prune Griddle Cakes

Soak two cups of bread crumbs in
two cups of hot milk fifteen minutes.
Then add two wellbeaten eggs and
two tablespoons of oil, then half a cup
of flour sifted with one teaspoon of
salt, three teaspoons of baking pow-
der and half a cup of sugar. Lastly,
add half a cup of stoned and chopped
prunes. Bake in cakes on a hot grid-
dle.

Prune Squares

Prune squares will be relished by
everyone. Wash and soak the prunes,
let simmer until so tender they may
be pressed through a sieve. Add the
sugar to the pulp and cook again for
a few minutes. Toast and butter neat
squares of bread and spread the
prune pulp over them. If served for
luncheon or dinner a teaspoon of
meringue may be placed on each and
delicately browned.

Prune Pudding

Soak a pound of prunes over night
in water to cover, then cook until ten-
der, sweetening to taste. Add half a
package of gelatine which has been
soaked and dissolved and a little lemon
juice. Turn into a mold lined with
split blanched almonds and serve cold
with cream.

Prune Soufflé

Run through a sieve enough cooked
prunes to make a cup. Mix with a
cup of sugar which has been sifted
with a teaspoon of cream tartar. Fold
in the stiffly beaten white of eight
eggs, turn into a buttered baking dish
and bake for twenty minutes. Serve
with cream.

RAISIN ICE CREAM

The appeal of raisins has recently
become so universal that it is not sur-
prising to note the appearance of a
new raisin delight, this time a summer
delicacy, cool and delicious. What
could be more tempting on a warm,
oppressive day than a delicious dish
of ice cream, made with luscious
raisins? An energizing food—just the
thing for summer weather.

How to Make It

Soak until plump 1 cup Sun-Maid
Seeded Raisins with 1 tablespoon lem-
on juice in 2 cups water. Then simmer
slowly, while closely covered, un-
til raisins are tender, and 1-2 cup
water remains. Dissolve one table-
spoon cornstarch with few grains
salt in four tablespoons cold
water; add to the raisins, cook until
clear, being careful not to crush rais-
ins while stirring. Add 3-4 cup sugar,
remove from fire, keep covered and
let it get cold. Whip 1 1-4 cups heavy
cream until stiff. Then fold raisins
with 1 teaspoon vanilla into the cream
and freeze.

Raisinut is the latest put out by the
Sun-Maid Growers. This is a choco-
late coated raisin and nut confection
put out in 10 cent cartons similar to
the "Little Sun-Maids."

PEP

"Nobody without some pepper is worth
his salt!"
That's pep!
Vigor, vitality, vim and punch—
That's pep!
The courage to act on a sudden hunch—
That's pep!
The nerve to tackle the hardest thing,
With feet that climb, and hands that
cling,
And a heart that never forgets to sing—
That's pep!

Sand and grit in a concrete base—
That's pep!
Friendly smile on an honest face—
That's pep!
The spirit that helps when another's
down,
That knows how to scatter the blackest
frown,
That loves its neighbor, and loves its
town—
That's pep!

RING TRUE

Don't be what you ain't,
Jes' be what you is.
If you is not what you am,
Then you am not what you is,
If you're just a little tadpole,
Don't try to be a frog;
If you're just the tail,
Don't try to wag the dog.
You can always pass the plate,
If you can't exhort and preach.
If you're just a little pebble,
Don't try to be the beach.
Don't be what you ain't,
Jes' be what you is.
—The Labor Union.

RIGHT OF WAY WRONGS

"The pedestrian always has the
right of way."
"Yes," replied the timid individual,
"but what's the good of a right of
way that's always filled up with mov-
ing vehicles?"

BUILT TO ORDER

"What's the matter with Smith? Got
lumbago or spinal curvature or some-
thing?"
"No; he has to walk that way to fit
some shirts his wife made for him."

SHE DIDN'T ACCEPT

"I ask you to be my wife. I don't
know of any greater compliment I
can pay you."
"Well, we'll take it as a compli-
ment Ferdy, and let it go at that."

TO SAVE TIME

Mutter—In printing the directory,
why do they always put the address
before the number?
Mumble—So you can write if you
haven't got time to phone.

Big Price Reduction Lowest in 14 Years

Realizing that farm equipment must be reduced to the same level as the prices of farm products the SHARPLES SEPARATOR CO. have reduced the prices of their separators to less than one-half of the former price and have not in any way decreased the quality. The new price will produce such a large volume of business that a satisfactory profit will be realized by the manufacturer. The new SUCTION FEED SHARPLES skims clean at any speed, is easy to operate, does not require an expert, easily cleaned, long lived and thoroughly dependable. It is in constant use by more than a million satisfied users. It skims to 1/100 of 1 per cent clean all the time,—the same even quality of butter fat today as tomorrow. Put a SHARPLES to work for you. Write to the nearest distributor for detailed information and name of nearest dealer.

Note the knee low supply tank which saves heavy lifting, yet the suction feed supplies the correct quantity of milk at all speeds.

CREAM SEPARATOR

"There are no substitutes for dairy foods."

FIFTY REGISTERED HOLSTEINS AT AUCTION

Scappoose, Oregon, Wednesday, June 14, 1922

This offering is one of the best to ever go under the auctioneer's hammer. The most of them are young cows; a few heifers, heifer calves and young bulls. They are nicely marked, in good condition, of conformation that would command attention in any show ring and they are heavy producers.

PRODUCTION

A Senior yearling producing over 62 lbs. milk per day.

A mature cow producing 90 lbs. per day.

Others producing from 50 to 90 lbs. Straight top lines, free from disease, square udders and right in every way.

Not a cow in the herd but what should produce 50 lbs. per day under ordinary herd care. The average percent test is high. Everyone a profitable producer.

Seldom if ever has as grand a lot of cattle gone over the auction block as will at this sale.

Sale to be held on the Wist Farm, one mile north of Scappoose, Oregon, just off the paved highway, easily accessible by train, stage or auto.

Catalog will be published, giving full information. Mailed upon request to Sale Manager.

One year's time will be given to responsible parties (see catalog for details). Do not overlook this opportunity to secure these ultra valuable Holsteins at a price set by the buyers.

WIST BROS, Owners, Scappoose, Oregon

Auctioneers: Col. Geo. A. Gue, Yakima, Wash.; Col. J. W. Hughes, Forest Grove, Ore.
Sale Manager: E. A. Rhoten

BLOOD LINES

A number of the offering were sired by Pietertje Beauty Segis, he a full brother to Segis Pietertje Prospect, 1448.68 lbs. butter; 37381.40 lbs. milk, world's record milk producer.

Others, close descendants of such bulls as King Segis, King of the Pontiacs, Lord Netherlands De Kol, King Segis Pontiac, Beauty Pietertje Prince, Aaggie Cornucopia Johanna Lad, Colantha Johanna Lad, and other noted sires.

State Record Broken

The Los Angeles County Farm advises that another state record has been broken in its dairy herd by the famous senior four year old Hollywood Lillith Palmyra Abbekerk. This helper will freshen within approximately 13 months from last calving, thus qualifying for the 305 day class which is now attracting particular attention of breeders and dairymen throughout the country because of being made under more natural conditions than many of the yearly tests. In 230 days "Hollywood" has 653 pounds fat, equivalent to 816.2 pounds butter, which already exceeds the former 305 day state record by over 30 pounds butter. As the county farm contender still has two and one-half months to go, and is at the present time making approximately 90 pounds butter per month, it may be seen that she will raise the state production mark by more than 200 pounds butter in the ten months. Early in May she will be again placed on seven day test for the eight months after calving class.

The production attained by Hollywood Lillith Palmyra Abbekerk is a remarkable example of the kind of breeding which may be relied upon to produce consistent performers. She herself has a senior four year old record of 30 pounds butter in seven days and has given more than 700 pounds milk in a single week. Five of the nearest dams in her pedigree are 30 pound cows, the nearest three averaging 960 pounds butter in yearly test. She completes three consecutive generations of cows, all making more than 30 pounds in seven days, and her sire has six daughters that have made records from 30 to 38 pounds butter in seven days, all under full age. Individually she is a very excellent example of dairy type, although she weighs approximately 1,500 pounds. She is an excellent feeder, and the fact that she has made these wonderful records after having twin calves indicates a strength of constitution which promises still greater accomplishment within the next two or three years.

American Berkshire 100 Years Old

The Berkshire hog came to America just 100 years ago, according to the best authorities, being landed in 1823 or 1825, an English emigrant to New Jersey bringing some of his favorite breed with him to the new world. A second importation came with another English emigrant who settled near Albany, New York, about 1832. This man, Sidney Hawes, sold a sow and a boar to Munson Beach of Ohio three years later, and the two did much to spread and establish the breed in the West.

The early specimens of the breed were very large, reports of animals weighing 1000 to 1100 pounds each being common in their native Berkshire of England. Choice hams, shoulders and bacon for the early English trade brought the Berkshire hog into prominence in England and gradually established its supremacy throughout the British Isles from where it has spread over the world, especially throughout the British colonies. In Canada, Australia, New Zealand, South Africa, as

well as in the South American countries, it has been planted to flourish as the leading breed of hogs.

In 1839, the breed received a great impetus in the United States when a group of English farmers in Orange County, New York, formed a corporation and brought in a large number. Two years later, A. B. Allen made an importation of 40 head of the best to be found in England, and he did much to advertise and popularize the breed in the new world. A little later, the dispersion of the New York importation through the states of Missouri, Kentucky and Tennessee did much to spread the Berkshire into the great farming empire being opened up at that time.

The Berkshire of today is scattered throughout the United States, fitting into corn belt, cotton belt, dairy belt and range territory with equal adaptability. He is classed as a medium to large type, quality and evenness not being sacrificed for excessive size.

Morgan Breed Improved on Government Farm

There has been a steady increase in weights and heights of horses maintained in the stud at the United States Morgan Horse Farm at Middlebury, Vermont, says a recent department circular, No. 199, Breeding Morgan Horses at the United States Morgan Horse Farm. In 1911 the average height of mature stallions was 14.3 hands and of mature mares 14.2½ hands. By 1916 these figures had been raised to 15.0 and 14.3, respectively, and by this year to 15.1½ and 14.3½. The average weight of mature stallions in 1911 was 1,025 pounds; in 1916, 1,040 pounds, and in 1921 it had been increased to 1,200. During the same period the weights of mares went from 1,025 to 1,049 to 1,063.

At the same time, however, the other qualities received just as much consideration as size. A frequent objection raised against the Morgan has been that it is too small, but the steady improvement in scale and weight is making the modern Morgan a handy and desirable horse for use on farms, for pleasure saddle horses, for

police mounts, and for cavalry purposes. It has good speed and exceptional endurance.

The government farm at Middlebury was established to insure the preservation of this famous American breed, and the stock at the farm is a fountain head where good blood will always be available. The circular just mentioned contains information concerning foundation animals, the story of the movement to conserve the breed, methods of breeding and management, showing records, and the records made by Morgans in endurance contests held in recent years.

Since the early days of the breed up to the present time the Morgan has repeatedly demonstrated his endurance, one of the most desirable qualities in any horse, particularly a light horse. In this publication attention is called to the great reputation made by the First Vermont Cavalry in the Civil War. This regiment was mounted on Morgan horses, and official reports made to the war department stated that the horses stood the hardships of the campaigns better than any others.

DIAMOND G HEREFORDS

13 choice yearling heifers, sired by a son of an International Champion, well grown and just the sort for starting a profitable herd. Also 10 yearling bulls. Come and see them; the price is right.

H. H. Gable Esparto, Cal.

Big Money Boring Wells

Have water on your own farm. In spare time make wells for your neighbors. It means \$1000 extra in ordinary years, double that in dry years. No risk—no experience needed. Outfits for Getting Water Anywhere. Earth augers, rock drills and combined machines. Engine or horse power. Write for easy terms and free catalog. LITTLE MFG. COMPANY Box 716 Clarinda, Iowa

Also their short, strong legs, round, full muscled bodies and beautiful heads called forth universal admiration. What applied to cavalry horses then applies today.

The Morgan still has the endurance. Castor, a Morgan gelding bred by the U. S. Morgan Horse Farm, made the second best time in the 300 mile endurance contest in 1919. He carried 200 pounds and made the trip in 51 hours and 18 minutes. The next year he carried 245 pounds and finished in 58 hours and 40 minutes, taking seventh place. In the contest for 1921 he was fourth out of 17 entries, carrying 245 pounds and making the 300 miles in 51 hours and 38 minutes.

This circular, which is well illustrated with halftone reproductions of beautiful Morgans, may be obtained free by addressing Department of Agriculture, Washington, D. C.

BARLEY FOR HOG FEED

Barley as a hog feed is coming on the markets in increasing amounts, probably for the reasons that its use for brewing purposes has fallen off and the hog industry has been moving into the barley producing districts. The United States department of agriculture has taken up the problem of finding out the relative feeding value of light and heavy barley. There are no federal standards for this grain, but light and heavy grades are recognized on the market.

During 1921 the department made feeding tests of the two grades, and the trials will be repeated. Not enough data are available yet for definite conclusions as to the relative merits of the light and heavy grain, but the results have shown that high-class barley has a feeding value only slightly lower than good shelled corn. When these tests are completed the department will have additional information on the methods of feeding barley, whether or not it should be fed whole, rolled, dry, or soaked.

It is expected that barley will be used much more in the future as a hog feed, especially when there is a scarcity of corn and when barley is comparatively cheap.

BLACKLEG

This disease is produced by the blackleg germ which is found in infected soil and bodies of animals sick or dead of the disease. Blackleg is regarded as a true soil disease and is transmitted most frequently from this source. The possibility of direct transmission of the infection from one animal to another is probably very rare.

After soil has once become contaminated with the germs of the disease it is not known how long they will remain alive but a given soil once infected should always be looked upon with suspicion. When a pasture is infected, the disease is likely to occur at any time even though several years may elapse between outbreaks.

Blackleg is most prevalent in the spring and fall. The heaviest losses occur in animals between the ages of six months and two years. It should be borne in mind, however, that younger or older animals under certain conditions contract the disease. Cases in young calves are not rare and outbreaks in cattle older than four years have been noted. Observations have demonstrated, however, that the influence of age with regard to susceptibility cannot be questioned and that we are justified in regarding animals free from danger of contracting blackleg when they have reached the age of approximately three years.—J. P. Iverson.

WHY MEAT IS A VALUABLE FOOD

The contention is often met that meat eating is responsible for a number of human ills. When one seeks to have this verified it will be found that meat is neither the cause nor regarded as a factor in producing the abnormal conditions. Eminent authorities on dietetics have refuted many of the claims made that meat eating produces this, that, or the other disease. In many other human ailments the causes for which we do not know we find that certain individuals attempt to enlighten the public on vital food problems which challenge the skill of our most learned dietitians.

It is universally accepted that protein is one of the essential requirements of the body tissue but it should also be borne in mind that this necessary tissue constituent is made up of many factors each of which is required in order to properly supply the tissue demands. The California department of agriculture calls attention to the fact that though an edible product may contain a given amount of protein it does not necessarily follow that this amount can be utilized by the body. We know that protein in the food eaten, in order to be assimilated, must be of the right kind and quality, and since animal tissues so nearly resemble those of the human we can reason that by eating them we are consuming the kind of protein demanded and utilized by the body.—S. O'T.

BREED PRIZES

A futurity show will be held at the 1922 state fair which will carry \$1,000 in prize money, the fair board and the Poland China Breed Promotion Committee each guaranteeing 50 per cent of the purse. This, in addition to offering in open classes by the fair board, will supply nearly \$2,000 for that one breed alone. Other breeds will have similar amounts offered in awards, which will assure a large exhibit of swine. Secretary Paine of the state fair board says that to assure a futurity show breeders must nominate their herds with their respective breed organizations. A breeder in an adjoining state where there is no futurity show is eligible to enter the California futurity, and all futurity entrants are eligible to exhibit in the open classes.

KEEP GRAY AND DARK WOOL SEPARATE

Quite often when examining pieces of white cloth we notice here and there black threads in the fabric, which mar considerably the attractiveness of the cloth. Fred A. Ellenwood, president of the California Woolgrowers' Association, has discussed quite extensively the reasons for the misplaced black threads and how such accidents may be prevented.

He warns the woolgrowers that if they expect the highest market prices for their wool they must exercise precaution in keeping the black and gray wools separate. He gives the following as his reasons for advising precautionary measures in this respect: "Pieces of the dark wool when they become mixed with the white must be picked out in the processes of grading, scouring, and sorting before the wool can be manufactured into cloth. In order to accomplish such separation it is necessary to employ experts. This unnecessary expense can be avoided if the gray and black fleeces are kept separate."

Pomona is planning a Los Angeles County fair this fall.

"She filled them all in 30 days"—a selling photograph

Let KODAK sell your livestock

You know how to pose your cattle, horses, sheep or hogs so as to bring out their strong points and you can leave the rest to the lens. Kodak pictures tell the story. Each print is the strongest kind of a selling argument.

Making pictures the Kodak way is inexpensive—and easy.

LIVESTOCK SALE CALENDAR

Sheep

June 15-16, Annual Ram Sale, California Woolgrowers' Association, Davis.

Little Beauty 2nd, a Guernsey cow belonging to the Brant Rancho at Owensmouth, has just completed her fifth yearly test and is the seventh Guernsey cow to have done so. Two of her records were made in heifer form and for two of the five years she was milked with a machine. In five years she has produced 56,729 pounds milk and 2,902 pounds butter fat. As her milk was sold at an average price of 28 cents a quart the income from her total milk production was nearly \$8,000. Her last record is the highest of the five as she made 679.5 pounds butter fat from 14,575 pounds milk. She has been a regular breeder and one of her daughters has lately finished a record of 552.4 pounds fat from 13,571.7 pounds milk as a junior two year old.

The Italian Vineyard Company is developing a great show prospect in the junior yearling boar, Guasti's Rival. This boar, commonly known as "Bobbie" because of an accident to his tail early in life, was first in his class in six shows last fall and was four times junior champion. The day he was a year old he weighed 510 pounds in breeding condition and without an ounce of excess fat.

Walter H. Dupee, the former owner of Edgemoor Farm near San Diego and now located at Riverside, was the lucky purchaser of four fine Guernsey heifers in the recent Western National Guernsey Sale at Chicago. One of them is Lone Pine Luxury who was sired by Langwater Warrior and is a double granddaughter of Imp. King of the May. Another is a daughter of the sensational bull King of Chilmark and another carries a double cross of the blood of Don Bernardo of Linda Vista. It is Mr. Dupee's intention to have a herd of about a dozen of the finest Guernseys to be procured at his new place.

The Hartsook Holsteins continue to do their duty by making good records for their owner, and during the past week Rosamaines Korndyke Beauty, who broke the junior two year old world's milk record last year, and freshened again at the age of three years and eight days, finished a seven days record of 34.22 pounds butter, from nearly 700 pounds milk. Burbank Uneeda Maid, another junior three, made 29.47 pounds butter in seven days and Athenia Roderick Luecke, a full aged cow, made 36.03 pounds butter in the same time.

J. A. Brown of Capitola in Santa Cruz County, who bought the Guernsey herd formerly owned by the late Judge Lindley of San Francisco, is doing excellent work in testing his cows. He has just lately finished some very good records and has more in view.

SMALL STOCKMEN WORK TOGETHER

Another story of practical cooperation appears in the Fresno Republican of April 30, describing an experiment which has been tried for two years and is being enthusiastically continued by a group of stock owners living at and near O'Neals in Madera County.

Each of the 17 stock owners forming the association is a "small man," the largest band of cattle counting 200, a majority having 100 and under. Before the association was formed each man took care of his own bunch, each one wanted a range as near the west front of the forest as might be, and each was jealous of the others' progress. While this was the case, one of the largest and best of the unit ranges in the Sierra national forest fell vacant. It was the famous old Jackson Meadow range, a series of rich and beautiful meadows with many timber hill slopes furnishing the necessary browse feed and shade. But this range would feed 1,200 or more head of stock, and no one small owner could handle it.

It was then that a suggestion was made to this group of O'Neals men that they should form an association

and take their cattle to the Jackass range. Many meetings, much heated discussion and two summers of experience have developed a plan that a recent meeting shows to be working in first class shape. The report of the treasurer shows that the association's assessment in 1921 of \$2 per head of stock accomplished the following results:

Paid the grazing fee required by the forest service of 54 cents a head for the season (June 15 to September 30).

Bought material for the construction of two holding pastures.

Built 50 A 1 salt logs and purchased sufficient salt for the cattle.

Bought the subsistence supplies for the men making the salt logs and building the fences.

Paid \$125 a month to two range riders for the season.

Paid the insurance on these two men.

Bought a supply of black leg "ag-gressin."

Bought barley and shoes for the saddle horses used.

Bought feed for the stock en route from the summer to the winter ranges, besides a number of small miscellaneous items.

And there is a balance in the treasury of 15 cents per head of stock.

The association now has appointed a committee to look into the question of obtaining cheap and satisfactory feed for their stock during the hardest months of winter, when these foothill stockmen lose most heavily in poor years. The same committee will also look up buyers who will go in to the range and bid on the beef cattle.

By working in cooperation, these stock owners have the greater part of their own time for their ranches or other business; the forest range is used to much better advantage; they can market their beef to better advantage, having enough to induce several buyers to look it over instead of having to drive a few head a long way. They are themselves enthusiastic over their success, and there is not a man among them who would now give up his share of the Jackass range for any other range on the forest.

They work in close cooperation with the forest rangers, driving in their stock carefully, keeping them moving on the range as one area after another begins to show that it is "fed out," buying high grade bulls, and, in fact, becoming first class stockmen. In their part of the foothills, the "scrub cattle" are disappearing and pure bred stock is taking their places. Instead of a few head of stock "on the side," drifting into the forest in summer and out in winter, such as were the type a few years ago, the foothill ranchers are owning good sized bunches of good stock.

THE DAIRY RATION

By A. C. Ragsdale, Missouri College of Agriculture

Farmers wish to know what is the "best" dairy ration. The answer must always be in terms of the conditions existing on each man's farm. On the average farm that ration may be classed as the "best" which will return the greatest production at the least cost.

In formulating an ideal ration, these six factors may be regarded as essential: Balance of nutrients, succulence, palatability, variety, bulk, economy.

Balance of nutrients to keep cows at their maximum production means one pound of digestible protein for each four and one-half to seven pounds of digestible carbohydrates and fat according to the cow's rate of production.

A succulent feed when given with other roughages and grains renders them more palatable and aids in their digestion. When good pastures are not available corn silage is the cheapest succulent feed that can be given. Beet pulp and linseed oil meal, also, have somewhat the same qualities.

Palatability is most important, as it is essential that a cow's feed appeal to her appetite. Make the feed palatable by keeping the mangers clean and by feeding three or more different grains.

Variety. While for low producing cows a variety of feeds is not so essential, maximum production cannot be obtained without at least three grains in the mixture and four plants should usually be represented in the entire ration, including both roughage and grain feeds.

You pay for a De Laval whether you buy one or not

If you are using a worn-out, inferior cream separator, or skimming cream by hand, you are surely wasting enough cream to pay for a De Laval in a short time.

The selection of a cream separator is more important than that of any other machine on the farm, for none other can either save or waste so much, twice a day, 365 days a year.

A De Laval Separator will:

—Skim cleaner for many more years than any other;

—Skim milk clean at lower temperature than any other separator;

—Deliver a higher testing cream, which is more acceptable to the creamery, and easier and less costly to ship.

—And deliver a cream which will make better butter.

Mechanically a De Laval Separator is the best that fine materials and skilled workmanship can make.

—It lasts longer than any other separator, many giving good service for 15 to 20 years.

—It is easier to turn.

—It is easier to clean.

—It is so simple that one tool will set it up or take it down.

—It has the most perfect lubricating system.

Do not be deceived by separators which are claimed to be "just as good and cost less." When you consider its greater savings, greater reliability, longer life, the extra time it saves, and the greater satisfaction it gives, the De Laval is, in the end, by far the most economical cream separator made.

Even if you have only two cows it will pay you to have a De Laval. One can be bought on such easy terms that it will pay for itself in less than a year. Why not see your De Laval agent at once or write us for full information?

De Laval Pacific Company

61 Beale Street, San Francisco

Sooner or later you will use a

De Laval

Cream Separator and Milker

Bulk is necessary because the cow's stomach is essentially adapted to handling bulky feeds. A ration deficient in roughage does not seem to satisfy the cow, regardless of the amount of grain feed she receives. A good rule to follow is to feed daily one pound of dried roughage and three pounds of succulent roughage for each 100 pounds of live weight.

Economy. Home grown feeds usually furnish nutrients most cheaply. Every dairyman should grow all the feed possible, and when necessary to purchase feed stuffs select those which furnish nutrients most economically.

One of the principles that should be observed in mixing grains is that light grains should be mixed with heavy ones to aid in the more ready assimilation of the latter. Heating feeds such as cottonseed meal, gluten and corn should be combined with cooling feeds such as bran, ground oats or

linseed oil meal. There should also be a sufficient amount of mineral matter. This is usually supplied when three or more grains are used, especially if a leguminous hay such as alfalfa is also used. Bearing these points in mind the following ration is suggested as approaching the ideal:

Corn silage, three pounds for each 100 pounds live weight.

Alfalfa hay, one pound for each 100 pounds live weight.

Grain mixture, 400 pounds ground corn, 200 pounds ground oats, 200 pounds wheat bran, 100 pounds cottonseed meal, 100 pounds linseed oil meal. Feed daily one pound for each three or four pounds of milk produced according to richness. Also make any slight variation that may appeal to the appetite of the individual cow.

HOW A GREAT INDUSTRY DEVELOPED

The great California cattle industry had its inception in a shipment of five head of cattle in the early part of 1600 from Acapulco, Mexico, to the Mission fathers in California.

The mild climate and abundance of wild grasses which covered every hill and valley made the business of raising cattle attractive to the early settlers of the state; large capital was unnecessary; the labor required was easily obtained and gratifying results and profits were certain. The cattle were permitted to roam at will, no care being taken to keep them together except annually in order that the owner might mark and brand the increase of his herd.

The rights of ownership in these cattle were determined by certain marks and brands. The recording of marks and brands was a legal requirement in California under the supervision of the recorders of each county. This jurisdiction was transferred in 1917 to the director of agriculture, and since that time all marks and brands are now required to be recorded in the office of cattle protection of the division of animal industry.

SELF FED HOGS GAIN FASTER

Self fed hogs gain 7.4 per cent faster than when hand fed, according to thorough tests at the Missouri agricultural experiment station. Yet hogs self fed require no more feed to produce a given amount of gain than when hand fed. Hence the practice is a labor saver. When each feed is placed in a separate self feeder the hogs will choose the different feeds so that the gain will be both rapid and economical.

Experiments here have shown that the proper use of supplementary feeds like tankage, linseed oil meal or wheat middlings increase the profits derived from swine feeding. A ton of tankage saves 169 bushels of corn. A ton of linseed oil meal saves 90 bushels, and a ton of wheat middlings saves 33 bushels.

These experiments have shown that fattening hogs gained 23 per cent faster on a ration of corn and wheat middlings than on corn alone, 32 per cent faster on corn and linseed oil meal, 32 per cent faster on corn and tankage, and 33 per cent faster on corn and soybeans.

The saving of grain resulting from the use of pasture crops is found to be from 20 to 50 per cent.

TOO FAST

"Is this a fast train?" the salesman asked the conductor.

"Of course it is," was the reply.

"I thought it was. Would you mind my getting out to see what it is fast to?"—Sonora Bell.

HOW TO CLEAN A MILKING MACHINE

With the advent of spring the milking machine will be used more extensively. For this reason the division of animal industry, California department of agriculture, calls attention to the fact that such a contrivance is not regarded as an efficient labor saving device unless operated under sanitary conditions.

A very timely report on the methods of cleaning a milking machine has been recently made by Dr. A. F. Hanna, field veterinarian. For the benefit of those not familiar with the details required in order to maintain a milking machine in a sanitary condition, the following procedure, as carried out by a Swiss cheese plant at Alton and noted by Doctor Hanna, is considered quite satisfactory:

When through milking run warm water through tubes.

Thoroughly brush with hot water and washing compound all parts with which the milk comes in contact.

Place tubes, etc. in water which has reached the boiling point and permit them to remain therein for 30 to 60 minutes. Do not resort to further boiling.

Place tubes etc. in brine and chloride of lime solution and drain three to five minutes before the next milking period. They will then be ready for use.

Small top pails are used for stripping the cows.

The four main points are observed daily in the morning, and only the third point is omitted in the evening.

The brine and chloride solution is made as follows:

Five gallons saturated solution of sodium chloride to which is added a 12 ounce can of ordinary household chloride of lime. To keep this up to strength, a stock solution is made by dissolving a 12 ounce can of chloride of lime in one gallon of water and adding one quart of the stock solution to the bath each week.

INCREASE IN PUREBRED FEMALE STOCK

Noteworthy progress during the last three months in the federal-state campaign for livestock improvement is reported by the bureau of animal industry, United States department of agriculture. The most striking development is the increasing tendency for purebred sire users to acquire purebred female stock as well. In the period, January 1 to March 31, of this year, 970 persons filed with the department signed enrollment blanks, endorsed by county agents, showing the use of purebred sires exclusively for all classes of livestock kept. This number is an increase of 254 over the previous three months and is nearly three times as many as for the same period in 1921.

Although the department has stressed chiefly the use of purebred sires, records of the "Better Sires-Better Stock" campaign show a gradual rise in the proportion of purebred female animals, including cattle, horses, swine, sheep, goats, and poultry. The proportion of purebreds to the total of female animals kept now exceeds 35 per cent. A decline in the proportion of scrub females in herds headed by purebred sires accompanied the rise in purebreds.

SOUTHERN PURE BRED MEN MEET AT LA HABRA

The regular monthly dinner and meeting of the Southern California Pure Bred Live Stock Association was held on Saturday at La Habra, the association being the guest of the La Habra business men and D. J. Bastanchury whose Berkshire ranch is only a little way from town. An excellent dinner was provided by the hosts in which roast Berkshire garnished with frijoles was the main article of diet.

At dinner a hidden secret mark on a napkin was eagerly sought as the holder was to be the recipient of a Berkshire pig given by Mr. Bastanchury. The lucky man proved to be Bert Blackmore whose name appears on most of the livestock pictures in this state. As this is Blackmore's first pig, her progress will probably be recorded photographically as carefully as that of the ordinary first child.

The next meeting will be held in the San Fernando Valley.

Wipe Out Every Rat and Gopher

Amazing New Discovery Quickly Kills Them All. Not a Poison.

Rats, Mice, Gophers — in fact, all Rodents can now be wiped out easily and quickly. Imperial Virus will do it. This new discovery is a fluid, true Virus. Entirely harmless to humans, poultry, stock, pets, etc.

Infects Rodents only. Greedily eaten on bait. Sets up burning fever. The pests communicate it to others, and all die outside, hunting air and water. Imperial Virus is put up in sealed bottles, thus insuring full strength and potency. Only safe, sanitary method to overcome these pests. Protect your Poultry, especially Baby Chicks and Egg Hatches.

YOU CAN GET YOURS FREE

Here's how! Send \$1.00 today (currency, M. O. checks, etc.) and we will give you by return mail, postpaid, two regular, full sized (double strength) \$1.00 bottles of Imperial Virus. Use one to rid your place of these pests, and sell the other to a neighbor, thus getting yours free. Special inducements to represent us.

If more convenient, send no money, just your name and address to Imperial Laboratories, Dept. 435, 2110 Grand Ave., Kansas City, Mo. Pay postman \$1.00 and few cents' postage when two bottles arrive. Guaranteed to do the work to your entire satisfaction within 30 days or your \$1.00 will be cheerfully refunded.

Control of the Argentine Ant in Orchards and Homes

By Bureau of Pest Control, Department of Agriculture

The chief importance of the Argentine ant in orchards is its habit of protecting mealybugs and other scale pests from their natural enemies, thus permitting them to increase rapidly and do serious damage to the trees and fruit. It is extremely difficult to control these pests unless the orchard has first been freed from the ants. In homes they make themselves obnoxious by gaining access to refrigerators, pantries and other places where food is kept.

The Argentine ant is one of the social insects having habits somewhat similar to the honey bee in that the colony is produced by a queen who lays all the eggs. This is a fact of first importance in the control of the pest, since unless the queen is destroyed the colony will continue to increase regardless of the fact that the workers are destroyed. For this reason it has been found that the best way to control the pest is to provide the worker ants with a food in the form of a dilute poison syrup which they carry back to the nest, feeding to the queen and the young and thus destroying them. The best formula for this purpose is that worked out by the U. S. department of agriculture, and is as follows:

Granulated sugar 12 pounds; water (distilled) 10 pints; tartaric acid (crystallized) 1-4 ounce; boil 30 minutes. Cool. Add distilled water to allow for evaporation. Dissolve sodium arsenite (C. P. only) 3-4 ounce in hot

water (distilled) one pint, cool. Add poison solution to syrup and stir well. Add to the poison syrup, honey (strained) two pounds. Mix thoroughly.

The success of this syrup depends primarily upon the ingredients used, their purity, accuracy of measurement and combination. Do not accept a single substitute for any article included. Sodium arsenite chemically pure only should be used. The so-called technical grade handled by druggists is unsuitable for ant poison. We prefer cane sugar to beet sugar; glucose should not be substituted for the granulated sugar. The strained honey should be entirely free from crystallization. Use distilled water, as very hard water contains material that affects the solubility of the arsenic. Boil in a clean vessel. Keep in a tightly closed, clean receptacle while temporarily stored.

This syrup should be placed on the trunks of trees in cans or in ant runways about the house. The best containers for this purpose are two ounce spice cans. They should first be dipped in hot paraffin to prevent rusting. A nail hole should be made near the top of the can, through which the ants may enter. Place a small amount of clean excelsior in the cans and then add about one inch of poison syrup. These cans may be hooked onto the trunk of a tree by driving a small finishing nail into the latter. They should be inspected frequently and the syrup replenished when necessary. They should also be labeled "Poison."

Arizona Crop Report for May, 1922

The condition of the Arizona wheat crop on May 1, as reported by crop reporters of the U. S. bureau of markets and crop estimates, was 92 per cent of normal. This compares with 95 per cent one month ago, 80 per cent one year ago, and 92 per cent, the ten year average on May 1. The acreage remaining for harvest on May 1 is reported at 49,000 acres, which compares with 40,000 acres last year and 36,000 acres two years ago. Based on a condition of 92 per cent, the forecast is for a total production of about 1,330,000 bushels. The condition of the crop by counties is as follows: Maricopa, 92; Graham, 90; Pima, 70; Yuma, 92; Greenlee, 85; Apache, 93; Navajo, 90, and Coconino, 91.

The condition of alfalfa and grain hay in Arizona on May 1 was 90, compared with 80 one year ago, 90 two years ago, and 94 the ten year average condition on May 1. The total acreage of tame hay is estimated at 180,000 as against 150,000 acres in 1921 and 123,000 acres in 1920. Counties reporting the largest acreage are as follows: Maricopa, 90,000; Yuma, 18,000; Graham, 13,000; Apache, 7,000; Coconino, 3,200; Pinal, 12,000; Yavapai, 8,000; Pima, 6,000; Cochise, 6,500, and Navajo, 4,300.

Arizona pasture conditions on May 1 were 87 per cent of normal, compared with 55 per cent one year ago, 96 per cent two years ago, and 90 per cent, the ten year average condition on May 1. County estimates of the condition of livestock ranges and farm pastures on May 1 are as follows: (Figures for May 1, 1921, are shown in parentheses): Maricopa, 93 (57); Yavapai, 84 (57); Coconino, 84 (74);

Navajo, 86 (47); Apache, 94 (60); Pinal, 97 (50); Gila, 90 (80); Graham, 70 (50); Greenlee, 87 (50); Cochise, 84 (36); Santa Cruz, 89 (58); and Pima, 97 (52).

Arizona farmers report that 80 per cent of the spring plowing was completed by May 1 this season, compared with 80 per cent last season, and 88 per cent, the ten year average on May 1. Of spring planting, 70 per cent was completed by May 1, compared with 70 per cent May 1, 1921, and a ten year average on May 1 of 70.

The condition of Arizona cotton on May 1 was 77 per cent of normal. The condition of Pima was reported at 75, and short staple at 85. Conditions have not been favorable for cotton, the late spring and cool weather together with late frosts and damage from insects having prevented the normal development of the plants. Much replanting has been necessary and many fields show a poor stand.

Arizona fruit on May 1 was reported in better condition than last year, due to the excellent prospects for apricots and peaches in Maricopa County, the principal producing county in the state. Late frosts greatly reduced the prospects for peaches in the higher altitudes. The prospects for both apples and pears on May 1 was very good in the principal producing counties.

NATIONAL INSTITUTE OF PROGRESSIVE FARMING

The tractor and implement people of the United States have effected a new organization which will be of value to farmers and especially to those who are supplying farmers with implements and power. Guy H. Hall, director of the National Tractor and Implement Show held in Los Angeles some years ago, is made director of this new institute.

One feature of the work contemplated is shown in the following letter from the manager of a branch office of the institute, touching upon the valuable aid which can be rendered by agricultural colleges.

"We were especially well pleased with the suggestion you make that we use our agricultural colleges as a means to educate and sell the present and future generation on power farming. We solicit your assistance * * * to teach the farmer boy the things that he should learn and sell him on the idea that the farm is the best place to live. Supplement the efforts of the agricultural college by furnishing a competent farm engineer to report to the industry, make a state institution the clearing house where the farmer can come and get reliable unselfish information with regard to any equipment he might want. Protect the farmer from buying tools without company or service behind them. Make it plain to the industries that they shall furnish a product that will render service that will enable the purchaser to make a profit. Teach the farmer how to care for and operate his tractor, impress upon him his responsibility and that any delay, damage, or breakage for which he is responsible should be paid for by him.

"Have the salesmen sell service. Have in mind when making sales, the result to be accomplished, and sell only such equipment as is suitable to the farmer's use and under the conditions it is to be operated. Put himself in the farmer's place and sell him what the salesman would buy himself.

"There are too many instances where salesmen simply extract the price from the customer without any regard for the purchaser's interests, which reacts on the industry and retards progress. You cannot take a man's money and give him less value in return without injuring him, yourself, and the community at large, but it is possible for every one connected with the sale of power farming machinery to make a profit, the purchaser included, and all prosper, if the right goods are conscientiously sold to the right man, to be operated under suitable conditions in the right way. All of which is under the control of the manufacturer and distributor.

"This country is full of opportunities, we have only scratched the surface—look back for 40 years and see where we were then, and imagine where we will be 40 years hence."

Director Hall writes: "Those who know say it is the most comprehensive and practical program ever presented to make use of the proper power and give the farmer time to devote his labors to raising more pure bred animals that will bring more returns from the crops through milk, meat and wool producing animals. No talk of increasing production to flood the markets, but turning the crops, planted, cultivated and harvested efficiently and on time, into better livestock."

WHEAT IN FOREIGN LANDS

The condition of the winter wheat crop is generally fair in Western Europe and good in Central Europe, according to advices received by the United States department of agriculture. Warmer weather is needed to aid growth in France and Great Britain. The area sown in Italy is 288,000 acres less than last year but 510,000 acres more than the last 5-year average. The crop is up to the average in Egypt but rain is needed in Algeria, Tunis, and Morocco. Very little winter killing is reported in Canada.

The first estimate of wheat production in British India is 365,235,000 bushels which is 140.4 per cent of the corresponding estimate for 1921, and also above the 5 year average (final estimates) which was 346,737,000 bushels. It is expected that the Argentine production will exceed the original official estimate of 154,873,000 bushels. Recent reports indicate that production in Australia will probably not equal the early official estimate of 134,184,000 bushels.

CALIFORNIA GRAIN STANDARDS

California grades for shelled corn, wheat, oats, barley and grain sorghums become effective June 10, 1922. In accordance with the provisions of the California grain standardization act, the standards for shelled corn, wheat and oats, established by the United States department of agriculture, become California standards. Tentative United States grades for grain sorghums have been adopted by the California department of agriculture. Under the provisions of the California grain standardization act the grading of these grains in accordance with the established standards is not compulsory. However, whenever grain is bought or sold on the basis of these standards it is necessary that it be graded. Certificates of grade can be secured either at point of shipment or at destination, or on the basis of agreed samples which may be submitted to any state grain inspection office. These inspection offices are maintained at 11th & K Sts., Sacramento; 2200 Ford St., Oakland; 38 West Weber Ave., Stockton. An inspection fee of \$1 will be charged for all samples so submitted.

HAIRY PERUVIAN ALFALFA HAY MARKETS READILY

Farmers in the Yuma Valley and vicinity apparently are not different from those elsewhere. When their products bring good prices they always ask for more, but nevertheless they took the slump in hay prices this spring with general good humor and through their dealers marketed several hundred cars of alfalfa hay, which brought top prices on the Los Angeles market. This is the first time alfalfa hay from this district has been sold in such large volume on this or any other market, and the fact that 90 per cent of this hay was Hairy Peruvian and well received by the dairymen and dealers speaks well for this variety of alfalfa. Reports received from dairymen concerning its feeding qualities are uniformly good. However, it is not intended to convey the impression that Hairy Peruvian alfalfa can be cut, cured and baled any old way and make good hay, for it is little different from other alfalfa in this respect, but it has been amply demonstrated that good Hairy Peruvian alfalfa hay sells for top prices and does not last long on the Los Angeles market.

Saving a Nickel a Mile

STATISTICS show that even the most economical automobiles cost at least seven cents a mile to run. Compare that with the Harley-Davidson's average—50 miles for a dollar—(gas, oil, tires and all)—and you'll see why so many farmers are using motorcycles for business errands.

You, too, will find a Harley-Davidson the "handiest rig on the farm"—a time saver as well as a money saver. The roomy side car will carry a surprising lot of luggage from store, railroad station, post office, or from neighboring farm. Save your automobile for family use. Ride a Harley-Davidson on business errands. Swift, comfortable, dependable, easy to operate—even on the worst roads.

Do you know the reduced Harley-Davidson prices? Write us for FREE illustrated literature. No obligation to you.

Attractive dealer proposition for unassigned territories. Address Desk A-2.

Beeman Tractor Cheap—Young man learn trade. Cash Nursery, Sebastopol.

SEEDS AND PLANTS

SUDAN GRASS SEED
(The Great New Hay Crop)
First introduced in the United States 1909 from Sudan, Africa.
Culture. Strictly an annual, may be drilled or broadcasted, 15 to 25 lbs. per acre. It screws 8 to 10 ft. high, yields 3 to 10 tons per acre, two to four cuttings.
Pasturage. It will yield food for six times as much stock as any other forage without irrigation. For milk cows and hogs there is no better and more abundant pasture than sudan. It will solve the hay proposition as nothing else can or will do in this climate. This seed is grown on our farm and is free from Johnsongrass.
Price—5 lbs. \$1, 10 lbs. \$1.50; 50 lbs. \$5; 100 lbs. \$8; 500 lbs. \$35; 1000 lbs. \$50.
BOWMAN'S SEED CO. & IMP. CO.

Catalogues and Booklets, office forms and correspondence stationery for the nursery, seed and florist trade; half-tone cuts of many standard plants. Correspondence invited. The Kruckeberg Press, 236 Court St., Los Angeles.

FARM LAND FOR SALE

\$750 SECURES EQUIPPED FARM WITH 38 ACRES GROWING CROPS. Only mile high school town; 40 acres; easily-worked fields; spring water; valuable wood; orchard peaches, apples, cherries, grapes; good cottage, porch, pleasant view; barn, wagon shed; mules, cows, poultry, implements, 38 acres corn, potatoes, peas, fruit, garden truck, etc. included to close; all \$1,500, only \$750 down. Details page 106 Illus. Catalog 1200 Bargains FREE. STROUT FARM AGENCY, 831 H K New York Life Bldg., Kansas City, Mo.

IRRIGATED LAND ON GOOD TERMS. You can't beat the terms we offer to farmers who know how to farm rich, irrigated bottom land. This land will grow heavy crops of alfalfa, fruits and vegetables. It is ideal for intensive farming. Transportation and irrigation, the best. It is in the heart of the Sacramento Valley. A real opportunity for you. Write now.

SUTTER BASIN COMPANY
Calif. Fruit Building
Sacramento, California

Best Value Around Los Angeles—Poultry Ranch, 2 acres, close in, all conveniences, 6 room house, 2900 layers, brooder house, colony; paying plant, bonafide bargain, \$16,500—terms. Also 5 Acre Ranch, 400 chickens, a real home. \$11,000, terms. 616 Sierra Vista Ave., Alhambra, California.

For Sale—258 Acres Land situated one mile north Somis, Ventura County, on an elevation of Mesa land. Is good grape or fruit ranch. With all modern ranch improvements. Present crop Lima Beans. For particulars write M. V. R. A., Box 306, Oxnard, California.

Dairy Ranch—140 acres, 13 miles from San Diego, Cal. Pumping plant plenty of water; 40 head stock; improvements; stock worth \$15,000. All for \$30,000. Owner, Oscar Lehner, 3120 Colton Avenue, San Diego, California.

For Sale: A Whole or Part of well improved 400 acre stock, fruit and grain ranch, near highway, town and railroad. Terms. Address owner, S. J. Gummow, Box 274, Soledad, Monterey County, Cal.

25 Acres Citrus Land, 800 pedigreed navels being put out, plenty water, pumping plant \$7,500. Oscar Lehner, Owner—3120 Colton Avenue, San Diego, California.

Florida—Indian River Orange Lands and groves. Booklet and list and local paper 5c. Goodwin & Baker, Realtors, Ft. Pierce, Fla.

For Sale—Ranches, Homes, Acres, free list. Wilson Bros., Santa Cruz, California.

For Sale: Good grape land, 20 acres \$225 per acre. No. 27 Shawmut, California.

PATENT ATTORNEYS

WEBSTER, WEBSTER & BLEWETT, Savings and Loan Bldg., Stockton, California. Established 50 years. Send for free book on patents.

TURKEYS

Mammoth Bronze Turkey Eggs 25 cents each, \$20 per hundred. W. L. Duval, Pomona, Calif.

DUCKS

Mammoth White Pekin Duck Eggs for hatching \$1.00 per dozen; \$8.00 per hundred. A Surtman, Petaluma, California.

BURNING SOIL DESTROYS ORGANIC MATTER

Something over a hundred years ago it was a common practice in some parts of Europe to burn soils to improve their physical condition. This was often done by digging a series of trenches parallel to each other and building a fire in them. In this manner the soil between was heated to a relatively high temperature. The heat generated was sufficient to destroy a large part of the soil colloids, giving better physical condition to heavy soils in which clods had previously been a problem. This kind of treatment, however, in the light of present day science, is known to be destructive of organic matter, and hence the use of fire as a means of ameliorating the difficulties caused by colloids has become nearly obsolete. It has been suggested by Ehrenberg that the beneficial effect known to accrue from partial sterilization of soils by steam or other heat may be due in a large measure to the effect of heat on colloids.

One of the most common causes of a poor seedbed is the presence of clods. By decreasing the surface of the soil particles with which the roots of plants may come in contact and interfering with proper moisture relations, they contribute to poor germination and later limit growth. They may be formed either by working the soil too wet or too dry. By working the soil too wet the particles are pressed tightly together and remain so until they dry out, when the soil breaks up into coarse chunks. When allowed to become too dry before plowing, the soil is usually quite compact and due to lack of moisture it breaks into coarse lumps instead of being sheared into fine crumbs. Clods formed by the first process are usually harder, denser and more difficult to pulverize.

Legal Queries

Louls B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When queries are wished in Cultivator address query to 317 Central Ave., Los Angeles.

Rescinding Deed

In 1912 I deeded property to a brother. Is it now too late to bring action against him to recover the property?—Subscriber, Red Bluff.

If in some manner a trust could be established the statute of limitations would not commence to run until the date of repudiation of the trust. If, as is sometimes the case, however, the transfer was made to place the property out of reach of creditors the law would give no redress.

Judgment on Contract

I purchased a ranch on contract and for the last two years have been unable to pay the interest. Could the owner take the crop, tools or horses if I cannot pay this fall? How long a notice will I have before being advised to vacate?—Subscriber, Camarillo.

If the contract is recorded it would be necessary for the owner to bring suit in the superior court and have either a judgment rescinding the contract or one quieting title. This form of action can be taken in three different ways, two of which may result in a personal judgment against the contract purchaser. Under such personal judgment execution may be levied in the usual manner. As to the crops growing upon the land at the time of the entry of judgment those probably would be forfeited to the owner of the land as being a part of the real property. In any event execution could be levied upon them. The ordinary agricultural implements and two horses are exempt from execution.

Weeds on Adjoining Property

Adjoining owner some time since leased his land to other parties who allowed it to grow up to brush and thistle, the seeds of which blow on to my land and have caused me much expense in eradicating them. Could I collect damages for the time it took me to pile and burn this brush and could I attach the land to pay such damages?—Subscriber, Ontario.

There are several general principles of law which might indicate that some such action might be taken, but apparently there is no record of such case ever having been prosecuted. However it would seem that as far as the owner of the land is concerned, where a lease was made, he would be in no wise responsible, for the possession of the land is out of his control. The immediate remedy is by making application to the county horticultural commissioner who is vested with power to compel the destruction and eradication of these noxious weeds, either requiring the land owner or lessee to effect their destruction or in case they fail to do so, he is given power to enter the land himself and clear it himself, and for the expense thereof a lien against the land is given which may be foreclosed in an action brought by the commissioner in the superior court.

BERRIES IN INTERIOR VALLEYS

Imperial and other valleys with similar climatic conditions have given but little attention to strawberry or small fruit culture, but one Imperial experimenter, Wm. Von Mueller, has maintained a most practical experiment plot in his "Berry Gardens," not only with blackberries but with rhubarb and strawberries, and finds that if right selection of berries is made strawberries do very well in the early spring and fall months. He is now investigating as to a sub-irrigation plan.

ONE MAN'S TIME SAVED

Dirt moving has always been a more or less expensive proposition. With the coming of tractor power it was handled with more speed and economy but required a tractor operator and a man to "buck" the scraper.

Pull the String—The Automatic Does the Rest

W. W. Tolman leveling sandy loam soil for orange grove in Ojai Valley, using automatic scraper hitch. With Cletrac, 6 foot Fresno scraper and automatic hitch which loads and dumps from the driver's seat, earth is moved at a cost not exceeding 15 cents per cubic yard, or about half the expense of moving with teams.

An automatic scraper hitch has been patented by a California man that makes it possible for the tractor operator to load, spread and dump the scraper while operating the tractor. A feature that appeals especially is the ability of the hitch to spread or level to any of three desired depths.

It can be attached to any tractor, the hitch and Fresno scraper being made up to 7 foot size.

AN ELECTRICAL COTTON PICKER

Picking cotton by electricity was recently demonstrated in a field near Little Rock, Arkansas. The machine is mounted on a tractor whose engine provides the electric power to operate pickers and fans of the cleaner.

The principle of the picker was suggested to the inventor by watching a trespassing cow clean out the bolls of newly opened cotton. The neatness and dispatch with which her rough tongue extracted the white morsels gave him the initial idea for a picker which 14 years of experiment has brought to completion. A writer in St. Nicholas describes the machine:

"It consists essentially of two revolving brushes (which pluck the cotton lightly, but cleanly, from the open seed pod), of a suction system, and of a set of electric motors, together with an electric generator and a switch-board or panel board.

"It is the brushes, of course, which play the part of the rough and flexible tongue of the cow. They are enclosed in a small metal frame about as big as your two fists, and they revolve toward each other. When these are placed in contact with the cotton they instantly pull it free, without collecting any part of the boll or leaves of the plant, as a human picker is only too apt to do.

"Connected with the revolving brushes are flexible tubes, known as pickers tubes, which carry the cotton by means of suction to the collecting bags just as the dust and fluff picked up by a vacuum cleaner are carried to a collecting bag."

The machine can be operated by one man and will pick eight rows in one passage across the field.

FREIGHT RATES REDUCED

Rail rate reductions amounting to ten per cent of present levels become effective July 1, under decision of the interstate commerce commission announced May 24. The statement is made that this cut will reduce the national freight bill by \$400,000,000 a year. Western grain and grain products are included in commodities carrying this lower rate. Farm products in general have already received reductions, but the present ten per cent cut includes practically all other classes of freight.

Comfort is largely a matter of habit. If our particular brand of it requires too many ingredients—just the right kind of weather, of companionship, of surroundings—we shall seldom be comfortable.

SHADE AND ORNAMENTAL TREES OF CALIFORNIA

Book Review

"Shade and Ornamental Trees of California" by Merritt B. Pratt, state forester of California, published by the state board of forestry.

PLANTING OF CITRUS TREES

By R. R. Snowden

OR the past 12 years the writer has been trying to show the citrus growers of California an unfortunate error in the planting of their trees. Many of the citrus trees in this state have been planted with the root crowns from six to 18 inches below the surface of the ground. From observations covering many years it seems obvious that this error is responsible for more citrus troubles than any other one cause. In nature all trees grow with their root crowns at the surface, and this condition is so necessary that the deeply buried crown roots will send up branches toward the surface, and in time a citrus tree will endeavor to produce a new net of crown roots at the surface. In the wild state we find the cypress of the southern swamps, although an aquatic organism, sends up from its submerged roots "knees" into the air, presumably to obtain the air so necessary to root action, and which it cannot get under water.

I have found this unnatural condition closely associated with gum disease and scaly bark of the citrus, showing a constitutional weakness in the trees, caused by such abuse, which renders them an easy prey to the fungus pest. Even in the same orchard may be seen the diseased buried trees and others which have fortunately had the earth removed by adventitious circumstance, enjoying freedom from the trouble.

The excuse for this practice is said to be an effort to protect the bud union from the action of the sun while the tree is unable to shade it properly. But it would be far better to correctly plant the tree and then protect the bud union by banking up the earth or otherwise shielding it from the rays of the sun until a large enough top is produced and then removing the protecting medium.

I venture to predict that should all new citrus orchards from this time be planted at the proper depth, in accordance with the above, 20 years hence many old orchard trees will be replaced with new ones, being unable to compete with the properly planted ones.

CANNING STANDARDS ANNOUNCED

Partially as a result of a suggestion offered by the extension service, the Southern California Cannery Bureau has recently published a little booklet, "A Message to Growers of Deciduous Fruit," which consists of a clear cut statement pointing out the mutual interest of the grower and canner in the production of a first quality product, announcing the standards adopted by the canners for apricots and peaches for the coming year and urging special attention to those practices which result in the production of a better quality product. Every grower of deciduous fruits who expects to handle any part of his crop through canneries should have a copy of this publication which may be had from the manager of the bureau, S. W. Cunningham, 612 Homer Laughlin Building, Los Angeles.

SOIL TEMPERATURES

During a time when we are studying the effects of atmospheric temperatures on lowland and upland it is interesting to note permanent soil temperatures at different elevations.

A report from the University of Illinois states it was determined that soil in bottom land forests is constantly colder than in the upland forests, the average difference, at the depth of three inches, being two and a half degrees, the greatest difference, three and a half degrees, being noted June 24, the smallest difference occurring in July and August. The average difference in air temperatures was still greater, over four degrees.

Shipments from the 1921 California orange crop will be about 13,050,000 boxes, according to the final estimate received by the United States department of agriculture. The loss due to the wind damage of last December was 2,250,000 boxes and to the freeze of last January, 7,200,000 boxes. This loss of 9,450,000 boxes was 42 per cent of the production.

Wooden cars were responsible for many holiday deaths in New York. Wood alcohol for more. Wooden heads for still more.—Syracuse Post-Standard.

Rid Hens and Chicks of Lice and Mites

A Few Drops of Wonderful New Remedy
in Drinking Water Does It—No
Dusting, Spraying or Greasing

Any poultry raiser can easily and quickly clean out Lice and Mites by using a new Remedy recently discovered by a Kansas City chemist and called Imperial Lice and Mite Remedy.

All that is necessary is to occasionally put a few drops of this amazing remedy in the fowl's drinking water. It renders them immune from the attack of all blood-sucking parasites, as these pests positively will not stay on a fowl taking this remedy.

It also acts as a splendid Tonic and Blood Purifier, as well as increasing egg production and growth, for with these pests eliminated, hens lay better and young stock grows faster. It is positively guaranteed not to affect the meat or eggs.

The manufacturers of Imperial Lice and Mite Remedy are anxious to get it quickly introduced among poultry raisers everywhere, and make this Special Introductory Offer. Send no money, just your name and address to the Imperial Laboratories, Room 558, 2110 Grand Ave., Kansas City, Mo., and they will send you a regular full sized \$1.00 bottle and will also send you free a big full sized (double strength) \$1.00 package of Imperial White Diarrhoea Remedy, the standard, time-tested remedy. Pay the postman only \$1 and a few cents postage when both packages are delivered. Any time within 30 days, if you are not satisfied with results, just say so and your money will be cheerfully refunded.

Baby Chicks

We incubate 250,000 eggs every three weeks; the largest and finest equipped electric hatchery in the Southwest. All popular breeds: Rhode Island Reds, Barred Rocks, Black Minorcas, Anconas, etc. Also our famous Oregon-Corvallis White Leghorns. Order now for immediate or future delivery of Baby Chicks, Pekin, Muscovy or Indian Runner Ducklings, Mammoth Bronze baby turkeys. All kinds of pullets supplied—anytime. Incubators and brooders. Careful attention to every order, large or small. Send today for prices.

REDWING HATCHERY

2030 East Florence Avenue
Los Angeles, California

Sick Baby Chicks? GERMOZONE is a positive remedy for roup, colds, bowel trouble and such costly ailments. Preventive as well as curative. A wonder worker for poultry. On market over 20 years. Endorsed by many thousand users. Don't lose your baby chicks. Get GERMOZONE TODAY. At drug and seed stores. If no dealer, order by card. 75c and \$1.50 sizes. Postman will collect. No extra charge.
GEO. H. LEE CO., Dept. R-30 Omaha, Nebr.

Feeding Baby Turkeys

By Jean A. Koethen

HERE is no one "best feed" for little turkeys. So many rations are used successfully, both for the first few days and afterward that one wonders if there is not more in the methods of the feeder than in the actual fare. Possibly more depends on the frequency and amount of meals and the way in which they supplement the food found on range than on the mixture used or the way in which it is prepared. Certainly we will do well to remember that the little turkey thrives best on what it is able to pick up for itself, and that the more it picks and the less it stuffs itself with prepared food the more likely is it to survive. As I have watched my little turkeys the past two weeks peck here and there at a bit of green or an elusive fly, here a little and there a little more, I have wondered if the main fault in our feeding is not the rapidity with which we permit them to stuff their crops.

The young turkey naturally eats rather slowly, but when we "keep them hungry" as we are constantly advised to do, and they come piling onto the tray, ravenous with hunger, each one doing its best to get a little more than the others, their crops fill with wonderful rapidity. This year I am making no attempt to time their eating or to limit the amount set before them. Instead I watch their crops. As soon as I can feel the crop beginning to bulge like the half of a small marble away goes the food. If some crops bulge more than others I allow the slower eaters a little more so that all crops will feel about alike. Perhaps I shall find that this is not the best way, but I am sure there should be some bulge to the crop. The question is, just how much. At the Rhode Island station when time feeding was practiced the poultts were allowed to eat from two to three minutes. This is all right at first when they are learning, but at two weeks old it is too long. One minute is nearer to what they can stand.

Different Rations

Farmers' Bulletin 791 of the department of agriculture gives the following list of the most commonly used rations for little turkeys:

Hard boiled egg chopped fine and corn bread crumbs the first week, then whole wheat and hulled oats.

Stale bread, soaked in milk and squeezed dry, for the first few days, then common chick feed.

Clabbered milk seasoned with salt and pepper, corn bread crumbs.

Equal parts pinhead oats, whole wheat and cracked corn.

Cracked wheat.

Corn meal and wheat bran mixed in the proportion of 3 to 1 and baked into bread.

Bran or middlings one-half, cracked Egyptian corn one-quarter, wheat and hulled oats, one-quarter.

Skimmed milk and buttermilk are often used in addition to any one of the above rations.

A study of the list quoted convinces the reader that it came from and was prepared for Eastern and Middle West farmers. In our climate we dare not feed corn meal as they do in the East. Perhaps we could use it more than we do, but I have met only one turkey raiser who used corn in any form for little turkeys. Even chick feed,

which contains a little corn, we avoid. Hard grain, especially wheat, which seems to be in considerable favor East we might, I feel sure, use more freely than we do. I have been throwing a handful of wheat once or twice a day to the hen that is mothering my poultts, and from the eagerness with which they eat it I am convinced they are ready for it. Hens, we are told, must have some hard grain daily to keep their digestions in order. Why should not the same thing be true of turkeys?

What might be called the standard feed for baby turkeys here in Southern California is the bread and egg mixture, which may be prepared in several ways, supplemented with onions and other greens. It is important that the egg be thoroughly boiled. Put it on in cold water and boil from 15 minutes to a half hour. When it is cold chop shell and all with an equal amount of very stale bread, wheat flakes or rolled breakfast oats, or a mixture of two of them. I have raised a good many turks on this mixture, using rolled oats exclusively, but the objection is made that oats may become sticky in the crop and digest less easily than the drier wheat flakes. After trying all three I prefer bread to either wheat flakes or rolled oats because it makes a drier mixture. Take very stale white bread (the dark breads are too moist) and dry in the oven till it is crisp like zwieback. Chopped with the eggs and greens it soaks up the moisture in the green and still remains dry. I have met one man who dries this mixture with bran, and that may be just as good as the white bread.

Now for the green part of the mixture: Onions in some form have long been considered a sine qua non in feeding turkeys. Perhaps it makes little difference whether dry onions are used, or young onions or onion tops. My own practice is to use the tender young onions, cutting up both onion and whatever of the top is green and succulent. If I raised many turkeys I might find young onions too expensive, and very likely the dry are just as good. Sometimes I wonder if our use of onion is not just a superstition like not starting on a journey on Friday or avoiding 13 at table. For the other green which is used with the onion nothing is better than alfalfa, and for most turkey growers that is the easiest green to provide. I used to use lettuce but have avoided it since I heard that it sometimes makes chicks "dopy." This year, as I have no alfalfa, I am mixing alfalfa with the onion and egg and bread, and the little poultts have certainly thriven on it. It makes a less moist mixture than either alfalfa or onion.

The proportion of egg, bread and green is one which nobody is able to give exactly, and it is not important. The green should be at least half the mixture, and is generally more. For seven or eight poultts half an egg, with an equal amount of bread or a little more, and as much green as you have egg and bread together, should make a day's feeding the first week. The second week they will eat an egg a day.

I fed four times a day for ten days, then dropped to three, but some turkey growers never feed more than three times a day, and some drop to

three meals after four or five days. It has seemed to me better to feed less at a meal and more frequently than to allow the turks to get so very hungry that it is hard to keep them from stuffing their crops. Something depends, of course, on the hour of feeding. If breakfast is given before seven o'clock it makes the three meals a long way apart. If the meals are given at eight, twelve and five o'clock the interval is not so great.

A Fresno man who is very successful with his turkeys follows the following schedule:

First day, nothing but grit. Second day, grit and hard egg once. Third to seventh, 2 parts bran, 1 part corn meal, egg, moistened slightly and fed five times a day.

Second and third weeks same as above 3 times a day.

Fourth week, Same with more meal 3 times a day.

Fifth week, Omit egg. Twice a day.

Sixth week, Part corn. Twice a day.

Seventh and after, all corn.

For ten poultts he uses 2 handfuls bran, 1 handful corn meal, 2 hard boiled eggs, just enough water to hold the mash together.

A Vacaville subscriber, whose method I have mentioned before, gives her turkeys till they are three months old a morning mash consisting of 1 medium sized onion chopped fine, 1 quart chopped green, 1 pint bran and 1 pint hulled barley or oats.

A Hemet man who has had much experience raises his poultts on a johnny cake made of ground oats, ground barley, ground milo, bran, corn meal, meat meal, (a very little) charcoal, Cayenne pepper, salt and baking powder, mixed into a batter with water and baked. This is crumbled and mixed with chopped green one fourth of which is always chopped onion. At two weeks he begins giving a good grade of chick feed for every other meal.

The above sample rations will serve to show what a diversity of methods there is in feeding baby turkeys. Very likely they are all equally good if used with gumption, which seems to be the one secret of turkey feeding. Sour milk may be set before the little birds in addition to the regular ration, if it is available, but experience has shown that it is not an essential part of the feed. I used to put cottage cheese in my feed mixture instead of egg, and at the first I was successful. Later I lost so many poultts on the same mixture that I was convinced the turkey's life depends on something more than cottage cheese or clabbered milk. At the Rhode Island station for a time milk was considered a preventive of blackhead, but I believe that theory has been entirely abandoned.

The addition of grain to the ration as soon as the poultts are old enough to digest it would seem the natural thing since turkeys live naturally by foraging. I have sometimes used cracked wheat to pave the way for larger grains but see no object in it when poultts two weeks old can eat and digest whole wheat. After the age of two months, if not before, dry bran should be before the poultts for at least a part of the day. A Gardena man whose method in this respect I followed last year, feeds his turkeys the bread and egg (only I believe he uses rolled oats instead of bread) mixture for two months, then works them into bran and rolled barley which are kept constantly before them. I do not remember that he used wheat as an

interlude, but such an interlude seems reasonable because wheat is more easily digested.

One thing I failed to mention in describing my own feed mixture, that is the chick grit which I never fail to sprinkle over it. This, I believe, is very important, for the little turkey does not like grit very well and is in danger of overlooking it if he is not compelled to eat it. Grit and shell are kept before the birds in their yard, and ultimately they learn to like it.

It hardly seems necessary to say that no young bird should be fed for a day or two after it is hatched. Keep the poults quiet and warm for 48 hours, and longer if the weather is cold or they do not act very hungry. I believe one reason my poults have done so very well this year (so far) is that they came off in a very cold spell, and I had to keep them and the mother closely confined for two days. The cold spell was followed by a very warm spell, and this gave them the start they needed. Now that the fog has come again they do not seem to mind it except in early morning and late afternoon, when I confine the mother securely in her small coop and make her cover them whether she wants to or not.

FEEDING EXPERIMENTS AT SOUTHERN CALIFORNIA FARM BUREAU EGG LAYING CONTEST

The birds in the experimental pens at the Southern California Farm Bureau Egg Laying Contest at Pomona have been on their respective rations for six months now and changes are still being made in the order of total production. The fresh buttermilk pen is still in the lead with a total average production of 84.09 eggs per bird for the six months, but the dried skim milk pen which has held second place for sometime has now been replaced by the dried milk albumen pen. The birds in this latter pen did not seem to like their mash at first but since the first two months have been eating it well and gaining steadily in egg production. For April they gave an average production of 24 eggs each, a lay of 80 per cent. The birds in Pen 4, which are given the semi-solid reduced to the equivalent of fresh buttermilk to drink, do not drink the semi-solid in this dilution readily and are now consuming very little of it. Their average egg production has increased a little each month but their total egg production is now the lowest of all the experiment pens. It will be noted that of the four highest producing pens only one is fed liquid milk and that one is the fresh buttermilk pen. The birds in this pen have, however, consumed the least amount of grain and mash and are giving the highest percentage of eggs, averaging twenty-two ounces or more per dozen.

Feed	Ave. No. Eggs per Bird			Feed Consumed to Date per Bird	
	5 Mos.	April	Total	Lbs. Gr. & Mash	Milk
Check Pen	50.91	21.66	72.57	34.49	
Buttermilk	62.28	21.81	84.09	31.60	46.79
Dried Skim Milk.....	56.91	21.85	78.76	35.27	
Semi-solid 1-2.....	47.01	16.18	63.19	30.60	10.51
Semi-solid 1-25	49.88	19.74	69.62	32.66	45.89
Dried Milk Albumen.....	55.46	24.00	79.46	32.24	
Semi-solid 1-25.....	47.76	19.02	66.78	32.30	44.79
Lactein 1-25	46.73	18.72	65.45	32.96	39.29

Pen 7 is fed the same mash as the check pen, plus a solution of 1-25 semi-solid buttermilk to drink. Pen 5 is fed no meat scrap in the mash.

Clackamas County, Oregon, has paid 75 bounties on bobcats this year.

COOPERATIVE EGG HANDLING PROGRESS

The Pacific Cooperative Poultry Producers (the Oregon poultry corporation) announces the consolidation of the Oregon and Idaho egg pools and the closing of the Caldwell, Idaho, office. The directors of the association decided to do this as a means of economy. It is estimated that there will be a monthly saving in expenses of \$800 and perhaps more in general overhead. In the past the Oregon and Idaho eggs have been handled separately. Now they will be combined, the association paying the same price in the two states and merging the costs and receipts.

Beginning with the 13th pool all Oregon-Washington members, and beginning with the 15th pool, all Idaho members, who have signed the cold storage agreements, will be paid 75 per cent of the current market price for their selects, browns and pullets.

POULTRY SHOW AT RIVERSIDE

Manager Hammond of the poultry show at the Southern California Fair to be held in Riverside, October 9-16 writes.

"We have selected to date two Eastern judges, one for poultry and one for bantams. E. C. Branch of Lee's Summit, Montana, will handle all of the poultry, and he is considered one of the best judges we can secure. He has acted as judge in some of the greatest shows held in the United States and is also chairman of the committee on New Standard of the American Poultry Association.

"R. P. Krum of Stafford, Kansas, will handle all the bantams. He is regarded as the greatest bantam judge in America, and has been secured to judge the bantam show for the American Bantam Club at Chicago.

"With these two well known judges secured, we have already figured on enlarging our tents, and while we covered fully 22,000 square feet of ground last year, we no doubt will occupy 30,000 square feet this year. We will have a tent in which specialty clubs can hold their meetings, and have already secured the Pacific Coast Bantam club and several others to meet with us during the week. Rabbits and covies will be stronger than ever.

The poultrymen's department of the Los Angeles County farm bureau has arranged for a series of poultry culling demonstrations the week of June 26. R. B. Easson will conduct some of the demonstrations.

NEW ROAD INTO SEQUOIA PARK

The first step toward the realization of a new road into Sequoia national park will be taken with the letting of a contract by the state highway commission to extend the road from Three Rivers seven miles toward Hospital Rock. This road will afford a paved highway to the park boundary. The national park is already at work in grading the road from the boundary

into Grant forest. It is estimated that when this road is completed fully six weeks will be gained in the earlier opening and latter closing of the park.

Sonoma County tomato growers are contracting at \$15 a ton.

Drive Out Disease

Your flocks and herds represent a cash investment. Good sense suggests that you keep them in living-quarters where they are not exposed to their ever-ready enemies—contagious disease, lice and mites.

makes the job of whitewashing and disinfecting a matter of one operation—turns a mean job into easy, rainy-day work. It increases the light more than whitewash and helps make buildings clean and sanitary—a condition necessary if poultry and livestock are to be free from the losses and troubles caused by lice, mites and contagious diseases.

Use it Instead of Whitewash and Disinfectants

Carbola comes in powder form with a disinfectant already combined. It is ready to use as soon as mixed with water and can be applied either with a brush or sprayer to wood, brick, stone, cement or over whitewash. Carbola doesn't blister, flake nor peel off. It doesn't clog the sprayer and it dries out clear white. Carbola can be kept in powder form or mixed and left standing in pail without spoiling. One gallon covers 200 square feet.

And don't forget that the dry powder is unexcelled as a louse powder and costs less than most brands. Use it on poultry, cattle, horses, hogs, etc., just as other louse powders are used. Carbola is harmless to the smallest chick or to stock that licks a painted surface.

Your hardware, seed, drug or paint dealer has Carbola or can get it. If not, order direct. Prompt shipment by post or express.

HAUSER PACKING COMPANY LOS ANGELES

WESTERN CANADA for Big Wheat Crops

Canada is the world's greatest producer of wheat—second only to the United States—yet only about 12% of the tillable area has been worked. Yields of 40 bushels of wheat per acre are not uncommon. Oats have given as high as 100 bushels per acre, while 40 to 50 bushels per acre are ordinary yields; barley and rye in like proportion. Cattle and horses thrive on the native grasses which grow abundantly and corn and sunflower culture are highly successful.

Stock Raising, Dairying and Mixed Farming

secure for the industrious settler ample returns for his energy. Clearing the cost of one's farm with a single year's crop has an appeal, and has been done by hundreds of Western Canada farmers. Taxes only upon land (not on improvements). Perfect climate, attractive social conditions, good neighbors, churches, schools, telephones, excellent markets and shipping facilities make life happy as well as prosperous.

For illustrated literature, maps, description of farm opportunities in Manitoba, Saskatchewan, Alberta and British Columbia, reduced railway rates, etc., write

Rhubarb: Local, best, strawberry, packed box, 1.00@1.10; Crimson, 90@1.00.

Squash: Market steady, 4-basket crates summer squash, mostly 60@85; Italian, 1.00@1.25; lugs, Crookneck, 1.50@2.00.

Tomatoes: Market firm. Mexicans, repacked lug, 3.25@3.75; original lugs, best, 2.75@3.25; loose, per lb., best, 12@15; poorer, 8@10. Imperial Valley, 4-basket crates, 3.00@3.50.

Turnips: Sack, 1.50@1.75.

FRESH FRUIT

These are actual prices obtained May 29 by Los Angeles wholesalers from their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc., as compiled by the U. S. Bureau of Markets. Terms, cash on the walk.

Apricots: Imperial Valley, lb., 9@11; Ariz., 10@12.

Blackberries: Cr., 5.00@6.00.

Cherries: Best, 20@24; poorer, 15@18.

Figs: Brown Asiatic, 2.25@2.50 per 7 lb. flat.

Gooseberries: 18@20 lb.

Loquats: Best, 12@14 lb.; No. 2, 8@10.

Raspberries: Cr., 4.00@5.00.

Strawberries: No. 1, 3.75@4.00; few, 4.25; No. 2, 2.75@3.50; San Jose, 1.50 tray 12's.

CITRUS FRUITS

These are actual prices obtained between 7 and 8 o'clock May 29 by Los Angeles wholesalers from their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms, cash on the walk. There may be slight fluctuations during the day's trading. Higher prices are frequently obtained where credit is given or goods are delivered.

Grapefruit: Market steady. Californias: Northern, packed box, 3.25@3.75; market pack, 3.00; small, 2.25@2.50.

Lemons: Demand and movement light, market firm. Locals: Loose boxes, best, 2.50@2.75; poorer, 2.25; special brands, fancy, 6.75@7.50; choice, 5.50@5.75.

Oranges: Demand moderate, market steady. Navels, market pack, 5.50@6.00, according to size and quality; culls, 1.00 per field box; few best, 1.50; Valencia, special brands, 7.50@8.00, according to size.

HONEY

Continued cool and foggy weather with occasional showers has retarded the new honey crop until it is not expected that new stock will be on the market in appreciable quantities before the 20th or 22nd of May. The market is in a waiting position, as the old crop is practically cleaned up and no sales of new stock have been reported. Dealers report few purchases. Extracted honey from growers at 6c for light amber sage, 8c for extra light amber and 9c for white sage.

HAY

Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats 20.00@26.00

Barley 18.00@22.00

Prices quoted f. o. b. L. A. to producers are:

Rabbit Alfalfa 17.00@19.00

No. 1 Alfalfa 15.00@17.00

Standard Alfalfa 12.00@14.00

PURE STRAIN OF COTTON SEED

As conditions now exist in many parts of the cotton belt, farmers find it next to impossible to maintain a superior staple for more than two or three years. The principal reason for this is the general custom of growing a number of varieties in the same locality and ginning the crop at public gins where it is almost certain that seed will be mixed. Modern ginning equipment has increased this difficulty. There is also mixing by flying insects when different varieties are grown in adjacent fields and in the same field as a result of mixing of seed at the public gins.

The most practical way of maintaining pure seed supplies is for farmers to unite upon a single variety so that only one kind of seed will be handled at the gin. If it is not possible to agree upon any one variety, it is still possible for farmers and ginners to cooperate to prevent seed becoming mixed at the gin. One day a week may be devoted to ginning selected stock, after cleaning out the flues, feeders and cleaners, dropping box. The seed should not be allowed to pass through the conveyors, which can not be cleaned thoroughly, but should be collected on the clean floor or on a canvas spread on the floor. If special days can not be arranged for, it may be possible to store the seed cotton and hold it for ginning after the rush season is over. But the most effective method for avoiding mixing and the resulting deterioration of cotton is the organization of one variety communities. The value of such communities has already been demonstrated in the Salt River Valley of Arizona, where the Pima variety of Egyptian cotton is grown exclusively.

CONTROL OF SWARMING

Honey production on an extensive scale makes it necessary sometimes to distribute the colonies of bees in several apiaries to avoid overstocking. Then comes the serious problem of controlling the swarm. Swarm control is less difficult in producing extracted honey than with comb honey. It is less troublesome in some locations than in others. The reasons for these differences are important in devising measures for swarm prevention. These and other problems relating to swarming are discussed in Farmers' Bulletin 1198, issued recently by the United States department of agriculture. This bulletin may be had, free, upon request addressed to the Division of Publications, Department of Agriculture, Washington, D. C.

Some strains of bees have a stronger tendency to swarm than others. So, to some extent, swarming may be reduced by careful selection in breeding. Colonies having large brood chambers are less inclined to swarm than those in quarters too small. Strong colonies having good queens may need 60,000 to 70,000 cells for rearing of brood during the period of extensive brood rearing in the spring, in addition to the cells used for storing honey and pollen. Colonies having good combs throughout are less inclined to swarm than colonies having poor combs. Inferior combs may greatly increase the swarming tendency both by reducing the amount of available brood rearing space and by acting as barriers in the way of a free expansion of the brood nest. The bulletin gives a dozen or more swarm preventive measures to be taken by bee owners.

BEEES BRING WEALTH

The honey bees of California in 1920 supplied a surplus of over five and one-half million pounds of honey, which is enough to supply almost three pounds for each person in the state. California ranked third in swarms of bees in 1920 but first in honey crop. Recent investigations by the University of California college of agriculture have thoroughly demonstrated the need of cross pollination for many varieties of fruit to give a good crop, and bees are exceedingly important in doing this work. Beemen and fruit producers of the state will be interested in a new correspondence course which is now being offered by the college of agriculture. The course was written by a practical bee keeper in this state. Circular 113 describing the course may be obtained from the College of Agriculture, Berkeley, California.

COMING EVENTS
(Corrections and Additions Requested.)

- Peach Day, Yuba City, June 3.
- Western Sonoma-Marin Dairy Cattle Show, Valley Ford, June 10-11.
- Citrus Institute, Pomona, July 14-15.
- California Rodeo, Salinas, July 24-29.
- Sonoma County Fair, Santa Rosa, August 23-27.
- San Joaquin Valley Fair, Stockton, August 24-30.
- California's Pageant of Progress and Industrial Exposition, Los Angeles, August 26-September 9.
- Walnut Growers Field Day, Santa Barbara, September 2.
- State Fair, Sacramento, September 2-10.
- Grape Day, Escondido, September 9.
- Tehama County Fair, Red Bluff, September 11-17.
- Tulare County Fair, Visalia, September 12-19.
- Colusa County Fair, Colusa, September 14-17.
- Glenn County Fair, Orland, September 18-23.
- Kings County Fair, Hanford, September 20-23.
- Fresno County Fair, Fresno, September 25-30.
- Shasta County Fair, Anderson, September 28-30.
- Ventura County Fair, Ventura, October 1-8.
- Kern County Fair, Bakersfield, October 2-7.
- Butte County Fair, Oroville, October 2-7.
- Pork Day, Turlock, October 4.
- Southern California Fair, Riverside, October 10-15.
- San Francisco Livestock Show, October 18-22.
- California Horsebreeders Association, Los Angeles, October 18-22.
- Indio Date Festival, Indio, October 18-22.
- Imperial Valley Fair, October 23-28.
- Orange and Olive Festival, Oroville, November 28-December 2.
- COAST AND GENERAL
- National Foreign Trade Convention, Philadelphia, May 10-12.
- Plant Quarantine Conference, Washington, D. C.
- Rose Festival, Portland, Oregon, June 7-9.
- Southwest Washington Fair, Chehalis-Centralia, August 28-September 2.
- Interstate Fair, Spokane, Washington, September 4-9.
- Washington State Fair, Yakima, September 18-23.
- Oregon State Fair, Salem, September 25-30.
- Arizona State Fair, Phoenix, October 30-November 3.

COMMON NAMES OF USEFUL CHEMICALS

It sometimes happens that a chemical name is given to some commodity that the farmer is advised to purchase. Under its imposing title he wonders what it is, but really the substance is perfectly well known to him by its common name. Nobody goes to the paint shop and asks for two-pennyworth of sodium chloride when he wants common salt, and most of us have learned that methylated spirits are pure alcohol with 10 per cent poisonous methylated or wood spirit added for commercial purposes and to protect the revenue. Still there are many other common substances which are veiled under scientific names. Here are a few, the first name in each case being the common name and the second the chemical name:
Alum, potassium aluminium sulphate; ammonia, ammonium hydrate; baking soda, hydrogen sodium carbonate; bluestone, copper sulphate; borax, sodium biborate; carbolic acid, phenol; caustic soda, sodium hydroxide; chalk, calcium carbonate; chloride of lime, calcium chloride and hypochlorite; common salt, sodium chloride; cream of tartar, potassium tartrate; epsom salts, magnesium sulphate; glycerine, glycerol; laughing gas, nitrous oxide; litharge, lead oxide; liver of sulphur, potassium sulphide; oil of vitriol, sulphuric acid; pearlslash, potassium carbonate; slaked lime, calcium hydroxide; spirits of salts, hydrochloric or muriatic acid; stone lime, calcium carbonate; sugar of lead, lead acetate; sulphate of ammonia, ammonium sulphate; verdigris, basic copper acetate; vinegar, acetic acid; washing soda, sodium carbonate; white lead, basic lead carbonate; white vitriol, zinc sulphate.

Farceur, generally rated as the greatest Belgian stallion ever owned in America and one of the greatest ever produced within the breed, died last month at the home of his owner, C. G. Good, Ogdon, Iowa. Farceur will

be remembered as winning the Belgian championship at the Panama-Pacific Exposition. Later he was sold to Mr. Good for the record breaking price of \$47,500. He was foaled in 1910 and was sired by Bayard de Ruyan and his dam was Lisa de Ruyan.

POTATO SELECTION

In Circular 46 of the Utah agricultural college, entitled "Thirty Years of Agricultural Experiments in Utah," the most interesting record is one of seed potato selection. In the trial all strains were eliminated whose progeny for three to five years did not yield up to a specified standard. As a result of such seed selection this strain has produced for the past six years a yield more than 60 per cent greater than the unselected seed from the same original stock. The precise figures were 307 and 190 bushels, respectively, per acre. The selected strain set 18 per cent more potatoes to the hill, and the average size of the tubers was 24 per cent larger than in the unselected check lot. In every way the selected seed was more vigorous and common diseases and other troubles less apparent.

OPPORTUNITY FOR SOUTH AFRICA

The Fruit Growers' Exchange announces that cable advices received direct from New York indicate that California citrus growers have suffered a 50 per cent loss to their crops by frost. This will materially affect the price for South African exports of citrus during the coming season, as it was known that heavy shipments of Californian citrus were expected to arrive on the European markets. Letter advices dated from Liverpool on February 28 give the following results of citrus sales: Valencia cases containing 300 oranges, 13s. 6d. to 14s.; cases containing 360, 11s. to 13s. 3d.; cases containing 504, 13s. to 14s.; cases of Jaffa oranges, containing 144 fruits, made from 17s. to 27s. per box, according to condition. The whole of the Valencia fruit is therefore failing to realize the prices which are required to cover the cost.—Farmers Weekly of Bloemfontein, So. Africa.

THE ANDES BERRY

In the November, 1921, issue of the Journal of Heredity, Wilson Popenoe, plant explorer, has an interesting article on the Andes berry, Rubus glaucus, a berry which has about a midway "make-up" between the raspberry and the blackberry. Though growing from Guatemala far to the south, it reaches its best development and greatest appreciation in Ecuador. There it is found in gardens as well as in the mountain wilds.

Throughout its extensive range it is found from 4,000 to 10,000 foot altitude and in a great variety of soils. It is generally of very rank growth everywhere. The fruits vary much, especially as to color and flavor. In Ecuador there are three varieties distinguished by color; maroon, light red, and pink. Nowhere does it grow in the region of frosts, and plants sent to Washington, D. C. were winter killed. Its range in this country is therefore limited to California, Arizona, New Mexico and parts of Texas. It may not prove the equal of our best berries, under cultural care, but if not, Mr. Popenoe believes it will prove of great value to the plant breeder in development of new or better varieties, or both.

FREQUENT IRRIGATION TO SET BOLLS OF PIMA

The number of bolls set during July and August largely determines the size of the crop of Pima cotton in the Salt River Valley of Arizona. Experiments conducted by the United States department of agriculture indicate that effort should be made to stimulate the setting of fruit to the fullest extent during the summer months, especially in areas visited by relatively early frosts. It was found that this could be effected by irrigating soon after the first flower buds begin to form and at frequent intervals thereafter.

A professional paper on the Water-Stress Behavior of Pima Cotton in Arizona, by C. J. King, has been is-

sued as United States Department of Agriculture Bulletin No. 1018, and is available upon application to Department of Agriculture, Washington, D. C.

COOPERATIVE MARKETING OF GRAIN

The grain growers of Imperial County have decided to join the California Farm Bureau Exchange and market their grain cooperatively through the grain department of that organization. Over 50 per cent of the grain acreage in Imperial County has been signed up to date and the campaign is going rapidly forward.

The total acreage signed up in the state as reported May 13 was 174,315 acres. This represents only a portion of the grain from eight counties where the campaign has been put on to date. Arrangements will be made to carry the campaign into other grain growing counties and it is expected that 300,000 acres will be signed up before the grain is harvested.

SYRUP FROM BEETS

A process, developed by the bureau of plant industry, U. S. department of agriculture, consists essentially in extracting the juice from thin slices of washed and trimmed beets by heating at 80 degrees centigrade for an hour in sufficient water to prevent access of air, straining the extract to remove suspended material, heating it in an autoclave or pressure cooker at from 108 to 110 degrees for one hour, during which time steam is blown off at 15 minute intervals, straining the extract again, and finally evaporating it to a syrup. Successful results have also been obtained by heating to 110 or 112 degrees for one hour with constant blowing-off of steam. The objectionable odor and flavor of ordinary beet syrup are said to be eliminated by this process, the resulting product being very palatable, although possessing a flavor quite different from other syrups.

In the experimental work reported, the yield from 100 pounds of beets averaged slightly over two quarts of syrup for a single extraction and one quart for a second. With beets at seven dollars per ton the cost of the material would thus amount to only 35 cents for a yield of three quarts. The method is thought to be admirably suited to the preparation of beet syrup in homes provided with ordinary pressure cookers.

MULCH FOR PINEAPPLES

According to a paper read by A. T. Longley, at the annual meeting of the Hawaiian Pineapple Packers' Association, experiments have shown that the use of mulching paper materially increases pineapple production per acre. The idea of a paper mulch for sugar cane was patented some years ago, but no experiments with pineapples were conducted until 1919. It is estimated that there are now 461 acres planted in paper, of which 68 acres will fruit in 1922.

The paper mulch appears to consist of a strip of paper in which are cut holes large enough for the pineapple plants to grow through. The first yields from the method were obtained last year, and according to Mr. Longley it was found that the plants in paper grew uniformly larger, greener, and more healthy, and the fruit larger (equal to a little over 3 1/2 tons per acre) and better conditioned. The paper mulch prevents the growth of weeds and the packing of the soil under heavy rains, thus greatly reducing the cost of intercultivation. In an experiment at the Hawaiian Pineapple Association's experiment station the plant growth on paper mulch was three times greater in weight and much healthier than on other plots.

And Now, Profit in Farming Without the Drudgery

A century ago our grandfathers replaced oxen with horses. Today, a far greater change is taking place. Mechanical power now supersedes the horse!

THE power-farmer of today presents a striking figure, a living symbol of the new agricultural era—the era of Fordson Farming. Now, with mechanical power he accomplishes in *days* what formerly required weeks—sometimes months of labor. His crops are bigger, his profits greater, his time for pleasure doubled. And, what is perhaps the greatest reward, the toil, the slavery, the drudgery of old-fashioned farming is rapidly passing.

This remarkable advance in farming methods is made possible by the perfect combination of the Fordson and the Standard Equipment specially designed to be used with it.

In developing this line of Standard Equipment, the manufacturers have provided economy of first cost and economy of operation that is such an outstanding feature in Fordson Farming.

During the time the Fordson was being perfected, the Oliver No. 7 Plow was undergoing its exacting tests. So, when the Fordson tractor was completed the Oliver No. 7 became its plowing partner.

The plow is so constructed that the center line of draft is

in perfect alignment with the center line of draft on the tractor. This scientific alignment avoids side draft, and the plow turns a clean furrow. Nor is there any loss of power.

The Oliver No. 7 is so light running that there is no stress on the tractor. No effort is required by the operator to do the most thorough plowing.

Every unnecessary part has been eliminated. Strength that means long life is built in every detail. Steel parts are heat treated and castings are of tested strength.

To adjust the depth of plowing is merely a matter of working a lever to operate a jack. This jack arrangement—which is an exclusive Oliver feature—gives such a purchase on the lift that it is extremely easy to change the depth of

Oliver No. 7—the plowing partner of the Fordson

the bottoms without stopping or without even slowing down.

The power lift is tripped by simply touching a lever that is

Oliver Single Bottom Sulky
For deep mouldboard plowing in trashy conditions with the Fordson. Similar in construction to world famous No. 7 gang.

Special Oliver Orchard Plow
Fordson orchard plowing is done thoroughly with the Oliver special orchard gang. Branches and trunks are not injured.

Roderick Lean Automatic Harrow
Fitting the seed bed the Fordson way with the Roderick Lean Automatic Tractor Disc—a special Fordson Harrow.

Roderick Lean Orchard Harrow
Orchard discing with Fordson speed with gangs set in or extended with the Roderick Lean Automatic Orchard Disc.

Good Work With Roller Pulverizer
Final Fitting of the seed bed with Fordson power and the roller pulverizer has meant more bushels for many farmers.

The Amsco Tractor Drill
Tractors speed and accuracy utilized by the Fordson owner with the Amsco special drill. Force feed makes positive planting.

The Amsco Two-Row Cultivator
Cultivating corn is easy for the Fordson farmer with the Amsco Cultivator—special for the Fordson. Made for hard work.

Money-Maker Ensilage Cutter
Fordson silo filling with the Money-Maker done quickly and cheaply. Strength and scientific design give perfect work.

The Money-Maker Hay Press
Baling hay with the Fordson and Money-Maker baler is an important operation to the farmer with large hay acreage.

Wood Bros. Individual Thresher
The Wood Individual Humming Bird Threshing and Fordson make short work of threshing. All grain is saved.

so conveniently placed that the operator need not turn his head.

Sixty-five years of plow building experience is one good reason why the No. 7 is built so well that it has been known

from the beginning as Standard Plow Equipment with the Fordson. The long, profitable service built into the plow as a result of that experience is your assurance of plowing satisfaction the Fordson way.

Ford Dealers Everywhere Sell Standard Fordson Equipment

Don Pedro Dam on Tuolumne

AT the present moment there are being made investigations and surveys of almost every nook and corner of the Sierra Nevada. For years we have dreamed of the wealth there going to waste and said: "Sometime we will conserve these waters; we will put them on the land which needs them, they will turn our machinery, lessen our labor, give light and heat in our homes." That time is here; we are actually and actively engaged in providing the means of storage.

This illustration shows one of the projects now under way. It is that of the Turlock and Modesto irrigation districts. These two districts have been pioneers in making use of the waters of the mountains. They went up on the Tuolumne above La Grange and built a diversion dam which has given to them all the irrigation water they needed early in the season. This dam supplied to the Turlock irrigation district some 50,000 acre feet and to the Modesto district, 35,000. As the days lengthened and the snows of the mountains in part disappeared the alfalfa and other fields were left in need of more water. Surveys were made, and some 10 miles above the La Grange dam an excellent site offered itself at what is now known as the Don Pedro dam. The gorge is very narrow and is of solid rock. The storage basin behind is not as large as desired. However, it has a capacity of 250,000 acre feet. This storage was secured by building the dam to a height of 286 feet, but as bed rock was at the bottom of the river no deep excavation through quicksand was necessary. The cost of the dam will be about \$3,750,000, this exclusive of the power house which will cost with its equipment practically another million dollars.

It is some ten months since the work was begun on this great structure. A hint of the method of operation may be had by studying the photograph taken on May 26 with the Cultivator camera. First glance at the extreme lower left of the picture and the method of handling the waters of the river, some 13,000 second-feet. Before dam construction was begun at all, in the midsummer of 1921, a wooden dam was built some hundred feet above the upper edge of the dam. A flume from that dam carried the waters down stream and passed the lower edge of the dam to be built. This left the bed rock at the bottom of the stream entirely dry, and after it was cleared of sand and debris the concrete was placed under the flume, carried up on either side and on above, forming the steep-like opening entirely through the dam. Besides that opening there are six others, three of which may be observed just beyond the main part of the stream. These openings are supplied with gates and are only for emergency purposes. After midsummer when the waters subside so that the six circular openings will carry them all the long opening will be entirely closed with solid concrete and the floods of 1923 may then be held back. After passing through the power house the waters are released into the bed of the stream again and are not diverted into the irrigation canals until they reach the La Grange diversion dam.

The mixers for the concrete are in a large building to the left of the extreme upper left corner of the picture. Running from that to the platform at the top is a track on which cars run which carry the mixed concrete to the great conveyor which is seen supported by cables from the one larger cable running across the canyon. (Continued on Page 631.)

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against
loss through dishonesty of any advertiser
in the Cultivator. We do not attempt,
however, to adjust trifling differences
between subscribers and honest, respon-
sible advertisers, nor will we pay the
debts of honest bankrupts. Notice of
complaint must be sent us within 30 days
from date of the transaction, and the
subscriber must have mentioned the Cul-
tivator when writing the advertiser.

If among the more than 40,000
Cultivator's weekly circula-
tion any fail to find any article they de-
sire to purchase advertised in the Cul-
tivator's columns, a special request is
extended to let your wants be known to
the California Cultivator and we will
place you in touch with proper parties.

EDITORIAL ETTES

The illustration on the cover
speaks for itself. It records the build-
ing of a monument which will per-
petuate the memory of an enterpris-
ing, home loving people in that sec-
tion of the great San Joaquin Valley
known as the Turlock-Modesto irri-
gation districts. The lands of these
districts are mostly in Stanislaus
County, a few acres lapping over into
Merced.

* * *

These acres are not of such abun-
dant richness that they exceed all
other acres of California for there are
some which run "a bit light," others
which run "a bit heavy," in other words,
an all-around California average.
But Stanislaus County energy has re-
sulted in bringing from the mountains
the springtime waters which have
given to alfalfa, melon, sweet potato
and other fields power to produce
wonderfully. Not content with these
springtime waters the farmers have
said, "Let us store and secure more
abundant harvests." So the Don
Pedro dam is building, and an addi-
tional 250,000 acre-feet of water will

be conserved and will add to Cal-
ifornia's greatness.

* * *

The ant like figures which appear
in different portions of the construc-
tion work illustrated on the cover are
human beings, in fact, there were
nearly 300 men busy in the various
building operations of the dam as this
picture was taken.

* * *

Sutter County Peach Day proved
most successful from the queen of the
peaches down to the smallest young-
ster. There were no peaches served
excepting those which had already
been placed in cans. In fact, the can-
ning peach and how to make it better
and bigger was the topic of the day
and the real reason for the event.
Sutter County made one big success
of her peach growers' contest last
year and declared the coming year's
successes will far surpass last year's
effort.

ALMOND EXCHANGE WINS

The California Almond Growers
Exchange will operate under the new
five year contract with larger member-
ship, larger acreage than ever. Tele-
grams are being sent out to agents
authorizing them to take subject-to-ap-
proval business for 1922. Reorganiza-
tion was determined upon at the June
1 meeting at San Francisco. Manager
Tucker writes that it will be a "bigger,
stronger and better organization than
ever."

RESOLUTIONS ON JAPANESE

Discussion of the everlasting
fight necessary on insect pests and
fungus diseases which cost Californi-
ans millions was suspended for a
moment in the series of conferences
and conventions held in Sacramento
last week when Senator Inman ap-
peared and asked privilege of a few
words in regard to alien ownership of
lands which is inimical to the best
interests of the people of California.
Senator Inman made strong appeal
for justice and asked Eastern attend-
ants at the conferences to make care-
ful investigation of the blighting ef-
fect which follows occupancy of Cal-
ifornia lands by the Japanese. Fol-
lowing Senator Inman's appeal the
following resolution was unanimously
passed:

"Whereas, recent developments
have demonstrated that Japanese
farmers in the West are rapidly gain-
ing a strangle-hold on the agricultural
industry and by reason of a lower
standard of living are underselling
American farmers and thereby under-
mining this basic industry, and
whereas,

"A continuance of this deplorable
situation will either result in driving
white farmers from the land or in
lowering the American standard of
living to make competition possible,
and whereas,

"Local and state legislation has thus
far proven inadequate to deal with
this acute problem,

"Now, therefore, be it resolved,
that it is the sense of this body rep-
resenting the 11 Western states most
vitaly affected by this menace, that
the federal government take cogniz-
ance of the situation and that legis-
lation be enacted to alleviate these
conditions.

"Be it further resolved, that copies
of this resolution be sent to the pres-
ident of the United States and to all
congressmen representing the 11
Western states."

ALIEN LAND LAW UPHELD

Californians are more hopeful
since the recent decision of the Uni-
ted States circuit court when Judge
Morrow ruled that "California's alien
land law violates no provision of the
constitution of the United States nor

does it conflict with the treaty be-
tween the United States and Japan."
This decision was unanimously con-
curred in by all of the three judges.

The case was one in which an
American owner of stock in the Mer-
ced Farm Company sought to transfer
his stock to a Japanese subject. At-
torney-General Webb secured an in-
junction preventing the transfer. The
Japanese carried the matter to the dis-
trict court, contending that the Amer-
ican constitution and the treaty with
Japan guaranteed to them the right of
purchase.

IT'S TIME TO BEGIN

It's none too early to begin pre-
paration for a hot reception for Jack
Frost. It is yet six months before he
may be knocking at our doors, but
they will be a busy six months for
manufacturers of frost fighting equip-
ment, and the early order gets the
heaters, the tanks, the lighters, the
oil supply, or the wind engine or what
ever has to do with raising tempera-
ture. The Covina chamber of com-
merce, whose committee is one of the
most active in the field, is still push-
ing its investigations and has made
the following preliminary report.

"First—That from our investigations
we believe there are two, possibly
more, well defined principles that have
prospects of better frost-prevention
methods.

"(a) The wind machines, or what
we call the 'windjammers,' to be
operated with and without heat, but
all more or less in the experimental
stage, with the exception of one,
known as the Cobb device, he having
one machine in operation in Lind-
say, Tulare County, for the past three
years, and in this year's operation the
grower claims to have saved 80 per
cent of his crop—at least he has ship-
ped this much, while his neighbors'
were frozen. We have checked up his
statement and find it is correct.

"(b) Heat generating plants, the
heat to be generated by furnace and
blowers from a central plant, also
acetylene generator plant, the heat
to be distributed to each tree by
means of underground or surface
pipes. These various plans are also
largely in an experimental stage,
none having been in actual use. The
Bell plan is now in process of con-
struction in Pomona and will shortly
be ready for operation.

"We are not ready at this time to
make any recommendation and wish
you to consider this as informa-
tive rather than as final. Our future
work will be investigational as well
as experimental and we may from
time to time call upon your body as
individuals to cooperate with and
aid us in putting in some experimental
plant which we might feel would be
for the community good."

WATER RIGHTS ON COLORADO

The supreme court of the United
States has acted in the matter
of settling water rights or filings
on the Colorado River. Cultivator
readers may recall that this paper has
referred to the attitude of the dele-
gates from Colorado and Montana
who were attending the hearings be-
fore Secretary Fall a few months ago.
Both Colorado and Montana insisted
that all the waters within the bound-
aries of those states and all the hy-
dro-electric possibilities were entirely
the property and under the control of
those states. To bolster up that claim
old time state sovereignty arguments
were brought forth and presented at
the hearings referred to and also be-
fore the League of the Southwest.
On Monday the supreme court ren-
dered its decision, and amongst the
findings as reported by the Los An-
geles Times are:

"First—That as between two states
recognizing the law of water power
appropriation, prior appropriation in

time governs. In other words, which
ever state first appropriated power
rights of the water flowing through
two or more states recognizing the
law of power appropriation had the
senior and prior right to such power.

"Second—That all power rights of
such a river as the Colorado not yet
appropriated by the respective state
remain within the federal power and
jurisdiction.

"Third—The contention of Colorado
that it as a state was entitled to all
the power and water that fell within
the state and found its way into the
river was untenable and therefore dis-
allowed by the court.

"Fourth—The contention of Colorado
that the productivity of the acre in
Colorado with the use of acre feet of
water was greater than an acre of
land under the same conditions in
Wyoming was found by the court to
be without merit and was disallowed
on the ground that the citizens of
Wyoming were allowed in law the same
right to production per acre as in
Colorado, and the contention of bette-
use on the part of Colorado would no
be fair in the distribution of water."

JOINT STOCK LAND BANKS

Pacific Coast farmers will now
find greater opportunity to use their
credit in financing farm operations, or
at least they soon will be able to, for
the entire length of the coast is to
have a large number of joint stock
banks which will work in harmony
with the federal farm loan bank. The
farm loan bank loans only on real
estate security for a long time. The
joint stock land bank on the other
hand also handles short time paper and
will deal with cattlemen and others at
a rate of interest only slightly above
the farm loan banks. These banks
will deal directly with the farmers for
no association or other intermediary
is required. Some of the coast's lar-
gest capitalists and banking institu-
tions are uniting in capitalizing these
stock banks.

STANISLAUS BANKERS ENCOUR- AGE BETTER DAIRYING

In an effort to impress upon dairy
men of Stanislaus County the neces-
sity for better methods, the Stanislaus
County Bankers' Association has adop-
ted resolutions urging their members
to show their customers who are en-
gaged in the dairy business that the
time is close at hand when it will be
practically impossible to secure a loan
on a herd from any bank unless the
owner is a member of a cow testing
association and has a pure bred bull.

Under the resolutions bankers are
urged to:

Assist the dairy department of the
farm bureau in calling special meet-
ings of the dairymen to discuss in-
creased production by elimination of
the unprofitable cows, and better feed-
ing methods.

Aid the dairy department in get-
ting signatures to cow testing con-
tracts.

Loan money to members of cow
testing associations for purchase of
pure bred sires out of dams with good
yearly records.

Adopt the new system of dairy loans
based on dairy value of cows, as fol-
lows:

Untested cows—one-half to three-
fourths beef value.

Tested cows—Not to exceed \$50 a
cow.

Insist that land owners insert a
clause in leases requiring lessee to
test his cows monthly during term of
the lease, and to keep pure bred sire
with herd during his tenure on the
land.

The First National bank at Victor-
ville, San Bernardino County, has in-
stalled radio apparatus to receive mar-
ket reports, concerts, etc.

California Cultivator

Vol. LVIII, No. 23

Los Angeles, June 10, 1922

One Dollar Yearly

THE 21st annual convention of the State Association of County Mutual Fire Insurance Companies recently held at Turlock, Stanislaus County, discussed matters of general interest to mutual fire insurance people but centered most strongly on one subject which concerns every property owner in California. This was Fire Prevention. It was discussed by the chief of the Modesto fire department, representatives of large public utility corporations and by members of the association. The appeal was made to be more careful with camp fires, cigarette stubs and pipes, matches, shot guns, oil, gasoline and gas in the home, chimney and general building construction, and everywhere that thoughtfulness may overcome or at least reduce losses.

Secretary John A. Orr said:

"A fire which destroys a home is a terrible thing. Think of it for a moment! You have a comfortable home, some one is careless or negligent, it takes fire and in 20 minutes what was once a comfortable home is a pile of ashes with here and there a broken cook stove, the remains of a bedstead and a burned and unsightly bath tub. What a change to take place in 20 minutes!

"A vast amount of data has been gathered by various fire prevention agencies, from which we learn that 90 per cent of the fires are the result of neglect or carelessness. So nearly every time there is a fire some one has been careless or negligent. Somewhere over the United States a fire breaks out every minute of every day throughout the year. Enough buildings are destroyed annually to house

Fire Prevention Discussed

By C. B. Messenger

a city of 10,000 people and supply it with schools, churches, theaters, hospitals and other public buildings. Fifteen thousand lives are lost annually through fires. One and one-half million dollars worth of property is burned every day. Five school houses burn every day. Sixty-five per cent of the fires are in homes. The fire waste for a period of five years would build the Panama canal four times over. The fire loss in the United States for 1920 was five hundred and five million dollars or a per capita of five dollars. In 1919 our per capita fire loss was \$3.13, while for about the same period, that of Russia was \$1.16, England 61 cents, France 55 cents, Austria 37 cents, Germany 25 cents.

"Now when we think of the terrible havoc which fire works all about us we come to wonder if these fires can't somehow be prevented. How can this be done? If fires are caused through carelessness, let's be careful, careful about matches careful about burning grass, careful about where we put our ashes, careful to see that there are no dry leaves collected on the roof, careful to clean up the dry grass about the buildings. What would you do first in case of a fire in your home? Had you ever thought about that? Do you have something that you could turn to immediately to use in putting out the fire? If we work together we can do great things toward preventing fires."

In addition Mr. Orr described an educational fire prevention campaign in Stanislaus County high schools. A fund was divided into various purses and prizes were offered to high school pupils for the best paper on fire prevention in the home. The first winner in this contest was George James of the Hughson high school. We hope we may quote this prize winner and others who competed, in later issues of the Cultivator.

The subject next in interest was reinsurance. Reinsurance, which has been made possible by enactment of the last state legislature, has wonderfully strengthened cooperative mutual insurance. It enables the local company to carry any amount of insurance permitted under the state insurance laws, providing it is protected by reinsurance in other mutual insurance companies. Formerly the limit was \$4,500. Under the new law one company which has secured sufficient reserve may carry \$6,000 without reinsurance, but many companies are not taking advantage of that feature and others are carrying above \$4,500 only on written consent of some of the members of the board of directors. This form of insurance has proven absolutely satisfactory and, as noted, has strengthened these companies. Discussion at the state convention had to do only with working details. Two separate committees have been at work in planning these details, one

with members from companies near Stockton and the other representing Southern California companies. Details worked out in each case were almost identical.

Legislation having to do with mutual fire insurance was considered at some length and a strong legislative or law committee appointed to watch after mutual interests. Within the state organization there are two members of California's assembly in the persons of George W. Ashley of San Joaquin County and Assemblyman Smith of Santa Barbara County. Another supporter of cooperation who can be counted on in California's assembly is Assemblywoman Esto Broughton of Modesto. She addressed the insurance people at the banquet held in Prescott Community Hall near Modesto the last evening of the convention.

There were, by the way, two of these banquets, or dinners, tendered the convention delegates. The one on Thursday evening, May 25, was at Hilmar, Merced County, by the members of the Hilmar Mutual Fire Insurance Company of Merced County, Inc.; the other, near Modesto, by the Farmers Mutual Fire Insurance Company of Turlock. The Turlock company, especially its president, W. M. Way, and its secretary, John A. Orr, did some magnificent work in looking after the comfort of the delegates.

The officers elected for the coming year are: President, Bern Barger, Hemet; vice-president, J. E. Copeland, Riverside; secretary-treasurer, L. P. Hathaway, Ventura; delegate to national convention, Dean Johnston, Santa Ana. The next annual meeting will be held in May, 1923, in Riverside, County.

Quarantine and Other Conferences at Sacramento

THE week beginning Monday, May 29, and ending Saturday, June 3, was the great convention week at Sacramento. It had many of the marks of a state fruit growers convention week though there were few of California fruit growers in attendance. The most far reaching event of the week was the quarantine hearing of the federal horticultural board and the hearing of the bureau of markets on standardization. Other features of the week were: Semi-annual state convention of the county horticultural commissioners; meeting of the western plant quarantine board; the perfecting of a new organization made up of state agricultural officials of the western and coast states; and state fertilizer control hearings. Then to give a rousing closing to the week the California State Association of Nurserymen held its 12th annual convention.

To give anything like a complete account of any one of these conventions is beyond the capacity of any paper. We may, however, touch the high spots.

Horticultural Commissioners

The week began on time, almost to the minute, when President Ryan of the county commissioners called for order at 11 o'clock Monday morning. The first session was largely given up to appointment of committees and routine business. The chief guests of the commissioners were L. O. Howard, chief of the bureau of entomology, and Dr. C. L. Marlatt, chairman of the federal horticultural board. Other entomologists, pathologists and specialists from Washington were in attendance. The one "big kick" some commissioners secured out of the week's work was "the phylloxera question"; others, the "standardization question." The phylloxera question had its warmest session when the commissioners met with the nurserymen late in the week. It then developed that the commissioners were not united as to best method of phylloxera control. The southerners were rather inclined to draw the line at the

Editorial Correspondence

Tehachapi. The northerners were, some of them, in favor of a regulation which would permit shipping from a phylloxera free county regardless of which end of the state was entirely free. Other commissioners asked for a showing of hands of those commissioners who would guarantee any counties in the state as absolutely free from phylloxera. Then the nurserymen took the boards and proved that they were not a unit in expressing their wishes, so the question was left more or less open.

As to shipping point inspection there was one hot time in room 118 of the state capitol. The room was not overly large; there was not a single window and no outside door. It was filled with officials representing 11 western states anxious to secure agreement with federal inspectors as to just how fullest cooperation could be secured between state and federal officials.

The discussion was long and the mental temperature compared with the weather which prevailed in Sacramento, especially in room 118 at that particular moment. Miles Cannon, commissioner of agriculture of Idaho, led in a stiff fight on the federal bureau of markets because the bureau presumed to join in the inspection-at-point-of-shipment campaign. Lloyd S. Tenny, assistant chief of the bureau of markets, replied that the bureau would not under any circumstances join in inspection where it was not wanted. Any state which wished to do its own inspection was entirely competent to do so and only those which wished the added advantage of federal inspection would be served. However, Mr. Cannon and representatives from Washington and Montana stood pat and voted for the maintenance of state sovereignty and action on the part of the state officials absolutely independent of the federal bureau.

In the matter of shipping point inspection, Geo. W. Ashley presented the following signed by himself and Frank B. McKevitt and Geo. Cutter:

Whereas: An act of congress effective July 1, 1922, which act definitely

authorizes the bureau of markets and crop estimates to make carlot inspections at shipping point and issue certificates thereof, said certificates being prima facie evidence in any court in the United States, and whereas, we believe this inspection will be more closely in touch with the fruit interests if accomplished through the local state inspection service, thus retaining both as to grades, packages and trade identify the local color, said service to be accredited with authority and under the general supervision of the bureau of markets and crop estimates, therefore be it resolved that we, a committee from the California Growers and Shippers Protective League, representing some 30,000 cars of inter-state deciduous fruit shipments, believe that such inspection, made upon the request of, and the reasonable fee therefor, paid by, a party at interest, will be of untold value to all concerned, and we further recommend that a treaty agreement be made and entered into as between the department of agriculture at Washington, D. C. and the proper departments of the various states interested for the purpose of putting into effect this plan.

Western Directors of Agriculture

This bringing together of commissioners and directors of agriculture from the 11 western states resulted in the completing of a permanent organization. The field to be covered will be much larger than that covered by the western plant quarantine board. In outlining the work possible for such an organization Mr. Hecke said in part:

"For sometime we in California have had a feeling that we had no particular part to play in the national association of state marketing officials other than helping them wherever possible by our friendly cooperation. After consulting with certain of the other Western directors and commissioners of agriculture, I found that the same feeling existed in other

states and the need for a smaller and more compact organization of state departments representing entirely the interests of the Pacific slope became so apparent that this organization meeting was called.

"It is a well known fact that we have reached in the history of our agricultural industry a period when organized action is necessary. In an era of big business the efforts of the individual are not always successful, but through organizations of producers of shippers, of distributors, and even of departments of agriculture, whether they be cooperative or purely for profit, large results have been forthcoming.

"The necessity for an agricultural organization among the states comprising the great Far West is more apparent than ever before. An almost complete collapse in the machinery of distribution and marketing occurred in 1921. Vast supplies of staples were sold at prices far below the costs of production, while the prices of articles the farmer has to buy have remained so high proportionately as to strike a staggering blow at his prosperity. There are, of course, exceptions to this condition, and none of the exceptions were more apparent than those that existed among the organized producers of the Far West. The splendid distributing agencies, both cooperative and otherwise, of California, the Northwest, Idaho and other Western states have proved their stability and worth beyond a shadow of doubt. It is this lesson of organization that should stand out as a beacon of encouragement, pointing the way toward which the thought of the American farmer, banker, and business man should be directed.

It is just as necessary that uniform quarantine regulations be established for the livestock work as for the fruit and vegetable industry. I think that this is a matter to which special attention should be given by this organization and I would suggest an appointment of a committee to consider animal industry and livestock problems, with a view to incorporating

(Continued on Page 639.)

Agricultural News Notes of the Pacific Coast

Northern California

Petaluma shipped 744 cars of eggs to eastern markets in 1921.

Vacaville will ship about 950 cars of deciduous fruit this season.

Santa Rosa reports \$125 a ton being offered for black wine grapes.

Petaluma chamber of commerce is making plans for celebration of its annual Egg Day.

Sun Maid Raisin Growers will build packing plant at Yuba City to handle Thompson Seedless.

The Days of '49 have cleared the clothes out of all the old trunks in Northern California.

The Livermore Valley reports better than normal crop of grain, barley looking exceptionally well.

California alien land law is upheld by decision of the United States circuit court of appeals.

The California Growers Association estimates the state's cherry crop at not more than half normal.

Colfax reports some damage to plums from snowfall early in May through breaking of trees.

Horticultural Commissioner Norton of Nevada County reports fruit five weeks later than the normal season.

The California Cherry Growers Association has fixed price of Royal Anne canning cherries at \$9.20 per hundred pounds.

Grain farmers of Livermore Valley gathered at Livermore, June 3, to discuss the California Farm Bureau Grain Exchange marketing plan.

A tractor is being used by the state highway commission to break a road through the snow between Strawberry and Meyers Station on the Tahoe road.

Fifty delegates from Modoc County attended the good roads meet at Winnemucca, Nevada, June 9-10 in the interests of a northern transcontinental highway.

Canners will take most of the Santa Clara Valley cherry crop so it is estimated that shipments of the fresh fruit from San Jose will not total more than 120 cars.

Fruit shippers of Placer County have agreed to adopt the Los Angeles lug for bulk packing of plums; for cherries, the Pioneer lug, three inches deep, holding 14 pounds.

Sonoma Pomona Grange at its last meeting passed resolution calling for federal legislation to control immigration of Japanese who now "lease control one-eighth of the irrigated lands of the state."

To meet the demand for trained men for positions with California's farm cooperative organizations the state college of agriculture has established a new major line of work designated rural social economics.

At the California Grape Growers meeting held in San Francisco, June 8, it was reported that the estimated wine grape tonnage this year is 350,000. Last year 17,000 carloads of grapes were shipped from California.

The Stockmens Protective Association has appointed a committee to confer with Alameda County supervisors on means of carrying on fire protection work this summer. Lack of county funds to carry on the work after June 30 creates a serious situation.

Central California

Monterey Pomona Grange picnicked at Sherwood Park, Salinas, May 27.

The Big Oak Flat road to Yosemite was opened to automobiles, June 1.

The Modesto chamber of commerce reports inquiry for rye straw, \$40 per ton offered.

A grain elevator is being built at Salinas by the Farm Bureau Elevator Corporation.

The county highway between Ben Lomond and Boulder Creek has been opened to travel.

Thousands of acres of grain in Tulare Lake bed are flooded by waters from Kings River.

Tuolumne County has completed its share of the work on the detour around the old Sonora road.

The Modesto branch of the state employment bureau was opened, May 24. D. W. Reidy is in charge.

A three day agricultural fair will be held at Oakdale, Stanislaus County, the latter part of September.

Oakdale creamery patrons are receiving four to five cents more for butterfat than at this time last year.

Dairymen about Crows Landing have signed up over a thousand cows in the Stanislaus County cow testing association.

Santa Cruz County farm bureau picnicked at New Brighton Park, May 27. The park is half way between Soquel and Aptos.

Proponents of the state water and power act met at Modesto, May 27 to form a country organization to campaign for its passage.

Formation of an irrigation district in the Owens Valley is being discussed by the Owens Valley Protective Association, farm bureau and other interested organizations.

Stanislaus County supervisors have ordered construction of concrete highways from Westley to the Stanislaus-San Joaquin County line and from Newman to Hills Ferry.

The California Peach and Fig Growers has joined with other organizations in protesting against the proposed senate amendment giving jurisdiction over railroads wholly within states to state regulatory boards.

Apple shippers of the Pajaro Valley are watching the box shoo situation. Strikes in mills in the northern part of the state and in Oregon are making for serious shortage. Resort to barrel pack is even suggested.

West Side ranchers at a meeting of the newly organized Fire Protection Association at Newman elected Geo. Delaney, president; C. D. Price, secretary. The association is asking appointment of a deputy fire warden for Stanislaus County.

The 21st Annual Convention of County Mutual Fire Insurance Companies met at Turlock, May 26. C. B. Messenger, editor of the California Cultivator and president of a Los Angeles County Mutual, talked on "Mutual Insurance Publicity."

Horticultural Commissioner Hickman of Monterey County gives warning of danger of poisoning from wild lupine. He says that owing to late season there is unusually large percentage of matured lupine in hay fields and care should be taken to cut around it.

Southern California

Aphis are a serious pest in many citrus groves this season.

Fallbrook, San Diego County, has voted to form a water district.

The Mutual Insurance Associations will convene next year at Riverside.

Construction work is humming on the 40 miles between Banning and Indio.

Lytle Creek Canyon road is open after several weeks of reconstruction work.

The Date Growers' Association is planning to build a packing plant at Brawley.

Cantaloupe shipments from Imperial Valley are expected to reach 15,000 carloads this season.

First figs from Indio sold at \$2 a pound in Los Angeles to the Southern Pacific dining service.

Proposition is again advanced to bring waters of Arrowhead Lake into the San Bernardino valley.

First carload of cantaloupes left El Centro, May 30; last year two carloads left the valley, May 21.

A paved county highway between Thermal and Mecca is to be built. Bids will be opened June 26.

E. C. Merryfield, manager of the Highgrove Orange Growers Association, died suddenly last week.

The Ontario-Upland Rabbit Association held a show at Ontario last week. 500 rabbits and covies were shown.

Rialto Packing Company reports average return of \$5.87 per 100 on all grades and sizes of Navels shipped in March pool.

Two days poultry culling demonstrations were given in Imperial Valley this week by Prof. Newlon of the state university.

Close of the season pool on Navels and odd varieties is marked by Rialto Orange and Lemon Association by sending out checks for \$175,000.

San Bernardino County farm bureau picnicked at Sylvan Park, May 27. Sports occupied the forenoon, agricultural discussion the afternoon.

A strong delegation from towns and farming districts of Southern California has gone to Washington to urge building by the government of Boulder Canyon dam.

Chas. L. Van Wert of Palo Verde has been chosen to succeed W. J. Burton as director of the Palo Verde joint levee district of Riverside and Imperial Counties.

Valencia shipping season will practically end at Rialto the middle of the month. The Brogdex paraffine coating of fruit has been satisfactorily tried out on 100 carloads.

The Covina chamber of commerce committee on orchard heating plans reports "prospects for better frost prevention methods" in wind machines and central heating plants.

Work has begun on building high power electric line to the site of the proposed Warner's dam in San Diego County. 1000 horsepower will be required in construction work.

Dr. L. O. Howard of the U. S. bureau of entomology is making inspection of pest control work in San Diego, Imperial and Coachella Valleys. He is accompanied by Harry S. Smith of the state department.

The Coast and General

"Buy at Home Week" was observed in Arizona, May 22-27.

Oregon Interstate Fair will be held at Prineville, October 4-7.

Early tomatoes are on the market from the Yuma district of Arizona.

A carload of onions was shipped to Denver last week from Phoenix, Arizona.

The Salt River Valley of Arizona shipped its first carload of apricots, May 29.

Washington has expended \$10,000,000 on highway construction in the past two years.

Whatcom County, Washington, berry growers have organized a marketing association.

Salt River Valley of Arizona reports a large crop of apricots, fruit now coming on the market.

A southern Idaho wool pool sold 1,000,000 pounds to a St. Louis company at an average of 30 cents.

The Tillamook, Oregon, cow testing association starts its 14th year with 2300 cows on test for 110 members.

Hood River Valley, Oregon, will increase its strawberry yield 20 per cent over last year, which was 85,000 packed crates.

Plans are being made to hold a state poultrymens convention at the Oregon Agricultural College at Corvallis, August 1-3.

A second dam is to be built across the Gila at Sacaton, Arizona. An 18 foot highway will cross the dam which is to be 1260 feet long.

Forest and brush fires in western Washington have partially destroyed the town of Cedar Falls, burned over much land and caused loss of thousands of dollars.

Over 1,000 acres have been signed up by Gadsden, Arizona, farmers for lettuce planting. Somerton, Yuma and Bard are also going into lettuce growing extensively.

In the interests of cooperative marketing a big barbecue meet was held at the state fair grounds at Phoenix, June 1. Grain growers problems principally were considered.

Orchardists at Nampa, Idaho, report successful frost fighting by means of smudges of baled straw. One end of the bale is dampened and it is claimed it will burn from 24 to 30 hours.

The railroad committee of the Washington Woolgrowers' Association has secured a reduction in rates to and from summer grazing grounds, approximately the rate in force last year.

The Bonneville County, Idaho, Potato Growers' Association has 150 members who will plant 3,500 acres of potatoes this year. An eastern firm has contracted for the entire yield.

Farmers living near Rexburg, Idaho, telegraphed protest to Washington against "discrimination in favor of big cattle and sheep interests in distribution of loans from the war finance board."

At the National Holstein-Friesian Convention and sale at Kansas City, June 5-10, 24 booths were arranged by the federal department of agriculture to demonstrate need of improving dairy cattle.

ROP prospects on drying peaches indicate that a good crop will be harvested this season. Trees are in excellent condition and except for a few scattered sections, spring frosts have done very little damage.

Thinning of the fruit is now being practiced by many growers in order to increase the size and the quality of that left on the trees. The tonnage of dried peaches on hand is small, the crop being practically cleaned up in most of the plants belonging to the association.

Statistics show that the tonnage of dried peaches in California has not materially increased during the past ten years. The older orchards are being displaced by vineyards in some sections as the peach tree is normally regarded as short lived. The new orchards are being planted to a small extent in some sections, but not in acreages which will materially affect the total tonnage for the state. Prospects for dried peaches during the next few years, especially for the Muir, which is the standard of quality, appear to be very good.

Returns already made to the growers total seven cents a pound on dried peaches. The total returns made since 1916 to growers are: 1916, 6 cents; 1917, 8.32 cents; 1918, 11 cents; 1919, 14.88 cents, 1920, 12.03 cents.

The cumulative effects of the cold weather of last season on fig trees are just beginning to be appreciated.

Peaches and Figs

By I. J. Condit, Horticulturist, California Peach and Fig Growers

On both April 4 and November 19 last year fig trees suffered more or less seriously from unusual frosts. Both young and old trees have been more or less weakened and in many cases the bearing border and orchard trees are showing dead and dying branches. The Adriatic crop will, therefore, be somewhat reduced although no estimate of the per cent of loss can be made at this time. The Calimyrna and Mission trees in the Fresno and Tulare districts do not seem to have suffered so severely as the Adriatics.

The first crop of the Mission trees has been injured and it is doubtful whether any large quantities can be shipped fresh. The first crop Kadota figs are good in most sections. The caprifig crop is unusually good and an abundance of profichi figs is expected for caprification in June. Growers of Calimyrna figs are very much encouraged over the prospects of disposing of their crop fresh. The fresh fruit contract guarantees a first payment on delivery of six cents a pound minus a reasonable charge for picking and hauling expenses. Three

picking gangs are to be in the field, one in Stanislaus County to handle the Calimyrna figs from the Ceres and Modesto district, one in the Fresno district and one in the Reedley-Dinuba district. Kadota figs will be handled wherever they are available.

The association now has three canneries in operation or in process of construction, at Turlock, Figarden near Fresno and at Dinuba. It is predicted that canned figs put up in syrup will soon be as common a commodity as canned apricots, peaches or cherries, and preserved figs put up in a heavier syrup, a delicious dessert, which will be available at all grocery stores.

As with peaches, a limited amount of figs is unsold. The entire crop will be cleaned up before the new crop figs are ready for market. The recent fire at Fresno destroyed the plant in which Fig Brownies were being manufactured, but preparations are almost completed to continue the manufacturing of these Brownies at Plant Number 9, Fresno.

The directors recently authorized the following payment on account to the growers of dried figs: (in addition to the amount furnished at the time of delivery, which was three cents a pound for Adriatics and Kadotas, four cents for Calimyrnas and two and one-half cents for Black Missions), Calimyrna and Black Missions two and one-half cents a pound, Adriatic and Kadotas one and one-half cents a pound. The above advances were made on "A" and "B" grades. Later on when the figs have all been marketed a final settlement will be made in accordance with the grades delivered by each individual, in which will be included "C" grade as well.

The year's operations on canned figs have proven very satisfactory from a marketing standpoint and the quality of the cannery products under the "Purple Ribbon" brand has been highly complimented by the trade. The year's business resulted in the following net returns to the growers:

	Payment on Delivery	Final Payment	Total Payment

The Farm Bloc

HE farm bloc is perhaps the most significant development in congress since the "Insurgents" in 1910 sheared Speaker Cannon of his power and laid the foundations for Colonel Roosevelt's independent candidacy two years later. The sequel to those two events was the election of Woodrow Wilson as president of the United States.

But the farm bloc differs from the incident of the "Insurgents" in several vital respects. The farm bloc is said by its leaders to be non-partisan. It is not sectional. It is not, as was the Roosevelt Independent movement, dependent upon the masterful personality of one man.

The farm bloc is essentially based upon an economic idea. That idea can be simply stated in a few words:

The farmer believes that he does not receive a large enough price for his products. He insists that what he is compelled to buy has decreased far less in price since the war than the things he sells. His contention is that he is unable to borrow money as advantageously as those engaged in other great industries.

Hence the farm bloc in congress. The bloc is not composed of farmers as there are but few real "dirt" farmers in Washington, but it comprises those congressmen mainly from the West and South who represent agricultural constituents.

The leader of the bloc and its most powerful single agent is Senator Capper of Kansas, who is not a farmer, but an editor and publisher of many farm journals. These publications are issued in several states including Pennsylvania. They have a combined circulation mounting up into many hundred thousands a week.

But few men among the 531 who make up the two branches of congress have so wide a personal following among the voters of the country as Senator Capper. Perhaps no other senator can regularly make his appeals directly to such great audiences.

There have been in the past other blocs in congress, but they were not so designated. The greatest by far was the slave bloc, which, for at least 40 years, voted on nearly all questions that came before congress in order to sway public opinion for or against slavery. That was largely a sectional bloc.

In more recent times there was the silver bloc. The actual idea behind that was to enhance the price of silver metal, but it was skillfully mixed in with elaborate theories of dual standards of value for money. It was not confined to any party, but was mostly Western.

We positively disagree with some of the conclusions reached by the writer of the following article, who is connected with the Girard Trust Company of Philadelphia. We reproduce it in order to show to producers 3,000 miles away from one of the greatest manufacturing centers of the world the mental attitude of the folks "back East." For instance, note the paragraph beginning "But the farmer," not what it says so much as its implication. It would appear that the writer is entirely ignorant of the fact that there have been prior to the "farm bloc" "financial blocs," "steel blocs" and a thousand and one other lobbying interests and because of the success of these former blocs which may have operated under different names the farmer has been compelled to maintain a lobby of his own. It is to be regretted that this has to be done. The careful reader will observe many other points wherein he will differ with the writer.

People residing in cities may feel now that they are not concerned in the farm bloc, but they are quite as directly involved in it as were all the inhabitants of our country in the final outcome of the slavery issue or in the free coinage of silver heresy.

American agriculture measured by its money value is the greatest one industry in any country on the earth. Forty out of every hundred of our population live on the soil.

Broadly speaking the American farmers produce in a year one-third of this country's wealth and create a half of all our commerce.

There are more than six million farms in the United States.

Three years ago the agricultural output of the United States reached almost to the dizzy figure of fifteen billion dollars.

Thus there came from American soil in 1919 \$150 for every inhabitant of this land. But such was the far downward sweep of prices for farm products last year that with approximately the same volume of output from the same soil as in 1919 its market value was considerably less than half.

Hence the farmer argues that with the same capital involved, or about \$12,000 on the average per farm including stock and buildings, and with the same labor expended, he received less than 50 cents in 1921 for what he had been paid a dollar two years before. Even that wide discrepancy does not measure the full adverse swing of the farmer's pendulum.

The purchasing power of the farmer's dollar has reached its lowest point in 30 years. Of course, others have also seen the value of their products greatly dwindle.

As an example may be cited The United States Steel Corporation, which is our largest manufacturer. It did a business last year of almost \$800,000,000 less than in 1920. Those who toiled for that corporation received in wages \$259,000,000 less than they were paid the year before.

But the farmer who doubtless would combat a bloc in congress which should aim to advance steel prices so that steel making profits and steel workers' wages might increase, has gone into congress to obtain legis-

lation which will directly benefit himself.

Conceding that the farmer should have every facility to borrow money on equal terms with other producers and that he is entitled to a bigger return than he now obtains from his invested capital and his hard labor, it must still be contended that he can secure greater prosperity outside of congress than in it.

In other words a farm bloc will not ultimately help agriculture nearly so much as agriculture can help itself by the process of better cooperation. This is not a simple process by any means but it has been successful in Holland and in some localities in this country and could be very widely extended here.

The agriculturist insists that he sells at buyers' prices, but that he himself buys at sellers' prices. Cooperation among farmers in selling is the sole answer to that condition. It is exactly what others have had to do.

Farming has been described often by poets and others as the one truly independent existence. The truth is that farmers have acted so independently of each other in the matter of marketing their produce, each selling regardless of time, price or conditions as suits his own purpose, that they have impoverished themselves through lack of combined action.

As a rule the American farmer is a hard worker and a first rate producer. Just as often he is a poor seller.

If our twelve million farmers and farm hands worked as intelligently to sell what they grow as they work to grow it, their profits at the end of the year would be greater by hundreds of millions of dollars.

A railroad president knows that it often requires quite as much skill to sell transportation to the shipping and traveling public as it does to produce transportation. Thus the traffic department of a railroad ranks right up in importance with the operating department. Perhaps it ought to rank above it.

Carnegie said his great forte was not as a maker of steel but a seller of steel.

The world's richest man did not become so by merely owning oil wells or by producing oil, but Rockefeller's

prodigious success came from his ability to refine and market the products of petroleum produced by others all over the world.

The United States Steel Corporation recognizing the vast value of the selling end of its business, made Mr. Farrell president of the corporation after he had demonstrated as a foreign sales agent a remarkable ability to sell steel.

The United States agricultural department and the agricultural departments of various states as well as schools of agriculture are today doing an immense work teaching American farmers how to increase their crops. The time is overripe for some education along the line of teaching farmers how to sell their agricultural output.

(The letter cites numerous instances of successful cooperative selling organizations of producers in different states with which we Californians are more or less familiar.)

Were congress to become broken up into blocs along the lines of industry or personal interest, the farm bloc would outvote any other, but it would be a calamity for the nation should such a system of blocs be established.

There are many more farmer votes in the United States than railroad votes, or coal mining votes, or steel and iron manufacturing votes, or cotton and woolen weaving votes.

But it is also true that the farmer's prosperity depends directly upon great masses of non-agricultural people to consume his produce. Whatever should impoverish the towns and cities where now dwell more than half our country's population, would instantly be reflected in a reduced buying power for what the farmer has to sell.

And therein lies the greatest danger to a bloc system for a national legislative body. A bloc is per se organized to look out for its direct and immediate interest, regardless of the welfare of others.

But nobody can raise a voice of protest if the owners of 6,000,000 farms by cooperative action, introduce economies in buying what they need or in selling what they produce.

Other industries in order to accomplish both those ends consolidate through incorporation. That farmers cannot do, but there is neither law nor sentiment against a more intelligent process of marketing farm products so that the farmer himself shall obtain a larger proportion than he now receives of what the city consumer pays for all that comes from the land.

The cost of local distribution in large cities has grown to immense proportions.

(Continued on Page 639.)

Crop insurance

HAPHAZARD farming is being rapidly put in the discard by keen agriculturists alert to the advantages of scientific methods developed largely in recent years.

The modern Byron Jackson direct motor drive centrifugal pump is an important factor in this new era of farming.

A Byron Jackson pump will insure you against drought and pay dividends in the form of capacity quality crops.

Byron Jackson service follows every pump through the period of installation and the years of its operation.

THIN FRUIT

It's already late but if peach and apricot growers act quickly many dollars may be added to the returns from the orchard by doing some vigorous thinning. It takes nerve and it takes considerable time to properly thin peaches and apricots. Apricots this year are running rather light crop and in some orchards thinning will not be necessary, but careful examination should be made.

It takes more fertility from the soil and strength from the tree to produce a pound of pits than a pound of edible fruit, so that every time a needless

scab, or other skin or meat blemishes.

"Canning peaches shall be 2 1/4 inches in diameter or larger, ripe but firm and free from fungus, scab, or other skin or meat blemishes."

Lack of proper attention to thinning has been the outstanding sin of deciduous fruit growers in years past. One cannot expect a tree which has strength enough to mature to proper size only 100 or 200 or 500 peaches or apricots, according to the size of the tree and conditions affecting it, to mature to the same size twice or three times that number of units. There is another side to thinning, too, which deserves the consideration of all growers. Trees that have borne too heavy a load of pit as compared to meat one year do not make a healthy growth of new bearing wood for the next year. The usual result of a big crop of small fruit one year is that there is a very small crop the next year. Now the important question in this connection is how far thinning can be carried without reducing the tonnage. The canners do not ask the growers to thin an orchard to the point of reducing tonnage, but they do ask and urge them to thin to the point where the fruit left on the tree will size up suitably for canning in accordance with the sizes stipulated in the above resolution.

NURSERYMEN IN CONVENTION

California nurserymen never held a more enthusiastic nor better attended meeting than that held last week at Sacramento. The attendants listened to committee reports, elected officers, transacted new business, banqueted and lunched at the Country Club, conferred with the State Association of County Horticultural Commissioners and had a royal good time.

This issue of the Cultivator is so overfilled with good things brought from the various conventions at Sacramento that a more general account of the nurserymen's convention is necessarily held over until the next issue. One of the things which will be given is an outline of the nursery business in the state of California contained in an address by Former Secretary Kruckeberg. This outline was largely taken from more extended history written by Dr. E. J. Wickson. The new secretary, C. K. Grady, proves to be an aggressive, active leader, and his work in preparing for the convention resulted in effective program from the opening moment.

AVOCADO OFFICERS

The California Avocado Association board of directors met recently and discussed reports of committees and other events of the recent convention. Director Jameson tendered his resignation as a member of the board and F. O. Popenoe was elected to fill the vacancy. The board then organized for the coming year: President, F. O. Popenoe; vice-president, Chas. D. Adams; treasurer, J. M. Elliott; secretary, Karl M. Wagner. The secretary's address is 2160 E. 7th Street, Los Angeles.

Cracked Wide Open by Frost

Trunks of bearing trees were never affected by the severe cold as they have been this year. Many trees even much older than the one appearing above had the bark split from crown to branches. In some cases the injury was so severe that the bark lifted entirely around the trunk and the tree was destroyed. There is no effective treatment; there is, however, effective prevention, and that is through orchard heating.

pit is removed the grower's wealth is increased. This principally because the canners are usually oversupplied with small sizes and too large a proportion of the fruit has to go into "pie" or "water" grades.

This year canners report all first grade stock already sold and prices cut on lower grades in order to dispose of them, so the canners have resolved that

"Canning apricots shall be of a size that will run not over 16 to the pound, ripe but firm and free from fungus,

Saved by Heaters

Note fruit loading down the trees, leaves and even tender growth not touched while adjoining orchards lost fruit and even leaves. This year's campaign of frost fighting has proved as never before its efficacy.

For Economical Transportation

The World's Lowest Priced FULLY EQUIPPED Light Delivery Car

\$525 *f. o. b.
Flint,
Mich.*

Complete with Body, as illustrated

The Greatest Dollar Value in the Commercial Car Market

Every farm needs this car to carry milk, garden truck, feed and all moderate loads.

Every country merchant needs it to enlarge his trading territory and give better service to customers.

Costs no more to buy and keep than a team but does the work of two teams and saves one driver.

With two extra seats makes a fine bus or jitney for livery, hotel or school uses.

Can be had with special pane. body at very reasonable cost.

Chevrolet Invites Comparison Because Comparisons Sell Chevrolet

Consider What Chevrolet Equipment Means:

Standard Rear Axle Construction. The new Superior Chevrolet has the strong, quiet Spiral Bevel Gear Axle that "stands the gaff" without breaking

Standard Transmission—three speeds forward and one reverse.

Standard Braking System—foot service brake, hand emergency brake.

Standard Electrical System: Starter, storage battery, Remy ignition, electric lights front and rear, on battery circuit.

Standard Cooling System—pump circulation, large, honey-comb radiator and fan. This means a cool, efficient engine, saving gasoline and oil and ensuring driving comfort.

Standard Instrument Board, containing speedometer, ammeter, oil pressure gauge, lighting and starting switch, and choke pull.

Standard Type of Carburetor, with exhaust heater—one reason why you get most miles per gallon of gasoline with a Chevrolet.

Powerful, Valve-in-Head Motor. The same type as used in successful cars selling at much higher prices.

Demountable Rims—extra rim on side. No trouble to change tires on a Chevrolet.

Full Weather Protection—Waterproof curtains let down on sides and rear, fully protecting driver and load against rain or snow. Flexible windows in curtains.

Many Other Advantages which will be noticed on inspection, comparison and demonstration.

INTERNATIONAL

HAY PRESSES

BALED HAY is better hay. It has a higher food value. It is more economical to handle, haul, and feed. It occupies only one-fifth the space of loose hay, therefore can be stored and protected more economically. Each of these advantages represents added profits from your hay crop.

An International hay press, horse or power, will yield you full returns for your power and labor. And after you have multiplied the profits on your own hay crop, you can fill in the late summer and fall months profitably, baling hay and straw for others. Some farmers say they have paid for their presses in thirty days, baling for their neighbors.

International horse hay presses are made in four sizes, with capacities of from six to fifteen tons a day; power presses in three sizes, two of which can be furnished with 6 h. p. engine attached, with fifteen to thirty-ton capacities.

Write for catalog, and see the McCormick-Deering dealer without fail.

INTERNATIONAL HARVESTER COMPANY

WANT 25¢ Per BAG MORE for Your Potatoes?

Potatoes graded with the Boggs Grader vary less than 3%. Buyers know this and willingly pay 25 to 50 cents more per bag or barrel for Boggs machine-graded potatoes than for hand-graded potatoes. Just stop and figure what that extra profit would amount to on your whole crop. Then add the wages you would save if you could grade your potatoes with one-third the help.

Boggs Potato Grader

The Standard Grader

will pay for itself the first season in labor saved alone, as it sorts and grades potatoes into the two Government sizes and eliminates culls and dirt in one operation. No danger of bruising or injuring potatoes.

Capacity ranges from 75 to 700 bushels per hour. The Boggs has been on the market for eight years and we have never found one worn out. Six models. \$40 and up. Send for booklet.

Avocado Varieties

From Report of Committee of California Avocado Growers

IN addition to text given last week in the Cultivator special varieties were reported on at the Avocado Growers meeting at Pasadena, as follows:

Victory.—Grown at Sherman by Mrs. L. M. Chaffey. Samples of the fruit were submitted to the committee, as well as to the board of directors at an October meeting. We give the record from one fruit. Weight 18 ounces; seed three ounces; shape round; skin light green turning brown in places as it ripens, similar to the West Indian type, 1-16 inch thick, smooth and granular; flesh yellow shading to light green; quality good; flavor good. Flesh does not discolor for days after cutting. Tree 17 years old, vigorous, bearing 200 fruit in 1920, 350 in 1921.

Chidester Seedling No. 1.—Two samples were picked October 15 and sampled ten days later. Weight of one sample 13 1-2 ounces and of the seed 2 1-4 ounces, and of the other 12 ounces, seed 3 1-2 ounces; skin smooth glossy black, leathery, 1-16 inch thick; shape, pyriform; flesh smooth, bright cream yellow. No fiber and flavor good.

Clower.—The tree was furnished by Mr. Clower to Mr. Shedden and grown by Mr. Shedden at Monrovia. It has fruited for several years and produces fruit of good quality and mild and agreeable flavor.

Ward.—Grown at Sierra Madre by Irving N. Ward. Tree nine years old and has borne some fruit since its fourth year. Crop in 1920 three fruit, in 1921 two hundred. Trees budded from it three years ago were easy to bud, are vigorous and were all in bearing in 1921, averaging twelve fruit each. Weight of the fruit 12 to 16 ounces. An analysis showed oil contents 24.98. Flavor good but some samples showed some bitterness and a rather neutral flavor. This is an early spring fruit beginning to ripen in February and showed reasonable hardness last winter. A sample received January 12, weighed 12 ounces, seed two ounces. Another on February 11 showed, shape pyriform with neck one sided. Skin only 1-32 inch thick, of a dark red or purple to black color; flesh cream yellow to pronounced green; quality smooth and flavor good.

Dutton.—A large, tall, reasonably hardy tree ripening a large part of its crop during the early spring, with fruit approximately a pound in weight. On account of a change in the ownership of the tree it has been difficult to obtain samples of the fruit in good condition. Those obtained showed watery, poor flavor and discolored flesh and were not in accord with the reputation of the fruit. At last in April we received one that does, which we are glad to report. Weight 14 1-2 ounces, seed 2 1-2 ounces; tight in the cavity. Shape pyriform very slightly necked; skin dark maroon with many warts of a lighter color, 1-24 inch thick; color of flesh cream to light green, a trace of fiber, quality smooth, flavor very rich. Keeping and shipping qualities good.

Thompson.—Grown at Montebello by Miss Jessie Thompson. Some seeds sent from Atlixco, Mexico, were taken from a tree known to bear the smallest seeds compared with the size of the fruit, of any tree at Atlixco. Eighteen seeds grew and produced trees now ten years of age of which this tree is one, and produced last season 44 fruit, one other tree bore one. The remaining trees are not in bearing. The Thompson fruit justifies its parentage and is notable for its exceedingly small seed. The tree is growing in a cold location, suffered injury, and was not as hardy as a Fuerte near it. We give a test of a fruit sent us after the freeze on February 6. Evidently not a normal fruit. Shape pyriform, weight 16 1-2 ounces; seed 1 3-4 ounces, tight in the cavity; skin red purple, 1-12 inch thick; flesh light yellow to light green, some red fibre showing, quality good, flavor watery. The ripening season is stated to be February 1 to April 1.

Prince.—The tree is growing in Hollywood on the place of E. W.

Dickey. It is described as ripening its fruit in October, November and December, averaging 25 ounces in weight, seed 2 ounces; no fiber, good shipper, best in flavor. Many hundred small samples of this variety were given out to the public at our October display in Exposition Park, and ample opportunity given to judge of its fine flavor and see the fine looking fruit. A sample sent to the committee was tested on November 2. Shape pyriform; weight 21 ounces; seed 2 1-2 ounces, tight in the cavity; skin dark green with brown spots, causing it to look dark, granular, 1-16 inch thick, a trace of fiber showing dark color; quality smooth, flavor good, keeping quality good.

A few buds taken from the parent trees and top worked last summer from the Dorothea and Billingsley proved hardy in the recent freeze. Both varieties have much merit. The location of the Dorothea is in a frost free place at Hollywood. Of this kind evidence is needed to prove correct the belief of the owners that the tree is a cross between the original Miller tree, from which came the seed, with a hardy Mexican variety in the vicinity. With previous records of regular crops both the Dorothea and Billingsley had practically no crop in 1921, due no doubt to the heavy crop of the previous year. We reproduce for your information the 1920 tests:

Dorothea.—Grown by A. W. Miller, Hollywood, from a seed of the well known Miller tree and believed to be a cross from one of the Mexican race.

The tree is vigorous and productive. Crop 1918, 16 fruit, 1919, 30, 1920, 250. It blooms April and May, ripens mainly in December and January. Three samples, picked and tested in January weighed 12 ounces, 8 1-4 ounces and 8 ounces. The seed respectively one ounce, one ounce, 1 1-4 ounce. Color light green with many yellow spots, skin leathery, flesh clear attractive yellow of good mixture, no fibre and excellent flavor.

Billingsley.—A large tree on the property of Ray Billingsley, Villa Park, Orange County. A spring fruit weighing 10 to 16 ounces. Weight of three fruit samples, 10 1-2, 13 and 16 ounces. Weight of seed 1 5-8, 1 3-4 and 1 3-4. Fruit pear shape to oval. Color light yellowish green, turning partially brown. Flesh clear, bright yellow with merely a trace of fiber, quality excellent, with a good, rich and agreeably distinctive flavor. The tree was 18 years old when it bore its first crop.

Dickey.—A spring ripening fruit, pear shaped, fine looking, red, turning to reddish purple in color, with bright clear yellow flesh, free from fiber and having one of the smallest seed known as compared with the flesh. The quality and flavor has been the very best. Because picked out of season, or for some other reason, some of the fruit sampled last year was not quite as high in flavor as before. The size in three-quarters of a pound to a pound.

Nimloh.—Sampled November 30, 1921, had a growth of the seed showing it past proper maturity; shape broad oval, rough skin with small warts, dark green in color with many yellow spots. Weight 33 ounces, seed one and one-half ounces; no fiber smooth quality, very good flavor and good keeping quality. In another sample tested the flavor was much lacking in richness.

Panchoy.—Tested December 2, 1921. Shape obovate, weight 30 ounces, seed two and eight-tenths ounces; skin dark green to purple, one-eighth to three-sixteenths thick and slightly rough; flesh yellow to green at the edge; quality very good, flavor somewhat strong on account of over ripeness. Keeping quality good.

TEACHER TRAINING COURSES IN AGRICULTURE

Special summer courses in agriculture will be given by the state university at the Davis branch, June 26-August 5. These are designed to prepare teachers of agriculture to meet certification requirements of the state board of education.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.
Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When queries are wished in Cultivator address query to 317 Central Ave., Los Angeles.

Improving County Road

Have people living on a road any legal means of compelling the county to grade and gravel it? In reply to application to the supervisors they have repeatedly stated that there are no funds.—Subscriber, Stockton.

It would seem that your only remedy would be to have a new board of supervisors elected who would provide for your road needs. It is necessary that power of this nature be vested somewhere. It is not only a question of putting in the road but of raising taxes to pay for it, and the law has vested that power with the board of supervisors. The court could not very well order the levying of taxes for putting in a road as such matters involve practical judgment, rather than judgment on the legal points.

Collecting Wages

Men are hired for two week's work. They fail to receive their pay. Then they are hired to continue the work. Part of them receive pay, part do not. What can be done?—Subscriber.

Those who do not receive pay could take the matter up with the state labor commissioner or his deputy, who is empowered to take criminal action as well as civil, or all of the members not receiving pay could assign to one member and he could bring action to collect, in which he would be entitled to receive the amount due as well as costs and attorney's fees.

Deed by Incompetent Person

Is a deed legal when signed by a sick and mentally incompetent person?—Subscriber.

The deed is valid unless proceedings are taken to set it aside. What the nature of such proceedings would be and who would be entitled to take them would depend on the circumstances of the case.

Collecting from Corporation

Two parties are in business as a corporation. They give note as part payment for goods and individually guarantee the note, waiving demand and protest. What could be done to collect upon the note, it being understood that the corporation has been dissolved?—Subscriber, Denair.

In the question there appeared to be some uncertainty as to whether it was a corporation or a partnership. If it was a corporation suit could be maintained even without the guarantee against each of the members of the corporation for that proportion of the obligation which the amount of stock owned by the party bore to the total issue of the capital stock of the corporation. If it was a partnership then action could be taken against either of the parties for the full amount of the obligation. As the note was guaranteed by each party and demand and protest waived in writing, action can be taken against either or both of the parties for the full amount of the obligation.

Support of Destitute Person

A destitute old lady has sisters and a brother, also grandchildren. Who is liable to contribute to her support?—Subscriber.

The rule of the Civil Code is to the effect that children of any poor person who is unable to maintain herself by work may be required to maintain her to the extent of their ability. This does not seem to cover the case here, but there is a provision to the effect that the county or city and county may recover sums paid for the support of such person from the relatives. It would doubtless be necessary for you to take such matter up with the district attorney of your county.

Division of Property

My brother died recently, leaving property. There is a widow but no

Every atom of "Red Crown" mixes with air FOR POWER

"The gasoline of quality" is 100% POWER. It is refined to vaporize thoroughly. Every atom of it mixes in the carburetor with from 12 to 16 times its volume of air for POWER. With "Red Crown" you get ready starting—rapid acceleration—greater mileage—a continuous stream of power.

Run your car on "Red Crown" and *nothing else*, and you won't have to bother with carburetor adjustments. It is uniform in quality wherever and whenever you buy it.

Fill at the Red Crown sign—at Service Stations and garages and at other dealers.

will. Is it necessary to have administration of the estate, and what division would be made of the property?—Subscriber, Tejuanga.

Administration of the estate undoubtedly would be necessary. The division would depend upon the nature of the property. If the property or any part was community property the wife would be entitled to receive one-half; in case there are children the remainder of the estate would be divided two-thirds to the children and one-third to the surviving wife, or if there is only one child, one-half to the child and one-half to the surviving wife. In case there are no children, one-half to the surviving wife and the remaining one-half to the decedent's father and mother in equal shares, or if either is dead then the whole of said one-half to the other, and in case of pre-decease of both father and mother then one-half goes in equal shares to the brothers and sisters of the decedent.

and to the children and grandchildren of any deceased brother or sister by right of representation.

Ran Over Lease

I rented land for cattle and when my term of lease was up it took ten days to find them. The land owner now wants pay for the time they were there after the lease.—Subscriber, Winters.

If you leased the land for a definite period of time you should have gathered your cattle together so as to vacate the land at the expiration of the lease. Not having done so the owner is entitled to receive the additional pay.

Unsigned Question

If inquirer at San Gabriel who asks about cavies will send name and address we will take up the matter.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

New Zealand Reds

Would you please write a brief history of the New Zealand Red rabbit.—Subscriber, Acampo.

To write a history of the New Zealand is to profess to be wise and to provoke much discussion. Some breeders profess to have bought from sailors in San Francisco harbor rabbits brought by them from New Zealand ports. They were then a dirty white with a red tinge, black hairs mixed in the back and hind quarters, white bars on front feet and much black lacing on ears, large white circles around eyes. A Scotchman also claims to have raised them when a boy and they then called them the "Sandy rabbit" on account of color. But be that as it may we Western fanciers have taken them and by line breeding and expert judgment perfected the beautiful Red New Zealand of today. As with the Red so with the white New Zealand. Many claim to be the originators, but they are Albino sports from the Reds. The writer has a nice lot of them and his first pair of which he still has the buck were litter brother and sister from line bred Red New Zealand. There is no variety of rabbits today that for meat, fur and fancy can beat the Red or White New Zealand, no matter what their origin, so we must take them as they are and be content.—W. D. W.

Canker in the Ear

Answering subscriber at Burbank who asks for treatment for canker in dog's ear S. R. Symonds writes:

"We raise Fox terriers and can say this that olive oil will cure canker in the ear. Slightly warm the oil and put one-half teaspoon in the ear twice a day."

Having had recent experience of the same trouble and found a successful remedy I am anxious to give information regarding same. Get some Aromatic Chlorazene powder and drop a tiny pinch, or what one could hold on the point of a penknife, into the ear about twice a week, using no other treatment. Three or four treatments with the Chlorazene will be sufficient to complete a cure.—Mrs. Dorothy Rambo, Sebastopol.

Comphorated oil will slick the ear out with one application for rabbits. I believe it will do so with dogs. Six to ten drops.—Subscriber, Loma Linda.

Sergeant's canker wash will cure the dog, no matter how bad the ear is. If subscriber cannot get this locally any wholesale druggist in city would have it.—Mrs. M. H. Warfield, Corning.

Sulphuring Grapes

Will you please tell me if sulphur hurts vines just before they bloom? Last year bunches had different sized grapes, some claim due to sulphuring at the wrong time.—Subscriber, Ontario.

Sulphuring grapes during the bloom-

ing period should not affect setting of fruit. In fact, many people believe that sulphuring during the bloom is advantageous, the theory being that the sulphur slightly dries the pollen, thus making it more easily distributed by the wind. Poor set of fruit may be caused by a number of things, among them being rapid changes in weather at or during the blooming period, improper irrigation, or weakness of the variety. The Muscat, for instance, is notorious for poor setting.—F. K. H.

Poisoning Rabbits

Would like to know how to save young grape vines from rabbits without fencing. How can I poison them?—Subscriber, Cucamonga.

As the green grass disappears the rabbits are very fond of watermelon rinds, pieces of apple or other bait, which may be poisoned with strychnine. The formula for poison grain, recommended for squirrels and rabbits is: Barley (clean grain), 16 quarts; strychnine (powdered alkaloid), one ounce; bicarbonate of soda (baking soda), 1 ounce; thin starch paste, $\frac{3}{4}$ pint; heavy corn syrup, $\frac{1}{4}$ pint; glycerin, 1 tablespoon; saccharin, 1-10 ounce. Mix thoroughly 1 ounce of powdered strychnine and 1 ounce of common baking soda. Sift this into $\frac{3}{4}$ pint of thin, hot starch paste and stir to a smooth, creamy mass. (The starch paste is made by dissolving 1 heaping tablespoon of dry gloss starch in a little cold water which is then added to $\frac{3}{4}$ pint of boiling water; boil and stir constantly until a clear thin paste is formed.) Add $\frac{1}{4}$ pint of heavy corn syrup and 1 tablespoon of glycerin and stir thoroughly. Add 1-10 ounce of saccharin and stir thoroughly. Pour this mixture over 16 quarts of clean barley and mix well so that each grain is coated.

Drying Figs

Would like to know how figs are dried as I have four or five trees.—Subscriber, Mayfield.

Mission figs are dried on trays in the sun. No further treatment is generally necessary. The second crop of the Adriatic and Smyrna is the only one of sufficient size and importance to be of value for drying. The limp and partly dried figs drop naturally or are lightly shaken from the tree and are picked up within three or four days since an inferior product results from too long exposure to the effects of sun, dust and insects. The figs are spread on trays after which the Adriatics are sulphured to bleach the skin and improve the appearance. Sulphuring in lug boxes is often practiced but does not give as uniform or as good results as on trays. Smyrnas which are properly handled should not require sulphuring. Adriatics are dried in direct sunlight from one to three days depending upon the heat and humidity, while Smyrnas are best dried by stacking the trays one above the other so as to allow free circulation of the air between. Over-dried figs become tough, woody and inferior. After sorting out the bird pecked and split fruit, the figs are dumped from the trays into perforated boxes or containers, washed for 20 minutes in cold water containing four ounces of salt to the gallon of water, and again

You Can Use Universal Brand Sprays With Confidence

Universal Brand Sprays are specially made to save citrus groves from Red Spider, Citricola and Black Scale. Everywhere trees have been sprayed with Universal Brand products these destructive pests have been promptly controlled.

Here is the spray you should use now. It will clean your groves, and stimulate the trees so the fruit will mature earlier.

B. T. S. 15 lbs.	per 200 gal. tank.	B. T. S. 12 lbs.
TRIUMPH 1 1/2 to 2 1/2 gals.		TRIUMPH 1 gal.
K-SEEN GLUE 1 lb.		K-SEEN GLUE 1 lb.
(for citricola and black scale)		(for red spiders)

(patented formulas)

4 Gals. Lime Sulphur Solution can be substituted for the above B. T. S. dosage.

The economy of Universal Brand Sprays is not realized only in the crops that are saved and bettered, but also in the purchase price. Our prices have always been consistently low.

Be sure to call on Mr. Herbert, our assistant entomologist, if you have a special problem regarding your grove. He can be found at our Los Angeles office.

spread out for a final drying of half a day in the sun. They are then placed in piles on a clean floor or in sweat boxes, where they are allowed to go through a sweat for about two weeks, being turned with a shovel two or three times during that interval. Sweating equalizes the moisture and gives the product a better texture. The figs can then be stored for packing, to prevent infestation by insects.

Japanese Pear Stock

I have eight acres in two year old pear trees on Japanese pear root. Since planting these I have been told that the pears on Japanese root will not thrive on heavy, damp ground, that in a course of three to five years they will commence to die. Can you give me any information in regard to them?—Subscriber, San Jose.

We do not think you have any cause for alarm. Japanese roots are considered as good as any and adapt themselves to as great a variety of soils as any pear stock used in California. It is also as resistant to pear blight as any.

Potato Disease

Last year my potatoes had some kind of a disease and I did not know what to do and I fear it will come again. They simply withered and dried when they were half grown. Please tell me what to do for them.—Subscriber, Nevada City.

This is no doubt rhizoctonia and nothing can be done to growing crop to alleviate trouble as it is carried by the tubers. The control lies in dipping the seed potatoes, if dormant, in a solution of formalin, one pound to 30 gallons of water. If sprouted, the formalin may injure the sprouts, therefore dip in corrosive sublimate, four ounces to 30 gallons of water. With either dip allow the potatoes to soak one and a half hours.

Tomatoes Damping Off

Would you please tell me what is the matter with my tomatoes and what to do for them. They were set out two weeks ago where tomatoes have never been grown before on nice new ground. After they were planted about three days there was a slight frost. The plants looked real nice and green when planted. At first they turn yellow and the stems turn pale and wilt and die. They also have little black bugs on them but they just seem to eat the leaves. These same bugs eat up the turnip leaves also. But I do not believe these bugs have anything to do with the tomatoes dying. Could they have had too much water when set out? The roots were nice and large when planted.—Subscriber, Carlotta.

Your plants are merely "damping off," caused by a fungus for which there is no help in the field, and it is a difficult trouble to control at any time. It is much more common in the seedbed and seldom extends to the field. Cold weather with too much water are the contributing causes. Drying out the soil is the remedy and sprinkling air slaked lime on the surface will hasten the drying. Some claim sprinkling with sulphur will aid, but if so the action is dependent on dry heat. A weak Bordeaux mixture, three pounds of lime, three pounds of bluestone and 50 gallons of water, may be sprayed over plants and soil. It is unusual for damping off to occur where tomatoes have not grown before. If very bad let plants go and start in new place, preferably where soil has been turned over and thoroughly dried.

Rose Troubles

Will you please have the enclosed rose leaves examined. You will see the eggs around the edge. The leaves wilt and the flowers do not mature. A reply in your valued paper will be greatly appreciated.—J. W. H., Anaheim.

A careful examination reveals no disease except slight discoloration by black spot, which is controlled by sulphur. No eggs are in evidence and if present must have dried with the leaves, which were very dry when received. The grayish appearance of the leaves suggested red spider and the eggs may have been present. Sulphur will also get rid of the spider, but gardeners control it by daily morning or evening spraying of bushes with water from the garden hose.

General View of Don Pedro Dam

This was taken April 11, and work at the present moment has been carried well up the canyon side, almost to the tower supporting the cable across the canyon. The old miners flume built some 60 years ago is shown on the left bank of the stream. It is rumored that as a youngster John Hayes Hammond did some of his first engineering on this flume. It is now carrying some 66 second-feet of water. Its usefulness will be destroyed when the dam is completed. This photo was taken by L. S. Brooks who has been connected with the drafting and more important work on the dam since its earliest beginnings.

DON PEDRO DAM.

(Continued from Cover.)

This conveyor is easily swung over a distance of several hundred feet.

To operate the various valves, controlling outlets for water for irrigation, for power purposes or for safety, there are chambers and corridors running through the entire structure. These halls and stairways aggregate in length about three-fourths of a mile. Near the center of the picture may be seen a slanting wooden tube which will be surrounded by concrete, and later form one of the stairways. The spillway is around the farther end of the dam.

It is a wonderful structure and an inspiration. Especially should it inspire the rest of us to closer cooperation in saving the flood waters which are now wasting and tearing fertile lands.

RAILROAD WAGE CUT

Following ten per cent freight cut announced a few days ago comes news of a 13.2 per cent cut in wages of approximately 400,000 railway employees. The cut is effective July 1 by decision of U. S. Railway Labor Board.

HUDSON

The Coach
\$1795

Has the Wonderful New Hudson Motor

This beautiful closed car is the most attractive value ever offered by Hudson.

See how fully it meets your closed car requirements at a saving of perhaps \$800 to \$1500. Think of a closed car on the famous Super-Six chassis, for \$1795.

Hudson's Greatest Value

It is less than 6 per cent above the cost of the Hudson open models. It is the lowest differential between open and closed cars ever attained.

It is a sensational achievement in car manufacture.

And now it adds a new and greater motor. Even Hudson owners marvel at the change. Performance is wholly altered—smoother, quieter, more reliable.

Order Now to Insure Prompt Delivery

The Coach is certain to be the most popular type Hudson ever built. Be sure to see it and take a ride. It is just out. Early deliveries will be possible only for those who place their orders at once.

Phaeton \$1695 7-Pass. Phaeton \$1745 Coach \$1795 Cabriolet \$2295 Coupe \$2570 Sedan \$2650. Freight and Tax Extra.

THE FLAG

(Flag Day, June 14.)

There's no coward stripe upon it,
And no shame is written on it,
All the blood that's in its crimson
Is the blood of manhood true;
There's no base and brutal glory
Woven sadly in its story,
It's a bright flag, and a right flag
And the flag for you and me.

It's a flag without a fetter;
It's the flag of manhood better;
It has never done a mean thing,
Never waved about a brute;
Greed and hate it never snielded,
Unto wrong it never yielded,
It's a fine flag, a divine flag
That in reverence we salute.

It's the flag of all the glory
That is written in man's story;
It's the emblem of his freedom
And the hope of men oppressed;
It asks no disgraceful duty,
Never stains with shame its beauty,
It's a pure flag, and a sure flag,
It is our flag and the best.
—The American Boy.

THE LOST CARD

By Clara Peterson

DANNIE DICK had been left alone with grandma. He and mother had been visiting at grandma's old stone house for a week so this quiet afternoon when Dannie asked for another story, grandma just laughed and shook her silvery head and said:

"Dannie, I have told you every story I can remember. This time you will have to tell me exactly what kind of a story to tell and what to tell it about. Perhaps if you help me enough I can think of one."

Dannie began to walk around the big room. He meant to find something to make into a story. He went right past the spinning wheel for he knew all about that. He went past the angel painting too. He even passed the rack of old time swords and guns for he had heard four stories about them. He stopped before the little cabinet which stood in the corner and had bright panes of glass for doors.

"I am sure there must be something here I haven't heard about," said Dannie to himself, and he bent down and looked way back on the bottom shelf.

Sure enough, there was a plain black box, not very large and not very small.

Grandma nodded when Dannie asked whether he might take it out, and very carefully he carried the box over to where grandma sat between the windows with sunlight and yellow jonquils shining all around her.

She lifted the cover. There was nothing at all in that fine black box except a smaller box of shiny yellowed pasteboard. The pasteboard box was empty and it was creased and bent and torn. Across the top of it in golden letters was written the word "candy."

Grandma leaned back and closed her eyes and Dannie Dick knew that she had thought of a story without any help at all.

"Once long, long ago, Dannie Dick, your grandma was a funny fat little girl with curls she hated to have brushed just as baby sister does now. One day in June that funny fat little girl got out of bed with a hop, skip and jump and danced and sang until her mother and father said that it really made them dizzy to look at her. Do you know why she was so happy? Because it was her birthday and her best friend was coming over and there was a most enormous cake with five candles.

"That night the table was set with the very best buttercup dishes and the cake stood in the very center of it on the loveliest lacy doily and the little girl friend in her best white dress came knocking at the door but the funny fat little girl whose birthday it was, wasn't anywhere to be found.

"Her mother looked and called. Her father came in and he looked and called too. He had brought a guest for supper, a tall, thin man with eyes that smiled and a mouth that was sad. Pretty soon everyone grew worried and the father put on his hat and said, 'I shall go and look until I find her.'

"But just then there was the sound of a great many little feet on the front veranda, and the door flew open and the funny fat little girl bounced in carrying a baby, quite a thin, sorry

looking little baby. Behind them came other children of different sizes like the schoolhouse steps; three boys with faces not very clean and old, old clothes, and two big eyed little girls who tried to hide behind their brothers.

"The funny fat little girl began to talk, 'Oh, mother, what do you think? These are the new Smith children down the street and they've come to my party. I'm so glad. I just ran to the corner to see whether father was coming and I stopped to pick their baby out of the mud for he was crawling away, right into the road. Then we all got acquainted and you'd never guess the rest! Not one of them has ever had a birthday cake so their mother said they might come and eat some of mine.'

"Then what a bustle there was. The funny fat little girl's mother got five extra chairs and a high chair for the baby and she made all the children laugh with the funny things she said. And pretty soon everyone sat down. I don't think anyone, Dannie Dick, ever ate a better supper than that. The funny fat little girl was so happy that she kept looking up and smiling into the eyes of the tall thin man who had been placed next to her.

"'You have such a hard name to remember,' said the funny fat little girl.

"'Yes, it is hard for a tiny tot like you,' said the man, and smiled. 'It is Abraham Lincoln.'

"After the cake had been eaten, even every crumb of the lemon frosting, the children went out into the yard and began to swing for it wasn't quite dark, and the two men took a little walk. They got back just as the Smith children were leaving.

"'We hurried,' said the tall thin man. 'I wanted all of the children to have a bite.'

"He handed a box to the funny fat little girl; this box, Dannie Dick, only it was white and shining then. She opened it. There were ever and ever so many pieces of candy, twisted molasses candy, the kind that tastes like butter and spice. All of the Smith children went home chewing as hard as they could.

"As for the funny fat little girl she was very happy. There was something that was all her own. She had found a card in the cover of the box, a square white card with something written on it,

To Deborah Wood, a little girl who is kind, from Abraham Lincoln.

"Down in the corner of the card was something so cunning, Dannie Dick. I wish you could have seen it, a little bird made of feathers, three feathers. I can see them now, red and green and brown. Someone had drawn a beak at the top of the feathers and little legs which stood upon a painted branch. The funny fat little girl kissed the feather bird and crooned over it. She went into the parlor, this very room, Dannie Dick, and later when she practiced her music lesson she put the precious card up beside the music. Her mother called her for a moment, and when the funny fat little girl came back the card was gone. She never saw it again."

"Oh, dear!" sighed Dannie Dick for he felt so very sorry about the card.

"Someone is knocking," said grandma opening her eyes. "Please open the door, Dannie Dick."

It was the piano tuner. He spoke very politely to grandma and walked over to the old piano. Dannie Dick watched him take it apart. Off came the front and there were the shiny steel strings, like a hundred harps thought Dannie Dick.

The man sat down and began to play "My Bonnie Lies Over the Ocean." It sounded very loud.

"Well, well!" said the man, smiling at Dannie Dick. "Here is a key which goes clickity click—and here is another. I shall have to take out the keys. Something has been nibbling at the tapes on the keys. I shouldn't wonder if we found a mouse nest."

Out came the keys. "First time they've ever been out," said the tuner, putting them down very carefully all in a row on a paper on the davenport. "And here my boy, is—"

"The mouse nest!" cried Dannie Dick.

He was standing on tiptoe and peeping down under where the keys had been. There was a great deal of old, old dust which smelled faintly musty and almost in the middle of the piano was the nest. It was round and looked just like a bird's nest except that it was loose. It was made of bits of white paper and red fuzz, yes, and chewed pieces of tape too, all gray and dusty now. But the nest was empty. The baby mice had grown up and gone away. Perhaps they had taken one good look at grandma's big yellow cat and had never felt safe afterward.

"Oh!" said Dannie Dick disappointedly. "I wanted—"

Then he stopped. The tuner was bending over his bag of instruments but Dannie Dick was staring with wide brown eyes at something yellowish white which stuck closely to the block at the end of the keyboard, something which had been just out of sight next to the very highest key on the piano. It was only a square of cardboard. But, there was a bit of red and a bit of green and a bit of brown showing on the corner of it, and as the summer wind blew the curtains back and forth the tiny colored feathers stirred gladly for they had not felt the breeze for many and many a year.

"Grandma!" cried Dannie Dick. "Here is your Abraham Lincoln card!"

So grandma, smiling very gladly now, had to tell all over again the story of the bird card in her hand.

SOME OF MY FAVORITE RECIPES

By Maud Marxmiller

Orange Marmalade

Three large oranges, 2 lemons and 1 grapefruit. With sharp knife cut yellow part of rind off oranges, being careful not to get any of the white. Cut the rind into thin strips with sharp scissors. Remove all the remaining white on the oranges and discard as this is what gives the bitter taste so many dislike in orange marmalade. Cut the pulp into pieces and be sure no seeds are left in. Add flesh of lemons and grape fruit. Take $1\frac{1}{2}$ pints water to each pint fruit. Boil 30 minutes then take $1\frac{1}{2}$ pints sugar to each boiled pint of fruit. Let this boil until it jellies. This will make 10 or 15 glasses. Select the best oranges, tart if possible.

Currant or Plum Conserve

Five pounds currants or plums, 1 pound raisins, 5 pounds sugar, rind 4 oranges, 1 pound nuts, rind and juice of 1 lemon. Remove outer yellow rind of oranges and cook in water 20 minutes, then chop with raisins. Boil currants or plums ten minutes, then add sugar and other ingredients. Cook ten minutes and put in jelly jars.

Chili Sauce

Seven pounds tomatoes, 5 large onions, 6 green peppers, 1 bunch celery, 1 tablespoon cinnamon, 1 tablespoon allspice, 1 tablespoon cloves, 1 tablespoon ground nutmeg, 1 pound brown sugar, $1\frac{1}{2}$ cups vinegar, salt to taste.

Delicious Dark Cake

One cup butter and lard scant, 2 cups brown sugar, yolk 2 eggs, 2 cups sour milk, 3 cups flour, 1 cup chopped raisins, 1 tablespoon cinnamon, $\frac{1}{2}$ teaspoon cloves, 1 teaspoon nutmeg, 1 heaping teaspoon soda dissolved in a little hot water.

Potato Flour Cake

Four eggs, $\frac{1}{2}$ cup powdered sugar, $\frac{1}{2}$ cup granulated sugar $\frac{1}{2}$ cup potato flour, 1 teaspoon baking powder. Flavoring and salt to taste. Beat the whites stiff and add $\frac{1}{2}$ cup powdered sugar and beat the yolks and add the granulated sugar. Mix together and add flour and baking powder.

Macaroons

Two eggs, beat whites stiff, 1 cup sugar. Beat again. $\frac{1}{2}$ pound coconut. Add about $\frac{1}{4}$ cup flour or as much as needed. Add flavoring and salt to taste. Bake in very slow oven until golden brown, or about 20 minutes.

Sponge Cake

Four eggs well beaten, 2 scant cups sugar, 2 scant cups flour, 2 teaspoons

baking powder, 2-3 cup hot water. Flavoring and salt to taste.

Pound Cake

One pound sugar, 1 pound butter, 10 eggs. Beat yolks and whites separately. Cream butter and sugar, 1 pound flour, 2 pounds raisins, $\frac{1}{2}$ pound citron. Nutmeg. Add the whites last.

HINTS FROM HOUSEKEEPERS

Bran-Oatmeal Muffins

These are an accidental discovery but they are going to happen many times in our household because they are "lickin' good."

One cup bran, half cup rolled oats soaked in one and one-half cups milk for several hours. When ready to make add 3 eggs, 1 tablespoon honey, pinch salt, 1 cup white flour. Beat up quickly and lightly, add 1 heaping teaspoon baking powder, 2 tablespoons shortening. Put in well greased hot muffin pan and cook in moderate oven. These are almost a meal in themselves. With the addition of coddled eggs and strawberries they are perfect—if you make enough of them.

Walnut Catsup

Do Cultivator readers know what a delicious addition to salad dressings, creamed fish, creamed soups, sauces, etc., walnut catsup is? It is something on the order of Worcestershire, but not hot and has a rich, mellow flavor.

Fine Brush Gets the Dust

One of my most prized household helps—if not my dearest—is a fine, long bristled paint brush which is kept religiously dedicated to the cleaning of corners where the dust will lodge. No amount of careful dusting or poking with broom or the ordinary brush will reach the little corners of baseboard, window casings, etc., but these long, soft bristles whisk the corners out so quickly and leave them so clean and respectable that I wouldn't swap my brush for a whole pile of silver dollars. Try it yourself—I mean owning one.

An optimist is one who expects to do something tomorrow; a pessimist is one who was done yesterday.

HOUSEHOLD QUERIES

Farmers Cake

Can someone tell me how to make "Farmers Cake?" When I was a little girl I used to taste it at a neighbor's house and thought it was the best cake I ever had. Maybe it wouldn't taste so good now, but would like to try it.—Subscriber, Pasadena.

Dissolve level teaspoon soda in 2 tablespoons warm water. Add $\frac{1}{2}$ cup molasses. Mix and add very quickly 1 cup sour cream, 1 cup sugar, 1 tablespoon cinnamon, $2\frac{1}{2}$ cups flour and beat about 5 minutes. Then stir in one cup seeded or seedless raisins that have been dredged in $\frac{1}{2}$ cup flour. Bake slowly for one hour. Make boiled icing to cover and scatter chopped nuts thickly over it while icing is warm.

Potato Pie Crust

I would like very much to find out how to make potato crust for meat pies.—Subscriber, Pleasanton.

One quart finely mashed potatoes, 3 tablespoons shortening, 2 teaspoons

Four Million Women Cook on the NEW PERFECTION

Have you seen the latest?

The New PERFECTION Oil Range with SUPERFLEX Burners that cook as fast as gas. You can tell it at a glance—its chimneys are a beautiful, soft French-gray instead of the familiar New Perfection blue chimneys on the stove pictured here.

Ask your dealer about this handsome, sturdy super-range and its revolutionizing new SUPERFLEX burners.

MANY of your neighbors cook three meals a day on the New Perfection—and are delighted with the results.

The New Perfection has many advantages that appeal to the busy housewife. Its quick-heating Blue Chimney Burners light at the touch of a match and start meals off promptly. Its cooking heat is always clean—doesn't blacken pots or pans. And the flame stays where you set it.

Let your local dealer show you the many features of the world-famous Blue Chimney New Perfection and its ease of operation. He will also gladly show you the perfect baking New Perfection Oven and Aladdin Utensils in aluminum and enameled steel.

THE CLEVELAND METAL PRODUCTS COMPANY

NEW PERFECTION Oil Cook Stoves & Ranges

salt, 1 teaspoon paprika, 2 teaspoons baking powder, 1 teaspoon grated onion, 1 well beaten egg, 6 tablespoons milk. Beat thoroughly to mix and then spread in layer about one inch thick on meat pies. Brush top with milk and bake in moderate oven 35 minutes.

Cinnamon Doughnuts

Will some one please give recipe for making cinnamon doughnuts.—Subscriber, Riverside.

These are made with buttermilk and are delicious. One cup buttermilk, two tablespoons shortening, one egg, one cup sugar, one teaspoon soda, one teaspoon cinnamon and if liked one-half teaspoon ginger. Beat to mix and add five cups sifted flour, two teaspoons

baking powder and work to smooth dough. Roll out half inch thick on well floured pastry board, cut and fry golden brown in hot fat. Roll in sugar plentifully sprinkled with cinnamon.

Brioche

Please tell me what brioche is and how to make it. My boy talks so much about the brioche he got in France.—Reader, Lincoln.

Brioche is made from bread dough with a little sugar added then molded in loaves and baked like bread. A light, porous bread is used. They are then prepared in various forms. When cold loaves are sliced and slices steeped in orange syrup. Or the slices are spread with jam and covered with icing. Or steep in syrup, then dip in

batter and fry golden brown in hot fat, spread with jam and serve with orange or lemon sauce. There you are: It seems to be a case of trying out and finding the combination you like best. Directions for making French bread are given in the Cultivator of April 1.

SOME HOUSEHOLD HELPS

By A. M. H.

Some of the best household helps we have are just simple things that are found in every kitchen, such as fine ashes, salt and soda.

To make a cement which never fails take equal parts of soft putty, finely sifted ashes and sifted table salt. Mix thoroughly and pack well into holes in pans, then place the pan on a warm stove with a little water in it until the cement hardens. Fill broken places in plastered walls with the mixture and smooth with a knife.

The steel of the range, steel knives or any article of steel can be highly polished by rubbing with fine ashes moistened with coal oil and then rubbing with a dry cloth. To polish nickel on stoves, take cold wood ashes and mix with enough cold water to make a paste. Apply with a cloth. When dry polish with a dry cloth.

To remove grease spots from carpets and woolen goods dissolve a teaspoon of salt in a pint of gasoline and apply with a cloth or soft brush. To remove ink stains from white goods cover the spot with table salt, wet with vinegar and rub, and for iron rust stains rub with lemon and salt and hold the spots over steam from a boiling kettle.

The color can be set in nearly all nice wash goods by soaking in salt water and then washing the garment in warm suds in which a tablespoon each of borax and salt is dissolved, and use this also in the warm rinsing water and put a little of this mixture in the starch to make the ironing easier.

Machine grease spots can be removed if washed in warm rainwater and soda, and a faded dress can be made perfectly white by boiling in strong suds with a little soda added.

If any one of the family has catarrhal trouble, an excellent spray for the nostrils is made by dissolving a teaspoon each of salt, soda and borax in a pint of water, and if there is an acid condition of the system that causes the skin to itch, this solution will be found very soothing. The solution without the soda makes one of the best gargles for the throat, and if used daily many serious throat ailments may be cured.

A little soda put in water in which meat and vegetables are boiled will make them tender, besides hastening the cooking, and such acid fruits as gooseberries and plums will take less sugar to sweeten if a little soda is put in first. You can keep small ants out of the pantry by sprinkling soda where they run.

MARKETING LIMAS WITH ASSOCIATION PAYS

Richard Bard, general manager of the Berylwood Investment Company owning more than 5,000 acres which are planted to Lima beans this season, has supplied the California Lima Bean Growers Association with a statement of facts that set forth most conclusively the benefits to be derived from cooperative marketing.

"On the five-year basis cooperation in the Lima bean business wins in a walk," says he. "Our cost accounting system has been carefully kept and it shows that in the six years from 1916 to 1921 inclusive, our average return for Limas through the California Lima Bean Growers Association was \$7.69 per 100 pounds. These figures are based upon the conclusion that the 1921 crop will bring us about six cents per pound.

"Checking back over our Lima bean sales from 1912 to 1915, inclusive, a period of four years prior to the formation of the association, I find that Limas brought us an average price of \$4.85 per 100 pounds. The differential in favor of cooperative marketing, with one lean year after the war to offset one fat year during the war, is \$2.85 per 100 pounds."

Following are the comparative figures from Berylwood Company's books showing prices received for Limas under four years of independent

marketing and six years of cooperative marketing:

Prices from independent sales.—1912, 5 cents; 1913, 4.775; 1914, 5.07; 1915, 4.50; average, 4.84.

Prices from association sales.—1916, 4.97; 1917, 11.06; 1918, 9.15; 1919, 9.56; 1920, 5.40; average, 7.69; 1921 price will probably average 6.

"It should be borne in mind," Mr. Bard adds, "that the prices received during the four years we sold Limas independently did not include insurance, storage, and taxes, whereas the association prices fully covered those expenses."

PINT STRAWBERRY BOX STANDS

Constitutionality of the California fruit and vegetable standardization act is upheld by decision of the state supreme court in action brought by a San Francisco Japanese. This Japanese was prosecuted for persisting in selling berries in containers less than standard size as prescribed by the standardization act. He attempted to show in court that the act was unconstitutional.

ATTACK ON ALMOND DUTY

Attack on the tariff schedule on almonds is chiefly directed against the 15 cent duty on shelled almonds as the importers from Southern Europe have a complete monopoly of this business in America. This is the most remunerative part of the almond traffic as 80 per cent of the money spent in the United States for almonds goes into the pockets of importers for the shelled nuts.

LIMA BEAN PLANTING

A preliminary canvass of bean planting operations indicates approximately 96,000 acres planted to Limas, about 13,000 to Baby Limas in the five counties of Southern California. Besides this there are small plantings of baby limas in the San Joaquin Valley. More accurate figures will not be available from the California Lima Bean Growers Association until the middle of July.

THE PREACHER DECLARES

Temptation never bothers the man who has his thought on heaven and his nose on the grindstone.

Insure yourself against scanty size and inferior details.

New Super-Virus Kills Rats & Gophers

Improved Virus, Not a Poison, Quickly
Wipes Out All Rats, Mice, Gophers.

At last, a perfected rat virus that can be depended upon to destroy rats, mice, gophers and other rodents. Anywhere, at any time.

The virtue of any rat virus is in the Danys organisms—disease breeding organisms that affect only rats and other rodents.

Repeated tests of virus made with salt solutions, agar and bouillon as media for carrying the Danys organisms, show that decomposition occurs which destroys the organisms in a few days.

Hunter Super-Virus is made with a different and superior carrying medium. Decomposition does not occur. The Danys organisms, in billions, are kept alive and virulent, even for months, until used. Stands shipping in any weather.

Bait prepared with this Super-Virus is a tempting dessert to the warlike of rats. In a few days they are dead. Meantime the diseased rats foul their runways, spreading the virus organisms and exposing other rats to the disease. The same with mice and gophers. Yet it is harmless to people and all animals except rodents.

LOWEST IN PRICE

Hunter Super-Virus is sold on a positive guarantee. Send only \$1.00 for a 30 c. c. \$2.50 bottle postpaid. Over 20 to 50 times more rat killing effectiveness than an equal quantity of any other form of virus. Or if you prefer, send no money, but pay the postman the \$1.00 and few cents postage when he delivers the package. If not satisfied with results in three weeks, ask for and get back the \$1.00 promptly. Send today to the Hunter Laboratories, Dept. 101, New Nelson Bldg., Kansas City, Mo.

Cooperative Marketing of California Grain

PLAN for the marketing of California grain has been devised by the California Farm Bureau Exchange and is being submitted to grain growers of the state. The exchange is a non-stock, non-profit organization for the purpose of marketing its members grain and to purchase their requirements in larger quantities. Its officers are: C. K. Hardenbrook, Salinas, president; J. J. Hollister, Gaviota, vice-president. In addition to these two the board of directors is composed of W. H. Walker, Willows, president of the California State Farm Bureau Federation; T. A. Kilkenny, Dixon; A. E. Lindstrom, Oakland, president of the California Farm Bureau Elevator Corporation; W. L. Hagg, fruit grower of Hanford; I. L. Borden, San Francisco; J. H. Hauschildt, Santa Cruz; and Harry W. Thomas of Merced.

The exchange is incorporated under the laws of California and was organized to act as a central organization for the various farm bureau exchanges. Any growers in California can take advantage of the opportunities offered.

This has been accomplished by entering into an agreement with Messrs. George Willis & Sons, Ltd., (head of fices, London) whereby they have become the exclusive United Kingdom and Continental distributing agent of California grain for the account of the exchange. This contract provides that George Willis & Sons, Ltd., will work exclusively in the interests of and with the exchange. The exchange, however, has the privilege of marketing its products through any other source provided better prices can be obtained and, of course, may sell to any market in the United States, in which case George Willis & Sons do not participate. The contracts also provide that when shipments for export are made the California Farm Bureau Exchange will receive payment in full therefor upon presentation to its bankers in San Francisco of ocean bill of lading with other necessary documents attached. This eliminates all danger upon the part of the California Farm Bureau Exchange for credit risk as sales will always be effected before shipments are made and this method of payment will prevail. This, therefore, provides a means of securing for the growers the full European price less a slight commission as referred to in growers contract and actual costs of freight, insurance and other necessary charges covering such export sales.

The next step necessary was to secure the services of someone thoroughly familiar with the handling of grains of all varieties for export as well as domestic requirements. The exchange, after due consideration, selected T. E. Morgan to act as general manager. Mr. Morgan was formerly manager of grain department of the Globe Grain & Milling Co., later with Albers Bros. Milling Co., in the same capacity, and for the past two years has been president and general manager of the Morgan Grain Company, Inc.

Any farmer in California can market his grain through the grain department by becoming a member of the farm bureau exchange in his county. In case there is none provision is made in the contract for him to join the exchange in the county nearest his. He must also become a member of the farm bureau in his own county. He must enter into a contract with the county farm bureau exchange whereby he permits it to market his grain through the grain department of the California Farm Bureau Exchange, in a manner which is already thoroughly outlined in growers contract. The various county farm bureau exchanges have agreed with the California Farm Bureau Exchange to market their grain through the channels provided by, and under the direction of the exchange.

There are three ways provided for the grower to market his grain through the California Farm Bureau Exchange; one known as the pooling plan, another whereby the grain is sold at a price named by the grower; and a third, whereby the grain is consigned by the grower to a point selected and sold upon arrival at the highest price obtainable. Where grain is sold un-

der the latter two plans either for direct shipment from the fields, for shipment from storage, or against warehouse receipts, as the case may be, the exchange will advance to the grower 85 per cent to 90 per cent of the sale value of such grain immediately upon receipt of bill of lading or warehouse receipt, deducting any previous advances made, if any, and any balance due to be paid as soon as possible after the final settlement has been received from the buyer. The grower may select any one of these three plans or apportion his grain among the three as he sees fit. He is also privileged to change his selection of plans any year during the life of the contract. The growers contract also provides that the grower may sell his grain through any other source than the exchange after first having secured a release from the exchange for such purpose.

It is not the object of the exchange to make any attempt to create a monopoly with a view of withholding supplies from the consumer, but it is the object to secure for the grower the price the consumer pays for his products, less a reasonable cost of getting it to the consumer.

The grower contract provides that the grower will market through the exchange for a period of six years. The grower, however, may cancel the contract any year after the first year by proper notice.

The exchange charge will not exceed \$1 per ton. Part of the money thus derived will go to the county exchanges for the proper supervision and direction of the movement of the grain received at county points and to expenses of sampling, etc. The balance will go to the California Farm Bureau Exchange to cover operating expenses and for the maintenance of an organization necessary for the proper fulfillment of its obligation as distributing agent for the growers. It should be considered, however, that this service charge should be reduced as the volume of grain marketed through the exchange increases, as the larger the volume the lower proportionately should be the operation expenses. It should be considered, however, that in the event there is a surplus created from this charge which is made by the exchange that this surplus so created will be apportioned back to the growers according to their deliveries to the exchange, as under the manner in which the exchange is to operate the grower will only be assessed the actual cost incurred for maintaining the proper selling organization.

The California Farm Bureau Exchange has completed arrangements for an initial loan of \$5,000,000 with which it will be possible to finance such growers as become members, thereby preventing the necessity of forcing grain upon the market in a disorderly manner at harvest time. The financial arrangements are such that the grower will not be forced to liquidate in three months or in six months as has been the case in the past. Loans will be made in such a manner that gradual liquidation will be permitted as in keeping with orderly marketing.

Meetings are being held in many farm bureau centers of the state, but on account of the near approach of harvest time all centers may not be visited. It would therefore be advisable for the growers who are interested in this movement to communicate with their nearest farm adviser or county exchange with a view of ascertaining whether there is to be a general meeting in that county.

The plan as set forth in growers contract has been presented to the federal reserve, war finance corporation and other of the largest financial institutions in San Francisco and has secured the approval of all. The plan of the organization is along approved lines recommended by the agricultural department of the University of California.

King Korndyke Pontiac 20th Sells for \$8,000 at Burr Farm Sale

Under the direction of the California Breeders Sales and Pedigree Company with C. L. Hughes as pedigree man and Rhoades and Rhoades of Los Angeles, assisted by Col. John A. Davis of Manteca, as auctioneers, the Burr Farm dispersal of Holsteins at Los Angeles on June 1-2 was one of the most satisfying sales that has been held in a long time. The herd had been carefully selected, largely at public auctions during the past three years, and the offering was made up principally of young females who had good yearly records with good records behind them. The Burr Farm has always been an advocate of the long distance record and has had as many yearly record cows as any one in the state.

Together with the splendid herd of females it has been the policy to have the best bulls that money could buy. The first noted bull purchased was Sir Veeman Korndyke Pontiac, a son of Sir Veeman Hengerveld out of a 30 pound cow. This bull has proven his worth by siring many excellent daughters including the world's record three year old milk cow, Princess Malda Veeman, owned by Earl Graham of Compton.

In 1920 Burr Farm paid \$12,000 in W. J. Higdon's sale for King Korndyke Pontiac 20th, a grandson of King of the Pontiacs and out of Miss Valley Mead De Kol Walker who won the first prize in the Holstein Association in 1917-18 with 1113.57 pounds butter in 342 days. She has lately finished a record of 1156.7 pounds butter, which gives her three yearly records of over 1,000 pounds and two over 1,100 pounds. She is the dam of the two bulls, Sir Aaggie De Kol Mead and Prince Aaggie Mead De Kol, owned jointly by A. W. Morris and Sons and Fred Hartsook. King Korndyke Pontiac 20th came into the limelight when as a calf he was sold at public sale by Anita M. Baldwin to Mr. Higdon for \$6500. In Mr. Higdon's possession he was bred to one of the highest class herds of females ever assembled in this state and he got a lot of wonderful calves. He has 18 sons at the head of pure bred herds, which have sold for a total of \$61,200. The most famous of these is King Korndyke Pontiac Acme owned by Mrs. Baldwin. He is the sire of 15 A.R.O. daughters and a number of semi-officials, one of which is finishing a record of 1150 pounds as a junior three year old. The sale of this great tried bull drew many breeders, and it was a tense moment when he stepped into the ring for the third time in his career. There was no question but that he was infinitely more valuable than when he sold as a calf and a great deal more so than when as practically an untried bull he sold for \$12,000, but conditions have changed considerably. Money is not so plentiful as it was in days gone by and a lot of breeders who could afford to pay a long price have, in the past year or so, purchased bulls to head their herds. However bidding was spirited up to \$5,000 where it simmered down to two or three men. He was finally knocked down to Sargent Brothers of Tulare for \$8,000 after Mr. Mosher of the Sunshine Ranch at San Fernando had refused to go farther on him.

As has been the case in every big sale in the past two years Fred Hartsook picked the top female. Tops are the only kind that will fit into the Hartsook herd, and this one will do so nicely. She is Gracia Pontiac Burke, a 33 pound four year old, sired by King of the Pontiacs 14th, and out of a 30 pound cow. A number of breeders wanted her and made her cost Hartsook \$1,500. He also picked another good one in Buddie Promise, a daughter of Sir Veeman Korndyke, Pontiac, for \$1,100.

The second highest female was the beautiful three year old Snowball De Kol Pontiac Lass who has lately finished a year's record as a two year old of 652 pounds of butter and is about ready to calve again to service by King Korndyke Pontiac 20th. She went to the newly formed Glenwood Stock Farm at Riverside for \$1,300. This company was the longest buyer

in the sale taking 21 head, mostly young ones.

The Sunshlne Ranch Company bought six head, paying \$1,000 and over for three of them, the best known being Miss Veeman Witte, a junior two year old who has just freshened and is completing a seven day record of about 24 pounds. She is by Sir Veeman Korndyke Pontiac and is out of lowana Witte one of the first and most famous cows owned by Burr Farm. Miss Veeman Witte cost Mr. Mosher \$1,050.

Lutge Brothers of Burbank, Los Angeles County Farm, the Miller Cattle Company of Phoenix, Arizona, and Frank Helm of Fresno were also among the heavy buyers.

A total of 114 head were sold for \$47,975 at an average of \$420 each. The 109 females which ranged from calves to cows way past their prime, brought \$39,140 or an average of \$359 each. Five bulls sold for \$8835.

This sale teaches that good cows, tuberculin tested and given year records are in demand no matter what the condition that such a herd is potential wealth which can be cashed in at any time.

The sale marks the end of a three year agreement between E. Burr, G. M. Brown and Kenneth Abbott who formed the Burr Farm Company. As the land is being demanded for industrial sites it was thought best to sell all the cattle of breeding age and hunt a place elsewhere. It is not known whether the same combination will be made again but it is a sure thing that all of the men interested will be in the Holstein business.

A list of the purchasers and their buys follows:

THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

"TUBERCULOSIS FREE ACCREDITED HERD"

A tuberculosis free accredited herd is one which has been tuberculin tested in a manner approved by state and federal authorities and in which no animal affected with tuberculosis has been found upon two annual or three semi-annual tests or by physical examination.

A series of additional terms and conditions govern the mode of procedure in the testing work as to who may do the testing, how reactors must be disposed of, directions for disinfecting premises, for isolating calves from accredited herds, etc. Strict compliance with these methods and rules entitles the owner of a tuberculosis free herd to a certificate "Tuberculosis Free Accredited Herd" to be issued by the United States bureau of animal industry and the cooperating state, said certificate to be good for one year from date unless revoked earlier, due to noncompliance on the part of the breeder or cattleman with the conditions as outlined.

Human Hands Can't Compete with This

A user of a De Laval Milker recently said: "I would no more attempt to milk cows without a De Laval than I would try to raise wheat without a binder."

You know that hand labor can't compete with machinery—and yet there is no machine a dairyman can own that will save so much time as a De Laval Milker. Figure up what cutting your milking time in two, twice a day every day in the year, amounts to; and then compare this with the time any other machine you own will save.

But this is just one reason for using a De Laval Milker. It milks cows in the way they like best—vigorously, yet with a gentle, soothing and uniform action which

stimulates the milk-forming organs to greatest production. That's why De Laval users are practically unanimous in their statements that they get more milk with it than by hand milking.

But that isn't all; with the De Laval cleaner milk can also be produced—and cleaner milk is worth more money.

There are thousands of De Laval Milkers in use which are giving perfect satisfaction. Many users state they would sell their cows and go out of the business if they couldn't have a De Laval.

If you are milking ten or more cows by hand you are losing enough to pay for a De Laval. Send for complete information.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Garget

I have a cow that seems to be perfectly healthy but at times there are small lumps in the milk and it will not go through the strainer. Sometimes we have to milk all of one teat on the ground. Please tell us what is wrong and what to do for her to correct the trouble.—Subscriber, Porterville.

The lumpy milk is a symptom of congestion of the udder. Congestion is the forerunner of inflammation and that would increase the lumps and might clog the ducts and ruin a part or all of the udder. Now is the time to cure it. Mix five pounds epsom salts with three pounds common salt and give a large handful of it in the feed twice a day for a week. Also reduce the feed because such conditions are caused by too rich feed and too much of it. Give more green feed. In the future if you notice the lumps in the milk again give a few doses of the salts.

We fancy that circumstances bar success, but no life that does its best through the channels open to it can be a failure.

THE FARM BLOC

(Continued from Page 625.)

portions. You may ship a piano 500 miles on a railroad for less than you will pay to have the same piano carried from a freight station to your home a mile distant. So if the farmer were to attempt city delivery of his own products, he would encounter heavy financial costs all along the line.

There is no law to prevent a Bucks County farmer from slaughtering his steer and hauling the hide and beef into Philadelphia, to market them directly, but in actual practice the farmer could not do as well as he does now by selling his livestock to a local butcher under present conditions.

A national farm conference recently met in Washington at the call of President Harding. Economy was the keynote.

Plans were discussed for introducing economies in raising produce, in borrowing money to carry crops until marketed and especially in furthering methods of cooperative buying and selling.

The Washington conference frowned upon a policy of price fixing by the government, the farmer's short wartime experience having taught him that political meddling is an expensive commodity for everybody.

If the farm bloc in congress can further the work of obtaining satisfactory farm loan facilities and can more especially encourage farm cooperation in introducing economies in both producing and selling, and can widen out school or college accommodation to teach agriculture, it will do a good work. If, on the other hand, it becomes a political machine it will prove a misfortune, because the real prosperity of the gigantic farming industry in America can never be successfully tied to a political leash.

QUARANTINE AND OTHER CONFERENCES AT SACRAMENTO

(Continued from Page 623.)

ing into our organization those authorities in charge of law enforcement work with reference to the great livestock problems of the Pacific Coast states.

"Finally it is exceedingly important that a conference such as this consider with seriousness the relations which should exist between state and federal departments. It is apparent that in some sections of the West there is a feeling of mistrust with reference to the activities of the federal department of agriculture. These feelings of mistrust and suspicion are usually based on misunderstandings. They are avoided when reasonable men sit down together, get acquainted and talk their mutual problems over. There is usually a way out of any difficulty or any misunderstanding, and it is the hope that this, the first of a series of agricultural meetings between the states of the West, will play a part in eliminating them. The relations between the departments of agriculture of the West and the federal department of agriculture should be most cordial. There is a distinct place for each. There is a distinct ground on which we may come together. It is felt that our relations in California with the federal government have been most valuable. We would not dream of interfering with them. We are constantly seeking to broaden and enlarge the scope of our understandings.

"Nevertheless we feel, as you probably feel, that the state departments of agriculture have a distinct group of functions to perform. Those functions should be held sacred and should be carried out to the best of our respective abilities.

"In addition an organization, such as the one proposed, can consider with great profit the relations that should exist between colleges of agriculture and state departments of agriculture.

There is just as much need for conference on this subject as there is in the outlining of our relations with the federal department of agriculture. I might also add right here that in California our relations with the college of agriculture have been most cordial and most valuable and we propose that they continue. There seems to be a general feeling that the functions of the colleges of agriculture should

be educational, investigational, research and extension. It is easy enough, however, to simply talk words. It is another matter to put them in operation. Specific problems create new situations, and it is for this reason that the consideration of such an important question can be had with profit to all of us.

"It is also my feeling that in meetings of this character considerable can be accomplished in determining the future agricultural policies of the west. The departments and colleges of agriculture can and should play an important part in guiding the agricultural thought of the nation. If our policies can be fixed in a large measure in these important conventions we can indeed lay the ground work for accomplishments that have never been even approached before. There is a great opportunity before every agricultural representative present at this conference. If we can weld the great states of the Far West into a homogeneous agricultural organization, working for the same great purpose, I believe that this conference will go down as one of the landmarks in the history of the country west of the Rocky Mountains, just as the National Agricultural Conference called by President Harding in January, has passed into history as one of the epoch making events in our national agricultural industry."

The hearings under direction of the federal horticultural board called forth more oratory in the urgent appeal for more effective work, not in criticism of the quality so much as the quantity of work done at present by federal and state officials. A committee of something over a dozen growers came from San Jose, headed by Mr. McDougal who recently went to Hawaii and studied the Mediterranean fruit fly situation. He had been so startled by the revelations made by fruit growers and the fruits of the Hawaiian Islands that he returned to California and followed the plant quarantine inspectors for one day's rounds in the harbor of San Francisco. He then appealed to Director Hecke for a stronger force to conduct this work. Lack of funds has prevented a material increase in the number of inspectors, hence the growers made appeal for more efficient protection.

A committee consisting of Messrs Coleman and McDonald of San Jose and Dr. Clements of Los Angeles proceeded at once to the office of Mr. Daniels, chairman of the state board of control, and asked the release of a fund sufficient to increase the number of plant quarantine inspectors for the term of 12 months from July 1, 1922 until a new appropriation may be made by the state legislature which will convene in January 1923. The committee was prompt in action and equally prompt in return from the board of control and brought report of refusal on the part of Chairman Daniels. Many California fruit growers present, however, expressed the belief that when the great danger which confronts California's fruit industry is explained

to the board of control it will quickly come to the aid of the industry.

Western Plant Quarantine Board

Representatives of each of the 11 states, British Columbia, Hawaii Lower California and Ottawa, Canada, were present and made reports of quarantine provisions which they were enforcing and of various insect and pathological troubles which affect their own state. One of these which was most interesting was that of H. F. Willard of Hawaii. He described fruit conditions and how they are affected by the most destructive of all fruit pests, the fruit fly. Mr. Willard's address will be given entire in a later issue.

Fertilizer Control

George P. Gray of the fertilizer control and his inspectors held conference with fertilizer manufacturers and dealers. This conference was for the purpose of ironing out many small differences which have existed and was declared by fertilizer people and Prof. Gray to have accomplished its purpose. As a rule buyers of fertilizer are greatly benefited by the provisions of the fertilizer act.

Cotton Conference

The cotton conference ended in a very short time after it was called to order. It was felt that it would be desirable to have Dr. Hunter of the cotton quarantine service present. Adjournment was had and it was decided to hold a conference at some later date "some place in the South."

PRUNING OF FROSTED CITRUS TREES

A series of 19 field demonstrations is being given by the farm adviser of Los Angeles County: Roscoe, La Canada, June 12; Alhambra-San Gabriel, Covina-Charter Oak, 13; Pasadena, 14; Monrovia-Duarte, Azusa-Glendora, 16; Baldwin Park, San Dimas, 19; North Whittier Heights, Spadra-Walnut, 20; Pomona, La

Verne-Claremont, 21; Rivera, Whittier, 22; Downey, 23; San Fernando, Owensmouth-Chatsworth, 26.

A STORY FOUR THOUSAND YEARS OLD

From the days of the pyramids to the present is a long period of time, yet, in those days as at present, paints were used for beautifying and preserving the objects which they covered. In the old days paint was used as a decorative material for the mummy cases. Today it is used to conserve the natural and converted resources of the country.

Painting one's buildings is not an expense. It is an investment. It absolutely insures against depreciation and rotting. It is the only form of insurance that can be guaranteed to perform its duty 100 per cent.

Paints have been high during the last few years but are now down to normal basis. It would seem to be economy to paint now. The Dutch have an old proverb which says "Good paint costs nothing, for it saves more than it costs."

There are many brands of paint on the market and to the consumer all paints look alike. It is only when the paint has been applied to a building for four or five years that the quality is demonstrated. It is too late to regret one's poor choice of paint. It is well to buy the well known, reliable advertised lines.

THOSE PEACEFUL DAYS

The oldest inhabitant remarks: "I can remember when our casualty list was published only on July 5 instead of every Monday morning."—Christian Register.

A 2-month-old cockerel a few hours after being attacked by head and neck lice. Both baby chicks and grown fowls are killed in great numbers by this type of louse.

MINERALIZED WATER ROUTS CHICKEN LICE

A new scientific discovery makes it easy to rid poultry of lice and mites. Simply dissolve in the fowls' drinking water the harmless mineral tablets known as Paratabs. Soon after the fowls drink the mineralized water, all lice and mites leave them. Chicks that drink the water never will be troubled by vermin.

The body louse of chickens.

Paratabs do away with the bother of greasing, dusting, spraying and other unsuccessful methods of fighting lice. They are warranted to impart no odor to flesh or eggs. They cost only a trifle and are sold under a money-back guarantee. Thousands of poultry raisers are using them with complete success.

The head and neck louse of chickens.

What Users Say

Paratabs are the best thing for chickens I ever used. They clean the hens and make them lay, and I don't find any lice, mites or fleas on any of my young chicks. Paratabs are a good tonic for all chickens.—Mrs. W. A. G., Jacksonville, Fla.

Paratabs are fine. My chickens have no more lice. Before using Paratabs I had 20 loafers on the roosts, but now they are out.—A. F., Keeseville, N. Y.

I never saw anything like the work of Paratabs. It reminds me of the fairy story of the magic wand. Early this year I was getting 14 to 16 eggs a day. Then, without visible cause, the number dropped to 5 to 7 a day. I began using Paratabs as directed and in 2 or 3 days there was a difference of 1 or 2 eggs a day. On the fifth day I got 17 eggs and on the seventh I got 23. I heartily recommend Paratabs.—Mrs. E. H., Centralia, Ill.

I received the Paratabs all right and my hens seem to be laying better already.—Mrs. W. S. C., Monticello, Ark.

I am giving Paratabs water to my chickens and am having better luck this year than ever before. I haven't had a little chick to be a bit sick. It is the greatest medicine we ever used for young chickens.—Mrs. M. N., Pulaski, Ky.

Send No Money

LET US TAKE ALL THE RISK

Anyone can try Paratabs without risking a penny. We are so confident this new scientific discovery will free your flock of lice and mites that, to introduce Paratabs, we will send two full \$1 packages—enough for 200 gallons of water—for only \$1. BUT SEND NO MONEY. On delivery, pay the postman \$1 and postage, and if your flock is not free from lice and mites in 10 days, your money will be refunded without question. Don't let vermin kill your fowls and steal your profits. Write for the Paratabs today.

Poultry Queries

Conducted by Jean A. Koethen

Ducks and Ducklings

A Del Mar subscriber sends the following outline of her method of handling ducklings and breeding ducks, which we are very glad to publish:

"Ducks are waterfowls, and while they can be raised with little water it is a crime against their nature to deprive them of sufficient water to bathe in. Besides a small pool of water in their pen attracts many insects and these help to nourish the ducklings. In each pen of 75 ducks I have a shallow pool about three feet wide by eight feet long, sloping from the outer edge to about a foot deep in the center. This is lined with a coating of cement which any one can make with 50 cents worth of cement. I clean mine daily with an old broom and the waste water runs off and sinks into the ground outside the pens. I fill them with a hose attached to a hydrant in the yard.

"Shade is most essential, also plenty of coarse, sharp sand. A simple bran mash with about as much salt added as one would use in food for the table is fed to both ducks and ducklings, twice a day to the older ones, four times a day to the ducklings. Since I eliminated meat scraps I have had no

if they had a cold, but their eyes are neither swollen nor watery. I put coal oil in the drinking water but it does no good. Is this contagious?—Subscriber, Adelanto.

Your pullets have bronchitis. It is caused by exposure to dampness or drafts just as it would be in a human being. You will have to make their quarters more comfortable before you can cure their colds. Give them plenty of fresh air, preferably through an open front, but without cracks or knotholes at the back, and above all, keep them dry. The only medicine I have ever found effective for bronchitis is olive oil given internally, a tablespoon once or twice a day. It is not contagious.

Boiled Wheat for Turkeys

Mrs. Clara Schrack of Valley Springs, Calaveras County, feeds her little turkeys boiled wheat slightly salted. The first day or two hard boiled eggs are fed with the wheat. Mrs. Schrack says:

"I think one reason young turkeys die is that they are fed too often; three times a day is sufficient if they eat heartily. If they do not eat heartily or appear hungry or weak they should be fed oftener till they gain strength. Onions, chopped tops and all are beneficial, also black pepper sprinkled in is a good corrective for turkey ailments.

POULTRYMAN'S CALENDAR,—JUNE, LIGHTENING THE LOAD

There is no better month than June for taking account of stock and getting rid of what is not worth keeping. The early hatched pullets are now nearly or quite ready for the laying house. Cull out those that are undersized or backward in development and send them to market with the cockerels. Sometimes these cull pullets are not equal to the strain of the commercial egg ranch and still will do good work in a backyard flock. Look over the hens this month and cull out all that show signs of beginning the molt, all that go broody, all that indicate by wilted combs that they have stopped laying. Get them out of the way so that there may be more time and room for the better stock.

Unless males are of special value they should be marked for slaughter. There will be plenty more next fall, and the rooster is a good deal of a nuisance even on the commercial ranch. In the backlot he is unendurable, especially to the neighbors. Off with his head.

more ducklings with weak legs and am raising 95 per cent of every hatch. The first ten days of their life ducklings are fed bread crumbs in addition to the pan of soft bran mash which is kept before them constantly. They also have greens and sand and water to bathe in, and after they are old enough to require grain I keep a trough filled with barley before those I intend to market. At three and one-half months many of my Muscovy drakes will weigh nine pounds. I feed greens once a day and keep a box of charcoal in the pens.

"I do not believe in wetting or handling the eggs after they have been put under the hen. My duck mothers will dip their heads in the water but carefully avoid getting their breasts wet while sitting. In a very hot climate wetting the eggs may be necessary, but the mother knows best when and how to turn her eggs, and if they are disarranged she loses her calculation and cannot give the best results."

Early Molt

Will you please tell me why our chickens are shedding their feathers? Some are nearly naked.—Subscriber, Orland.

A sudden hot spell following the cool weather of a season such as we have just passed through will often throw hens into a molt if the ration is not changed to fit the change in the weather. With the first approach of the hot spell the ration should be lightened by the addition of bran to the mash, the dropping of part of the corn or milo out of the scratch, and the use of all green feed the birds will consume. The use of lights during the winter sometimes brings on a molt in March. If your hens began to drop their feathers in March or the early part of April it may be due to this cause.

Bronchitis

Some of my R. I. Red pullets breathe heavily with their beaks open and seem to choke. Two hens rattle as

Brown Droppings

Can you tell me the cause of loose brown droppings with reddish tinge? The birds are about three and one-half months old. I am feeding the following rations: Grain, equal parts wheat and corn. Mash, 100 pounds each of bran, shorts and meat scraps; 50 pounds each of corn meal and bone meal; 10 pounds charcoal. This mixture kept before the birds from 9 A.M. to 3 P.M.—Subscriber, Ontario.

Those brown droppings are due to too much beef scrap in the mash. Fifteen per cent is considered about right under average conditions, and you have 25 per cent. If you add 200 pounds of bran you will bring the beef scrap down to 15 per cent. If this does not remedy the trouble, add more bran.

Turkey Mortality

My young turkeys are bright and healthy the first ten days, then refuse to eat and soon die. I feed curd and chopped onion at first, later mix in chick feed, hard boiled egg and charcoal. They are on a green lot that has many bugs. I have tried different rations on different lots but it seems to make no difference. I have raised turkeys years before but never had an experience like this.—Subscriber, Waukena.

As you have been successful before with the rations you are using I am inclined to think the fault is in the brooding rather than the ration. It is very often chill that kills little turkeys the first week. Still, your ration is quite different from those of most turkey growers, and it may be the poult lacked what they needed most to give them a start. I notice you feed no cereal; bran, rolled oats, wheat flakes, stale bread or anything of that sort until you begin using the chick feed, and that is not so easy of digestion as the softer preparations. I have met one woman who started her poults on chick feed and got away with it, but you have started yours on green feed and curd, which is practically all protein. I believe you

Science Discovers Greatest Lice Killer

Changes Old Methods. No Dusting or Spraying. Birds Delouse Themselves. Gives Lasting Relief.

A recent discovery promises to revolutionize all the methods accepted up to now for keeping poultry free from lice and mites. This wonderful lice killer keeps the birds always lice free without the poultry raiser doing any work. It is the simplest, easiest, surest and best method ever discovered.

Hick's Lice Kill, which is the name of this sensational lice killer, is added to the drinking water. The medicine taken into the system of the bird comes out through the pores and every louse or mite dies or leaves the body. It does not injure the hatchability or flavor of the eggs or meat; is harmless to chicks and does not affect the plumage. A few days treatment at the start and then a little in the drinking water each month.

A Trial Costs You Nothing

So confident is Mr. Hick that Hick's Lice Kill will kill every louse or mite, that he is making a special guaranteed offer of two regular full sized, double strength, \$1.00 bottles and a regular \$1.00 package of Hick's Egg-Lay Tablets all for \$1.00. Use one bottle yourself and sell the other at one dollar, thus getting your own free. Send \$1.00 today (currency, money order, check, etc.) to Chas. H. Hick & Co., Dept. 1555, 1018 S. Wabash Ave., Chicago, Ill. If you prefer, send no money, just your name and address, and pay postman \$1.00 and postage on delivery. If after two weeks' trial you are not absolutely satisfied, write Mr. Hick and your money will be refunded.

Stop Chicken Pox

Sterilize drinking water, dip birds and cleanse pens with

—a powerful relentless germicide—ten times more effective than carbolic acid, yet harmless to the youngest chick. Sprayed around pens and put in drinking water it destroys disease germs which cause fearful ravages in your flocks—white diarrhoea, roup, canker sore, diphtheria, and pip. It destroys the eggs of vermin. B-K saves its cost many times over.

If your dealer hasn't B-K have him order it. Ask for our authoritative bulletin on chicken diseases.

will find the standard mixture of egg, cereal and greens, making it fully half green (onion and alfalfa, alfalfa or chard) and using a very little egg at first, more suited to their needs. You can add a little curd to the mixture if you wish, but be sure the poults have enough carbohydrates to give the needed heat and energy.

Poor Management

A neighbor of ours asks for advice about his chickens. He has been running about 400 chicks of all ages up to ten weeks in one bunch. Now the bunch has white diarrhea. They have no vermin but some were chilled and killed in a recent rainstorm. Some have tight crop and mope and won't eat. Crop apparently shows nothing wrong when opened. Same bunch are eating feathers.—Subscriber, Valley Center.

There is something essentially wrong in management when a flock has so many troubles all at once. The most evident mistake is in running chicks of all ages together. When that is done the younger chicks invariably suffer. They are bullied and mistreated by the older, have little chance at the feed troughs, are most likely crowded into the corners of coop and roosting house, and drag out a miserable existence. There must be something wrong with the ration if they all have diarrhea. I am given no details as to feeding, but can tell you how they ought to be fed. The chicks under three weeks old should be by themselves, with a good growing mash before them most of the time. Until their bowels are normal add 50 per cent bran to the mash. Give chick feed either in hoppers or litter, where they can scratch it out

when they will. If hoppers are used better put before them only morning and night. Add wheat and Egyptian corn to the chick feed after a week, and gradually work them off the chick feed onto whole grain by the end of a month.

The older chicks should have a growing mash and mixture of grain. Cracked corn is an important part of this ration. Feed sprouted oats to all once a day, as much green feed as possible, and keep sour milk before them when it is available. Be sure water is clean, also mash troughs if moist mash is given. Diarrhea may be caused by filthy drinking water. Grit and shell should not be forgotten. Charcoal in the mash will help bring the digestion back to normal.

The tight crops are doubtless due to wrong feeding. The best treatment is to hold the birds by the legs, head down, and massage the crop gently downward in order to work out its contents. A teaspoon of olive oil to soften the contents of the crop is sometimes a help, and a little baking soda in water afterwards may be given if the crop seems sour. As a last resort the crop may be opened, contents removed, crop washed with weak soda solution (1/4 teaspoon in cup of warm water) and crop sewed up, but this is more of an operation than most of us care to undertake. The feather eating is probably due to lack of sufficient meat in the mash and to the crowding and mixing up of all ages. Segregating the different ages and removing cockerels will go far toward stopping it.

What Makes Runts?

Will you please say something in your column about the cause of runts, especially in large flocks of chicks.

A customer of ours is feeding chicks eight weeks old their mash only 20 minutes at a time, twice a day, and insists the many runts among them are due to poor stock or faulty incubation rather than to underfeeding. His younger chicks are fed in the same way. I wonder what proportion of chicks in large flocks are non-eaters. Everything being favorable, is not this the principal cause of mortality the first two weeks?—Subscriber, El Cajon.

I do not see how any one can feed chicks in that way and expect them to grow. The poultry division of the state college of agriculture the last few years has advocated leaving mash before the chicks only part of each day as a preventive of coccidiosis, but they begin with two hours a day and gradually increase, which is quite different from 40 minutes a day. Chicks in small flocks on range may manage without mash, but large flocks in confinement must have bran in particular, and a mixture of ground grains to supplement it, for bran is the very most essential feed for young stock. It contains the protein they need for feathers and deep tissues, and ash for building frame, and I believe it should be before chicks constantly from the fifth or sixth day till they are ready for the laying mash. If mash is responsible for coccidiosis it is not because of the bran but more likely too much beef scrap. I have raised many chicks on chick grain and bran and have always noticed that those which grew most rapidly were those that were always at the bran hopper. In every large flock there are some weaklings which should be put out of the way the first week. There are others which do not show at first that they are behind the rest in vitality, and yet are easily frightened or driven away from the feed troughs by the more vigorous birds. It is for the sake of such birds as these that mash should be kept before the flock most of the time. Given a chance to eat, they may develop into strong, profitable layers. Browbeaten and bullied, they become discouraged, stop trying to eat, and soon die or live on as runts. I do not know that I can say just what proportion in any flock should be culled. We expect in any thousand chicks that 500 will be cockerels. Out of the 500 pullets probably 50 will not survive the first three weeks, and at least 50 more will be culled. Poultrymen usually count on 300 to 350 fine, well developed pullets from 1000 chicks, but where they lose the other 50 I am not sure. Mortality is sometimes greater than ten per cent for one reason and another, and there is sometimes an excess of cockerels. A great many losses the first three weeks are due to chilling and to lack of mothering. Many are also due to lack of a fair chance at the mash hoppers.

To Break Up Broodies

Can you tell me of a good way to break up broodies?—Subscriber, Lodi.

Most large poultry plants have their "jail," a slatted coop built off the ground, either high up on the wall or on legs or it may hang by wires from the roof. As this has a slatted bottom the hen is unable to find any place where she can even pretend to sit. If she is well fed she should be over her broodiness in four days, but she will not lay for a week or so.

Paralyzed

My yearling hens suddenly have no use of their legs. They lie on the side with legs stretched out and neither eat nor drink. I have fed mixed feed, mash, plenty of greens and grit, and have always been successful with my flock. What ails them?—Subscriber, Covina.

This paralyzed condition may be due to fright or some other intense excitement which has caused congestion of the brain. Often it is associated with acute indigestion or intestinal worms. If your runs are not well shaded they may have been overcome by the heat. To treat it apply cold water to the head, give a laxative (2 teaspoons castor oil, 30 grains Epsom salts or 1 1/2 grains calomel) and keep the bird in a cool, quiet place. If this treatment is not efficient Dr. Salmon recommends 1 to 5 grains of bromide of potassium dissolved in 1 tablespoon water 3 times a day. If intestinal worms are found in the

droppings treat for removal of these parasites by adding a pound of t-bacco powder to 50 pounds of mash. Keep this before them three weeks, then remove.

Lame Hens

In our small bunch of laying hens there are always one or two that have some kind of weakness in legs or feet. They get down all at once and are soon gone. I wonder if you can tell me what is wrong with them.—Subscriber, San Gabriel.

Are the hens that go lame very thin? If they are I should suspect (Continued on Page 643.)

Rid Hens and Chicks of Lice and Mites

A Few Drops of Wonderful New Remedy In Drinking Water Does It—No Dusting, Spraying or Greasing

Any poultry raiser can easily and quickly clean out Lice and Mites by using a new Remedy recently discovered by a Kansas City chemist and called Imperial Lice and Mite Remedy.

All that is necessary is to occasionally put a few drops of this amazing remedy in the fowl's drinking water. It renders them immune from the attack of all blood-sucking parasites, as these pests positively will not stay on a fowl taking this remedy.

It also acts as a splendid Tonic and Blood Purifier, as well as increasing egg production and growth, for with these pests eliminated, hens lay better and young stock grows faster. It is positively guaranteed not to affect the meat or eggs.

The manufacturers of Imperial Lice and Mite Remedy are anxious to get it quickly introduced among poultry raisers everywhere, and make this Special Introductory Offer. Send no money, just your name and address to the Imperial Laboratories, Room 638, 2110 Grand Ave., Kansas City, Mo., and they will send you a regular full sized \$1.00 bottle and will also send you free a big full sized (double strength) \$1.00 package of Imperial White Diarrhoea Remedy, the standard, time-tested remedy. Pay the postman only \$1 and a few cents postage when both packages are delivered. Any time within 30 days, if you are not satisfied with results, just say so and your money will be cheerfully refunded.

Baby Chicks

We incubate 250,000 eggs every three weeks; the largest and finest equipped electric hatchery in the Southwest. All popular breeds: Rhode Island Reds, Barred Rocks, Black Minorcas, Anconas, etc. Also our famous Oregon-Corvallis White Leghorns. Order now for immediate or future delivery of Baby Chicks, Pekin, Muscovy or Indian Runner Ducklings, Mammoth Bronze baby turkeys. All kinds of pullets supplied—anytime. Incubators and brooders. Careful attention to every order, large or small. Send today for prices.

Only one-fifth of the buildings owned by the Bell System are shown in this picture.

A Telephone City

Above is an imaginary city, made by grouping together one-fifth of the buildings owned by the Bell System, and used in telephone service. Picture to yourself a city five times as great and you will have an idea of the amount of real estate owned by the Bell System throughout the country.

If all these buildings were grouped together, they would make a business community with 400 more buildings than the total number of office buildings in New York City, as classified by the Department of Taxes and Assessments.

Next to its investment in modern telephone equipment, the largest investment of the Bell System is in its 1,600 modern buildings, with a value of \$144,000,000. Ranging in size from twenty-seven stories down to one-story, they are used principally as executive offices, central offices, storehouses and garages. The modern construction of most of the buildings is indicated by the fact that the investment in buildings is now over three times what it was ten years ago.

Every building owned by the Bell System must be so constructed and so situated as to serve with efficiency the telephone public in each locality, and to be a sound investment for future requirements.

Strawberries: No. 1, 4.00¢@4.75; No. 2, 3.50¢@3.75.

CITRUS FRUITS

These are actual prices obtained between 7 and 8 o'clock June 6 by Los Angeles wholesalers from their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms, cash on the walk. There may be slight fluctuations during the day's trading. Higher prices are frequently obtained where credit is given or goods are delivered.

Grapefruit: Market steady. Californias: Northern, packed box, 3.25¢@3.75; market pack, 3.00; small, 2.25¢@2.50.

Lemons: Demand and movement light, market firm. Locals: Loose boxes, best, 2.50¢@2.75; special brands, fancy, 6.75¢@7.50; choice, 5.50¢@5.75.

Oranges: Demand moderate, market steady. Navels, culs, 1.50 per field box; Valencia, special brands, 7.50¢@8.00, according to size.

HONEY

New honey is arriving in very light quantities but the quality is said to be excellent. Due to the early freeze and to disagreeable weather during blooming period of the oranges and other fruits, the yield from deciduous fruits has generally been light except in some few counties which were not hit by the freeze. Present prospects excellent for a good sage crop. Shippers are asking in carlot quantities F. O. B. California points for extracted white orange blossom or white sage 8¢@9 per pound and for light amber 6½¢@7 per pound. No recent carlot sales reported. Beeswax is bringing the beekeepers 22¢ per pound cash.

HAY

Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Hogs: Hard, fat, grain-fed, weighing 125 to 200 lbs., 12¢ per lb.; 200 to 250 lbs., 11¢ per lb.; 250 to 300 lbs., 10¢ per lb.; light sows, 10¢ per lb.; do, heavy, 9¢ per lb.

POTATOES AND ONIONS

Sales to Retailers: Averages of actual prices obtained between 7:30 and 9 o'clock by San Francisco wholesalers from their sales to retailers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk. Slight fluctuations may be noted during the day's trading, while higher prices are sometimes obtained where credit is given or goods are delivered.

Potatoes: River, fancy, 1.60¢@2.00; Oregon Burbanks, nominal; Idaho and Wash. netted gems, 1.75¢@2.10; Salinas, 2.25¢@2.75 per cwt.; new, 3½¢@4½.

Sweet Potatoes: Per cwt. 3.50¢@4.00; Arkansas, 1.75¢@2.00 per 50-lb. crate.

Onions: New Crop White, 1.25¢@1.50 crate; Yellow, 1.00¢@1.15 cwt.; Gr. Onions, 1.75¢@2.00 box; Stockton Red 1.50¢@1.65 cwt.

Garlic: 4¢@6 per lb. for medium grades; poorer quality, less.

VEGETABLES

Prices furnished by state department of agriculture, division of markets:

Sales to Retailers: Below are listed averages of actual prices obtained between 7:30 and 9 o'clock, May 22, by wholesalers from their sales to retailers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. Slight fluctuations may be noted during the day's trading, while higher prices are sometimes obtained where credit is given or goods are delivered.

Artichokes: 4.00¢@6.00 per cr.; Extra 8.15, lem. 2.00¢@4.40.

Asparagus: 3¢@6 per lb.; white, 5¢@7 per lb.; graded, 8¢@10 per lb.

Beans: Ky. Wonder, 10¢@11 lb.; wax, 9¢@10.

Bunched Vegetables: Carrots, 60¢@1.00 per dozen; turnips, 55¢@60 per dozen; beets, 50¢@60 dozen; parsley, 30; radishes, 30 per dozen bunches.

Cabbage: River, 2½¢ per lb.

Cauliflower: Half-moon Bay, doz., 1.00.

Carrots: 3.50¢@4.00 sack.

Corn: New, doz., 1.00¢@1.25.

Cucumbers: Ariz. and local, sm. cr., 50¢@75; do. English, 2.25; Texas, 4.00; hot-house, 1.50¢@2.00 doz.

Lettuce: Local, 25¢@50; Walnut Creek, 50¢@75.

Mushrooms: 50¢@1.00 lb.

Parsnips: 3.00¢@3.25 per sack.

Peas: Bay, 1½-3 lb.; Half-moon, 4¢@5.

Peppers: Florida and Mexico, 10¢@17 lb.; Chili, 6¢@9.

Rhubarb: Box, 1.35¢@1.50.

Squash: Italian, 1.25.

Tomatoes: Mexican, repacked, 4.25¢@4.50 per L. A. lug; off grades, 3.50¢@4.00; Imperial, 3.00¢@3.25 lug; Fla., cr., 5.00¢@6.00.

Turnips: 2.00¢@2.25 per sack.

FRESH FRUIT

Apricots: Lb., 10¢@15.

Avocados: 10.00¢@15.00 per doz.

Bananas: Hawaiian and eastern, 7¢@7½ lb.

Cantaloupes: Mexican, 3.00¢@4.50 per standard cr.; Imperial Valley, pony, 6.00¢@7.00; do, standard, 7.00¢@8.00.

Cherries: Box, 1.25¢@1.75; bulk, black, 10¢@13; white, 6¢@9.

Figs: 1.25¢@2.25 bx.

Gooseberries: 10¢@12 lb.

Pineapples: 5.00¢@6.00 per doz.

Strawberries: Watsonville and Salinas, 1.20¢@1.40 cr.; locals, 45¢@65.

Peaches: Cr., 2.00.

Raspberries: 90¢@1.25 dr.

CITRUS FRUITS

Grapefruit: Cal., fancy, special pack, 4.25¢ per box; Tulare, 3.00¢@3.25; Imperial, 4.00¢@4.50.

Lemons: Special pack, 6.00¢@7.00; choice, 5.00¢@5.50 box; Lemnettes, 2.00¢@3.50.

Oranges: Culls, 2.50¢@4.50; Valencias, fan., 7.50¢@8.00; choice, 6.50¢@7.00.

ward. No cotton pests have made their appearance as yet. Returns indicate that there are very few new or "freak" crops being planted this year, except several hundred acres of hemp in the Rio Oso District of Sutter County and a small acreage of experimental cotton in Butte County.

Livestock News Notes

LIVESTOCK SALE CALENDAR

Sheep

June 15-16, Annual Ram Sale, California Woolgrowers' Association, Davis.

The Holstein-Friesian Association of America has recently granted the special prizes to be awarded at the fairs of the country this coming season. California was particularly fortunate in being recognized three times, and 20 per cent of the premium list on the general classification will be paid at the state fair, the San Francisco show and at Riverside. To be eligible for this money all animals must be tuberculin tested if over six months old and must be registered and owned by the exhibitor. Now is a good time to register the calves you will want to show next fall and the last minute hurry will be eliminated.

Arthur Klusendorf, the new superintendent of the Carl Ray Ranch at Lankershim, reports that Rosamaines Bonita Ormsby, a junior three year old, has made a seven day record of 30.14 pounds butter from 464 pounds milk. As she is still going strong it is quite possible that this record will be increased.

California Holstein men are advocating the formation of a state herd composed of the best show animals of the state to be taken to Portland this fall. The trip is too long and costly for a single breeder to make but a combination could do so easily. It is the plan at present for the State Holstein Association to assist in the expenses by the use of money which it can set aside out of its general fund. The Portland show pays a long list of high prizes, and on top of that the Holstein-Friesian Association of America allows the show \$2,000 to be paid as special prizes and \$750 for state herd prizes. Every breeder who has an outstanding animal should call the attention of the association to the same so that the California herd can give the other states a run for their money. Herds from Washington and Ohio have already been promised.

Record prices for Guernsey cows were broken in the recent Langwater dispersal sale when Langwater Cleopatra sold for \$19,500. The total for the sale was \$262,930 with 96 cattle selling at an average of \$2728 a head. Langwater Warrior sold for \$15,000 and 20 of his progeny averaged \$4500.

R. A. Condee of the California George Junior Republic at Chino is attending the National meeting and sale of the Holstein-Friesian Association of America at Kansas City, as delegate from the California association. It is the hope of Californians that the 1924 meeting of the association can be held in California, and Mr. Condee is working towards that end.

Kings County cows are right up among the tops according to the report of the cow testing association for last month. 713 cows were tested with an average of 914.6 pounds of milk and 30.3 pounds of butterfat for the 30 days. The highest individual was a Holstein owned by Arthur & Maxfield of Hanford who made 84 pounds fat from 1,986 pounds milk. Frank Helm's herd at Corcoran had 24 cows between 53 and 81 pounds and 24 others between 40 and 50 pounds.

The report of the Holstein-Friesian Association of America giving a list of the awards for milk and butter fat production for the fiscal year ending March 31, 1922, shows that the Bridgford Holstein Company of Patterson won \$447.25, which is the largest amount won by any breeder during that period. The Bridgford herd won ten first prizes, which is the largest number of firsts ever won by a single breeder in a year. Eight of these firsts were won by daughters of the great show bull, King Segis Alcartra Prilly, which makes him the leading

prize winning sire for the year. A. W. Morris & Sons of Woodland, who stood fourth for prize herd with \$300 won, was second on first prizes, having won five.

Alanson Swain of Lancaster in the Antelope Valley is establishing a sanitarium for reacting cattle too valuable to be killed. Mr. Swain's Bang farm should be a great convenience to the small breeder who desires to keep his herd clean and yet cannot afford to lose high priced and valuable animals on account of their offspring which can be kept clean if properly cared for. Mr. Swain has lately purchased Sir Aaggie Prilly Pontiac, a son of Sir Aaggie Acme De Kol 2d and out of Queen Korndyke Prilly, from W. J. Higdon of Tulare. This bull's five nearest dams average 1,064 pounds butter in a year and nine out of 11 dams average 1,031 pounds. He is a splendid individual and is good enough to breed to anybody's cow.

In the Western National sale of Guernsey cattle held in Chicago recently, 61 head were sold for a total of \$53,115 or an average of \$870.68 a head. The 53 females average \$900.28. The top of the sale was Jean Du Luth Coronet who has made 952.27 pounds butter fat in a year and dropped two calves while doing so. Her price was \$8,000. W. H. Dupee of Riverside acquired four heifers for \$6,100.

SOME POINTERS ON THE GUINEA FOWL

Of the three varieties of guinea the color is the only distinguishing mark. The pearl is by far the most common variety, though there are to be found many fowls of white variety, and a few of the lavender, which closely resembles the pearl.

Guineas are nervous and noisy and require plenty of room where there are trees and brush. However, they can, though at less profit, be reared in pens and coops like other poultry. In the wild state they mate in pairs, but under domestic conditions, it is necessary to keep only one male for four females.

Guineas are prolific layers through the late spring and summer. They cannot, however, compete with the ordinary hen in egg production. They usually hollow out a place in the ground for their nest which they make every effort to conceal. They frequently lay 20 to 30 eggs before becoming broody. If the eggs are removed, from the nest, they will continue to lay until late in the season. As many as three or four nest eggs should be left at all times.

To prevent guineas from hiding their nests, they should be kept, during the forenoon, in an enclosure where nests are provided for them.

A bottomless box set on the bare ground makes an ideal nest for a guinea hen.

Guinea hens do not sit well, nor do they make as good mothers as ordinary hens. A guinea will cover 14 of her own eggs, while an ordinary hen will cover 18, for the average size of a guinea egg is considerably less than that of a hen egg. Incubators, however, have been used successfully. The period of incubation is 28 days, just as in the case of turkey or duck eggs.

Like a turkey hen, a guinea is apt to drag her young ones around through rain and dew. Moreover, she will never hunt shelter at night, but will roost on the ground, wherever she happens to be when night comes. For these reasons it will be much better to put the young guineas in charge of a chicken hen. A hen that is inclined to range afield, like the Leghorn hen, will make the best mother for young guineas. A coop should be placed in a field or lot, at a distance from the house, and the hen made to stay there at night until the young guineas are old enough to roost in trees or on a perch. This they will do when they are six weeks old.

They are great foragers, roaming through the fields in search of bugs and worms. Hawks will get very few guineas, since guineas dart to cover at the slightest alarm and warn other fowls by their loud chattering.

When game is out of season or scarce the guinea is considered a very satisfactory substitute, the flesh having a flavor which is very attractive to lovers of wild fowl.

CALIFORNIA EGGS GO EAST

Interesting figures are given out by the California Development Board as to egg shipment from this state to Eastern markets during 1921.

While prices received by poultry producers were slightly below those of 1920, the shipments to the east exceeded all years. It is estimated that Petaluma shipped 744 cars of eggs to the east; Los Angeles shipped 70 cars; San Diego 39 cars and other scattered sections 38 cars, making a total of 1,105 cars. Reduced to dozens, this would total some 13,500,000 sent by rail from California. Between December 20, 1920, and September 30, 1921, the Poultry Producers of Central California, handling the majority of the eggs in the San Francisco Bay region, Petaluma and Santa Cruz districts, in the lower Sacramento and entire San Joaquin valleys, report sales of 560,802 cases, valued at \$5,275,458 to the producer. The Poultry Producers of Southern California handle much of the production from the Los Angeles region, the Imperial valley, San Diego, Riverside and San Bernardino Counties, in addition to some shipments south of Porterville in the San Joaquin valley, and report sales of 4,103,444 dozen eggs in 1921, valued at \$2,096,450, compared with 4,054,283 valued at \$1,819,333, in 1920.

COOPERATION IN SWEDEN

Sweden has about 1,000 cooperative stores, besides many varieties of other ventures such as cooperative dwelling and building associations, purchasing societies, large number of cooperative dairies, farmers' societies, 70 egg selling organizations, cattle breeding societies and fruit and vegetable growers' cooperatives.

Last year's report shows that a net surplus of about \$125,000 has been made by these nonprofit making societies, while the cash on hand has increased from \$1,250,000 to \$1,850,000.

In spite of the dismal year for other industries in Sweden, 1921 was a banner year for these cooperative societies whose membership is mostly drawn from the ranks of farmers and workers in the larger industrial centers. These latter, of course, are members of buying associations in the main.

POULTRY QUERIES

(Continued from Page 641.)

tuberculosis. If they are of normal weight the trouble may be rheumatism. The lameness is quite similar in the two diseases, but in tuberculosis there is increasing emaciation and a post mortem discloses yellowish white cheesy nodules on liver, spleen and intestines. If you open a hen that has died and find these spots you will have good reason to believe she died of tuberculosis. If the hen is fat and you find no such spots you may safely conclude that she had rheumatism, due, probably to dampness in house or yard. Tuberculosis often affects the joints and causes this apparently rheumatic condition. The only cure for tuberculosis is to kill and bury deep or burn every affected bird, and thoroughly clean and disinfect the premises. To cure rheumatism, keep the birds in dry, warm, well ventilated houses with well drained runs and give a good nourishing ration with plenty of green feed.

Blood in Eggs

The past two months some of our hens have been laying eggs with blood in the yolks, some of them so bloody I do not like to use them. We feed a scratch mixture and laying mash, with grit, shell and charcoal always before the hens.—Subscriber, San Gabriel.

Those blood spots in the yolks are due to slight hemorrhages in the oviduct and are almost always seen when the hen is doing her best laying, that is, in the spring. Sometimes there may be a congenital weakness in the blood vessels of the oviduct, but more often the trouble can be controlled by the use of a less forcing ration. If you will add bran to the laying mash, making it half bran and half mash, and feed a liberal amount of green feed I think you will see fewer of those bloody spots.

Mysterious Deaths

Is it possible to feed laying hens too much clabbered milk? I feed wheat twice a day and the hens run on alfalfa morning and night. I have lost three the past week and two more are sick. There is no bowel trouble. They droop and refuse to eat but drink a great deal and only last a few days. Combs remain red to the last and then turn black. They have a large yard, and since the weather turned warm, roost outside.—Subscriber, Madera.

A ration of grain and green feed is not a balanced ration, but it should not cause the hens to droop and die. Are you sure there is no must or rot in the wheat and that they have found nothing on range that might have poisoned them? The fact that they are dying off so rapidly makes me think there must be something of this sort. A dose of castor oil as soon as you notice that a bird is sick might do some good, but the main thing is to find out the cause and remove it. Milk could not possibly make them ill unless it contained some drug that had been put in it to keep it from souring. It would be better to feed wheat only at night and keep a laying mash before the birds during the day.

Crippled Chicks

What makes crippled chicks?—Subscriber, Petaluma.

Insufficient turning and airing of eggs in the incubator and too high a temperature at hatching time stiffens the joints and make cripples of otherwise normal chicks. Chicks hatched under hens that do not leave the nest regularly are sometimes crippled but such cases are rare.

U. S. RECEIVES FAR EAST WEATHER REPORTS

Recent arrangements have been made with Father Algue, director of the Philippine weather service, whereby the weather bureau of the United States department of agriculture receives daily reports from Midway Island, Guam, Manila, and eight cities in China and Japan, including Hongkong, Shanghai and Tokyo. These reports are transmitted from Manila to San Francisco by naval radio stations.

The Deep Creek cut-off it is hoped will be finished before next winter. San Bernardino County supervisors are informed by the federal highway department, which is doing the work, that bids will be opened June 20.

The big cement mill at Victorville is putting in extensive additions which will increase its capacity one-half.

No. 1 of a Series of Letters from Satisfied Users of Victory Tree Spray

ALTA LOMA HEIGHTS CITRUS ASSOCIATION
Member of California Fruit Growers Exchange
Shipper of Sunkist Oranges and Lemons
Alta Loma, California,
April 1st, 1922.

Mr. William M. Pinckney,
Alta Loma, Calif.

Dear Sir:—

Concerning the Victory Spray, I will say that a number of our largest growers have used this spray in the past, and seemed very satisfied with the results.

The fruit showed to advantage when brought to the packing house.

Sincerely,
BRUCE MOORE, Secretary.

THE GREATEST TIRE TEST IN HISTORY

**100,000 MILES
OVER UNUSED TRAILS
AND UNCHARTED ROADS**

**THE MOST SCIENTIFIC
ROAD TEST EVER GIVEN
ANY MAKE OF TIRES**

COAST TIRES

WEAR DEFERS

Never before has such a test been attempted. Tire performances have been based upon track and road races, or inter-city runs over highways. Coast Tires have triumphed under such conditions, and we are now going to "treat 'em rough" and demonstrate their ruggedness and durability in this, the most severe test ever given any make of tires.

Colonel King Stanley, one of the most famous of the old-time Indian scouts and an experienced trail blazer, with William Spohn, of Oakland, a noted hunter and sportsman, have started on the first leg of their one hundred thousand mile journey over unbroken roads off the main highways of travel, in order to make a thorough and comprehensive test of the wearing qualities of Coast Tires, and to chart and break roads and trails hitherto unused by automobilists.

Regular Stock Coast Cord Tires

will be used throughout this entire journey, and at the end of each day's run accurate speedometer readings will be made and the condition of each tire carefully noted and reported upon to the factory.

THE LATEST RECORD FOR COAST TIRES

The Mt. Wilson Trail in 22 Minutes

On Friday, May 19th, Mr. Frank E. Benedict, driving a Paige 6-66 Special, equipped with Coast Cords, lowered all existing records for the famous mountain trail by 5 minutes, 51 seconds.

Mr. Benedict claims a great part of his success was due to the perfect service rendered by his Coast Cords over the rough and dangerous trail.

Peaches Are as Good as Gold

This seems to be a good peach year. Particular attention has been called to the value of the crop in one of the greatest peach producing sections in the state by Peach Day and pageant celebration which was held in Sutter County recently. This orchard, however, is one of old Tulare's finest. The favorite in Tulare County is the freestone, while the favorite in Sutter County and some other sections of the state is the canning cling.

Announcing the Introduction of the
Jackson Fumigating Pump

In line with the policy of this company to make available for its customers the benefit of every new device that tends toward the development and improvement of the Fumigating Industry, we are announcing the perfection of the new Jackson type pump—a cut of which is shown on this page.

Distinctive Advantages

The finer the atomization and the quicker the distribution, the more effective will be the fumigation. The finest atomization is secured through the powerful leverage that is a special feature of this new pump—which insures quicker distribution—and at much less effort to the operator.

Accuracy

The measuring means is protected from the heat by submersion in the cool liquid — maintaining accuracy and preventing waste.

Safety

As a result of the working part of the pump being entirely under the tent, any leakage that might possibly occur is saved for fumigating purposes—and at the same time is prevented from coming into contact with the operator.

Simplicity

Nothing could be more simple than the operation of this new pump—all that is necessary being for the operator to count the strokes when pumping.

Dependability

This pump is the result of exhaustive experimenting on the part of engineers with years of experience in the manufacture and use of fumigating appliances. Its performance is so satisfactory that we have spared no expense to make it available for your use this season. The pump is being supplied in two desirable sizes.

This pump, together with our high quality of product, backed up by an unexcelled field service, will greatly simplify your Fumigating Problems.

Owl Fumigating Corporation is sole licensee under the Dingle patents for the manufacturing and applying Liquid Hydrocyanic Acid for Fumigation.

California Water and Power Act

Affirmative?

WHICH

Negative?

By L. F. Parton

CALIFORNIA'S water and power act is a proposed amendment to the state constitution. It was put on the ballot by the initiative and will be voted upon by the people at the state election November 7 of this year.

The purpose of the amendment—which is Number 19 on the ballot—is given in section 1 as follows:

"It is hereby declared to be the policy and purpose of the state to conserve, develop and control the waters of the state for the use and benefit of the people."

There are three factors involved in carrying out the above purpose. They are: Irrigation, flood control, hydro-electric power development.

These undertakings must be related. Each must be made to serve the other and all must be made to serve the people. In controlling floods waters will be stored; in releasing water for irrigation power will be generated. By properly relating the work of irrigation, flood control and power the maximum of development and the minimum of waste gradually can be attained.

The state is the only agency that can be trusted to develop the combination of power and irrigation in conformity with the greatest benefit. Private power development, in its insistence on continuous flow, wastes water that might be of greater stored value in the irrigation season than the increased units of power produced by permitting the water to run off during the non-irrigation period. This is strikingly exemplified in the long contest between the water power interests and the irrigation interests on Tahoe and Truckee River.

There are two general requirements for adequate water and power development in California. They are:

The greatest possible freedom for different communities in carrying out development which they know to be feasible and necessary, without invasion of any natural or vested rights enjoyed by any community.

Unified control by which communities may enjoy the advantages of co-operative development, the end of waste and duplication, and achievement possible collectively, but impossible separately.

There is one basic and fundamental requirement underlying all others. It is a method of finance which will assure ample funds, the lowest possible interest rates, the payment for construction out of returns, without profits to middlemen, and the supply of water and power at cost.

California's water and power act meets all the above requirements. To summarize:

California's Water and Power Act is a proposed constitutional amendment, to conserve, develop and control the waters of the state for the use and benefit of the people; to make possible the unified and scientific maximum of irrigation, flood control and hydro-electric power development; to guarantee to separate communities the fullest possible freedom in solving their own water and power problems, with state assistance; to provide a method of unified control by which communities may cooperate, and to make the remaining nine-tenths of the water and power resources of California pay for their own development, without taxation of the people, without profit to middlemen, without new bonded indebtedness on the land, and with rates at cost to users of water and power.

The provisions of the amendment for carrying out the above purpose

MANY MEN OF MANY MINDS

The old copy books had among the wise saws we wrote over and over and over, "Many men of many minds." That well worn phrase applies with special force to Californians at this moment. It is true of many questions of public importance; especially so of the California water and power act which will be voted upon on November 7 next. California has been wonderfully blessed in the white coal placed in her mountains. We have been gradually making this available; sometimes through the activities of corporations, sometimes through municipalities or districts. Now the proposal is made that the people increase the use of this power. The public utility corporations are asking if it is wise to take from them the handling of these great utilities. We believe, however, there is nothing in the proposed act which provides for condemnation or other proceeding which would deprive any company now existing in this state of any of its rights. Of course the right of eminent domain still stands as it has from time immemorial.

Discussion is waxing warmer every day, and we are glad to give in this issue in parallel columns statements by proponents of both sides. Dr. Walker, president of the state farm bureau federation, is quoted in a few sentences. J. A. Teagarden of Placer County, also a state farm bureau official, presents another statement. There is also given statement of what the California water and power act is, by one of its friends. These we hope will aid Cultivator readers in arriving at clear understanding of the act.

fall under four main headings. They are:

Availability of state credit for community development.

The organization of the California Water and Power Board, to which are assigned powers to carry out the purposes of the act.

A definite legal process by which single communities or communities in groups may proceed under the act.

Safeguards against political control, or corrupt or unwise administration.

Communities, separate or united, may, under the amendment, procure state credit for irrigation or power development, or both, or for building or acquiring distributing systems for water or power or both. This credit will be extended only on the basis of proven, feasible projects, with assured returns sufficient to retire bonds in fifty years, and meet interest, operating, depreciation, maintenance, and other charges. For distributing systems, the return must be in twenty-five years. The sale of bonds will be limited in each case to the amount required for the project in hand, and the final limit of this gradual extension of credit, item by item through a period of years, is five hundred million dollars.

The foundations of the amendments are rates at cost and unified development. Adjustments of rates from time to time, according to varying costs of labor and materials is provided, so that rates may always be kept on a cost basis. Pursuant to the need for unified development, the Water and Power Board, of five members, appointed by the governor, is given adequate powers in cooperating with various communities, the state, or the United States.

The actual sale of the bonds is in the hands of the finance committee, consisting of the governor, the treasurer, the controller, the chairman of the board of control and the chairman of the water and power board. The actual merits of a proposed project are made an essential part of the committee's consideration.

* * *

By Louis Bartlett, Mayor of Berkeley and President of the League of California Municipalities

I agree with Franklin K. Lane that "water power can do more than any one thing to lower the cost and raise the standard of living."

This act will give us cheaper water and cheaper power than can ever be had under private ownership. California has 8,000,000 undeveloped hydro-electric horsepower, worth \$3,200,000,000 when developed—one-third of the wealth of California.

The act is economically sound. It will develop these resources for the benefit of the people, eliminating private profit now responsible for the high cost. It permits development on state credit, that is, by money raised by the sale of state bonds bearing a low interest rate. When the state has completed the projects that may be built under the bond limit of the act,

(Continued on Page 651.)

By J. A. Teagarden, Before Convention of Pacific Coast Electrical Association

THE farmers of this state are very greatly interested in the development and distribution of its water and power. In California "water is king." No one appreciates this fact more than the farmer, for upon the proper development and distribution of its water and power depends the future greatness of the state.

This state, with its climatic conditions, its soil fertility, plus a reasonable development and distribution of its water and power, is destined to become the land of small farms, on small acreage, with intensive cultivation. There is no better place to grow patriots than on the small farm owned and tilled by the occupant. No nation can be more secure than to have its food supply in time of peace or war controlled and dependent upon its patriotic citizens who are owners and tillers of the soil, rather than to be dependent upon an alien tenantry. Is not the farmer entitled to a little protection whereby rural life can be modernized and Americanized? With every person in the Union seeking the delightful climate of California, it stands us in hand to convert every available acre of land into the building of rural homes.

Water and power are our greatest factors in the development of the farming districts, while tax free bonds and tax free property are fast becoming the greatest menaces. Taxes must be paid by someone. Whatever bonds and property are exempt, so much more must be paid by property not exempt. This year, the people of California are being asked to pass upon a new initiative measure, the proposed "Water and Power Act." Water being king in this state we as farmers can not afford to deal lightly and barter away our rights by endorsing a proposed plan that is something new, something untried and wholly idealistic in its nature.

They tell us that this proposed measure is not untried but that it is copied after the Ontario plan that is now in use in the Province of Ontario. If they have tried to copy this proposed act after the Ontario plan, we would advise the dismissal of their copyist. Two years ago the provincial legislature of Ontario recognized that by their system the cities were being granted special privileges over the rural districts, that on account of the difference in population between the urban and rural districts the cost of distribution was many times greater in the farming districts than in the cities, whereupon the legislature appointed a committee to prepare plans for a most just and equitable method of distribution. The committee recommended and the legislature approved such recommendations, whereby a subsidy was granted to the farming sections to the amount of one-half of the cost of construction of rural lines along public highways. Why was not

this clause added to the proposed act for this state?

In the Ontario plan the water and power commission of Ontario can not begin any new project nor expend one dollar without first being authorized by the provincial legislature. Why was this protecting clause not written in the proposed plan for this state? When Ontario would not, why did they write into the plan for this state, giving to the water board unlimited and despotic powers? Why empower any board to exercise legislative, judicial and executive functions whereby the people are disenfranchised in the exercise of their inalienable rights that must be exercised by them in order to perpetuate any democratic form of government?

This proposed measure is purposely camouflaged with certain catchy phrases such as "public ownership" and "water and power at cost." Ownership always carries with it the authority and power to use, control, direct and operate. In this proposed measure the public does not control, direct and operate, but this function is turned over to a board, therefore it becomes board controlled and directed, instead of publicly controlled and directed. Water and power at cost is a meaningless phrase. Cost is almost wholly dependent upon efficiency of the management. During the war we had much experience in purchasing things at cost plus ten per cent, so much so that it will take one generation plus another to pay the bills.

We have a commission at the present time, created by law, whose duty it is to regulate the service charges of public utilities so as to make them just and reasonable. If this commission is not promptly functioning for the purposes for which it was created, then the fault and the remedy both rest with the people. If we cannot control one commission we would be powerless to control two, especially when the appointing power of both commissions would be vested in the one person. It would be inconsistent to presume that the one appointing power would appoint the imps of hades on the one commission and the angels of heaven on the other.

Does this proposed measure give to the farmer any additional protection or assistance? No reasonable water or power project in this state has ever been denied proper financing where the earning power of such project was commensurate with the cost of installation, provided said district or municipality had not already used its bonding power for other purposes.

There is but one source from which money can be borrowed and there is but one basis of credit regardless of whether the borrower be an individual, corporation or state. When the state borrows money it pledges the farmer's ranch as security. Private corporations could finance themselves as cheaply if we would permit them to pledge our securities. The state is powerless to create wealth by law. Russia attempted such a feat, which resulted in the development only of the paper mills and the printing press.

Who stands sponsor for this proposed measure? Who are the agricultural philanthropists who have come so suddenly upon the scene of action for the purpose of conserving and protecting the farmers' interest? I presume that their long and arduous services in the cause of the farmer will entitle them to an honorary badge as protectors and defenders of agriculture! It looks to the farmer as though there was an axe to grind and a job to be secured. The League of Municipalities has indorsed this proposed measure. Why?

Why was that clause inserted giving (Continued on Page 651.)

Agricultural News Notes of the Pacific Coast

Northern California

Daily train service between Truckee and Tahoe City began June 10.

Glenn County farm bureau meetings: Capay, 21; Glenn, 23; Grapevine, 28.

Solano County farm bureaus held a joint meeting at Bird's Landing June 6.

A union rail, motor and ferry terminal is proposed on Goat Island in San Francisco Bay.

Cool, El Dorado County, reports Royal Anne cherry trees loaded and fruit almost ready to move.

Karmak, Sutter County, reports big wheat crop in prospect. Well above 30 sacks to the acre is expected.

The highway from Summit to Donner Lake is not expected to be open till the last of June because of snow drifts.

Experiments in revegetation of over-pastured range lands will be taken up by the division of forestry of the state university.

Results of the second year's work in plum pollenization at Newcastle are being given to orchardists by Prof. A. H. Hendrickson of the state university.

Westwood, Lassen County is planning a three days celebration beginning July 2 with ball games, ending July 4 with parades and other entertainments.

B. A. Rudolph of the state university will be stationed at Auburn, Placer County, to make study of troubles affecting peaches, plums and pears in that district.

Irrigation demonstrations will be given in orchards of Placer County by Prof. S. H. Beckett, of the state university. Meetings will be arranged by County Agent Roy McCallum.

Santa Clara Valley apricot men in the membership of the California Fruit Growers have named \$100 a ton on canning fruit and canners are said to be buying freely at that price.

The California Prune and Apricot Growers has purchased at Red Bluff, Tehama County, the packing plant of the Sanitary Fruit Company. It will be used as a receiving house for prunes.

The cannery at Lincoln, Placer County, will open about June 20. The first month's run of apricots will be shipped from Vacaville. 70,000 cases of the new peach pack are reported already sold, mostly to English markets.

The U. C. short course on preservation of fruit products at Berkeley was well attended. Prof. Cruess demonstrated preparation of new fruit drinks; Miss Lilian Clark, drying of fruits and vegetables in home built evaporators.

Fruit growers of Dairyville, Antelope and Oak Park have formed the Tehama County Fruit Growers Association and contracted to ship through the California Fruit Exchange. The new association expects to market 25 cars of fruit.

Directors and commissioners of agriculture of 11 western states in convention at Sacramento declared "Japanese farmers in the west are rapidly gaining a stranglehold on the agricultural industry and by reason of a lower standard of living are underselling American farmers," and asked congress to correct the situation.

Central California

Bakersfield is a center for shipments of live poultry.

Tulare County estimates its orange output at 6800 cars.

Lindsay Blue Goose oranges won sweepstakes in Valencia show at Anaheim.

Kern County farm bureau meetings: Pond, June 21; Inyokern, 22; Rosedale, 23; Muroc, 23; Shafter, 26; Arvin, 30.

Modesto cannery is running full capacity on peas grown in the Emplre section.

Grangers of the state are asking that at least two of the regents of the state university be farmers.

Farm home department meetings in Kern County at Weed Patch, June 20; Inyokern, 23; Kern Delta, 28; Wasco, 29; Edison-Fairfax, 30.

The annual encampment of boys agricultural clubs of Fresno County was held at Lake Sequola near General Grant national park, June 3-9.

The Pajaro Valley reports clean-up of apple stocks a month earlier than last year. Los Angeles has been steadily developing as heavy consumer of Newtons.

The state's apricot crop is estimated at 75 per cent of normal by President Clayton of the First National Bank of San Jose. He considers a price of 9 and 10 cents a pound likely.

Raisins from different parts of the world are being collected by the Sun Maid Raisin Growers. They will be installed as an exhibit but primarily are to be studied as to methods of curing.

The Stanislaus farm bureau cow testing campaign will be carried on through June among dairymen of the West Side. A survey by field men shows 14,553 cows milking in the district between Newman and Patterson.

T. B. McKelvy addressed olive growers at Madera, May 26, on the subject of the contract of growers with the newly organized California Olive Growers Association. Meetings will be held in all olive growing sections of the state.

Minimum wholesale price of strawberries was set at 45 cents a drawer by united action of wholesalers, retailers and growers at Watsonville last week. Last year's minimum was 50 cents. Growers do not expect this year's 45 cent minimum to be reduced.

Work was completed last week on the 12 mile link of the Coalinga-Hanford state highway. This will afford a direct connection for Coalinga to the valley highway system. The work of paving the Sierra-to-the-Sea highway, connecting the valley through San Lucas to the Pacific highway, has already been started, a ten mile stretch east from San Lucas now being under construction.

There is no immediate danger of additional severe loss in the Tulare Lake region from flood, is statement by C. L. Kaupke, Kings River water master, who returned from a survey of the flood zone. "None of the reclamation districts are menaced at present by the floods," Kaupke asserted. "Only the most unexpected flow of water at its peak would cause the districts behind the huge levees to be inundated."

Southern California

Citrus institute at Pomona July 14-15.

Niland, Imperial County, has been made a farm bureau center.

The Pomona-Chino district estimates its peach crop at 11,000 tons.

Second annual walnut field day will be held at Santa Paula, September 1-2.

Yucalpa Valley cherries are ripe and are drawing many visitors to the section.

A deciduous fruit growers department has been organized in the Los Angeles County farm bureau.

There will be a big walnut crop in the San Gabriel Valley according to estimate of J. E. Killian of El Monte.

The Imperial city council is proposing to plant fruit trees on city lots which have been sold to the city for delinquent taxes.

Orange County citrus growers will establish an insectary at Anaheim. Horticultural Commissioner A. A. Brock will be in charge.

Potato growers field day in Los Angeles County, June 27, convening at Van Nuys high school 10 A.M., field observations in afternoon.

Sales Manager Webber of the California Walnut Growers Association is urging an aphid and worm dusting campaign through June and July.

The Oasis farm center initiated a plan for a Grape Day for the Coachella Valley. It will be held on the Narbonne Ranch, July 11 as a combined grape institute and exposition.

The adjourned cotton quarantine conference opened at Sacramento will be held in Riverside in July. Palo Verde and Imperial cotton planters are asking embargo on cotton seed from outside the state.

The Imperial irrigation district has voted a bond issue of \$7,500,000 to buy up and consolidate mutual water companies and to construct drainage system. The consolidated district will include more than 600,000 acres.

Poultry culling demonstrations will be held by farm bureau in Los Angeles County at San Fernando, June 26; Van Nuys, Baldwin Park, 27; Lomita, Pasadena, 28; Downey, 29; Pomona, 30.

Members of the walnut associations of El Monte, Puente Valley, San Fernando Valley and Mountain View have voted to join the Los Angeles County farm bureau walnut department in a body.

Avocado top working demonstrations under auspices of Los Angeles County farm bureau at Pasadena and North Whittier Heights next week. Exact dates may be secured from farm bureau officers.

The justices of the peace of Imperial County townships have been notified by county supervisors and horticultural commissioners to rigidly enforce the laws prohibiting the shipment of green cantaloupes, watermelons and tomatoes.

Local farm bureau meetings in Los Angeles County: Baldwin Park, San Dimas, June 19; North Whittier Heights, Spadra, 20; Pomona, La Verne, 21; Rivera, Whittier, Owensmouth, 22; Downey, Tierra Bonita, 23; San Fernando, Owensmouth, La Canada, 26.

The Coast and General

A plague of grasshoppers is reported in grain fields of Tule Lake and Keno districts of Oregon.

Cotton chopping is in full swing in Arizona. Hot, dry weather has been favorable to quick growth.

Lettuce growers of Idaho have organized, adopting practically the same grades used by Californians.

The Association of Hawaiian Pineapple Canners is putting on another great national cooperative advertising campaign.

The state of Washington is starting a number of suits against Japanese for illegal holding of land under anti-alien laws.

More than 3,000 acres are being planted to potatoes in Malheur County, Oregon. Idaho Rurals are the favorite, with considerable plantings to Netted Gems.

Completion of the Sierra-to-the-Sea highway will be celebrated at Hanford, July 4. Kings, Tulare and Fresno Counties will join in the festivities.

A new bill is being drafted to stop grain "gambling", by Representative Tincher in place of Capper-Tincher bill which was nullified by decision of supreme court.

Aaron Sapiro of San Francisco is organizing tobacco growers of Wisconsin and a milk marketing association at Beloit along the lines of California's successful cooperative associations.

In keeping with the promotion of Bellingham, Washington as Tulip Town, local men have organized the Holland-American Bulb Company, with Bellingham as headquarters and a capitalization of \$60,000.

Last year Salt River Valley, Arizona, shipped over 1,000 carloads of cantaloupes. Growers this year are somewhat fearful that the late Imperial Valley melons may compete with theirs on the market.

Portland's annual Rose Festival June 20-23 will draw the usual large crowd railway officials announce. Following as it does this year the Shrine convention at San Francisco there will be a large number of Eastern visitors.

An agricultural demonstration train will be run over the Canadian Pacific Railway through the province of Quebec. It will carry instructors from various agricultural colleges. Two cars of the 12 in the train will be devoted to cattle.

Roundups are in progress in northeastern Arizona where the grass is reported as growing nicely and stock are improving. Favorable conditions prevail in the Pinedale, Prescott, Nogales and Williams districts; fair in the Thatcher section but poor about Grand Canyon.

A conservative estimate of this season's fruit crop for Yakima and Kittitas Counties of Washington by the district horticultural department is 14,675 carlots. This is 513 cars more than a year ago. The department estimates the crop in detail at 10,000 cars of apples, 2,500 cars of pears, 1,500 cars of peaches, 150 cars of prunes and plums, 140 cars of cherries, 65 cars of grapes and 300 cars of melons.

The Response of Deciduous Fruit Trees to Pruning

IN 1919 Tufts, in Bulletin No. 313 of the California experiment station, published some very interesting results of pruning young deciduous fruit trees. While he discussed numerous phases of pruning, the one which has perhaps attracted the most attention was his comparison of the results obtained by two different methods which may be designated as follows:

Reducing the tree severely by annual "heading back" or cutting the current year's growth to short stubs; a standard practice current in most orchards.

Reducing the tree slightly by thinning out surplus branches, especially those which crossed or interfered, in the center of the tree. No heading back was practiced unless necessary the first winter, to establish even development of about six main limbs properly spaced. Pruning mainly by thinning out, rather than by heading back, soon came to be referred to by many fruit growers as the "long" pruning system.

Tufts showed that trees pruned by the latter method made more growth; they had thicker trunks, a larger root system and stronger tops; they made shorter whips of new growth at the top, but far more numerous lateral branches and fruit spurs from the crotch of the tree upward; they came into bearing two or three years

By J. C. Whitten, Before Placer County Fruit Growers Convention

When John Charles Whitten came to California in 1918 from Missouri he brought with him some clean cut definite ideas on pruning of deciduous fruit trees, which were at wide variance with the ordinary procedure in California. His views were repudiated by some, accepted by others, questioned by more. He quickly made demonstrations which were so convincing that his long pruning theories were most generally accepted. This was made possible because he knew he knew and further because of his most delightful personality and his way of presenting things. Perhaps this way one of Dr. Whitten's strongest qualities, his ability to make others to see. It has been said of him that more of his pupils have become great in the realm of horticulture than of any other instructor in this country.

One of the last things written by Dr. Whitten before he went to Washington, where he died after a few days illness, was the article which appears on this page, and we are glad indeed to be able to give it as one of the best tributes to Dr. Whitten's worth because it reflects so much of his real personality. Dr. Whitten was a native of Augusta, Maine, where he was born in 1868.

earlier than the headed back trees; they have uniformly produced more profitable crops; their fruit has been better distributed from the lower branches upward and from the inside of the tree outward.

Tufts' bulletin and visits by fruit growers to the experiment station plots at Davis, where the pruning could be studied, resulted in requests to have the pruning work demonstrated in various fruit districts. The agricultural extension service and the division of pomology in cooperation with local farm advisers and fruit growers have held hundreds of pruning demonstrations during the past

three years. Thousands of fruit growers have attended these demonstrations.

It was the policy of the agricultural college staff to suggest that the few trees pruned at each demonstration (usually not to exceed ten) be observed during the following season, in comparison with the remainder of the orchard pruned in the usual manner. It was thought safest to try the method on only a few trees until its merits could be thoroughly tested for different varieties and different conditions. California fruit growers, however, are usually not content with modest beginnings, and they are not slow about

adopting a thing which appeals to their reason. If it appealed to them they tried it on perhaps half their orchard. If it appealed strongly they applied it to their entire orchard. Frequently they failed to leave even a few trees pruned in the usual way for comparison.

A large majority of the fruit growers who have tried the long pruning system have secured better growth of their trees, increased yields of fruit, and increased profits with less expense of pruning. Fruit growers in increased numbers are adopting the new pruning practice each year. Some are adopting it in part, by heading back much less severely than was their former practice. A few have tried it and abandoned it for the former practice of heading back.

At the present time long pruning prevails in perhaps one-half of the deciduous fruit area of the state, according to estimates of the farm advisers, farm center officials and fruit growers locally interested in observing the results. The degree to which it is practiced varies from a small proportion of the orchards in some counties to three-fourths or more of the deciduous fruit area in other counties. Leading fruit growers have said that they know of no other instance in which a standard agricultural practice has been so largely modified over so

(Continued on Page 663)

Frost Resistant Strains of Oranges

By H. A. Brandt

AMONGST the various suggestions that are now being made for overcoming the effects of cold there is nothing being said regarding the possibility of the discovery and propagation of frost resistant strains of our chief varieties of oranges. Anyone with experience in salvaging young orange trees after a winter like 1913 or 1922 must certainly have been struck by the difference in young trees in their resistance to cold. If this difference in resistance is inherent and transmittable it is a factor that may well be placed along with fruiting habits and proper root stock in the pedigree of young orange trees. It would be hard to think of a cheaper insurance against frost damage in the orchards of the future.

The probability of the existence of frost resistant strains of Navel and Valencia rests in the first place on the tendency of these varieties to vary. Since individual trees differ with respect to fruiting habits, size, foliage, etc., it seems reasonable to expect some difference in resistance to frost not accounted for by location, condition of tree, or cultural conditions. Not only do such differences seem probable and reasonable, but in actual experience the tree surgeon not infrequently finds all stages of resistance, from the tree that has to be cut off and sprouted to the tree that escaped unharmed. On the face of such findings it would seem that experience argues in favor of the existence of frost resistant strains of oranges.

There are several reasons why attention has not been directed to the importance of frost resistant strains of oranges in the past. Amongst these one naturally thinks of the difficulty of being sure just what factors make for the resistance or the susceptibility of trees in any given case. Little can be done toward the discovery of resistant strains until the values of all the controlling factors are known. This element of uncertainty has doubtless resulted in the neglect of the inherent resistance factor. A second reason why frost resistant strains have elicited no interest is the fact that the gains to be derived are rather in the future than in the present. The man with a bearing orchard is inclined to feel committed to the trees that he has; he might do otherwise the next time he planted an orchard if he does not forget about it in the meantime. Then, too, the maturity of trees brings increased resistance to frost. Thus,

trees that would have made a poor showing had a freeze come while they were young grow to maturity during a series of mild winters, after which for practical purposes they may do as well as harder trees. But whatever the reason the fact remains that the discovery and propagation of frost resistant varieties of Navel and Valencia is a task for the future.

So much for the theoretical aspect of frost resistant strains of oranges. What has experience to offer? In 1913 the writer did most of the surgical work on 15 acres of three and four year old Navels and Valencias about equally divided as to variety. Ten acres of three year olds were so badly frozen that they were cut off without fear or favor in the sound wood a few inches above the bud. Of course it was impossible to check up on frost resistance in the ten acre plot. The situation was very different with five acres of four-year old trees near by. These last were enough older so they showed considerable resistance from the standpoint of the age factor. In the five acre orchard the damage ran from twig damage to severe freezing of the main limbs and upper part of the trunk. After the tree surgeon was through some of the trees had received a light pruning, some had been bucked back, and those with trunk damage sawed off. It was a strange looking orchard, and since there was little in location and cultural differences to explain the variations in resistance the conclusion was that the factor of inherent resistance or susceptibility must have been important. However these orchards were planted old style; there were no pedigree trees available to the general public then.

The planting of pedigreed trees has enabled us to take the next step in evaluation of the frost resistance factor, and particularly to discover if resistance is transmittable. The writer has just finished going over 1,000 one and two year old trees about evenly divided as to Navels and Valencias. The damage in these orchards is not so severe but that many differences in resistance loom up, and in particular in a block of 256 two year old Valencias some interesting facts have come to light. The block is 16 rows square, and so far as soil and cultural conditions are concerned the trees in this plot are on a par. The trees are all pedigreed, the four rows on the west

being the progeny of one tree. These four rows have from the day of their setting shown some distinctive features, notably a very dark green color has been characteristic of both foliage and bark. As the tops have begun to form during the past two summers a certain compactness has been increasingly characteristic. Otherwise the trees in these four rows have developed like the other 12 rows. A casual observer would perhaps have noticed no difference, but one cannot associate with orange trees for 20 years and not begin to notice individual characteristics. Thus some little differences had begun to appear before the supreme test of the winter of 1922. Before pruning up this block of 256 Valencia trees the difference as between frost damage to these four rows and the remaining 12 rows had become apparent. At least there seemed to be a difference and so the tree surgeon carried a little card and noted the extent of the work done on each tree. Trees that showed no frost damage except the singeing of a few leaf tips and that were in full vigor were marked "S" for special. They were, so far as the 1921-1922 winter was concerned, immune to frost damage. Then there were more with no serious damage but with here and there a twig bitten back. They were the average trees, without serious damage of any sort, but not in a class with those marked "S". A third and still larger group were marked "OK" for all right. A third as a whole was the group needing trimming. Anything short of cutting in the trunk was marked "T" for trimmed. Where the trunk had to be cut the surgeon wrote "R" for reheaded. This class really included two groups; those trees needing to be sprouted just above the bud and those with enough good trunk that they could be cut off and reheaded. The tally for the whole block of 16 rows, or 256 trees, is as follows:

Grade	No. Trees	% total
Specials	33	13
OK	55	21
Trimmed	94	37
Reheaded	74	29
Total	256	100

The above figures show nothing except that as between individual trees there is a difference in resistance to cold which in this case seems best

explained by emphasis on the inherent resistance factor. Occasionally the condition of the tree furnished a determining factor, but on the whole general conditions as to location and culture were so similar that inherent resistance or susceptibility seemed the big determinant. A comparison of the per centages for the 12 row group and the four row group support this conclusion and indicate that in this case at least, resistance must "be in the blood" or sap. At any rate the four rows, the progeny of one tree, had about twice as many on the per centage basis in the Special and the OK groups as did the 12 rows. Of the four rows 25 per cent were Specials and 28 per cent were OK, total of 53 per cent in the two upper groups. In the 12 rows 9 per cent were Specials and 19 per cent were OK, or 28 per cent in the two upper groups. A second aspect of this difference is that the four rows had 47 per cent susceptible trees as against 72 per cent in the 12 row group. This would seem to indicate that with pedigreed trees it should be possible to locate frost resistant trees and that in addition from a study of their progeny the power to transmit this quality can be checked up. The comparative per centages for the 12 row group and the four group are as follows:

Grade	12 Row Group	4 Row Group
	%	%
Specials	9	25
OK	19	28
Trimmed	41	23.5
Reheaded	31	23.5
Total	100	100.

The table of comparative per centages shows differences between the two groups that are significant. This is the reason that attention is called to the importance of the discovery and the propagation of frost resistant strains. Of course, we can not expect to find in resistant strains the whole solution of our frost problem. What we may find is a factor that can be made to reduce the frost hazard in the orange industry, especially during the time that the young orchard is coming into bearing. A winter like 1922 has at least given us ideal conditions for testing out our stock, and now what remains is to check up and see as nearly as possible what trees are the least subject to frost damage. In this way orange growers may find some real compensation for present losses in the discovery of frost resistant strains of oranges that will reduce the hazards of the future.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended to you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

There will never be a finer fruit than the peach. It has been a staple since peaches began. The first recognition of this fruit in a large way was that given by Sutter County in the festival held a few weeks ago. This was not an occasion for glorification but intended to inspire growers to greater effort. The finest on earth is none to good for Sutter and none too good for California.

* * *

What are we going to do with our wine grapes? The question is being asked in all seriousness. It is being asked not because there is lack of market for the world has been surprised at the prices secured by the wine grape growers and there is no indication that they will be materially less this year, but the real trouble lies in the fact that there are not sufficient cars available to carry the enormous tonnage which will be delivered to the railroad companies in the short wine grape season.

* * *

A survey has been made in the wine grape producing counties extending

from Santa Clara to Napa and Mendocino and carlot shipments in 1921 found to be 543 cars. The anticipated demand and production of those seven counties in 1922 will exceed 4,000 carloads. Tokay and Emperor counties will also be shipping about the same time, and the question of the grape growers today is, "How can we do it?"

REORGANIZED

California Alfalfa Growers Exchange, which has been securing for alfalfa growers of California livable prices which have enabled them to remain in the business and occasionally go to the movies, has decided that under former methods of work those not members were receiving almost as much benefit as were the members who were holding the sack. The whole effort of the organization was to sustain and build up a stronger market. In order to do that most effectively reorganization was decided upon and along those lines followed by the raisin growers. A stock corporation to be the central selling organization was perfected and a \$350,000 capital stock subscribed and paid in. This selling organization may handle the product of the members and in addition make purchases on the open market and thus sustain and secure better prices for the members who have contracted to sell all their product through the one selling organization.

There are being organized in various alfalfa growing districts local associations of growers who affiliate and contract with the central selling association. Warehouses are erected so far as possible in the various producing communities. These may be filled with local hay and under the contract with the selling organization may be used as collateral which is readily accepted by the best financial institutions of California.

It looks as if the alfalfa growers are doing real business in a real business way.

FROST RESISTANT CITRUS

The article by H. A. Brandt of La Verne on "Frost Resistant Strains of Oranges," appearing in this issue is worthy of consideration by those engaged in citrus culture. The comparative tables given would indicate that buds from certain trees might produce trees more resistant to frost damage. However, this can not be definitely determined until these same trees have stood the test of one or more future freezes to determine whether they are more hardy or their resistance was due solely to the condition they were in when the frost came.

The ability of a citrus tree to withstand frost is dependent upon whether it is dormant or in a growing condition at the time of the cold weather. A tree that is in a growing condition will suffer much more than one that is nearly dormant and in which there is a minimum flow of sap, and it is not always possible to control this condition, hence a tree that passed through one freeze uninjured might suffer quite badly at another time.

Another phase of the situation and one that will probably interest the grower most is whether or not a resistant strain of tree will produce fruit that will be any more resistant. We hardly think that this is possible. However, there have been other things accomplished that seemed impossible to many of us, and we sincerely trust that Mr. Brandt's article may lead to the development of not only frost resistant trees but also fruit that will have the same resistance.

VACAVILLE CHERRIES

Through the courtesy of one of Solano County's enthusiastic cherry growers, Millard D. Sharpe, we have tasted Vacaville cherries—not one year, nor two, but many, and we wish to assure anyone contemplating eating cherries that it is a perfectly safe venture to try the kind made in Vacaville.

DON'T LIKE 'EM

Funny how folks kick about frozen oranges. Off up there in Winnipeg where they would fall dead if they saw an orange growing by the roadside they are objecting to the real California oranges now on that market. They would like some of California's climate, but they don't like it inside the oranges, and now they are talking of passing a law to prevent importation of that type of fruit. A committee has been appointed to investigate the situation and has reported: "We must have protective legislation or the products banned by British Columbia and the states of the Union would be dumped on the unrestricted provinces as was evidently being done. The city solicitor and the food inspector will frame the necessary legislation against the importation of frozen citrus fruit."

By the way, it would be a good idea for Californians to use that type of fruit for fertilizer. It doesn't pay to queer the game.

WELCOME TO CALIFORNIA

Florida fruit growers are inspecting California orchards. They are making comparisons as to their methods back home. This is the second journey of the kind made by Florida fruit growers. The former one, something less than a dozen years ago, resulted in the reorganization of co-operative movement in that state and the creation of a fruit exchange along lines identical with those of the California Fruit Growers Exchange. This resulted in a degree of affiliation or cooperation between the two widely separated states. We believe that both California and Florida were advantaged by the visit of the Florida growers. We trust the same will be true at this visit, and it occurs to us, "Why not Californians make a trip to Florida and learn the best of their tricks in the trade?"

The present visit is under the direction of Edgar F. Wright, editor of the Florida Grower. We believe every California grower joins the Cultivator in the most cordial welcome possible to our visitors. "Florida, the state is yours. But we hope you will leave it here next to the Pacific, and we will be glad to have you remain with us"

DON'T TAKE CHANCES

We are glad to note that the Covina district is making further investigations and experiments with frost fighting equipment.

We hope that the citrus growers will continue these investigations and that something definite will have been accomplished before another frost as disastrous as the last one hits the industry. However it is one thing to make investigations and determine what equipment will best serve the purpose and quite another to keep the growers interested to the extent that they will install the equipment and prepare for cold weather. One or two mild winters and the grower forgets his experience of the past and hesitates to make the investment necessary to protect his grove, hoping that he will get through another winter without injury and promising himself that next year he will prepare

to protect his grove. We think that every citrus grower, especially where frost is of frequent occurrence, should get behind these investigations and help keep the present interest in frost protection alive until the best equipment possible is produced and then proceed to insure his grove and crops by installing it.

ALMOND GROWERS

The fight is won, and the Almond Growers Exchange is safe. It has been one of the most strenuous fights which cooperators have had to face in California for sometime.

At the meeting held in San Francisco on June 1 careful checking up of contracts signed showed 2,500 almond growers in line on the five year contract, and these contracts were found to cover a sufficient per centage of the total tonnage of the state to make it entirely safe for Manager Tucker and the board of directors to proceed with plans for the crop of 1922. Sales are already making, and the exchange is receiving congratulations as well as orders from the Eastern trade. Under the old agreement any grower might withdraw any time from January 1 to April 1 of any year. This left altogether too much uncertainty; no manager can proceed with plans for the next year's crop when he doesn't know whether his constituency will stand by him or not.

The date for closing the membership rolls has not been definitely set, but the campaign is continuing until formal notice is given by the board of directors.

Practically all of the 1921 crop is now disposed of. The old board of directors is continued. This board has appointed a committee of 13 growers who will go over the by-laws of the exchange and submit recommendations for changes. It is now thought the board will be increased from five to nine, each of the nine to represent one of the almond growing districts of the state. Geo. W. Pierce remains president; the vice-president is C. D. Hamilton, while T. C. Tucker remains manager. In a recent interview Manager Tucker said:

"I know that our customers are going to be more than satisfied with the position in which the reorganization puts the exchange. Moreover our growers are going to be better satisfied. In other words, the exchange is going to function more efficiently, which should be to the best interests of both the grower and the buyer."

FUMIGATION SEASON APPROACHES

THE golden season for citrus fumigation is now approaching, for while both tree and scale are active is the surest time to effectively gas the insect pests. Woglum reported in 1920: "I wish at this time to emphasize that temperature is an important factor modifying fumigation results. For several years I have noted better results in some districts against the black and the purple scales during the high temperatures in August and September than during cold nights in November."

"It is a well known fact that insects are more active at high temperatures than at low temperatures, and generally speaking, as the temperature drops below 60 degrees and toward 40 degrees insects become more sluggish. With both insects and the poison gas most active at high temperatures it is reasonable to expect better scale kill with a given amount of gas at high temperatures. And this is what happens in sunlight fumigation as illustrated by the results of a series of trees infested with black scale which were fumigated at Alhambra with a 100 per cent schedule in February, 1920. The temperature within the tent on the sunward side was 90 degrees Fahrenheit, on the shaded north side, 70-74 degrees. The result was a 99 per cent kill on the sunny side where the temperature was 90 and but 93 per cent on the shady side where it was 70-74 degrees."

The normal hatch of the black scale is heaviest during July, and careful observers say that everything points to "normalcy" of the 1922 season. While some good results have been attained during cold weather it is the consensus of opinion with the experts

(Continued on Page 662.)

AFFIRMATIVE

(Continued from Page 647.)

the difference in interest between what is allowed private companies by the railroad commission and the interest paid on state bonds will amount to \$19,000,000 a year, or over 40 per cent of the present cost of the state government. This \$19,000,000 will remain in the pockets of the consumers instead of being paid out in rates to the power companies.

It is safe. Clyde L. Seavey, former chairman of the state board of control, says that it offers more safeguards in the expenditure of the state funds than any other state bond issue. The public interest is protected at every step. It will not increase taxation.

It is morally right. The investments of the private companies will be protected. Their bond and stockholders will not be hurt. The farming and all manufacturing industries thrive best with cheap power and water, which make employment steady and remunerative; and when every woman can afford to do all her cooking by electricity and use power for doing the household drudgery, she will be truly emancipated, and able to devote herself to the things in life most worth while.

Getting cheap power and cheap water is therefore a moral issue. California's water and power act will get them.

* * *

Dr. Walker, who is president of the state federation of farm bureaus, holds views contrary to those of Mr. Teagarden. In a recent interview Dr. Walker spoke of personal inspection of the great hydro-electric installation in the province of Ontario, Canada, showing wherein rural districts had been greatly benefited. Touching upon the California water and power act.

By W. H. Walker, President, California Farm Bureau Federation

As to that \$500,000,000 bugaboo: They claim they fear state bankruptcy if the state spends that amount right here in the state, yet the power corporations are preparing to spend several times that amount under supervision of the railroad commission and will ask and get 8 per cent return, net, above all extravagances and excessive overhead which the system encourages.

I haven't been able in my own mind to work up any fear over a board at least as easily controlled by the people as is the state railroad commission, whose job it will be to invest state money at low interest rates in revenue-producing projects which give us light and power at cost and carry interest and sinking fund. When the bonds have been paid off we will own the projects outright, free of debt.

The Farm Bureau Federation through its public utility department, has conducted for two years an investigation of power corporation methods. We have not found them so high minded, so idealistic, that I am willing to trust the entire development to them on 8 per cent perpetual returns of projects which the people never will own.

The four or five largest companies right now are asking for more than \$900,000,000 for new projects, and they have in sight other feasible projects that will increase that new investment to not less than \$1,600,000,000. They are not scaring me off with that half-a-million bugaboo.

* * *

Touching upon this question as it concerns one big irrigation district the Modesto Herald says:

"Why the people of these districts should generate power to sell to a private corporation to be resold back to them at a fat profit is beyond understanding. It would be just as sensible to do this with the water. It may be the easy and the expedient thing to sell the power at this time, but the harder thing will in the long run prove the way of wisdom."

PEACH DAY TO BE ANNUAL EVENT

Success of Sutter County's Peach Day has resulted in Sutter, Yuba and Butte Counties joining to make it an annual event. A three days celebration is being planned for June 1923.

NEGATIVE

(Continued from Page 647.)

ing to the board power to contract with the United States and other states regarding interstate waters? What interstate waters have we beyond the Siskiyou, the Sierras or on the borders of Mexico or the Pacific? There is but one point, southeastern California, traversed by the Colorado River. Why does the proposed measure provide that those nearest the

sources of supply are to be served first? There is one district which has aspirations to become the metropolis of the West, and it may be a coincidence that this section happens to be situated nearest the source of supply. This district is desirous of having an unlimited supply of power that it may become the manufacturing center of the West. This is a very laudable ambition if developed and financed by her own resources, but the farmer does not feel that he should be called upon

to pledge his hard-earned credits to develop a city leaving his own industry undeveloped.

We have encouraged private capital to develop and build the water and power systems of the state, and we, as farmers, have also been encouraged to develop and build up the agricultural interests of the state. How would we like to have the state empower this board to take over all the state lands and other agricultural

(Continued on Page 667.)

How To Crowd Two Days' Tillage Work Into One

MANY jobs are done on Fordson farms that would not be done if horses were depended upon for power.

More thorough seedbed preparation is possible because there is more time available for this important work. Good farming practice demands that stubble be disced immediately after removing the grain from the fields, to return valuable humus to the soil, to make fall plowing easier and to conserve moisture.

The success of the next crop may depend upon this saving of moisture already in the soil. For this work with the Fordson, as well as for cutting up corn stalks, cotton stalks, and for many other jobs, no other implement does as well as the double disc harrow. There is one disc harrow especially built in every feature to work with the Fordson.

Roderick Lean
Automatic Engine Disc Harrow

Made by Roderick Lean Mfg. Co.,
Mansfield, Ohio

This tool is operated entirely from the tractor seat, and the angle of the discs changed by the power of the tractor, providing quick and easy adjustment without stopping and with little effort on the part of the tractor operator. The entire harrow may be fully and instantly straightened for wheeling through a wet spot, or over an obstruction, while the tractor is in motion.

Working your ground with the Roderick Lean means working every foot of soil. Double reach bars connecting the rear harrow to the front, make the rear disc blades always cut midway between the cuts of the front blades. They cannot track. The rear section cannot slide down hill on sloping ground.

Because the rear section is flexibly connected to the front, this harrow turns short and works close in field

corners. No time is lost at headlands—straightening of gangs for turning is unnecessary. The harrow works

The World Famous Oliver No. 7
On thousands of farms, the world famous Oliver No. 7 has been the plowing partner of the Fordson from the beginning.

Special Oliver Orchard Plow
Fordson orchard plowing is done thoroughly with the Oliver special orchard gang. Branches and trunks are not injured.

Fordson Disc Plowing
Oliver Fordson special disc plows have set a new standard. They penetrate the toughest soils, yet are light running.

Roderick Lean "Cutmore" Mower
Attaches without changes to the Fordson. Power taken direct from driveworm. Makes a one-man outfit with Fordson.

Good Work With Roller Pulverizer
Final fitting of the seed bed with Fordson power and the roller pulverizer has meant more bushels for many farmers.

The Amsco Tractor Drill
Tractor speed and accuracy utilized by the Fordson owner with the Amsco special drill. Force feed makes positive planting.

The Amsco Two-Row Cultivator
Cultivating corn is easy for the Fordson farmer with the Amsco Cultivator—special for the Fordson. Made for hard work.

Money-Maker Ensilage Cutter
Fordson silo filling with the Money-Maker done quickly and cheaply. Strength and scientific design give perfect work.

The Money-Maker Hay Press
Baling hay with the Fordson and Money-Maker baler is an important operation to the farmer with large hay acreage.

Wood Bros. Individual Thresher
The Wood Individual Humming Bird Thresher and Fordson make short work of threshing. All grain is saved.

at uniform depth its entire width, leaving headlands level and well pulverized.

These and many other features have placed the Roderick Lean Automatic Engine Disc first in the estimation of Fordson owners.

Ford Dealers Everywhere Sell Standard Fordson Equipment

How long should a shingle roof last?

Answer that by another question—How much service in a tractor? Depends largely on the care you take of it. Same for a shingle roof.

Unless you fill the pores of the wood with a weather-resisting preservative, natural oils will evaporate, rain will soak in, then shingles will warp and crack under the hot sun and withering winds.

ORONITE SHINGLE OIL made by Standard Oil Company (California), is easy to apply, and will save your shingle roofs or shingled side-walls many a repair job. A tight, well-laid roof treated with it should last a lifetime.

Our agent near you will tell you the success others have had with ORONITE SHINGLE OIL in securing longer roof life. Ask him, too, for color-mixing formulas.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Commercial Fertilizers

Please tell me through columns of Cultivator what commercial fertilizer to use for the following crops on black or sandy loam soil; alfalfa, corn, potatoes, oats and vetch.—Subscriber, Santa Cruz.

The simplest answer to the above is: "Any high quality, complete commercial fertilizer." But as there are a thousand and one angles to this matter of building up a soil a better answer would be: "Make thorough study of our soil conditions and lay out a plan of soil building which should cover a period of years." It has been fairly well established that the application to the surface of soil of certain chemical elements of fertility is not all that is necessary to secure greatest productivity. The fundamental of fertilization is knowing something of soil conditions as they are at present. Then proceed with the addition of vegetable matter or needed simple elements as the physical and chemical soil conditions seem to demand.

Sour Sap, Brown Rot, Etc.

Some of my apricot trees are dying. In some cases whole limbs die back, in others just the branches or small shoots. Where the whole tree has died from the fork up new sprouts are coming out from the trunk. Gum is also running out. The trees are on heavy clay soil and have always had plenty of water.—Subscriber, Lindsay.

There are literally thousands of growers asking this question or questions very similar this year. Placer County growers have not only asked it of the Cultivator, but their farm adviser, their horticultural commissioner, their neighbors and others have appealed to the University of California to make a study of this condition or this disease of deciduous trees. The more common theory today is that the trouble is either the same as or closely allied to the brown rot of the lemon, showing somewhat different conditions under different circumstances. The experiment station staff has recommended a fungicide spray to be applied as trees begin to bloom, say not more than one-fifth of the bloom out at time of spraying. This was tried very thoroughly this year and at least partial success secured. B. A. Rudolph has been stationed at Auburn by the state university to make special study of the trouble.

Apricots Die

What is the cause of the limbs of my apricot trees dying back? The trees are about 20 years old.—Subscriber, Paso Robles.

Many other subscribers are asking similar question. We refer them to similar query answered above.

Publisher of "Human Geography"

Will you kindly advise me who are the publishers of "Human Geography," a notice of which appears in the June 3 Cultivator?—Subscriber, Arcadia.

We are not informed as to the publisher of the geography but the author is J. Russel Smith, Columbia University, New York City.

Sulphur for Tuber Moth

Would it do any good to scatter sulphur freely along the potato rows to repel the tuber moth?—Subscriber, Arcadia.

We do not think it would have any effect other than it might be a preventive of fungous or other diseases. One of the best preventives of attack by tuber moth is thorough tilth of soil hilling up so that the moth is unable to reach the tubers. Cloddy or hard conditions of the soil which may cause it to open up in large cracks give the moth easy access to the potato. In harvesting use extreme care to get the potatoes into sacks as quickly as possible. If exposed on the ground for a part of a day there is serious danger of infestation. The danger is increased if left over night.

Marketing Table Grapes

We have eight acres of table grapes. Can you give us information on marketing, the price per pound and ton? If we contract to sell by the ton would we have to furnish boxes? Is a license required if they are peddled in different towns? How are they disposed of in Los Angeles markets?—Subscriber, San Fernando.

Nearly all towns require a license or occupational fee for the privilege of selling products or merchandise. Some towns, however, exempt farm products marketed by the grower. The only safe way is to make a visit to the office of the city clerk of each town and find out definitely from him. Some places have established free markets which are open without charge to all producers. We believe there are none in San Fernando Valley. As to marketing located as you are near a large city it appeals to us that there would be many openings for marketing direct. First sell so far as possible in home or nearby town and then depend upon the larger market to dispose of surplus. If possible to unite with neighbors in a cooperative effort chances for success would be greater.

There are many ways of disposing of products. In the first place they may be consigned to commission houses or there are opportunities in the terminal market for securing stall or one may dispose of them by private barter to hotels or other large consumers.

Cabbages—Strawberries Dying

Am sending specimen of worm that is destroying my cabbage plants, eating off stalk just under surface of ground. What is it and how can I get rid of it? At the rate my plants are dying I will soon have none left. Am also sending specimen of strawberry plant that is beginning to die.—Subscriber, McCann.

In the cabbage plants sent, the youngest had died from "damping off" as a wilted and collapsed section of the stem plainly shows. There is no mechanical injury apparent, either from insects or otherwise. On the other injury from insects eating into the stalk at the crown is very evident and the worms you sent are root maggots.

The insects on the strawberry plants are leaf hoppers and can kill plants only by eating them. Your plants evidently are dying as whole plants. Nothing above ground could do this—the trouble is in the soil, evidently a fungus. There is a secondary fungus on the leaves but this is not serious. What your soil conditions are we do not know but death of plants is due to something in the soil. When received the plants were too old and dried to detect nematodes had any been present. These might have killed the plants.

In neither case, strawberries or cabbages, can anything be done to save

present crop. We would advise taking the matter up with your county horticultural commissioner or farm adviser as these troubles are no doubt common throughout the district. For precise determination send specimens to the state insectary, Sacramento. But, we again state, insects on your strawberry plants are not killing them or working serious injury.

Borax in Pork Curing

I have read that in England borax is used in curing ham and bacon, instead of salt. Can you give me the process?—Subscriber, Carpinteria.

Dr. Wylie's "Foods" admits use of borax as a preservative but says it adds nothing to quality and still less to its desirability. The best preservative for all meats is, of course, salt. The addition of sugar suits most tastes, and to preserve the natural red color saltpeter is excellent. A formula said to be excellent for meat curing is for each 100 pounds meat, 12 pounds salt, 3 pounds sugar, 2 ounces saltpeter to 6 gallons water. If dry curing is preferred, omit water, thoroughly mix ingredients and rub into the meat once a week for three weeks. Then pack in barrel.

Worms on Walnuts

Under part of leaves on walnut trees covered with worms about quarter inch long, many jointed, bright yellow to green with three black spots, one at head, one on a sort of horn, one on tail. What are they; where did they come from and how do you get rid of them?—Subscriber, Riverbank.

Without specimens it is nearly impossible to determine the exact identity of the worms. They are, little doubt, tussock moth larvae or closely allied, all of which stand in the same relation to the orchardist so far as remedial measures are concerned. Poison sprays have proved unsatisfactory and only hand picking will avail. In some cases this is a pretty big job, but the only way "out of the woods."

Care of Chrysanthemums

Can you tell me anything of the care of chrysanthemums? If not, can you tell me where I may go for such information? Mine are growing very tall already and I think they should be cut back some way, but I don't know how.—Subscriber, Garden Grove.

Cut back to six inches in June and again to 18 inches the first week in August—not later. This is treatment for plants set out in April. If set out May 15-June 15, the August cutting should suffice. Each stem will then break out with many side shoots. Select the four or five strongest and rub the rest off. Keep all other growths from developing and disbud each shoot to one flower if you wish size. Keep well watered at all times and when the first signs of a bud appear begin to fertilize. Keep this up once a week until color shows in the buds, then stop, but water well to the end.

Irrigating Tokays

I have a tract of 12 year old Tokay grapes that have never had any water but would like to water them now. I have been told they will mildew if they are watered and to water when they begin to turn. Part of the tract has trees among the vines and they must have water. Please tell me when to water and how often and when to stop. I have sulphured them once. How often should they be sulphured and when?—Subscriber, Bowman.

Our advice on watering your Tokay grapes is that they should be watered before the ground becomes dry enough to cause them to suffer. Mildew will not develop because of watering, provided the atmospheric conditions are

not favorable to its development. You should, of course, examine the vines very carefully at frequent intervals for the appearance of this disease and sulphur immediately if it is discovered.—F. K. H.

Horticultural Commissioners

The horticultural commissioner for Los Angeles County is located in the Hall of Records building, North Broadway, Los Angeles. His name is H. J. Ryan, and we doubt not he has inspectors near the home of the Zelzah subscriber. Horticultural commissioners in other counties are usually located in the court house or at some point near.

Watering Lawn

Please tell me which is the best time of day to water lawn, flowers or vegetable garden—in heat of day or when it grows cooler?—Subscriber, Covina.

Early morning or late afternoon is the better time for watering lawn. Especially if the lawn is recently seeded and all the plants are young and tender sprinkling under scalding noonday sun might cause death of much of the grass. However, when lawn is recently seeded and hot sunshine dries the surface unduly the afternoon irrigation should be as early as possible and the next morning's as late as possible in order to carry the sprouting seed through the heat of the day. With an old established lawn, especially where it is largely composed of devil grass, it might be immaterial as to the time of day for sprinkling.

Cutworms

Would like to ask how to destroy cutworms in hot beds and in gardens.—Subscriber, Lake Mountain.

Hand picking is safest and best. Early in the morning before the worms have crawled under clods or boards a little deft finger work is worth more than poison bait. However, if the job is too big and assistance is needed use the poison bran mash or citrus bran mash given under formulas 21 and 22 in the last special pest fighting number of the Cultivator issued September 24, 1921.

Spreader for Spray.

I would like to know if it pays to use casein spreader with arsenate of lead on apple trees for codling worms. They claim in the ads that it spreads better and sticks on better if this spreader is used, but this is first year it has been used here and I don't know from experience how it will work.—Subscriber, Watsonville.

The cost is but little increased by use of the spreader. It holds the poison longer on the fruit and leaves and certainly is worthy of trial. It is being used quite generally this year.

Rotate

I raise good potato vines with blossoms but no potatoes excepting a few small ones.—Subscriber, Orange Cove.

Change your crop. Rotate for two or three years. Meantime build up soil and get in best of condition. New seed, especially certified seed, might also prove beneficial.

Irrigation?

I would like to know the best methods of irrigation, if you please.—Subscriber, San Fernando.

This question surely calls for one long answer and is far beyond the limits of this publication. One would irrigate strawberries or barley or eucalyptus trees or alfalfa or a citrus orchard in materially different manners. Again 'dobe soil and sandy soil

(Continued on Page 663.)

Here's a real treasure from Nature's storehouse

GOOD old Mother Nature has placed in wheat and barley the wonderful food properties which build and sustain life and health.

Many so-called "refined" foods are robbed of vital elements which the body needs.

Grape-Nuts—that famous wheat and barley food—brings you all the natural goodness of the grains in perfected form, with a crispness and flavor that charm the appetite.

You will find Grape-Nuts an ideal dish for breakfast or supper-time. Ready to serve from the package, with cream or good milk.

Order Grape-Nuts from your grocer today.

Reduced Rates on Shipments

—to and from Eastern and Pacific Coast Points

ARE you moving "back East" or, have you friends or relatives who are moving out West? In either case, a substantial saving of freight charges on furniture, household goods and automobiles may be made by shipping "the Bekins way." It is possible for us to quote reduced rates because we consolidate carload shipments. Our method also provides for "thru car service"—quick transportation.

Consult Us Before Moving

For local and long distance hauling on California's superb motor highways we have over 50 vans.

KHAKI FOLK

The town is full of khaki folk
Headed for the hills,
Headed for the spaces far
That cure the city's ills.
Headed for the long, long trail
Where the golden sunlight pours,
For the open ways and the sunny days
Of the fragrant out o' doors.

The old machine is loaded down
Until you think she'd choke;
But there's smiles upon the faces
Of the happy khaki folk
They're headed for the white trails
The tilt of woodland streams.
The scent of pine so pure and fine
The summer land of dreams.

They know the guerdon of the quest,
They know the quiet skies;
They hear the gentle voice of rest
In Nature's lullabies.
They know the forest whispers
Though ne'er a word is spoke,—
They're off today for the great white way
Oh, happy khaki folk.

—Harry T. Fee.

"I WISH I WERE"

By Clara Ingram Judson
in Youth's Companion

ONE summer morning a fairy awoke so late that the dew was all gone from the flowers and he had to run down to the brook to get his before-breakfast drink. And after he had his drink he discovered that he was too late for honey, too; he could not find a speck of honey, not even one taste. You see, the fairies usually get up so early that they can eat all the honey they want long before the bees start from their hives.

But on this particular morning the lazy little fairy had slept so late that the bees had been round and eaten all the honey,—every scrap,—and that made the fairy so cross that he did not even remember that he might stir round and hunt for something else to eat.

He sat down at the foot of a tree, intending to sulk all day long; but before he had more than started sulking a robin came by.

"Good morning, Friend Fairy!" said the robin cheerfully: "Isn't this a fine day?"

"No, it's a very bad day," said the fairy crossly, "and I wish I were an apple!"

"What a funny wish for a fairy to make," said the robin, laughing. "If you change into an apple, I'll eat a hole in you."

"Then I won't be an apple," replied the fairy crossly, "for I don't want a hole eaten in me! I'll be something else."

The robin laughed and flew away just as a big toad hopped out from behind a tree.

"Good morning, Friend Fairy!" he croaked. "Isn't this a fine day?"

"No, it isn't," said the fairy crossly; "and I wish I were a spider!"

"What a funny wish!" croaked the toad. "Don't you know that spiders have to work very hard and spin a web before they can crawl on it through the air? But I hope you do change into a spider; I'm looking for spiders this very minute, and if you become one I'll gobble you up."

"Then I won't be a spider," said the fairy, "for I certainly don't care to be gobbled up. I'll be something else."

The toad laughed and hopped away, and the fairy was left alone to sulk.

"I don't know what I want to be," he sighed fretfully. "This is such a horrid world—no dew, no honey, no nice wishes! I think I'll be a star."

"A star?" exclaimed a soft little voice by his side. "Would you be a star and leave this beautiful world—all the flowers and birds—to live up in the bare sky?"

The fairy turned and looked. There, near by was a tiny ant tugging away at a big grain of sand.

"Do you think this is such a fine world?" asked the fairy. "I should think you would hate it. You have to work all the time."

"To be sure I do," replied the ant proudly. "That's the reason I like to live. Working is the jolliest and most interesting thing in this whole big world—didn't you know that? It's true." And the sturdy little ant picked up his burden and started away.

Left by himself, the sulking fairy began to feel very foolish and very sorry. He remembered the flower bud

he ought to have opened long ago; and he thought of the sunbeams he should have helped.

"What I should be wishing for," he whispered to himself, "is work. And then should hunt round and answer my own wish."

Slyly he slipped round the tree to open a buttercup bud he was sure he had seen there. And as the flower opened, what do you suppose that surprised fairy found? A drop of fresh, sweet honey all ready for him to eat!

As he sipped the honey and planned what to do next, a cardinal bird hopped by.

"Good cheer! Good cheer, Friend Fairy!" called the cardinal. "Isn't this a fine day?"

And the happy little fairy called back, "A fine day for working, indeed it is!"

AFTER THE CIRCUS

By Rollin Lynde Hartt

WHEN the circus moves grandly along its route, the wonderful thing is not the "stupendous aggregation of monster shows" or the "entirely new street parade" or the "world's greatest congress of living curios." Instead, it is Sonny. For weeks before the circus comes he is too good to live and for weeks afterward too daringly acrobatic.

You don't so much mind when wings threaten to sprout on Sonny, but this board fence tight rope walking, this aerial monkey-shining—oh, saints preserve us! A hundred times a day it brings your heart into your mouth. Needless, one may add. For there happens to be a safe and sane outlet for Sonny's Darwinian aspirations—an outlet Tarzan himself would have prized—namely, the horizontal bar.

Open the classified telephone directory, call up a dealer in playground apparatus, and within a surprisingly short space of time Sonny will be swinging in imaginary spangles and green tights, dangling like a jungle ape, and doing nine-and-twenty soul-satisfying stunts, which, viewed from across the way, speak for themselves and save him the bother of shouting as of yore, "oh, Skinny, c'mon over!"

But a properly constructed horizontal bar entails something of a bill if you get it from a dealer and pay to have it set up, and that is why Community Service has issued plans and specifications for a horizontal bar which any handy man about the yard can call into being and which any impecunious playground can afford, granted only that some enthusiast supplies the wits and the muscle to carry out directions. Here they are:

Provide yourself with a galvanized iron pipe six feet long and an inch and a quarter thick. Also, provide two posts—of strong wood, naturally—and ten feet tall by four inches square. At points two inches from each end of the galvanized bar drill holes five-eighths of an inch across. Then, six inches below the top of each post, bore a hole an inch and a quarter across. After that has been accomplished, bore a new hole intersecting this at right angles (the two holes must cross in the center without unevenness) and measuring a half-inch in diameter.

It sounds elaborate, all this fuss about perfection in a thing as simple as a horizontal bar, and yet strength and security are the object, and any circus actor will tell you that, while he never distrusts his skill, he lives in constant terror lest something may go wrong with his apparatus. Better safe than sorry.

After making sure that the bar and posts comply with the regulations furnished by Community Service, you dig two pits, three feet deep and about ten inches square and far enough apart so that the space between posts will measure exactly five feet and four inches.

Into these pits you spill six inches of concrete, made by taking a shovelful of Portland cement, two shovelfuls of sand, and four shovelfuls of gravel, and mixing with water. Then, you set the posts upright in the pits, careful to have them the stipulated five feet and four inches apart and to have the large holes near their tops exactly fac-

ing each other and—still more important, if anything—to have these large holes at exactly the same height from the level ground, as otherwise the bar will not be horizontal.

You are now ready to slip the bar through the two large holes. As soon as it is in place, you secure it by poking carriage bolts through the small holes in the posts. A carriage bolt four and half inches long and half an inch thick is the right size. And the bolts not only go through the posts, but also, thanks to the holes you bored in it, through the bar itself. Now you pour in the concrete to fill the space around the posts.

At this point it is advisable either to chloroform Sonny or to clap him in irons. Left at liberty, he will instantly begin turning himself around the bar like a demented cruller. Restraining him, and give the concrete two full days to harden.

If you prefer to get along without concrete, and use bricks and stones at top and bottom of the pits to brace the posts, well, so be it; only, in that case you must stamp the ground down firmly around them.

After the posts and bar are securely set, you can improve on perfection by drilling additional holes in the posts, at intervals of six inches, to within four feet of the ground. That makes the bar adjustable to various heights, so that the smaller small boys can perform on it and the big ones vault it.

Survey your handiwork. If any doubt remains as to its importance or your own, the doubt will soon enough be dispelled by Sonny's grin.

HINTS FROM HOUSEKEEPERS

Mint Sauce

Noticing direction for making mint sauce in the Cultivator of May 27, a reader says that she always cooks her mint sauce. She chops the leaves and tender stalks, covers with cold water and simmers 10 to 15 minutes to extract all the mint flavor, then takes from the fire, adding a little vinegar and sugar to taste.

Pretty Seam Finish

Here are directions for making a pretty seam finish for dainty summer things. I learned it from a high school girl who is using it on a dress she is making for a tiny niece—doing this as part of her class work. The little sleeves are set into the dress with a seam that looks like double hemstitching, only it's prettier and is made on an ordinary chain stitch (not lock stitch) machine. The edges to be stitched together are laid together in the regular way except that sheets of soft paper—newspaper will do—are laid in between (about 24 thicknesses, but this you will determine according to taste). Stitch together and pull out papers carefully. Open seams, press back raw edges on each side and you will see an even "double hemstitching." Press seam with iron to have perfectly flat and smooth and stitch along each edge of seam—on right side. This finishes the "hemstitching" and makes it very durable.

If you have a chain stitch machine, try this. You're sure to like it.—Reader, Los Angeles.

Many Ways of Using Mint

Query as to mint sauce in last week's Cultivator made me want to pass on to other housekeepers some of the many other ways we have of using mint leaves. First of all, there is always a patch of mint growing under the drip of the hydrant at our kitchen door. My mother always had a mint patch growing at her back door—it seems as much a part of the household as the screen porch or the honeysuckle over the arbor. Well, to come back to the mint, when I want some to use I run to the mint patch and gather fresh tips, wash them under the kitchen faucet thoroughly, and they are ready to add to glasses of cold lemonade or orangeade—just a

few tender tips of fresh green leaves in each. Their main charm is in their perfect freshness it always seems to me. Then often I add leaves, cut up fine with sharp knife as you would parsley, to mashed potatoes. Just before putting on the table, beat the leaves quickly into the fluffy white potatoes. We like very much a dinner dish of a mound of mint potatoes on a platter, surrounded by creamed dried beef.

Then instead of mint sauce with roast lamb we like to use just the cut up green leaves. We also use these with cold lamb or other meats just as one does parsley. This makes an especially nice addition, we think, to cold meat loaf. It is good too in creamed chicken, cream soups, etc.—Subscriber.

HOUSEHOLD QUERIES

Jelly Crystallizes

Answering query as to cause of grape juice and jelly crystallizing, W. V. Cruess, in charge of fruit products laboratory at the University of California writes:

"The crystals which appear in grape juice and grape jelly are cream of tartar crystals and are perfectly non-injurious to health. They can be made to go into solution by heating the juice a short time to 150-160° Fahrenheit. Bottles containing rough spots or sharp points on which crystallization may start develop crystals more quickly than perfectly smooth bottles; but usually all bottles of juice will in time develop the crystals. They may be eliminated by storing the juice at a low temperature (32° Fahrenheit) several months, followed by decanting from the sediment, rebottling and re-sterilizing.

Paint Remover

The painters have left our door knobs, bathtub, etc., splattered and streaked with paint till I am almost wild trying to get it off. Have tried turpentine, sandpaper, etc., but it hardly has any effect. There must be some way of getting it off. What is it?—Subscriber, Fresno.

My arms and back fairly ached—reminiscently—when I read this letter. Don't I know what that paint cleaning nightmare is! But cheer up, of course there is a way. There are too many splashy painters and too many nice new houses and bathtubs for some bright man not to have concocted a paint remover that will leave the new houses in good shape in spite of the splashiness. In fact, there are a number of perfectly satisfactory paint removers. Just ask your hardware dealer.

OUR BABY COLUMN

By Mrs. M. S. Sirdevan

Sometimes it is very hard to break a child of taking a bottle, especially if it has had one up to two years or more. This little incident may solve the problem. The parents talked to the child for several days, saying what a big lady she was getting to be, and wanted to know if she wouldn't throw her bottle in the garbage can, and she finally consented, doing it herself. Of course it was the topic of conversation all that day, but she remained a true little sport to her bargain.

It is every child's ambition to be like some one who is several years its senior, and a great deal can be accomplished along these lines. The child will eat certain foods if it will make it "grow big like John," and never think of crying because John is a big boy and doesn't do those things. On the other hand, it is very demoralizing for John to know of this hero worship, so my advice is not to do it before him.

Start in when a child in very young, by giving it either a doll or animal to take to bed, for it is company and soon becomes part of its little life. The child goes to bed happier and better contented.

I am going to give a short prayer that my babies love to say:

"Jesus, tender Shepherd, hear me, Bless Thy little lamb tonight. Through the darkness be Thou near me, Keep me safe till morning light."

Every Woman Loves to Paint When She Knows How —Let Us Tell You

PAINTING is really fascinating work. Once you are started you'll probably not want to stop until you have refinished many things you did not intend to do at first.

Of course, there are some simple directions that must be followed if the work is to be successful, and we have a special "Home Service Paint Department" which was organized just to tell you how to paint.

Perhaps some of your furniture, floors, woodwork or walls are beginning to look a little old—just on the surface. Pick out one or two things to do. Tell us about them and how you want them to look when finished.

Our experts will tell you what materials to use, how to do the work step by step, what brushes you'll need, and everything about it.

For 73 years we have been making paints, varnishes, enamels, wall finishes and stains for

women to use. They are the finest materials of their kind that we know.

Write for Fuller's Free Advice and refinish a few home things. You'll be surprised how fascinating the work is and how much you can save, too.

Free Advice

Write us now—a postcard—for Fuller's "Home Service" Paint Book, which tells you just what to buy for every kind of painting. Send full description and get our free advice on any kind of painting you want to do.

Decorat Varnish Stains for refinishing furniture and interior woodwork. They stain and varnish in one operation. Match the color of any natural wood. 8 colors.

Silkenwhite Enamel produces a rich, beautiful finish on woodwork and furniture. Flows out smoothly and does not show brush marks. Produces a mirror-smooth surface. Stays white and wears long. Gloss white, semi-gloss white and 8 colors.

Rubber Cement Floor Paint: A durable, sanitary, waterproof paint for floors of kitchens, closets, etc. Spreads easily, covers well. Dries hard over night. 12 colors.

Fullerwear: The all-purpose spar varnish which is unexcelled for all interior and exterior surfaces. Fine for linoleums, floors, woodwork, furniture, front doors and vestibules. Dries hard and glossy. Very durable.

Also makers of House Paint, Barn and Roof Paint, Washable Wall Finish, Tractor Paint, Fifteen-for-Floors Varnish, Auto Enamel, Porch and Step Paint, Fuller's Hot Water Wall Finish (kalsomine), Silo Paint, Milk Can Enamel, PIONEER WHITE LEAD, Implement Paint and Fuller's Oil Stains.

Fuller's SPECIFICATION "Home Service" Paints Varnishes - Enamels - Stains

Manufactured by W. P. Fuller & Co., Dept M-3 San Francisco

Pioneer Manufacturers of Paints, Varnishes, Enamels, Stains and PIONEER WHITE LEAD for 73 years.
Branches in 19 cities in the West. Established 1849. Dealers Everywhere.

Free Book—Send Coupon

Send coupon for Fuller's "Home Service" Paint Guide, a free book which tells you how to paint and varnish home things, what brushes to use, etc.

Ask our Service Department any question about paint which you would like to have answered—complete detailed advice is given free.

GHIRARDELLI'S

Ground CHOCOLATE

Western Canada

Wonderful Stock Raising Country

Vast stretches of undeveloped fertile agricultural land of the highest productiveness await the settler in Western Canada. The land possesses the same character of soil as that which has produced the high quality of cereals that have carried off the world's premier honors so many times in the past ten years.

Native Grasses are Rich and Abundant

Cattle fatten upon them without any grain being fed.

Limited capital on high-priced lands is not a success, neither can the tenant burdened with high rents hope to succeed. The place to overcome these is in Western Canada—where land is cheap where a home may be made at low cost, and where dairying, mixed farming and stock-raising give an assured profit.

Land may be purchased from the Railway Companies or from responsible land companies or from private owners. Free homestead of 160 acres each are to be had in the more remote districts.

SUCCESSFUL JELLY MAKING

By Arthur W. Christie, Assistant
Professor of Fruit Products,
University of California

FRUIT jellies are annually prepared by many housewives who take just pride in their ability to successfully prepare this most delicate fruit product. The process of jelly making appears very simple, merely a matter of boiling together fruit juice and sugar until the mixture jellies on cooling. However, even the most experienced housewives are occasionally unsuccessful in jelly making, indicating that the process as ordinarily practiced is at times uncertain. Most such failures are caused by lack of familiarity with the fundamental principles of jelly making which if, understood and applied, lead to the making of ideal jellies.

A perfect glass of jelly is clear, sparkling, transparent and of beautiful color. When turned out of its mold it will retain its form and not flow and yet will quiver. It should be so tender that it may be cut with a spoon and yet so firm that a sharp sparkling edge remains where it is cut. It should not be syrupy, sticky or gummy and should retain the delicate aroma and flavor of the fruit from which it was made.

A fruit jelly depends for its consistency on three substances. These are pectin, acid and sugar, the first two of which are obtained from the fruit and the latter to the greater extent added. The most important of these is pectin, the substance which, when combined with proper proportions of sugar and acid, gives the stiffness to jelly. Pectin is found in many but not all fruits and is more abundant in slightly underripe than in fully matured fruit. Without pectin jelly is impossible. As can be seen from the accompanying table some fruits are rich in both pectin and acid and lend themselves readily to jelly making. Some fruits are deficient in either acid or pectin and must be blended with other fruits in order to secure jelly. Fruits low in both acid and pectin can only be used to flavor jellies made from a jelly stock, usually apple. There are now on the market several concentrated pectin preparations. These are usually made from apples although one Los Angeles firm is now making a pectin powder from oranges. These pectin concentrates are inexpensive and a few spoonfuls will stiffen the most impossible jelly.

Suitability of Fruits for Jelly

From—Cruess, "Home and Farm Food Preservation."

Rich in Pectin and Acid Jelly Readily	Medium Acid and Pectin Jelly if Careful	Rich Pectin Low Acid Add acid fruit	Low Acid and Pectin Blend with fruit from Column 1
Sour Apples	Ripe Apples	Guavas	Apricots
Crab Apples	Blackberries	Feijoas	Peaches
Currants	Oranges	Figs	Pears
Loganberries	Grapefruit	Pie Melons	Raspberries
Cranberries	Plums		Strawberries
Lemons	Quinces		
Sour Plums	Sour Cherries		
Eastern Grapes	California Grapes		

Sugar and acid besides being essential ingredients in the physical consistency of a jelly are important in furnishing the desirable sweetness and tartness. Sugar is also the preservative which prevents the jelly from spoiling, making up about two-thirds of its weight.

Sound and clean fruit should be used. It is desirable but not always essential to use partly ripe fruit to impart the fine flavor and color and partly underripe fruit to furnish the necessary pectin concentration. This pectin is held in the tissues of the fruit and must be released by boiling. Very juicy fruits such as berries need only be crushed and boiled a few minutes without addition of water. Less juicy fruits, as apples and quinces, are cut in small pieces, barely covered with water and boiled 10 or 15 minutes till tender. Citrus fruits require about an hour boiling because of the tough skins which contain the pectin.

The juice is then drained or pressed through a cloth. If only drained a clearer juice results but a greater yield is obtained by pressure. Probably the best method is to drain off most of the juice first and press the

remaining pulp. This pressed juice will be cloudy and must be filtered through a jelly bag several times till clear. The juice should be as clear as possible before jelly making is started. The pulp from fruits rich in pectin may be mixed with water, boiled and pressed two or three times, yielding juices not as concentrated as the first but still capable of making good jelly if the proportion of sugar added is reduced.

Freshly made jellies are always best. If the juice intended for jelly is sealed in jars or bottles and pasteurized in a tub of water at 175 degrees for 30 minutes, it will keep indefinitely and may be made into jelly at any time by adding the proper amount of sugar and boiling down to the jelling point. An added advantage is that such jelly stocks clarify during storage and the clear juice may be poured off from the sediment.

If there is any doubt as to the jelling property of the juice, it should be tested for pectin. This simple test will avert failure. To one tablespoon of juice in a glass add an equal quantity of grain alcohol. This alcohol must be of 95 per cent strength, and if denatured is equally satisfactory. Mix the juice and alcohol. A juice rich in pectin will form a bulky gelatinous mass of pectin, almost solidifying the mixture. Juices moderately rich in pectin show a few large pieces of gelatinous material while juices too low in pectin to make jelly will only show a few small pieces of flaky sediment.

There is no simple way of testing for acid but if the juice is not rather tart the acidity may be increased by the addition of a small amount of lemon juice.

Knowing the pectin content of the juice the proper amount of sugar to add can be judged. To each cup of juice rich in pectin at least one cup of sugar may be added. If the juice is high in both pectin and acid 1 1/4 to 1 1/2 cups of sugar may be added. On the other hand if the juice is shown to be only moderately rich in pectin only 3/4 of a cup of sugar is added and if only a small amount of pectin is present the sugar is reduced to 1/2 cup per cup of juice.

Reducing the amount of sugar in proportion as the pectin is low makes it necessary to concentrate the mixture further than if equal quantities of sugar and juice had been used. In any case boiling must continue until the jelly contains over 60 per cent sugar. During this boiling the concentration of pectin increases because water is evaporated. If a large quantity of sugar is added only a short boiling is required to reach the proper

concentration of sugar, and this may be insufficient to reach a pectin concentration high enough to jelly. If a smaller quantity of sugar is added, necessitating a greater concentration by boiling, the pectin may reach a sufficient concentration to make jelly.

More failures result from adding too much sugar than from all other causes. When failure occurs housewives are prone to blame some ingredient. Beet sugar has been unjustly blamed for the failure of many a pot of jelly. Impartial tests conclusively show no difference between cane and beet sugar for jelly making.

The juice should be boiled for a few minutes and well skimmed before the sugar is added. Best results are obtained by cooking rapidly in small batches, enough for a dozen glasses, over a quick fire. Long slow cooking causes loss of flavor, darkening of color and the pectin may become partly inactivated by the action of the heat and fruit acid.

There are several ways of ascertaining when the jelling point has been reached. The "sheeting test" is fairly satisfactory and consists in dipping a large spoon in the boiling jelly and holding the spoon in the air so

The Cultivator Patterns

3559. Misses' Dress.—Cut in 3 sizes: 16, 18 and 20 years. An 18 year size will require 4 3/4 yards of 44 inch material. The width of the skirt at the lower edge is 2 yards. Price 10 cents.

3814. Girl's Dress.—Cut in 4 sizes: 6, 8, 10 and 12 years. A 10 year size will require 2 1/4 yards of 27 inch material for the gulpie and 3 3/4 yards for the dress. Price 10 cents.

4023. Ladies' Combination.—Cut in 4 sizes: Small, 34-36; Medium, 38-40; Large, 42-44; Extra Large, 46-48 bust measure. A Medium size requires 3 yards of 32 inch material. Price 10c.

4033. Boys' Suit.—Cut in 4 sizes: 2, 3, 4 and 5 years. A 3 year size requires 1 1/2 yards of 24 inch material for the waist, and 2 3/4 yards for the trousers. Price 10c.

4010-4011. Ladies' Costume.—Waist 4010 cut in 7 sizes: 36, 38, 40, 42, 44, 46 and 48 inches bust measure. Skirt 4011 cut in 6 sizes: 25, 27, 29, 31, 33 and 35 inches waist measure. To make the dress for a medium size would require 7 3/4 yards of 32 inch material. The width of the skirt at the foot is about 2 yards. TWO separate patterns 10c FOR EACH pattern.

4016. Girls' Dress.—Cut in 4 sizes: 4, 6, 8 and 10 years. A 10 year size requires 3 yards of 32 inch material, for the dress with flounce. Without flounce it will require 2 1/2 yards. Price 10 cents.

4021. Ladies' Apron Dress.—Cut in 4 sizes: Small, 34-36; Medium, 38-40; Large, 42-44. Extra Large, 46-48 inches bust measure. The width at the foot in the Medium size is 2 yards. It will require 5 1/4 yards of 32 inch material. Price 10c.

3613. Girl's Dress.—Cut in 4 sizes: 4, 6, 8 and 10 years. A 6 year size requires 1 3/4 yard of 36 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Do not expect patterns under Two Weeks from date of order.

CATALOGUE NOTICE

Send 12c in silver or stamps for our Up To Date Spring and Summer 1922 Catalogue, containing over 500 designs of Ladies', Misses' and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker. Also colored plates.

PATTERN DEPARTMENT

California Cultivator Los Angeles

the jelly will drip from it. If drops of syrup leave the spoon boiling must be continued further, but if the jelly drops from the spoon in a sheet or flakes the jelly is considered finished and removed from the fire.

A more reliable method is to use a thermometer in the boiling liquid. As the boiling progresses the liquid becomes more concentrated and when a temperature of 221 is reached it indicates that the jelly consists of 65 per cent sugar and should be stiff when cooled. If a soft jelly is desired boiling may be terminated at 219 or 220 degrees. This is the simplest and most accurate method of determining the jelling point. However, unless a sufficient amount of pectin and acid are present, merely boiling down to 221 degrees will not alone insure the formation of jelly.

Pour the hot jelly into clean and dry glasses and cool thoroughly. If necessary strain into the glass although if well skimmed the jelly should be clear. When the jelly is cold and stiff cover with a layer of melted paraffine. If a little stick is run around between the glass and the jelly about 1/4 inch down from the surface before the paraffine is poured, a much better seal is made. The hot paraffine sterilizes the surface of the jelly and makes a tight seal which protects the jelly from contamination.

In hot climates jellies finished below 221 degrees may ferment. In such cases the jelly must either be concentrated further or the hot jelly may be poured into scalded jars or glasses, tightly sealed and immersed in water, at 180 degrees for 30 minutes. Such jellies will keep indefinitely.

Jelly should be stored in a cool, dark and dry place. Light injures the color and warmth and moisture may cause the jelly to soften and "weep."

The following list of the more common jelly difficulties suggests the cause and prevention in each case:—

Soft Jelly: Too much sugar for the amount of pectin. Add more juice or pectin and reboil to 221 degrees.

Tough Jelly: Too little sugar for amount of pectin.

Gummy Jelly: Overcooked. Stop at 221 degrees.

Cloudy Jelly: Juice not well strained. Jelly not well skimmed. Partly congealed before pouring into glasses.

Sugar Crystals: Insufficient cooking or stirring after addition of sugar. Too much sugar because too much added or boiled too long.

(Continued on Page 663.)

How Simple to Install the Marvelous Colt "Gas Well"!

HERE is a cross-section of a farm house showing how the pipes carrying that wonderful carbide gas are run to every room from the COLT Lighting and Cooking plant.

Even though no provision was made for piping when the house was built it is a simple matter to pipe it now for Carbide Gas.

A good mechanic can set the COLT generator, pipe the average house and attach the handsome polished brass fixtures in about three or four days.

—without cluttering, upsetting and disturbing the whole house.

He works quietly from room to room.

Pipes are usually run between the partitions and under the floor—always concealed except in some cases where possibly in a room or two building construction prevents the running of pipe between a partition.

For illuminating the barn and outbuildings a shallow trench is dug from generator to barn, pipe laid and covered. After that, you can have the most brilliant, softest, whitest and most-spreading

light ever discovered in your home. The clearest light to read by—the very easiest on the eyesight of the whole family.

And instantaneous flame for cooking at the touch of a finger. Even, sustained heat for a gas iron. With a water heater, piping hot water for washing, shaving and bathing.

And no more lamp-cleaning, filling, trimming or carrying—no insufferably hot coal or wood range in the kitchen during the summer months.

And you'll have a cooking and lighting system that is unequalled for simplicity, economy and little attention. The gas is made automatically by the generator. No expensive parts needing continual replacement—a lifelong investment.

Interesting? You should hear what 341,000 farmers say about Carbide lighting. Space won't permit us to tell you the wonderfully fascinating story of carbide lighting and the COLT—so just drop us a postcard and get the full story.

How to Stop Calf Scours

You can do it in a quick simple reliable way—costs little. One good calf saved will repay the expense of protecting your whole herd for a long time against this infectious disease.

Leading breeders and dairymen throughout the country say there is nothing like B-K. It contains no poison or acid—it is clear as water and safe to keep anywhere.

B-K acts as an anti acid and sweetner in stomach and also quickly kills the germs that cause scours or diarrhoea. It heals the inflamed membranes, relieves irritation and restores healthy action.

SAVE EVERY CALF

It's so simple to keep your barns sanitary and your animals in a healthy condition. B-K also prevents such germ diseases as Abortion, Retained Afterbirth, Barrenness, Calf Pneumonia, and you have this wonderful help all in one bottle—always ready.

Keep a supply of B-K handy for all the "little ills" of the barn—cuts, scratches, anything where infection can do harm.

GENERAL LABORATORIES

214 Santa Marina Bldg., 112 Market St.
San Francisco, Cal.
Factory: Madison, Wis.

We will send you on request a bulletin telling you "How to Save Every Calf."

B-K is a pure sodium hypochlorite—every scientific man knows the value.

California Breeding Farms

By Jack Klein

THE GUASTI BERKSHIRES

ABOUT three years ago the Italian Vineyard Company at Guasti near Ontario, which has over 4,000 acres of the choicest wine and table grapes, installed a hog department in order that the hogs could eat the waste pulp and seeds of the grapes and provide much needed fertilizer for the big vineyard. Some of the vines are getting to be close to 50 years old and so little fertilization has been done that it was becoming a necessity.

Alex Wilson, who had been in charge of the hog department at the Pontana Land Company, was the one chosen by Secondo Guasti Jr., manager of the vineyard, to superintend the new department, and he has achieved wonderful success with it. An exceptionally capable hog man and a good mixer, he has a host of friends up and down the state.

While at Pontana Wilson had a number of different breeds of hogs under his care and when given the

The queen of the sow herd today is Violet's Festline who was grand champion in all the California shows last year. She is one of the best Berkshire sows of all time and she deserved every bit of the credit which came to her. There is a tragedy connected with this sow which is common among pure bred animals. Her sire was a boar called August Fisher who had no well known animals very close up in his pedigree and yet he was a truly great sire. He was bred to a few sows and before his get had a chance to prove his worth he was sent to the butcher. If the man who did this had restrained his impulse to get rid of the boar he could probably have topped all prices paid for Berkshire boars as practically all of his pigs were exceptionally fine ones. One of Violet's sisters was grand champion at Portland in 1920 and her own daughter had that honor last year. Violet is in wonderful shape now and is being carried along easily in order to be ready for the shows. She has four daughters in the herd

Violet's Festline and Four of Her Progeny

The Italian Vineyard Company's great Berkshire sow who was grand champion of all the California shows in 1921, with some of the good animals she has produced.

chance to choose which breed he desired to have at the Italian Vineyard he picked the Berkshire. There was a time when the Berk was the leading hog in Southern California, but when the Italian Vineyard Company started in to gather a herd of foundation animals, good ones were few and far between in that vicinity so Wilson had to go to Oregon, to Northern California and to Indiana for them. From the day of their arrival interest in Berks perked up and last fall at the Riverside show they led in numbers, and this year they promise to almost flood the place.

The Italian Vineyard Company has been a great asset to the Berkshire in California as it has always specialized on the big, high backed, straight sided and good footed hog that has become the accepted type in the past few years. It has maintained a representative show herd which has visited practically all of the big shows of the state and last year in six shows the herd won 46 firsts and about 20 championships and always against the stiffest kind of opposition. The company has done a great deal to foster pig club work and it is reaping the reward of its efforts. During the first three months of the year over 100 breeding animals, mostly young boars and gilts, were sold, and since that time the demand has been steady. In fact, the stock available for sale is just about sold out.

There are about 100 females on the place reserved for breeding. This includes the brood matrons, young sows and yearling gilts which will soon be bred for the first time. Among these are some of the greatest sows the world has ever known, and just recently a hog judge who has travelled widely and judged in all parts of the Union was heard to remark that he had never seen such a collection of sows in one herd in all his travels.

The best known of these great sows is probably Riverby Princess who as a pig was the grand champion of the World's Fair at San Francisco in 1915. Her day as a brood sow is past but she has left some excellent progeny. One of these, a sow by Baron Duke 201, is also in the herd as well as some younger ones. Another great sow who has left her progeny was Lady Rookwood 100, the grand champion of the National Swine show in 1917.

and some of them will also be included in the show string.

Another great sow is Grape Wild Rose 6th who won all the championships for A. B. Humphrey in 1920. She was purchased in the American Berkshire Congress Sale at Riverside in February. Although she was sold as an open sow it was found that she had been bred and is just now ready to farrow. Having pigs at this time of the year will probably keep her from being in the best of condition for the early shows but she should be in good shape for the Riverside and Portland. With Violet and Grape Wild Rose 6th, and with one of three or four of the other good sows to go

with them the female end of the aged herd could not be better.

The boar to be shown with these sows will be probably either Model Leader 3d. or Guasti's Rival. Model Leader 3d. is a littermate to Grape Wild Rose 6th, and he is a real good boar. He fitted up in fine shape for the Berkshire Congress show and was made grand champion. He is in good condition now and will be a lot better before fall.

The pride of the Guasti herd is the young boar Guasti's Rival commonly known as "Bobbie" because for some unknown reason he lost a part of his tail when only a day or so old. As a junior pig he was undefeated last year and was four times junior champion. He is an ideal junior yearling now. On the day he was a year old he weighed 510 pounds in just good breeding condition. He was sired by Mayfield Rookwood 2d. who was grand champion of the state in 1917, and is out of one of the best brood sows the ranch ever owned, Rival's Wondress 48th.

At the head of the herd is the great sire, Rincon Leader, one of the last two living sons of Grand Leader 2d. He is out of a littermate sister to the dam of Real Type who is probably the best known young boar of the breed. Real Type is at the head of the Barker herd in Indiana.

Another great sire is Winona Leader Champion, a son of Laurel Champion out of a daughter of Grand Leader 2d. Both of these boars have sired prize winners and their pigs are going to be hard to keep out of the honors this year.

The crop of about 350 spring pigs now on the place shows the results of mating such animals as are in the foundation herd and the Guasti Berkshires are going to demand a lot of attention in the near future.

Started to feed largely on waste and provide fertilizer, the hog department has become a valuable asset to the company. The hogs thrive on the fresh pulp in the crushing season and when it is over they earn a part of their living by picking the seeds out of the dried pulp which is used for bedding. While barley was high it was profitable to separate and grind the seeds as they contain a large amount of food value and can be fed up to 15 per cent of the ration. Now it is cheaper to let the hogs salvage them.

The Italian Vineyard plant is a show place and one of the cleanest we have ever visited. The soil is sandy and well adapted for cleanliness and everything is modern. The pens are so arranged that one man can transfer any hog or pen of hogs to any other pen without assistance. The farrowing houses are adequate and convenient and there is plenty of

Ranch Men Attention!

160 Acre Improved Ranch

Located about 5 Miles South East of OXNARD

To be Sold at Auction Thursday, June 22nd, at 2 P.M.

All Improvements good and well kept. Two cottages. 2 big barns, granary, blacksmith shop, tank house, chicken house and yard, wood and wash house. Phone, electric lights, domestic water piped under pressure. Electric pumping plant and about 2200 feet of irrigation pipe lines.

Ideal Condition for Stock, Hog or Dairy Farm or Adaptable for Truck Gardening

About 90 pure bred Berkshire hogs and pigs. Jersey cow. Splendid team of horses and ranch tools go with purchase.

shelter for the entire herd. Small fields of alfalfa provide ideal accommodations for sows with litters and for the growing stock.

The herd is cared for by A. W. Longley who has been with it from the beginning. Wilson Rough who has been in charge of the lowana herd at Davenport, Iowa, for a number of years, and August Sagehorn, a Davis farm school boy who distinguished himself by showing this herd last year and by showing the farm school bar rows at the International last winter. All of these men are very enthusiastic over the herd and its prospects of becoming one of the greatest herds in America.

WANTED: INFORMATION

Some of us believe that California has been slow to develop its hog and beef needs to correspond with population increase, because it lacks definite markets. A definite market may come from a stockyards or it may come from scattered auction sales of small numbers throughout counties and under an association or farm

STATE EXPENDITURES THAT WOULD PAY

By A. L. Spellmeyer

California is a wonderful state, in climate, soil and potential water development. It is great in some lines and woefully lacking in development of its livestock possibilities. Think of a country that grows its grass in the winter time in normal seasons, that can fatten livestock when other states are bound in snow and cold, yet as compared to developed, Middle Western states, which must fight the difficulties we don't experience, is producing livestock on a 20 per cent basis.

One specialist in one ill paid department of our state university is struggling along as best he can to ascertain and encourage the development of new forage grasses. With all its advantages California has a peculiar range condition for cattle and sheep. Our grass starts in good years in December and in fair years along in February, drying up by June. The period between August and February is usually hard on the range cattle

IMPORTANT NOTICE TO DAIRYMEN AND BREEDERS

Beginning next week the Cultivator will offer a series of important articles written by Earl J. Sturgis, superintendent of the Fred Hartsook Ranch at Lankershim, on the feeding and care of the dairy cow. These articles will be short and to the point and written in language that a child can understand. They will cover such subjects as the feeding of calves, rations for the dairy cow under ordinary conditions, fitting and feeding for both the short and long time tests and for the show ring. There is no necromancy nor slight-of-hand necessary in producing high records. They are the result of careful selection of the animal and the application of certain basic principles of feeding, before and during the test, which are learned by study and experience. Mr. Sturgis will not go into long discussions as to the relative values of various feeds and why he uses them. He will simply tell you how study and experience have taught him to feed to get the best results. There is no question as to his ability to achieve them.

Born and raised on a dairy farm in New York state, Mr. Sturgis came to California as herdsman for A. W. Morris and Sons of Woodland about ten years ago. While with the Morris Company he fed the calves, helped with their show herd and fed and milked their test cows. He finished the record on Tilly Alcartra which made her the first 30,000 pound cow in the world; made the first 33 pound seven day record in the state and made practically all of the state A.R.O. records for that time. After 2½ years with the Morris Company he became herdsman and later superintendent of livestock at the Santa Anita Ranch. While there he made a world's eight-months-after-calving record on Miss Valley Mead De Kol Walker as a senior two year old and later made her record of 36.81 pounds in seven days as a junior three year old. He also made the first strictly official 1,100 pound yearly record in the state and the first 34 pound junior four year old seven day record. He was responsible for the purchase of the great bull, King Korndyke Pontiac Acme, for \$41,000.

In February 1921 he became manager of the Hartsook Ranch and its great herd of cattle. Since that time he has completed four world's records; has made numerous high seven day records, two over 40 pounds and eight over 30 pounds; has made 17 yearly records from 800 to 1,121 pounds with five over 1,050 pounds; as well as a number of high 305 day records.

No one milking cows—grades or pure breeds—can afford to miss these articles. They should be read by everyone on the place, should be studied, and then filed carefully for future reference.—The Editor.

bureau management. The last might be best, but it appears so difficult to consummate, with the conflicting elements to consider, that it is impractical and stockyards are a practical possibility at once.

A yards are projected for Los Angeles, and without doubt the backers are responsible or they would not have secured any support from the Los Angeles Chamber of Commerce.

It would seem wise to know who these people are, and their plan, and the charge schedules intended to present for a general livestock patronage from this Southwest. We have had some bad experience in the last few years in farming and livestock raising, and we may be inclined to unjust suspicions, but no good can be possibly gained by a reticence in a matter of this kind.

Few stockmen will support anything blindly. A stockyards for Los Angeles concerns a wide circle which affects a part of California, Utah, Arizona and Nevada vitally as we are their cattle market and that district is our market for our merchants. The cattle supply of certain neighbor states is more affected and concerned about a stockyards here than the cattle districts of our own state north of the San Joaquin, where the bulk of California cattle are. However, people like to see the cards on the table frankly and exactly. They can then judge and if a stockyards secures a bulk endorsement it will probably succeed and prosper. Folks may be OK, but there is nothing like people being told so.—A. L. S.

because our general forage is of a short lived luxuriant type.

A vital need of California is the propagation and general distribution of some species of forage grass that will maintain a flesh producing quality in the summer and fall. California lacks summer rains, hence ordinary types usual in most districts of other states will not thrive. Several types have been found that may do but they are not fully proven. It is not enough to find the right grass or browse as these plants or seeds must be raised in great quantities and distributed on the great ranges.

This one thing would pay the state yearly a greater profit from livestock than the present cost of state government, and that is a mighty amount.

Jap's Rose 296927, owned by the University of California, recently completed a Register of Merit test of 12,810 pounds milk, 720.88 pounds butterfat, making her the second highest record Jersey cow over five years of age in the country.

Athenia Roderick Luecke, the Hartsook cow who recently completed a 36 pound seven day record, has just finished her 30 days with 134.2 pounds butter from something over 2,600 pounds milk.

Manure is worth money—if it gets into the soil.

Feed a cow all the roughage she will eat.

There is a size and style of De Laval Separator for you, no matter if you have one or a thousand cows.

De Laval Separators are furnished with hand, electric, steam turbine or belt drives, for any kind of power.

Don't Let This Happen to You

"Last week we replaced a machine made by which had been used only five years. Our customer, Mr. Crawford Cook, living near Foyil, Oklahoma, shipped one can of cream from and then one from the De Laval, and changed about in this manner for four weeks, the result being that the De Laval got him exactly two pounds more butter-fat per day, and he is milking 12 cows. This amount at 35c per pound makes 70c per day, or \$255.50 per year, more than twice as much as the new De Laval was worth. Mr. Cook said we could use his name and this information, and if they didn't believe it, he would make an affidavit to that effect."

This was taken from a letter from one of our agents, but there is nothing unusual about

it. We are constantly receiving letters of a similar character from people who say they waited too long before buying a De Laval.

On hundreds of thousands of farms today there is an enormous amount of butter-fat being wasted by inferior or worn-out separators and by hand skimming. Perhaps such waste is going on right on your farm. Stop it at once by getting a new De Laval. It is not only the world's best cream saver, but lasts longer and is easier to clean and turn than any other.

Call up your De Laval Agent today and ask him to bring out a new De Laval so that you can try it, or write us for full information. Sold on such easy terms that it will pay for itself while you are using it.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Skin Diseases (Horse)

I have a horse that has some kind of an itch in the skin. It is always rubbing and scratching on something. The trouble seems worst on the belly, shoulders and legs and the flies seem to aggravate it. Otherwise the horse is in good condition. What can I do for him?—Subscriber, Chico.

Probably there is a small mite in the skin. If the hair is long have the horse clipped. Then scrub him all over with warm water and soap, rinse the soap off with clean water and when dry wet him all over with a solution made of a bucket of warm water in which you have put a teacup of zeno-leum or some other good sheep dip. The solution should be applied once a week until three or four applications have been used. This is to get the young mites that may hatch after the first treatment. Put a blanket on the horse when he is wet and let him dry off slowly so he will not catch cold.

Skin Disease (Goat)

For six months my goat has been troubled with what seems to be small lumps in the skin about her head and neck and a few over the body. They never seem to have any pus in them nor go away. They are about the size of a pea and cause her to scratch. She is fed alfalfa and oat hay and some rolled barley. She has been fresh about a month. Please advise what to do for her.—Subscriber, Alta Loma.

This is probably cow pox. Feed her mostly green feed and give a tablespoon of epsom salts in a little dry feed or dissolved in a teacup of water twice a day for a week. Also bathe her all over with a gallon of warm water in which you have put two tablespoons of borax.

Brood Sow Ailing

My boy is a member of a pig club and is having some trouble with his project. First he got a three months old sow that seemed all right and in due time took her back to the ranch from which he got her to breed her. Nineteen days later we noticed a discharge of pus from her and next day her teats were filling as if milk was coming. Five days later she came in heat and again in 21 days, at which time we bred her again. Six days later the discharge appeared again and in due time she came in heat again. We gave it up with her and exchanged her for another that was supposed to be bred. In due time the pus discharge began with her and she has passed through about the same troubles as the other. In the meantime the first boar that we bred to died but we could not find out what was the matter with him. Does this look like contagious abortion and would you advise breeding the sow again?—Subscriber, Etiwanda.

We can not say that the trouble with the sows is the regular contagious abortion or not, but it is surely some disease that causes abortion. Of course we can not say positively that the disease came from the boars but there are few chances that they contracted the disease in any other way. Coming from the same source the second time we would not advise trying it again. Breeding that sow again to any boar would be useless and would probably transmit the disease to the new boar. We can only advise getting a sow from some other source if you wish to continue the experiment.

Running Sores

Horse has running sore on the front

leg between knee and elbow. It does not make her lame but the sore never stops running. It started two years ago when I was leading her home from pasture and she fell down on the highway. Do you think it is fractured? Please tell me what to do for it.—Subscriber, Vacaville?

No. the bone is not broken or she would be lame. Probably there is a thorn in there or something that punctured the skin and broke off, leaving a piece inside. Split the skin open from the sore down, an inch or more. Scrape out the cavity and wash it out clean. Then wet the inside of the cavity once a day with a solution of permanganate of potash. Use a teaspoon of potash to the quart of water.

Swelling about Neck

I have a nine year old mare that has been swollen about the neck for about a month. The swelling is from the ear down. Sometimes it nearly goes away and then comes back again. I feed her rye, hay and oats. What can be done for her?—Subscriber, Mac Doel.

Probably something has punctured the tissues from the inside, as barley beards sometimes do, and formed an abscess that empties periodically inside. That gives relief and the swelling goes down. When the swelling is at its worst you could probably find a spot where the pus is and by opening it there and washing out the cavity heal it from the outside so it would stay. Better get a veterinarian to open it for you. He would be more apt to find the pus.

Bitter Milk

The milk from our goats, especially after setting for 24 hours, is slightly bitter and in the case of one is very much more acid than the others. It fairly stings the mouth and throat. They are in the same pasture and getting the same kind of feed as they did last year. What is the cause and what can be done about it?—Subscriber, El Cajon.

The bitterness of the milk may be due to something the goats are eating, to an acid condition of the system of the animal or to a germ that has gotten into the utensils that are used for keeping the milk. First thoroughly cleanse all the milk utensils with boiling water and dry in the sunshine. Look to the feed and see that there are no new weeds in the pasture and give these powders in the feed for a week. Salicylate of soda 2 ounces, bicarbonate of soda 2 ounces, calcium phosphate 4 ounces and corn meal 8 ounces. Mix and give a teaspoon of the mixture in the feed once a day.

DAIRY PRODUCTS IN CALIFORNIA IN 1921

A recent statistical report of the state superintendent of dairy service shows that in 12 months California produced \$79,671,907 worth of dairy products. Of this amount approximately \$32,514,430 was the value of the butter and \$3,280,747 that of the cheese. The greater portion of the balance was the value of the market milk and cream in their various forms. Stanislaus County led the state in butterfat production with 9,931,685 pounds and Humboldt, Los Angeles, Merced and Imperial Counties followed in the order named. Monterey County led in the production of cheese. Compared with an approximate production of \$16,000,000 in gold for the same period, it is easy to see that the real gold mines of the state are the dairy cows.

Royal I Am, grand champion Duroc boar of all California shows and at Portland in 1921, owned by Peter B. Kyne's Sierra Vista Ranch at Perris, died recently. He left a long line of excellent progeny.

Sizes: 6, 7, 8, 10, 12, 15 and 24 inches

Bean Turbine Pumps

These pumps assure maximum delivery of water at highest efficiencies, against varying heads. They are made in very small sizes to fit your domestic well and deliver from 100 to 180 gallons per minute. Made also to deliver up to 3500 gallons per minute.

Careful, high grade engineering skill and workmanship is employed throughout.

Educating for Fire Prevention

WE recently referred to the campaign of education in fire prevention carried on by the Farmers Mutual Insurance Company of Turlock. Through its secretary, John A. Orr, the high schools of Stanislaus County were appealed to to make a study of fire prevention methods. Prizes were offered and the young people presented a large number of fire prevention suggestions. One of the prizes was won by George James of Hughson high school. It has so many valuable suggestions that we are glad to reproduce:

"Suppose that someone should make you the following extraordinary offer: You were to make certain for one year that conditions about your home were as fire safe as you could reasonably make them, no matter how little of your time it took and in no case the total amount of work put in by you to average more than ten minutes a day. At the end of the year \$1,000 to be deposited to your credit for services performed— would you take him up? Without hesitation you would.

"Let us change the case a little. No doubt insurance is carried on your home building. How many of us, though, even if full insurance is carried, would be willing for \$1,000 to go through the harrowing experience of a fire? Certainly not many. Even that, however, is only as you personally are concerned. As far as the nation is concerned the wealth, whether insurance is carried or not, is lost. Fire prevention is by all means worth your best efforts.

"Let us see if we cannot cover in a few brief rules the main points of a home campaign of fire prevention. "Perhaps the one thing along this line most often spoken of and least often practiced is the disposal of oily rags. Use rags for cleaning off grease in small pieces and burn them immediately afterwards. Be especially careful of linseed oil.

"Keep matches away from children. "Take out ashes in metal containers. Never dump them in boxes. Have a piece of sheet metal under the stove.

Do not allow stove pipes or flues to touch wood.

"Keep kerosene, gasoline and distillate in galvanized iron tanks away from buildings.

"Do not allow rubbish to accumulate. Burn it often. See that there is no dry grass where it will cause danger.

"Gasoline and oil lamps are, unless carefully used, a constant menace. Never let the children light them, and never leave the children alone with one. If you wish to be perfectly safe, you should not allow the lamp to rest on a tablecloth that falls below the edge of the table.

"Be sure that electric wires are nowhere exposed to dampness. If there is any danger of papers or trash falling across them, these should be inspected at intervals. Never try to make extensions yourself unless you know exactly what you are doing— And while we are speaking about electricity, remember that any electrician can very easily install an automatic fire alarm that will ring in any part of the house from any part of the house, or an outbuilding.

"When re-roofing, you should, if possible, use some fire resistant roofing material.

"A bucket of water standing in the attic and another in the cellar may never be used, but if they are wanted, you may depend on it that they will be wanted badly. Certainly you should keep them always ready.

"If you have an oil stove in the kitchen, you should have a small bucket of sand standing in a handy corner. It is, of course, useless to attempt to put out an oil blaze with water. If you have a fire extinguisher, by all means keep it in the kitchen. That is the one place where it is the most necessary.

"All of the above rules may be briefly summarized as follows: Don't take chances. Remember that it is still true that fire is a good servant but a bad master. Remember that it is still true that an ounce of prevention is worth a pound of cure. Use common sense. It is better to be safe than to be sorry."

Changes in U. S. Potato Grades

Proposed changes in the United States potato grades, to go into effect June 15 or July 1, have been submitted for consideration to 400 of the principal factors in the potato industry by the United States department of agriculture. The suggested changes contemplate the elimination from United States No. 1 of badly misshapen potatoes and potatoes affected by hollow heart, and the addition of a grade to be known as United States No. 1 Small. There appears to be a widespread demand in the potato industry for these modifications.

The principal reasons advanced for the proposed changes are: Hollow heart is universally conceded to be a serious defect which should be eliminated from the United States No. 1 grade, and the revised grade simply places official approval upon common commercial practice. For the past year or two it has been the practice to consider hollow heart as not affecting the grade, but in spite of this policy the inclusion of such stock has caused large numbers of rejections which necessitated allowances. The only argument in favor of admitting hollow heart stock to United States No. 1 grade has been the difficulty of discovering the defect. It is believed that this is not a sufficient reason for continuing the old policy, for unless United States No. 1 potatoes are recognized as being free from serious internal defects the grade is bound to fall into disrepute.

Badly misshapen potatoes also injure the appearance of the product and cause excessive waste. Since their undesirability is generally recognized the department believes that they should be excluded, just as are potatoes damaged by deep scab, growth cracks or grub injury. Many growers and shippers are culling out such stock at the present time.

United States No. 1 Small will provide a grade for potatoes which are

of good market quality, but too small to grade United States No. 1. During the movement of early potatoes from the Southern states and to a lesser extent from some of the late producing states two sizes are frequently shipped, as follows: Stock above 1 1/4 or 1 1/2 inches respectively, the United States No. 1 minimum sizes for long and round stock, and stock between these sizes and 1 1/2 inches in diameter. In the past this small stock has been sold as United States No. 2, but as this grade also includes large stock which varies widely from this standard of market quality an additional grade is deemed necessary for the sake of clearness. Such a grade is already provided by several state departments of agriculture.

It is the intention to recommend the revised grades for the old ones at some definite early date, perhaps June 15 or July 1.

PHILIPPINE ADLAY

In California gardens we sometimes grow an ornamental grass from the East Indies, known as Job's Tears, and to botanists as *Coix Lacryma-Jobi*. The beads or "tears" are pearly white or light lead color, hard and bony, much used as beads or in "everlasting" bunches of flowers, etc. There is a more ornamental variety with striped leaves. In the Philippines and other tropic lands they have a soft hulled variety quite distinct, which in Manila is called "adlay" and designated by the botanist as variety mayuen. It may largely replace rice in the drier districts for it does not require the flooded fields rice demands. Just at present adlay is the crop of most interest and value of all now recommended for Philippine culture, for it makes excellent bread, either used alone or mixed with rice or wheat flour. The growing plant also makes excellent hay or forage for cattle and the seeds are fed to poultry.

FUMIGATION SEASON

(Continued from Page 650.)

that hot weather fumigation is by far the most generally effective. One of the lessons all must learn is that if fumigation is to be highly successful the dosage must be truly proportionate to the size of the trees. Since the improved and simplified methods of fumigation have come with the use of liquid gas, closer attention has been paid to proper dosage through precise scheduling based on tree measurements with a tape. Woglum has this to say on what he terms "guess scheduling."

"The fallacy of the contention that estimating dosage is as accurate as measurement scarcely needs comment. There are in California careful, experienced fumigators who can estimate with a considerable degree of accuracy, and particularly is this true of orchards in which the trees are of uniform sizes. But when it comes to variable sized trees in the same orchard the accuracy of guess scheduling departs widely from the accuracy of the tape. And particularly is this true of large trees for on these there is a great tendency to cut well below the regular dosage schedule, and even this schedule is too low for big trees as I have already stated. Now, taping demands an effort, and I know many fumigators prefer to dispense with and actually do use the tape very little. I feel, however, that the grower as a protection to himself should demand that his trees be taped.

"Daylight scheduling is done before the trees are covered and based on a guess of what the size will be when tented. Now there are ways of covering trees—and other ways as well. If the tents are so carefully kicked in as to give the tree its proper draped form the inaccuracy is reduced to a minimum, but how often have you seen tents not properly kicked in, tents where the skirts were angling way out toward the next tree, in some cases even as they fell from the last tree? In such cases even the guess scheduler of excellence supreme fails completely. The taping of such tents not only necessitates a certain amount of kicking in of the edges when taped but also develops a dosage commensurate with the extra amount of space subtended by the outstretched skirts."

FIRST RESISTANT STRAINS
OF ORANGES

(Continued from Page 649.)

large an area in so short a time. Inasmuch as the standard practice of successful fruit growers is generally the safest to follow, it is not surprising if one-half the fruit growers of the state still regard long pruning with doubt. The remarkable thing is that so large a number have so quickly adapted it to their local conditions and made a success of it. The writer doubts whether this could have been accomplished in any other state than California, where fruit growers have taken the lead in innovations in fruit growing and fruit handling.

We may better comprehend a comparison of pruning methods if we recall to mind facts concerning the annual cycle of growth and development of a fruit tree. A tree puts out its leaves (and blossoms) in spring. This new growth is supported by plant food reserves (mainly starch or sugar) stored in the tree before it shed its leaves the previous autumn. Much of the reserve food stored in the tree is used up in pushing the tree into leaf. Crude plant food is supplied to the tree from two sources. Part of it is taken from the soil, through the roots. A larger portion is taken from the air (in the form of carbon dioxide) through the leaves. None of the crude plant food taken in by the leaves and roots can nourish the tree until it is manufactured in the leaves. The green coloring matter in the leaves does this work; sunlight, which reaches the leaves, being the source of energy. From the leaves the manufactured plant food is distributed to the grow-

ing layer, where it promotes growth of all parts of the tree.

The main length growth of branches and the formation of additional leaves normally should take place in the first few weeks of early spring and summer. So long as plant food manufactured daily in the leaves is being largely used in promoting rapid length growth of branches and formation of new leaves, just that much less remains available to nourish and develop the fruit crop, the blossom buds for the following year, and to store for winter in the tree.

As soon as length growth and new formation slows down, more manufactured plant food becomes available to promote diameter growth of the tree, to nourish the fruit, to develop flower buds for the following spring and to be stored as reserves in the tree for the following winter and spring. Studies made in connection with pruning show that normally the sap of a fruit tree is least concentrated (contains the least sugar and manufactured plant food) during the period of rapid length growth in spring and early summer. Sap becomes more and more concentrated after length growth ceases. The supply of plant food be-

comes greater as the tree goes into winter condition. The later a tree continues length growth in autumn, the less concentrated its sap becomes and the less abundant its supply of plant food reserves. The more concentrated the sap and the better lignified the wood of the tree, the more drouth it can endure and the more cold the tree can safely stand, either in winter or during spring frosts. In one plot, peach trees which had continued rank length growth until frost in autumn, had all their flowers killed on a night the following spring at a temperature of 27 degrees. The following night the temperature dropped to 22 degrees. An adjoining plot of trees, which ceased length growth early, but which maintained healthy mature leaves to store plant food until autumn, endured this lower temperature safely without injury to their blossoms.

Trees severely headed back call for more moisture, or are less able to endure drouth. The rank new branches and leaves at the top are soft, tender and succulent. This condition continues throughout the summer. The rank, succulent leaves at top are able to draw water out of the green fruit on the lower twigs whenever water supply is not adequate for both. The rank growing limbs above tend to rob and shade out fruiting twigs down on the tree.

Where the main limbs are not headed back, rank length at the top of the tree is not stimulated. Branches of shorter growth and fruit spurs are distributed about equally throughout the entire tree. Length growth ceases early. The tree early attains a concentrated sap, perfects firm wood

tion there are in the Cultivator library nearly a score of books, each of them containing several hundred pages discussing the problems of the duty of water and irrigation.

SUCCESSFUL JELLY MAKING

(Continued from Page 657.)

Mouldy Jelly: Paraffine not hot enough when poured. Paraffine seal not tight because glass wet or layer too thin.

Fermented Jelly: Not concentrated to 221 degrees. Boil down further or pasteurize in sealed jars.

AND THE OVERHEAD

"Are you sure you have shown me all the principal parts of this car?" asked the prospective purchaser.

"Yes, madam, all the main ones," returned the dealer.

"Well, then, where is the depreciation? Tom told me that was one of the biggest things about a car."—American Legion Weekly.

In their New Home

The Motors Equipment and Tractor Company is now occupying its new quarters at 1341 South Hope Street, Los Angeles. This firm has for the past four years been distributing tractors, disks, and other dependable implements. H. T. Hayes is president and L. G. Dodge is treasurer of the company.

comes greatest as the tree goes into winter condition.

The later a tree continues length growth in autumn, the less concentrated its sap becomes and the less abundant its supply of plant food reserves. The more concentrated the sap and the better lignified the wood of the tree, the more drouth it can endure and the more cold the tree can safely stand, either in winter or during spring frosts. In one plot, peach trees which had continued rank length growth until frost in autumn, had all their flowers killed on a night the following spring at a temperature of 27 degrees. The following night the temperature dropped to 22 degrees. An adjoining plot of trees, which ceased length growth early, but which maintained healthy mature leaves to store plant food until autumn, endured this lower temperature safely without injury to their blossoms.

The merits of the new pruning system now being advocated are better understood in the light of the above facts. The prominent feature of the former standard pruning system is that the trees are severely headed back each winter. As a result, rapid new growth is stimulated at the top of the cut back branches. This rank, succulent, spongy, tender growth continues to lengthen and make new leaves throughout practically the entire summer. It looks rich and luxuriant, but it fails to mature for winter and it prevents storage of plant food reserves and concentration of sap in the tree.

In the new system of pruning the main limbs (about six) are established as early as possible. Once they are established they are not subsequently cut back, unless a very long limb is shortened to maintain the symmetry of the tree. They are pruned by thinning out surplus limbs. Length growth is shorter at the top of the tree, but more light, lateral branches and fruit spurs from the crotch of the tree upward. Long pruned trees grow larger and stronger. Not being headed back their length growth early slows down toward the top of the tree and terminal buds form early at the tips

growth and stores plant food reserves. These slower growing twigs and leaves are firm in texture and do more efficient work. The leaves are less likely to draw water out of the green fruit on hot dry days. The concentrated sap gives up its water less readily.

Judicious summer pruning may be understandingly practiced. Indiscriminate summer pruning may severely weaken the tree. The removal of mature branches, which have ceased length growth, reduces efficient leaves which are needed to do the work of the tree.

Late summer pruning may be severe enough to induce the formation of late autumn sprouts and tender leaves. This draws upon stored plant food reserves and results in a thinner sap just when the tree should be storing reserves and perfecting its growth for the winter. Judicious early summer pruning may be done to shape the young tree or to remove succulent sprouts that are growing where they are not wanted. It is not desirable to reduce the leaf surface of desirable branches.

QUESTIONS AND ANSWERS

(Continued from Page 663.)

call for still other treatments. Alfalfa is of necessity irrigated in checks or basins excepting that in more recent years several kinds of irrigation pipe have been brought into action and the supply of water carried from point to point and simply allowed to flow over the land. For gardens and ornamentals around the house the ordinary furrow method of irrigation is the best. Southern California vineyard and orchard irrigation as a rule is by the ordinary furrow method though some will combine with the basin method along the lower edge of the orchard. In the North there is more general recourse to the basin method.

Victory Tree Spray

CURTIS RANCH COMPANY

ORANGE AND LEMON GROVES

Vacant Acres — Town Property

Bloomington, California,

Victory Spray Co. April 26th, 1922.

Los Angeles, Cal.

Gentlemen:—

Last year we sprayed in the neighborhood of
one hundred acres with the Victory Spray. The
work is now showing to a good advantage both
in the condition of the trees, and cleanliness of
the fruit.

The work, done under the direction of Mr.
Pinckney, was quickly and thoroughly done. Both
his equipment, and men on the job, were the
best to be had. The final cost, also kept to the
estimate given at the start. On the whole, we are
satisfied with the results from last year's spraying.

G. O. NELSON,
Manager.

COULSON'S EGG FOOD FOR GREATER EGG PRODUCTION

FULL PARTICULARS IN OUR FREE BOOK "CHICKENS FROM SHELL TO MARKET"

Weeding Out the Unfit

By Jean A. Koethen

CULLING the flock has just as important a place in the poultryman's program as renewing the flock by raising pullets each year. As long as chicks are hatched there are bound to be some in every lot that do not come up to the mark. Whatever the cause, whether it is lack of vigor in the parent stock or error in hatching or in management of the growing stock, some will inevitably fall behind, and it is these backward individuals, of whatever age, that must be eliminated. Some may be fit only for the table, while others, unable to stand the strain of commercial egg laying, are useful for the small family flock. To put every bird to its best use and retain in the commercial flock only such hens as are fully fit is a necessary and by no means an easy task.

Culling begins the day the hatch comes off. Chicks that fail to get themselves out of the shell are usually best left to die in it. All cripples and weaklings should be put out of the way at once. Very few of them will live long, and none will grow up into vigorous, profitable pullets. Killing them outright sometimes seems cruel but it is really kindness.

Unless coccidiosis or some other epidemic disease attacks the flock it is safe to say that every droopy chick should be removed, not necessarily killed; sometimes a few weaklings, when put by themselves with more room and care than they would have in a large flock, will make such gains that they may be returned to the flock. Take them away from the others and give them a chance if you can. The weaker and smaller chicks in a large hatch have little show. Special feeding and care sometimes have surprising results.

Successful poultrymen remove from the flock all through the growing period every chick that for any reason whatever falls behind the others in development. If these chicks are not sick, but merely undersized, they are fed on a good fattening ration and sent to market as soon as possible. When the pullets are ready for the laying house they are carefully culled again and any that lack vigor are sent to the fattening coop. The pullets that go into the laying house should be as near perfect as possible, with budding combs, fresh plumage and the alert air which always marks the up-and-coming hen.

Shall We Hoganize?

While I would be the last to minimize the debt of the poultry industry to the late Walter Hogan of Petaluma I have never felt quite sure that he is to be followed to the limit. In calling the attention of the world to the place of type in determining fecundity he did a great work, but his rules for picking out prospective layers have failed in so many cases that I doubt if they can be depended on except as they are supported by other marks of vigor and fecundity. Many poultrymen do Hoganize their pullets when they put them in the laying house, but I have yet to meet one who depends exclusively on pelvic bone and abdominal tests. If the distance from keel to pelvic bone is right, the pelvic bones are thin and elastic, the comb is red and the eye alert, the plumage glossy, and other signs of vigor apparent, the pullet will get by, but keel and pelvic bone tests are hardly half the examination. Vigor is the one essential in a layer. If she is vigorous the chances are other things will be right. If she is not vigorous nothing is right.

Let us Hoganize then as carefully as we may, but let us Hoganize with common sense, recognizing that vigor, the vigor that shows in alertness and singing and scratching, a red comb and glossy plumage, is more important than the number of fingers between keel and pelvic bones or the character of the pelvic bones.

Spring Culling

Hoganizing is generally done when the pullets are put in the laying house in September or October and removes the pullets that will not be profitable layers. Culling, in the sense of going through the flock and picking out the pullets that have not been profitable

layers, or, at least, will not continue to be, begins generally in May or June and continues at intervals till October.

The culling that begins in May aims mainly at finding out how good a layer a given hen has been through the season that is now past its height. The theory is that a hen with bright yellow shanks, beak and earlobes and glossy plumage in May must be a slacker, else she would have laid the color out of the yellow parts of her body and would be more or less faded instead of glossy. Another theory, and, to my mind, an easier one to follow, is that the hen that goes broody early or often cannot be a satisfactory layer. Some poultrymen cull out every hen that goes broody before the first of July and every hen that goes broody more than once after that date. In many cases these hens that are given to broodiness will be found to be the ones with bright yellow color.

Culling Early Molters

From the first of July till the latter part of September or the first of October the hens that are removed are mainly the molters. The theory in this case, and it has the best possible foundation, is that the early molter cannot be a long distance layer. The more months a hen lays before she stops to molt the more profitable is she for both present and future. The pullet that starts the molt in July has only eight or nine months of laying to her credit, while the pullet that goes ragged and frowsy till October has a year. Hens have been known to lay from October of one year till January of the next without stopping to molt, and these are the priceless layers. On one ranch I have visited every pullet that begins to molt before the middle of September is culled out, and every pullet that molts before November is banded. The hens that are kept for the cockerel pens are the hens that lay till November or later before they stop to molt.

September culling by color and appearance is really a culling of early molters for the hens that have finished molting by this time are those that show bright yellow in shanks and beak and are appareled in all the glory of glossy plumage, while the faded, ragged biddies are the ones that have been too busy to think of their summer dressmaking. Hens that do not molt till September will probably be profitable for another year. Hens that delay the molt till October are among the best in the flock. The hen that is ragged in November is head of the class and may be a profitable layer for several years.

Keep the Good Hens

The above tests, accompanied by the constant removal of birds that show any signs of lack of vigor, will effectually decide which hens should be kept two, three, or even four or five years. Don't sell a hen just because she is two years old. Many hens are profitable for three years and a few for four. Age is no test at all. The only test is "what is she doing?"

Poultry Queries

Conducted by Jean A. Koethen

Wild Morning Glory

Will wild morning glory poison chickens? We fenced in a patch of it for a chicken yard, but a neighbor tells us it will poison the chickens. Is there anything that will kill it and not injure other vegetation?—Subscriber, Galt.

As to killing the morning glory, I shall have to pass that on to the agricultural editor, except to say that I have never seen a weed yet that did not succumb in the end to repeated attacks of the hoe, especially if you plant something vigorous, like rape, in its place. Will it kill chickens? It might if they ate it, but I have too much respect for Mrs. Biddy's instinct to believe that she will touch it. Chickens have a wonderful sense of the fitness of things when it comes to noxious weeds.

Sour Milk

What is the best way to sour milk and feed it to chickens?—Subscriber Daggett.

I know no way of souring pasteurized milk, except to give it time. There ought not to be much trouble about souring raw milk this weather. If you have an abundance it is all right to keep it before them in pans and cut the beef scraps out of the laying mash. If you can feed it only part of the time it is better to use it once a day for moistening the mash. If you want to save labor just put it on top of the mash in the hopper or trough. The hens will eat milk and mash together.

Too Much Milk

Is it possible to feed laying hens too much sour curd where they have wheat twice a day and run on alfalfa morning and evening? I have lost several lately and can lay it to nothing else. They droop and die in a few days. Combs stay a good color and only one out of five showed bowel trouble.—Subscriber, Madera

Lay it to anything else you please, but not to the milk. Sour milk never made a hen sick, unless it was moldy, and there is no excuse for mold. If you buy your milk from a dairy it is possible that it has been doped to keep it from souring, but clean milk is the best poultry feed. You have upset your hens' digestions by feeding an unbalanced ration. Wheat is good, but wheat as the only grain feed is not good. Keep a laying mash or at least a hopper of bran, before the hens and let them have a mixture of grains including cracked corn instead of wheat alone. Is it possible that there are mites in your nouse? Better investigate and spray or paint with kerosene and crude carbolic acid or carbolineum. If you do not spray regularly there are almost sure to be mites at this season, and mites have been known to kill hens when there were enough of them.

Losing Feathers

Why are my hens losing the feathers from the front of the neck and down the breast? Is it a disease or an insect? Would throwing the feed in sand so that the hen gets a mouthful of sand with every grain cause it? Could stale, bad smelling water have such an effect? I found little biscuit shaped red lumps about as big as a pinhead on the neck of one hen, did not examine the others.—Subscriber, Elsinore.

I think a mite is at work on the necks and breasts of your hens—not what is called the depluming mite, for that begins at the tail, but a mite which causes body mange, a disease much like favus. You can cure it, I think, by a half and half mixture of lard and sulphur, rubbed on the affected parts twice a day. If this does not cure it, try oil of caraway ointment or balsam of Peru. There are certain mites which live on grains and bushes, which sometimes attack the bodies of fowls. Possibly these have such an origin, or they may come from lack of sanitation in the houses and yards. Eating sand could hardly affect the skin but it cannot be good for the digestion. Why not feed in a box or pen if you have no litter?

Dipping for Lice

"Poultry for Profit" mentions sheep dip as a remedy for lice, and I want to try it on our hens which are very lousy. Can you tell me how to dilute it?—Subscriber, Sanger.

If the dip is a Cresol dip you can make a one per cent solution, that is, one part of dip to 100 of water. There are a good many kinds of sheep dip, and I could not give the proportion without knowing what the dip contains. Kerosene emulsion is easily made and is said to be very effective. Dissolve a bar of laundry soap or a pound of soap powder in a gallon of boiling water, add a gallon of kerosene and a pint of crude carbolic acid and churn for 20 minutes. To use, dilute a quart of this solution with nine quarts of water. Dipping should be done in the morning of a hot day, and care should be taken to keep the liquid out of the mouths and eyes of the fowls.

Pullet Eggs

Pullets hatched in September lay a small egg. Will they lay larger eggs as they grow older?—Subscriber, Norwalk.

That is the one objection to hatching in September. Pullets begin to lay in February or March and invariably lay smaller eggs than spring hatched pullets which begin to lay in October or November. Their eggs will ultimately reach normal size.

Blackhead

Some of my three months old turkeys were suddenly taken sick and lived but a short time. Post mortem examination showed spots on the liver of one, while the second looked as if blood settled through it, and the liver of the third seemed normal. Can any one tell me what to do for them and the cause of the disease?—Subscriber, Santa Barbara.

The one with the spots on the liver certainly had blackhead, and if you had noticed the ceca or blind pouches near the end of the intestine of the other two you would probably have found them inflamed or full of pus, indicating that they had the same disease. The cause of blackhead in turkeys as old as these is always overfeeding or wrong feeding. Some turkey growers are having fair success with the ipecac treatment recommended by the Doctors Wegforth of San Diego. As soon as a bird begins to droop separate it from the flock and give ten drops of fluid extract of ipecac three times a day for three days, then twice a day for three days, and finally once a day for three days. To prevent blackhead give a teaspoon of powdered ipecac twice a week in the food for each unit of 20 turkeys. This treatment does not always cure but it is the only treatment that is even measurably successful.

Roupy Eyes

A few of our hens have trouble with their eyes. The eye is open but eyeballs turn a lighter color, almost white. Houses are dry and well ventilated, water fountains cleaned every day.—Subscriber, El Centro.

It looks as if there were a roup condition there in the eyes, or possibly what is called roup of the eyes. The best wash for the eyes is a boric acid solution made by dissolving 1/2 teaspoon boric acid in a cup of warm water. You can wash the eyes with an eye dropper or drop the solution from a bit of absorbent cotton. Wash thoroughly twice a day and at night anoint with white vaseline. If the boric acid alone does not relieve get your druggist to put it in a decoction of chamomile flowers which is particularly good for roup of the eyes. As you keep your houses so clean and well ventilated it is evidently not filth or dampness which causes the trouble, but there may be a crack or knothole behind the roosts through which the wind blows onto their heads, or they have been exposed to a very high wind. I am not sure but that lack of shade in very hot weather might cause just such trouble.

Gapes

Our chickens are dying with what we call gapes. They gasp and make a noise in the throat. Last fall we lost 200, and now the same disease has appeared in chicks hatched by hens as well as among those hatched in incubators. Houses and yards are clean. We feed cracked corn, sprouted wheat, barley, sometimes soaked and crushed, fresh meat scraps, and they have young alfalfa to run on. They have some clabbered milk.—Subscriber, Santa Maria.

Your chicks ought to have a growing mash, but it is not the ration that makes them sick. If the disease is really gapes—and the description sounds as if it were—it will reappear year after year as long as the chicks are on the same ground. The gape worms are in the soil and can only be eradicated by several years' cultivation. The chicks pick them up and the worms attach themselves to the membrane of the throat. Salicylic acid or salicylate of soda in the drinking water has been known to relieve gapes. Use 15 grains salicylic acid or three drams salicylate of soda to a quart of water. If this does not

bring relief you may have to extract the worms. That is done with an extractor, which you can buy at the supply store, or you can make one with a hair from a horse's tail doubled or a small quill feather stripped of all its web except a small tuft at the end. The chicken's beak is forced open with the thumb and fingers of the left hand, while the extractor is held in the right hand. When the glottis (the small aperture at the root of the tongue) is opened for breathing, the extractor is carefully inserted and pressed downward into the windpipe. The neck should be kept extended in a straight line so that the extractor will enter freely and not injure the delicate walls of the windpipe. At the first insertion the loop or brush should not pass more than an inch below the glottis; then it should be given two or three turns between thumb and finger and withdrawn. In any worms adhere to it, these should be burned. The extractor may now be inserted a little deeper, and so on till it reaches nearly the full length of the neck. If there is any resistance to the entrance of the extractor it should not be pressed upon or inserted any farther. In all cases the extractor must be quickly withdrawn to avoid suffocating or otherwise injuring the chicken.

Yellow Spots

Please tell me what causes yellow spots on the livers of my turkeys? I have lost a good many and all have these yellow spots. They look well and live four and five days after they begin to droop. Are lettuce and clabbered milk good for them?—Subscriber, El Cajon.

Please note reply to Santa Barbara subscriber. Your turkeys are undoubtedly dying of blackhead. It is not so much what they eat as the amount that develops this disease. Cut down the ration and be sure they have grit always before them. You had better try the ipecac treatment. The feeding of lettuce can be overdone, I believe, though a little does no harm. Alfalfa is better. Clabbered milk is one of the best feeds for turkeys.

COOPERATORS MUST STAY ON THE JOB

By J. H. Barber, General Manager
Poultry Producers of Central California

It has been well said that "Eternal vigilance is the price of liberty," and certainly with cooperative marketing associations constant watchfulness is absolutely necessary to success. The speculative dealer, deprived of his former opportunities of making money at the expense of the producers, is always on the alert to attempt something that will breed dissatisfaction among associate members.

Let us say that by "speculative dealer" we do not mean the legitimate distributor. The man who is engaged in the legitimate business of distributing farm products to consuming channels is performing a useful service and is entitled to reasonable compensation for his service and a reasonable profit on the money that he has invested in his business. We would be the last to deny him either. The speculative dealer, on the other hand, makes his profit by working the market; that is, by manipulating prices up and down for his own benefit. Sometimes he may also be a distributor, as well as speculator, but the two lines of activity are quite sharply differentiated and often the speculator does not handle the product at all—he simply gambles in it. To this type of man, who thrives on market manipulation, the cooperative marketing associations, which seek to stabilize market conditions, are especially distasteful, and he loses no opportunity of attacking them.

An illustration of this is a long article in the last issue of a Los Angeles trade paper attacking the state division of markets for supporting the membership campaign of the Almond Growers' Association. The writer of the article apparently is ignorant of the fact that the state market act not only authorizes, but specifically instructs the chief of the division of markets to promote the organization of producers' marketing

associations. The reason for this provision is obvious: the framers of the law realized that cooperative marketing contributes greatly to the prosperity of the producer and thereby increases production of farm products, thus resulting in a better supply at reasonable prices to the consumer and so benefiting the entire state, with the exception possibly of the speculators referred to above.

Every cooperative marketing association has at times to contend with this kind of misrepresentation, which often produces considerable effect upon members who are not acquainted with the facts.

One reason why many members of the marketing associations are susceptible to these antagonistic influences is because they are relatively new in the business. The prosperity that has come to various rural industries through the operations of the cooperative marketing associations handling their products has brought into these lines of production a great many new people whose experience of the industry is entirely confined to the period of prosperity. The older members of the associations, who can look back to the time when the associations did not exist and when the condition of the producer was much less satisfactory than at present, are seldom influenced by these misrepresentations; but the new people in the industry, who never knew the hard times which led to the organization of the associations, often fail to appreciate the benefits that they are now receiving through cooperation. They are apt, therefore, to be influenced by misstatements of interested dealers, overlooking the fact that what the dealer desires and what he is working for is to disrupt the organization so that the producers may revert to the former conditions in which they were absolutely at the dealers' mercy.

POULTRY PRODUCERS BUSINESS

Poultry Producers of Central California reports for April. San Francisco, May 31, 1922. Receipts of eggs during April were 18,507 cases weekly, or an increase of about 8 per cent over March receipts. However, April receipts were 7 1/2 per cent less than for the same period last year. April in both years was the high point of production. According to the bureau of markets, receipts of eggs on the San Francisco market have not been as heavy this year as last. On the other hand, in direct contradiction, we have the storage figures showing over 6000 cases more in storage in San Francisco this year. This difference is undoubtedly due to the fact that fewer eggs have been shipped East this year than last during the periods under comparison, for we firmly believe that consumptive demand has been greater recently.

The storage holdings in Southern California are greater than ever before at this season, and latest advices from Los Angeles show that there are 33,584 cases more in storage now than a year ago at this time. We also learn from the bureau of markets that the holdings in the four leading markets (New York, Boston, Chicago and Philadelphia) are more than 600,000 cases greater than last year. The movement into storage during the month of May has continued heavy, and, while production locally seemed to have dropped off somewhat, the receipts at all the principal markets

of the United States continued very heavy. The storage season is about to close, and we shall have to depend upon outside consumptive markets to absorb our surplus.

The market during May ranged high.

CITRUS FRUITS

These are actual prices obtained between 7 and 8 o'clock June 13 by Los Angeles wholesalers from their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms, cash on the walk. There may be slight fluctuations during the day's trading. Higher prices are frequently obtained where credit is given or goods are delivered.

Grapefruit: Market steady. Californias: Northern, packed box, 3.50@4.00; market pack, 3.00@3.50; small, 2.25@2.50.

Lemons: Demand and movement light, market firm. Locals: Loose boxes, best, 2.50@2.75; poorer, 2.25; special brands, fancy, 6.75@7.50; choice, 5.50@5.75.

Oranges: Demand moderate, market steady. Navels, culls, 1.50 per field box; Valencias, special brands, 7.75@8.75, according to size.

HONEY

New honey is arriving in very light quantities but the quality is said to be excellent. Due to the early freeze and to disagreeable weather during blooming period of the oranges and other fruits, the yield from deciduous fruits has generally been light except in some few counties which were not hit by the freeze. Present prospects excellent for a good sage crop. Shippers are asking in carlot quantities F. O. B. California points for extracted white orange blossom or white sage 8@9 per pound and for light amber 6½@7 per pound. No recent carlot sales reported. Beeswax is bringing the beekeepers 22c per pound cash.

HAY

NEGATIVE

(Continued from Page 647.)

lands and interests that they might need, with power to issue all necessary bonds in order that they might furnish farm products to the people of the state at cost? The farmers would certainly ask what does this board know about farming? Perhaps the reply would be that they know as much about farming as they do about water and power.

We can offer no greater argument in opposition to the proposed measure than to ask that the bill be carefully read. The idealistic impossibilities of the measure are not so much to be feared as the dangerous entanglements which will so throttle and stagnate business that it will require many years to remedy.

* * *

By Alden Anderson, Sacramento

The present is no time to even consider such a scheme as the water and power act. We are now just recovering from the effects of the great World War. Business has been unstable, farmers' prices low and crops largely unremunerative, and taxes, on account of war expenditures are extremely high. In addition this state has properly committed itself to increased expenditures on account of its schools and highways. To support our present commitments means a heavy burden of taxes on the farmers, every property owner and business generally. To add to this burden now would be akin to a species of insanity. It would stop the inflow of money and home-seekers to California, and it would lower property values.

* * *

In a statement issued by several bond houses the following appears: To California Investors:

There will be on your ballot next November a proposed amendment to the constitution of California known as the water and power act and authorizing an issue of state bonds to the enormous amount of \$500,000,000 bearing interest as high as 6 per cent.

The act would create a super-government of five persons appointed by the governor and removable only by recall or by the vote of two-thirds of both houses of the legislature. This board would have authority to issue \$500,000,000 of state bonds and to invest the money as it pleased in unspecified hydro-electric ventures and in any incidental business. The act provides for the issue of bonds to pay interest as well as principal of prior issues and also to meet operating and maintenance costs of the projects to be acquired or developed.

California today has more bonds outstanding than any state except New York and Massachusetts. With \$500,000,000 added to California's present debt of \$75,000,000, California would have about 45 per cent of the aggregate debt of all the states of the Union.

Bonds mean increased taxes, no matter what theorists supporting the water and power act may assert to the contrary. Taxes—national, state and local—have become a serious drag on business. What we need are proposals for reducing, not for increasing, debts and taxes.

You can help to suppress the menace of the water and power act by spreading correct information about it now before the scheme gains headway.

True, the scheme is preposterous, but no voter can afford to ignore it for it is an alarming menace to your welfare and to the prosperity of this state. It goes before the people with a clamor of slogans and catchwords artfully designed to conceal the real nature and consequences of the proposal.

Investors are men and women of affairs and should be informed about the water and power act which vitally concerns them. Unless the leaders in this state take the trouble to inform themselves regarding this dangerous act, demagogues are likely to do to California what the non-partisan league did to North Dakota.

* * *

The Journal of Electricity of San Francisco gives as possible results of the water and power bill the following:

The creating of a vast self-perpetuating political machine (hiring and firing are wholly within the control of

the five super-governors of the state who may be on the governing board).

The opening of metal mines, cement works, textile mills, machine shops, canneries, laundries, etc.—under state control in competition with private concerns.

Cut-throat competition with present power systems. The duplication of transmission lines, distribution systems and generating plants with the ultimate resulting higher costs to the consumer.

The abandonment of the principle of regulation and the resulting unfair distribution of power costs between consumers, determined by the particular bias of those in control.

The development of the state's resources by that portion of the state which asks for them first—the furthering of the interests of one section of government served at the expense of another which receives its power from private companies.

The increase of taxes. Owing to the lesser amount of taxes paid by the district doing away with its public utilities, the remainder of the state and other sources of revenue will have to bear a large share.

The lessening of market value of all private securities placed on the market, owing to the competition of this great block of tax free bonds.

High power rates to farmers. Owing to their distance from power sources and the long stretch of lines needed for each farm, costs will grow beyond the ability of the farmer to meet them.

The failure of certain portions of the enterprise to meet required returns, especially during the first few years, and the consequent levying of a tax for payment of bonds and interest.

Increasing burdens, through the gradual growth of the system—a tendency more and more to spread into related enterprises, to take up side lines of manufacturing, to control irrigation, as well as power. A growing feeling of irritation on the part of certain sections of the state against

others who have greedily reached for all in sight and shifted tax burdens from their own shoulders to those of their neighbors. Numerous weaknesses and failings in the act, which are not now apparent but which will develop in operation. At the same time a growing power on the part of the controlling board and a great difficulty in bringing about a reform through popular vote.

COOPERATORS ON THE JOB

(Continued from Page 665.)

er than a great many authorities had predicted.

Our operating fund made a further gain of \$6241.97 during April, and on April 30 showed a credit balance of \$24,978.59. Additions to our Eastern shipments account during April were \$4789.19, which brought the total credit up to \$37,579.80 on April 30.

Capital stock deductions during the month of April brought our capital stock fund up to \$400,071.24, exclusive of reserves; and you will note from the financial statement that up to April 30 it had not been necessary for the association to borrow any money with which to carry on the business and take care of storage requirements.

During the month, 57 members signed the produce sale agreement, of which two were members who had previously withdrawn.—John R. Denman, President; John Lawler, Assistant Manager.

NATIONAL EGG LAYING CONTEST

By T. W. Noland, Director

The 300 hens in the Eleventh National Egg Laying Contest, Mountain Grove, Missouri, laid 6,133 eggs during May, or an average of 20.44 eggs per hen. Pen S. C. Anconas, owned by Frank Van Bree, Zeeland, Michigan, won the cup by laying 133 eggs.

Number of eggs laid by the different breeds for the month and to date are: Wyandottes, 1005, 6502; Plymouth Rocks, 1107, 6446; Leghorns,

1065, 6323; Miscellaneous Varieties, 966, 6251; Anconas, 1101, 5996; Rhode Island Reds, 889, 5634.

Ten leading pens for May: S. C. Anconas, Michigan, 133; S. C. White Leghorns, Washington, 132; White Wyandottes, England, 130; R. C. Rhode Island Whites, Missouri, 130; S. C. White Leghorns, Missouri, 129; Barred Rocks, Missouri, 126; S. C. White Leghorns, New Jersey, 124; S. C. Anconas, Missouri, 123; Barred Rocks, Missouri, 123; S. C. Anconas, Missouri, 120; S. C. Dk. Brown Leghorns, Missouri, 120.

Ten leading pens to date: White Wyandottes, England, 789; S. C. White Leghorns, Washington, 776; White Wyandottes, England, 770; Barred Rocks, Missouri, 751; S. C. White Leghorns, England, 748; S. C. White Leghorns, England, 741; Barred Rocks, New Jersey, 729; White Wyandottes, Missouri, 727; R. C. Rhode Island Whites, Missouri, 727; R. C. Rhode Island Whites, Missouri, 724.

Farm home department meetings will be held in Tehama County at Red Bluff, June 19-20; Corning, 21; (These two will be home evaporator demonstrations); Flournoy, 22; Reed Creek—Red Bank, 23; Bowman, 27; Squaw Hill, 28.

The chamber of commerce of Williams, Colusa County, is having films made of farming scenes in that locality. These will be used for making known the resources of the country.

There is a project for carrying electric power from Norway to Denmark.

WEATHER REPORT

San Francisco, Cal., June 10, 1922.

Stations—	—Rainfall—			—Temp.—	
	Past Wk.	Season	Norm.	Max.	Min.
Eureka	.10	34.71	45.44	84	47

San Diego	.0	18.65	10.01	68	56

THE Northwestern Bell Telephone Company uses Red-Tops on all its cars, because "not alone do they give a greater amount of service, but because they give it without interruption."

Their men, who have to do the greatest part of their work in the worst kind of weather, when the telephone lines are down, always where the roads are roughest, feel certain when they go on these trips that no Red-Top is going to blow out or be punctured.

Last year this telephone company bought \$15,000.00 worth of Red-Tops for one district — and put them on every car it used.

The extra ply of fabric and the heavy tread of the Red-Top will carry any small car over the roughest road, under any weather conditions and with heavy loads, for a longer mileage than any other tire we know.

There's a Fisk Tire of extra value in every size, for car, truck or speed wagon.

Every Poultryman

FINDS THIS "PAY-STREAK" SOONER OR LATER

EVERY good hen is a mine—a golden mine of eggs. This mine will yield a certain revenue even if you go at it hit-or-miss. But, you can never expect to get the greatest yield—to strike the real "pay-streak"—until you tap the right vein. *And that's feed!*

No matter how carefully selected your stock may be—no matter how good the housing and care you give them—sooner or later you will "dig down" to this rock-bottom fact: feed is the nub and the rub of the situation.

Even the big poultry operators who have been mixing their own feeds and have switched to SURELAY will tell you it's the "cheapest" feed in the long run—cheapest because it nets *more egg-money* in return for the feed-money it costs.

These seasoned poultrymen realize—as you must—that a hen uses more energy in converting poor feed into money than she does in converting good feed into money. And, at that, how little is the difference in cost between good feed and poor feed! But look at the difference in the egg-sheet when you're through!

SURELAY has helped to put many a poultryman on his profit-feet by proving two things to him: First—that cheap feeds lessen the profits of every hen in his flock; second—that our large scale production enables us to turn out a better and more economical feed than he could hope to.

Blended and balanced according to a true-to-test formula, SURELAY stands top-high as a uniform egg mash that will make your hens pay by making them lay. The best way is the find-out-way. Order a sack of SURELAY from your dealer—and see! See how this high-grade mash "assays" in feed value. See how our daily laboratory tests insure the same feed value every time. See how SURELAY actually "pans out" with your flock. See how it rids your mind of feed-worry for all time. For "what's on the tag is in the bag"—always!

Also, send for the new edition of our booklet, "Makes Hens Happy." It is by far the most complete and helpful book we have ever issued on poultry feeding. And it's free! Simply clip the coupon—and mail today!

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against
loss through dishonesty of any advertiser
in the Cultivator. We do not attempt,
however, to adjust trifling differences
between subscribers and honest, respon-
sible advertisers, nor will we pay the
debts of honest bankrupts. Notice of
complaint must be sent us within 30 days
from date of the transaction, and the
subscriber must have mentioned the Cul-
tivator when writing the advertiser.

If among the more than 40,000
Cultivator's weekly circula-
tion any fail to find any article they de-
sire to purchase advertised in the Cul-
tivator's columns, a special request is
extended to you to let your wants be known
to the California Cultivator and we will
place you in touch with proper parties.

APRICOTS ARE WINNERS

The apricot grower who has a
crop is in clover. One Los Angeles
County orchardist who estimates a ten
ton production per acre has contracted
orchard run at \$52. Some with ex-
ceptionally fine high quality canning
fruit have reported as high as \$100
per ton for green fruit. There is
money in apricots.

A FIELD

There are some 14,000 raisin
growers sending the products of
their California vineyards two or may-
be three thousand miles to consumers
located in a section generally termed
"Back East." Of course there are al-
so some table grapes, and other grape
products which may go to Kalamazoo,
Timbuctoo or even more remote sec-
tions, but "Back East" furnishes the
great market for thousands of tons
of stored California sunshine and
sweetness. And they like 'em. We
believe it has been recorded that the
New Englander has said "Wall, I reck-
en them air raisins is purty good;"
but, in addition he, with a few South-

erners, Middle Westerners et al have
expressed appreciation more emphat-
ically in big round dollars which they
have sent to sunny California and
then remarked "Please pass the rais-
ins again." This has aggregated a
right neat sum, say, 'round 40 or 50
or may be more millions of dollars
and all within the one period of vine-
yard pruning to the next pruning. The
variations of a few millions in dif-
ferent years may be due to the con-
dition of appetite of those Easterners
or possibly the mood in which the
vineyardist was when he plowed, or
sulphured or suckered or cultivated
or pruned. If due to variation in ap-
petite, why?

Then there are some 15 or 16 more
thousands of growers who live in the
" . . . land where the lemon trees
bloom, Where the gold orange glows
in the deep thickets gloom." And be-
side the joy of living there they expect
not only the glow of the golden orange
but the more material glow of the
gold of those same Easterners—and
to the extent of some 50 or 60 or even
70 millions.

Then there are some dozen of thous-
and Californians who are caring for
and canning or drying or sending
lush and fresh from the tree, peaches
—beg pardon, California Peaches.

There are 12,000 prune growers,
other thousands of almond, walnut,
cherry, plum and 207 other distinct
products of California climate, water,
soil, toil. Much of this great range of
products calls for cooperative market-
ing organizations—250 of them. No
state in the Union has as many.

We boast—no, we tell the truth—
about our more than 200 products and
feel self sufficient. But really that
Easterner is quite an important per-
sonage. He has come out to Califor-
nia and admired and praised us, he
has staid at home and eaten our fruits.

We all know him pretty well. Each
year we get closer together, distances
are shortened, and sometime—maybe
—freights will be lower. Let us know
him better.

We Californians were, most of us,
born back there "in the states," but
we have forgotten.

It is "high onto" 40 years since
the editor of the Cultivator as a
youngster left the old home. Now he
is going back for the first real visit.
A half a dozen times he has dropped
in as an incident to a longer trip.

We are now on the way back with
time enough planned to see some of
the old-time friends, visit God's acre
where the names of many more are
graved in marble, look in the Little
Red School house and hunt for the
ole swimmin' hole.

It will be an even score of years
on the first day of September since
"we" began service at a Cultivator
desk and the score of years of service
is also justification for a bit of a play
spell.

Beside going "home" which is on
the Fire Lands of the western Re-
serve there will be trips beyond.

At Niagara a look will be taken at
the great power plants, then there
will be visits to Boston, New York,
Washington, New Orleans for infor-
mation as to procedure in federal
plant quarantine enforcement; down
into Florida to eat a Florida grape-
fruit—But why anticipate other than
to say that all the while we will be
endeavoring to get the opinions and
viewpoint of those Back Easterners
who render unto California the things
that be California's. As we get
those viewpoints they may work them-

selves into short notes, and if the
Cultivator folks at the office don't get
so excited in the fun of writing
their own pieces for the paper that
they will refuse to let my stuff in, I
will talk direct to Cultivator folks and,
if I may, will adopt the form of home
letters with the editorial "we" and
"our" dropped out here on this Utah
desert. If there is—and there will be—
lack of rhyme or reason at any time,
it is because the sway of the train
'round these Rocky Mountain curves
is jabbing holes in the copy paper.
Don't blame the proof reader—nor
me.

Also lest there be an occasional
tenderfoot whose memories of the old
home are so fresh that he takes ex-
ception to "Back" East, let me explain
that we Californians have become
accustomed to looking out through the
Golden Gate or other front doors of
the good old U. S. A., and taking the
boundless expanse of the Pacific as
indicative of the boundlessness of op-
portunity in California, and besides
the wending of Empire is responsible
for our expression regarding those
who still insist on remaining "Back"
there.

JANUARY TO JUNE

With this issue the California
Cultivator closes one volume of the
chronicles of the California farm, Vol.
LVIII. It is a volume of 700 pages,
and it has come in weekly install-
ments to 40,000 farm homes. Those
700 pages are a chronicle of the ups
and downs, the problems and the plans
of the California farm and home. In
running through the 25 issues the one
thing that impressed us most was the
number of questions which have been
answered. Of course, we knew the
questions had been coming and being
turned over to our attorney, our vet-
erinarian, our poultry editor, to spe-
cialists in potatoes, in walnuts, in
raisins, in calves, in rabbits, roses,
recipes, and so on, but as we turned
the pages we began to count. Here
is what we found. In those 25 issues,
835 questions have been answered
directly; there are 191 columns of
them; they appear on 180 of the 700
pages making up the completed vol-
ume.

Those 835 questions are to us an
indication of the close relationship
between our readers and our contrib-
utors. Not a question comes in but
is carefully and sympathetically
answered by specialists in daily touch
with the problems involved. Keep the
questions coming. We will do our
best. Keep the answers coming too.
We are more than glad to publish sug-
gestions and helps from our readers.
What we aim to be is a clearing house
for information and service.

Then the illustrations, 129 of them,
a large majority taken with one of the
Cultivator cameras by specialists who
are on the lookout—not for pictures
merely—but for concrete illustrations
which will convey at a glance accurate
information. Note the cover on this
week's issue.

But we can't go on talking about
the interesting features of this Jan-
uary to June volume; there isn't space
enough. Just turn to the index on the
last two pages of this issue; there
they will be found in outline. And
next week or next month when you
want to find an article or a formula
that appeared in the Cultivator in May
or maybe June or possibly as far back
as April or March, just turn to the
index to locate it quickly. That index
is a time saver—especially if the files

are kept in order on a handy low
shelf.

July to December brings another
volume, and both are delivered at
your home for one dollar. Pretty
good investment!

SPILLING THE BEANS

The bean growers need to wake
up. They are jeopardizing not only
the industry but the values of the
very lands on which the beans have
been grown. In a recent statement
issued by Mr. Churchill who is en-
deavoring to pull the Lima folks to-
gether we note:

Swapping dollars is an outdoor sport
which holds no charm for Carlyle
Thorpe, general manager of the Cal-
ifornia Walnut Growers Association.
For years he has been growing wal-
nuts, lemons and Lima beans on his
ranch holdings, and all of his crops
have been marketed through coopera-
tive growers' organizations, but he
frankly admits that producing Lima
beans under existing conditions is
pretty much of a dollar swapping prop-
osition.

"I wouldn't grow Lima beans and
market them outside the California
Lima Bean Growers Association," says
he, "but if the Lima growers don't
jump in and build up their member-
ship to a point where the organization
can eliminate the speculator and
handle the market in such a way that
a satisfactory average yearly return
can be had I'll be tempted to quit
growing Limas and plant other crops."

The only way a cooperative organi-
zation can prove highly efficient and
of the greatest benefit to the industry
is through not only moral support but
the active and wholehearted support
of its members.

GREEN VS. RIPE FRUIT

In the June 12 issue of The
Brawley News is given a sugar test
of five samples each of green cantal-
oupes, cantaloupes on the line and
ripe cantaloupes, the average of the
five samples being as follows: "Green"
—3.59 per cent sugar; "On the line,"
or half ripe, 5.81 per cent; "ripe" 6.82
per cent or almost twice the amount
of sugar in the ripe as in the green
and more than one per cent more in
the ripe than in the half ripe, which
has been the customary stage for
picking in the past. This showing
should convince the cantaloupe grow-
ers of the advisability of holding their
cants as long as possible without en-
dangering their shipping quality be-
fore picking in order to give the con-
sumer a product that will be relished
and for which he will call again. Green
and immature fruit of all kinds is
bound to reduce consumption while
ripe fruit increases it, and increased
consumption means better prices. Of
course there is a limit in the degree
of ripeness at which it is advisable to
hold fruit that is to be shipped but if
it must be picked so green in order to
stand shipment that it is not fit to
eat the grower can never hope to find
a satisfactory market for it.

NEW 1921 YEARBOOK

We wish to call attention to
the short article printed elsewhere in
this issue regarding the proposed
change in the new 1921 year book.
This change should certainly be ap-
preciated by the farmers as it will
make the book much more valuable
as a reference work and the articles
on production, marketing and distri-
bution will be appreciated by all in-
terested in farm products.

California Cultivator

Vol. LVIII, No. 25

Los Angeles, June 24, 1922

One Dollar Yearly

Moving 5,000 Mature Orange Trees

(See Cover for Illustrations.)

THE Limoneira Company of Santa Paula has a large tract double-set to citrus trees, about 15,000 altogether. It became necessary to transplant either the lemon or the Valencia orange trees, and orders were dispatched to the field force to have the orange trees "moved on." They are six years old and therefore the job of moving 7,000 or more trees is a gigantic and costly undertaking, for no doubt the undertaker will get some, figuratively speaking, as indeed he does with the first move.

For not all are worthy and only those found in past years to bear good crops of good fruits are transplanted. The others are decapitated and the stumps and roots will be removed later. The performance record of these orchards shows, however, but few trees unworthy of a new home. After the empty heads are cut off the remaining trees are heavily pruned about a month before moving day. Just enough foliage is left on to function feebly and partially resume the former sap circulation until the day when the tree undergoes the major surgical operation.

By Ernest Branton

After pruning the trees are at once whitewashed to protect from sunburn. A circular trench is then dug, three feet deep, three feet from the trunk, and the roots are cut. On the day of moving the trees are tilted, the tap and roots cut and the soil shaken from the roots. A sling of large rope is tied under the main roots and about the stem, by which the tree is raised by crane on to the auto truck. After roping, the roots are covered with wet burlaps and kept wet by an occasional sprinkling from a large garden watering can. When the truck with loading crane arrives the coverings are pulled off, the tree is loaded by hooking into rope and as soon as deposited "on deck" the roots are again covered with burlap. About 20 trees may easily be loaded on a large truck. They are then whisked away to the planting field.

Before replanting bruised, battered or split roots are smoothly cut on the ends, the smaller by shears and the larger by saws. Just at this point the close observer notes a startling range in the root system. Two trees are

closely alike above ground. When dug, one has short shaggy masses of fibrous roots, an ideal condition; the other has roots like large ropes, unbranched, same size all the way out, not a fibrous root in the three foot zone. The latter tree may have had a better root system than the former but it developed outside the three foot zone. The question arises: shall the two trees be treated alike? One has a root system ready to resume work at once; the other has none, but must grow one before it can begin to draw moisture and food from the soil. Will not the larger top overbalance the present insufficient root system before help arrives and so die or dry out in whole or part? It would appear that if each tree had six leaders the one of fiberless roots should be reduced to three. A wise head is needed to direct the work at this stage.

Of course holes of sufficient size have previously been dug to receive the trees. Water is first run in these holes so that roots may be made wet again as soon as possible. A stream

also immediately follows the planters so that all possible aid is lent to the preservation of their natural functions. The flow of water is long enough and sufficiently checked at each tree that there is no doubt as to the wetness of the entire zone. When finished dry soil is banked well up against the trunks to help conserve moisture and hold tree upright as the soil settles with percolation of water.

In addition to trees moved as herein outlined the Limoneira Company has a test plot of the same lot of trees moved by all the different methods thought worthy of trial. Some were boxed, others balled, still others moved with bare roots. On each tree is a large duplex wooden label on the inner side of which is written a history of the operations, dates of pruning, defoliation, moving, etc. The trees show for themselves the amount of pruning they received, some having but a heavy framework, others full tops with small branches. The present condition is best in the boxed trees and no doubt it will always be so, but the boxed trees cost the most to move.

The Control of Grape Mildew

By Fred K. Howard

ONE of the most common questions asked by producers of grapes at this season of the year is, "How many times is it necessary to sulphur my vines?" It is to answer this question in a measure that this article is prepared for the California Cultivator. It is not to be supposed, however, that there can be any set rule laid down for the time and number of sulphurings necessary to effectively combat this disease. Climatic conditions will determine how serious the trouble is any one year. It is possible, however, to so describe a disease that we may more thoroughly understand the nature of the thing to be combated and in view of this explanation can perhaps more intelligently apply the control measures.

What Mildew Is

Most of us have seen the gray felt-like growth which is quite common on some varieties of roses during the early spring. This is a mildew commonly known as rose mildew. Grape mildew is similar to this trouble although not usually quite so conspicuous. Mildew is a very low order of plant. It is commonly known as a fungus. It does not have the power of supporting itself from the crude minerals and chemicals found in the soil combination with the gases of the air as have the plants having green leaves, but must depend for its existence on the elaborated plant food which has been stored up for growth in the plants. There are a great many different kinds of mildew, some preferring to live on certain types of plants. The grape mildew prefers the grape vine. It has tiny root-like parts which penetrate the tissues of the

green parts on the vines and take up the stored or elaborated plant food from the cells. The growing part on the surface of the leaves develops very rapidly and soon forms spores which are really the seeds of the fungus. These spores are carried very quickly to other portions of the vineyard or to other parts of the same vine by the slightest movement of the wind. As the colder weather approaches the spore type changes, and there are developed spores which are hardier than those produced during the spring and summer. These winter spores as they are called, are capable of withstanding great extremes of heat, cold or moisture without affecting their ability to germinate and produce new fungus growth under proper climatic conditions. The winter spores gain lodgment on almost any part of the vine or even in the soil at the base of the vine and remain dormant throughout the winter. With the return of the first warm days of spring these winter spores will germinate and produce new infections. It is of course a practical impossibility to kill all of the winter spores by sprays during the winter period because they may lodge in such out of the way places that they could not be reached by the killing agent. Then too, as all are not killed, enough still remain to make summer control necessary in addition. So, after many experiments it has been determined that attempted winter control is a waste of effort and money. It has been said that it is far better to start control measures early in spring before the mildew has gained much

headway than at any other time. This sort of control is accomplished by ordinary dry sulphur, provided this sulphur is properly distributed over the entire green surface of the vine, and provided further, that climatic conditions are such that it will do the work effectively. Very little is definitely known regarding the action of the sulphur upon the growing parts of the mildew, but we are sure that whatever the action is it is a very effective remedy for the disease. The difficulty in the use of sulphur seems to be that a grain of sulphur has a very limited range of action; that is, the fumes given off (if the fumes are the killing agent) will not act at a very great distance from the grain of sulphur. This observation was brought to the attention of investigators probably due to the fact that distribution of the sulphur is very essential to the proper control of the disease. It is, in fact, now generally believed that the failure to control the disease has been due almost entirely to the improper distribution of the sulphur.

Kind of Sulphur To Use

The very finest sulphur that can be obtained should be used for this purpose. The reason for this is that only the fine sulphur can be distributed evenly over the vines. The fine sulphur particles float through the air and finally adhere to the lower surfaces of the leaves. Originally sublimed sulphur was used almost entirely, for this purpose, but in the past few years grinding facilities have been developed and a very finely

ground sulphur has been placed on the market and appears to do the work as effectively as the sublimed sulphur. A mixture of ten per cent lime with the sulphur also helps to improve the distribution of it.

Time of Sulphuring

It has become the usual custom to apply sulphur during the early morning hours. This is done for two reasons. First, because there is usually less wind at this time of the day and consequently sulphur can be better distributed. Second, because less wind makes for the comfort of the operator. The leaves are also then usually wet with dew and the sulphur has the chance to adhere to the surfaces of the plant better than if applied to drier surfaces. Care should be taken, however, to see that there is not enough dew on the leaves that it will collect in drops and carry with it as it collects the grains of sulphur. Aside from these reasons there seems to be no particular value in sulphuring early in the morning. Quantities of sulphur, however, should not be used during the middle of the day, particularly if the temperature is well above 100 degrees, as such application may cause a slight sulphur burning of the forming fruit.

When to Sulphur

Real mildew control is prevention of a further spread soon after the first summer spores develop in the spring. For this reason it is essential that the first application of sulphur be made about that time. This has been found to be when the shoots are no longer than eight inches. If sulphuring is done at this time it will

(Continued on Page 574.)

Agricultural News Notes of the Pacific Coast

Northern California

In the week ending June 3 Petaluma shipped nine cars of eggs to New Jersey.

Bids on construction of the state highway between Auburn and Colfax in Placer County will be opened July 10.

Contra Costa County is asking that roads and trails be built on Mt. Diablo and other nearby mountain sections.

Demonstrations of summer pruning and thinning of deciduous fruits were given throughout Placer County orchards last week.

Highest testing cow for May in the Petaluma association was Kate, owned by E. A. Lichau, with a yield of 74.4 pounds fat.

R. B. Easson, poultry specialist of the state university, closed today, June 24, a week of culling demonstrations in Sonoma County.

"All crops a month late" is the word from Fall River Mills in Shasta County. Cattle are in good condition and wheat crop will be large.

The stockmen of Sonoma and Marin Counties attended in force the Valley Ford Livestock Show, June 10-11. Over 200 head of dairy cattle were exhibited.

The Butte County Farm Bureau Market Exchange has been formally organized. Sam Cheney of Dry Creek will represent the exchange on the state board.

A committee of Colusa County farmers appeared before the state reclamation board at Sacramento to protest expenditure of \$520,000 by trustees of reclamation district 2047.

Napa Valley will harvest a 60 per cent prune crop this year according to estimates of Farm Adviser Baade. Between St. Helena and Calistoga the yield will be fully 100 per cent of normal.

The Livermore Valley Stockmen's Protective Association is cooperating with E. V. Sands of the United States department of agriculture in coyote extermination in the Corral Hollow district.

Superintendent Duffy of the Napa State Hospital reports sale of finished leather manufactured from beef raised on the farm, for \$9862.25. Leather manufacturers offered for the hides only \$1600.

Napa County poultrymen are planning inspection tour of Petaluma poultry plant. They will also visit the packing plant of the Poultry Producers. The trip is under management of the farm bureau.

Directors of the California Grape Protective Association met in San Francisco June 8 and set prices on wine grapes. \$105 a ton is named for Alicante Bouschet, Alicante Ganzin, Petit Bouschet, Grand Noir, and Lenoir, 18 per cent sugar.

In the effort to find orange variety better adapted to Butte County conditions than the Washington Navel the citrus experiment station at Riverside has sent to County Agent Drobish selected buds of Enterprise seedless, Boone's Early seedless, Indian River and Pineapple seedlings. Australian oranges in the Thermalito, Palermo and Wyandotte district will be budded with the new varieties.

Central California

Heavy rains last week made it necessary to close the roads to Sequoia Park.

The Tulare County board of trade is planning details of its exhibit at the state fair.

J. J. Hardie of Standiford, Stanislaus County, reports sale of his Zinfandels at \$125 per ton.

Farm center meetings will be held in Stanislaus County June 28 at Claus; June 29, Patterson.

Fresno chamber of commerce has acted to refuse admission to county fair grounds of games of chance.

May report of cow testing division of Kern County farm bureau shows 43 cows giving over 50 pounds fat.

The joint boards of the Turlock and Modesto irrigation districts have endorsed the Turlock melon carnival.

The highest testing cow in the Kern County Association during May was a grade in the herd of P. G. Grundt of Wasco. She made 80.7 pounds fat.

This year's bean crop in the district about Kings City, Monterey County, is estimated at about 50,000 bags, mostly Pinks and Limas. 800 more acres are planted this year than last.

The new state olive growers association reports more than 25 per cent of the acreage already signed up. Meetings are being held through the state this month to secure growers contracts.

The Shrine Hospitality Committee secured from the Sun-Maid and Fig Growers' associations thousands of baskets of specially packed fruits to distribute to visiting Shriners at San Francisco.

Turlock melon growers say conditions are just as satisfactory as they could be. Acreage approximates 2,500. Eighty-five per cent will be handled by the Turlock Melon Growers Association.

The Owens Valley local of the California Alfalfa Growers closed its year's business with showing of average net price to growers for choice dairy hay of \$19.04 as against the best price of \$10.70 offered growers last fall.

Carload shipments of loganberries will be made from Watsonville to Eastern cities. This was decided upon by the Central Berry Growers' Association which is also starting campaign of publicity to popularize the loganberry.

The first grain of the season to be delivered to warehouses in the Salinas Valley was received June 6 at Soledad. E. J. Hart, on the Salinas Land Company tract, and Al Eade, King City, were among the first to start harvesting.

The Turlock Melon Growers' Association will hold a two day melon carnival at Turlock. The chamber of commerce and the American Legion are cooperating. The carnival will be held the latter part of August, exact date not yet announced.

At the June 15 meeting of the Delhi farm center Consulting Engineer Shoemaker of the Turlock Irrigation District answered questions as to distribution of power from the Don Pedro dam. This question will soon be put to a vote of the people of the district.

Southern California

Potato growers field day at Van Nuys, June 27.

Imperial County has voted bonds for \$300,000 for a new court house.

Covina held its annual community picnic on June 22 at Ganesha Park, Pomona.

A party of Florida citrus growers is now making tour of California orange groves.

All of Ventura County is invited to a community fete at Berylwood farm, Huenceme, July 14.

The First National Walnut Exposition will be held at Santa Ana the first week in December.

The Colorado broke through the Raab's Bend levee on June 12, flooding several thousand acres.

Some 50 Florida citrus growers inspected groves and packing houses of the Riverside district June 16.

Agricultural courses for teachers will be given at the southern branch of the state university at Los Angeles.

A mass meeting of Escondido citizens was held June 20 to lay plans for celebration of Grape Day, September 9.

A poultry culling demonstration was held yesterday at the Hagar Ranch, Escondido, by W. E. Newlon of the state university.

A demonstration of orchard heaters was given at Riverside the evening of June 14 under the direction of the Stewart Fruit Company.

June 15 was a big Poultry Day at Ontario, Riverside County. A picnic supper was served on the Chaffey Union high school lawn.

Six carloads of feeder cattle were brought to Escondido last week from Arizona. They were taken to the Joe Crouch ranch at Witch Creek.

The California Walnut Growers Association is making careful census of all walnut districts in the state. The undertaking will probably be completed by September or October.

At a meeting held in Colton June 13, general endorsement was given to the plan of securing waters of Arrowhead Lake for the cities of Riverside, Colton, Redlands, San Bernardino and Rialto.

Palo Verde Valley has been suffering from raids of chicken and turkey thieves. The Blythe Herald says the raids ceased coincidentally with the capture of "Red" Cain who has been returned to the Hemet jail.

Francis Cuttle of Riverside, who has for many years been at the head of the Tri-Counties Reforestation Committee and Water Conservation Association, has left Riverside to make his home in Oakland.

Orchard heater demonstrations were given June 15 at the Santiago packing house at Orange and the Tustin Lemon Association packing house, Tustin. Demonstrations were under management of the Fruit Growers Supply.

Lynwood is one of the newest of the thriving centers of Los Angeles County. It is in a rich dairy and alfalfa country, owns its own water system, has an enthusiastic chamber of commerce of 100 members and a woman's club of 50 members.

The Coast and General

First blossoms have appeared in Arizona cotton fields; thinning is about completed.

The total production of milk in the United States in 1921 was almost 99 billion pounds.

First canning of raspberries in Bellingham district of Washington will start about July 4.

Douglas section of Arizona is feeding stock because of short pasture. Some stock is being lost.

California shipped during May 1263 carloads of lettuce out of the total for all states of 1816 carloads.

Salt River Valley of Arizona is harvesting second cutting alfalfa. Most of it is being baled.

The city council of Winnipeg is instituting action to prevent importation of frozen citrus fruits.

Arizona cantaloupe growers report vines have made luxuriant growth but fruit is fully three weeks late.

Two million pounds of dried and frozen eggs were brought into the United States from China in April.

The Oregon Prune Growers' Association reports sales already made of 7,000,000 pounds of Mistland prunes.

Shortage of citrus stock in Arizona is influencing orchardists to ask that quarantine against California trees be lifted.

Cold storage capacity of Yakima Valley, Washington, will be increased by this fall to 11,485 cars of fruit according to Union Pacific agent.

The Western Washington Fair Association has set October 2-8 as dates for the fall fair. For the first time it has put its officers on yearly salary.

A pure bred livestock tour has been arranged by the Washington state college. It will start at Vancouver, July 24 and end at Bellingham, August 4.

It now appears that the north central Washington apple crop will be smaller than last year's. Cold weather at blossoming time is considered responsible.

Oregon Agricultural College has established a fruit by-products laboratory at its Corvallis station. Effort is being directed particularly to standardizing prune drying.

Oregon Prune Growers' Association has named opening prices on Mistland prunes, 6 to 11 cents f. o. b. plants in 25 pound boxes. 70's, 80's and 90's run a quarter cent better than last year's prices; other grades about the same.

Five thousand acres of cut-over lands have been given to the state of Washington by the Weyerhaeuser Timber Company to be devoted to the first comprehensive scheme of reforestation in the state. The work will be under direction of the state college of forestry.

The 12 car special Shiner train from Cincinnati to San Francisco over the Southern Pacific was equipped with wireless. A long distance receiving record of 2000 miles for radiophone was established, as well as a 3000 mile record for telegraph reception while in motion. Aerials were constructed eight inches above the roof of one of the forward cars.

Feeding Dairy Cows--No. 1

GROWING CALVES

CONTRARY to the belief held by many people that "a dairy cow is a cow" and should be treated as such, a real dairy cow is a finely balanced machine capable of converting grains, roots and grasses, which in their natural state supply but little food for mankind, into milk and butter fat, two of the most important items on the human menu. Milk is the only food known which supplies all of the essentials required to sustain life and its value in the feeding of growing children is universally recognized.

Build Your Own Herd

As in all kinds of factories it is necessary that the machinery be of the right kind and properly made. In the dairy business this means that the parent stock should be the best obtainable and that the young should be developed in the most scientific manner. There is one glaring fault to be found with many dairymen: they make it a habit to sell their calves and when a larger volume of milk is needed go out and buy fresh cows. The usual excuse is that they have no milk to feed the calves, no time to care for them and oftentimes no place to keep them. With these men dairying can be nothing but a hand to mouth existence. The real dairyman who is in the business because he likes it and wants to make it his life work will have the best herd he can afford. It will be free from abortion and tuberculosis. Having assembled such a herd there is but one way to keep it clean, and that is to

refrain as much as possible from introducing new stock. By using the best pure bred sire he can get and carefully raising the heifer calves he can increase the value of his herd many hundred per cent in a few years. There are plenty of instances where the records show an almost unbelievable increase in type and production in three or four generations by following this method.

So it is the dairyman's duty to obtain the best foundation females he can and to use the right kind of a bull. Then he should build his future milk machinery by raising the heifer calves so that they will be in condition to do good work when they freshen.

Calves Need Whole Milk

Calves should not remain with their mothers longer than one or two days and it is the common practice of many dairymen to remove them as soon as they have nursed once. They should be fed whole milk for at least six weeks, preferably three times a day. There is less danger of scours from feeding one-third of the allowance three times a day than in a larger quantity twice a day. The total amount of milk should not be over eight pints a day at the start with a gradual increase as the calf grows, until at the end of the six week period it should be getting 16 pints a day. For the first two weeks the calf should have nothing but milk as food and drink as water is liable to induce scours. After that it can be given

water and a small pan of equal parts of bran and ground oats should be before it all the time. If more than one calf is kept in a pen there should be small stanchions in which to fasten them or they should be tied apart during the feeding. If they are given some of the grain mixture immediately after they have finished the milk there will be less chance of any danger of their sucking. If the milk-wet nose is dipped into grain for the first few times it is surprising how quickly they will learn to eat grain. A handful of good, bright oat hay morning and night should also be fed after the second week. Oat hay is a bone and muscle builder and provides a very necessary part of the ration.

Changing to Skim Milk

At the end of the sixth week the change to skim milk is begun. In order that the calf should go on growing without a set back it is best to do this gradually. Replace a portion of the whole milk with skim, increasing the proportion of skim each day until at the end of seven days the whole milk is entirely replaced. At the same time change the grain ration to the following mixture: 100 pounds ground oats, 100 pounds bran, 100 pounds dry beet pulp, 50 pounds linseed oil meal, 1 1/4 pounds salt. Begin with one pint twice a day and increase as the calf grows. Feed plenty of oat hay in small quantities and a handful of alfalfa can be added after a time. When the calf is two or three months old

five pounds of silage fed once a day is a good thing.

Calf Meals Satisfactory

Calves should be fed skim milk for a year if it is available. If the supply is short, calf meal of some one of the well known brands should be substituted for a part of the skim. The meal can be fed according to directions, always remembering not to feed too much and being sure to mix it with warm water. Should the calf scour decrease the amount of meal until the proper proportion is determined. Calf meal can also be substituted for a portion of the whole milk fed the first six weeks if it is absolutely necessary to do so.

Feed for Yearlings

After the calf is six months old alfalfa hay may be substituted for a considerable part of the oat hay if the breeder desires. At the end of a year the calf—if Holstein or Holstein grade—should weigh from 750 to 800 pounds, if a Jersey or Guernsey, somewhat less. From this time until she is bred, which is generally at 15 to 18 months according to her growth, she can be carried on silage and alfalfa alone. It is not good to have heifers in too high condition before breeding as they are often hard to settle if fat. After they are safe in calf it is a good idea, but not absolutely necessary, to add a small feed of grain once a day to the alfalfa and silage. If they run in pasture or in a large corral this helps to keep them from being easily frightened, keeps them in the habit of eating grain and gives the owner a chance to watch them more closely than he might otherwise.

Citrus Growing in South Africa

By R. E. Nebelung, Citrus Specialist, Union of South Africa

WHILE the growing of citrus fruits has been a practice in South Africa for about 100 years the industry is still in its infancy as a commercial proposition. It is only during the last decade that any attention has been paid to export, and during the war practically no fruit was sent out, giving the industry a setback, but one from which it has rapidly recovered. During 1922 it is believed that about 400,000 boxes will be sent out, principally to England.

The first trees set out were of course seedlings, and some of these in the Clan William section near Capetown are still alive and bearing good crops at 100 years. Seedlings 75 years old are not uncommon in Cape Colony and parts of the Transvaal. The original Dutch settlers or "voor-trekkers" set out trees which will stand as a monument to their enterprise. These early plantings have been invaluable in determining for the growers today the localities in which citrus will thrive. The principal districts in which citrus is being grown and planted extensively are Rustenburg, Marico and Waterberg in the Transvaal, the Eastern Transvaal or "lowveldt," Fort Beaufort, Uitenhage and Clan William in the Cape, and Pietermaritzburg and Greytown in Natal. Rhodesia also grows considerable citrus but is not a part of the Union, so will not be considered in this article.

The varieties which are being planted most extensively today are Washington Navel and Valencia, with

budded seedlings, Du Rois, St. Michaels and other miscellaneous varieties receiving some attention. Naartjies or tangerines are also produced quite extensively, but are not being planted to any extent now. Lemons, Eureka and Genoa (Lisbon, I believe) are grown but not for export. The Marsh Seedless and Triumph pomelo are grown in small quantities, but for some reason, probably inferior budstock, the Marsh Seedless has been a disappointment. The root stock that is used is principally the rough lemon, which is more resistant to collar rot than other varieties. The Seville orange, which appears to be similar to Florida sour stock, has not been successful. That fact alone would deter growers from importing California nursery stock commercially, were there not other insurmountable obstacles, such as long shipment, quarantine regulations, etc. As it stands today it is the rough lemon stock with Washington Navel and Valencia buds and an increasing interest in good budded seedlings.

The Navel has been somewhat of a disappointment to many growers. The reasons for this are, I believe, quite obvious. There has been a large demand for nursery trees and a small knowledge of bud selection, and many nurserymen and growers propagating their own trees have taken buds with little regard to type. This could only result in one thing—off type trees

bearing poor crops of inferior fruit. It is just the California experience over again, but thanks to the work done by the California growers the South Africans have learned how good trees can be produced and are coming more and more to bud selection. Thousands of trees should be topworked as they are very "Australian" in type and bearing, and some growers have started along this line.

Another fault of the Navel is its relatively large size, with often a tendency toward a thick skin. As the trees grow older, however, the fruit will no doubt improve in quality. London is the principal market, and the London consumer is used to and likes a medium sized orange such as the Spanish and Jamaican varieties. There is no particular objection to seeds, and for this reason the 200 size, thin skinned seedling is being planted by many growers. They are being encouraged in this, as the writer, during three weeks in London in October, 1921, found this type of orange in favor at Covent Garden and among the retailers. It is of a size and price that appeals to the masses. The Navel, if of good quality, will always command a good price however. It ripens in May, the beginning of the South African winter, and is sold during the northern hemisphere summer. The only probable competition is the California Valencia. The seedling is a little later, and the Valencia ripens in

October, which is liable to bring it in competition with the Spanish and Jamaican fruit.

While London is the principal market some fruit is sent to the continent, principally Holland. As conditions in Central Europe improve a large market will be developed there, but in the present state of affairs no attempt is made to export. New York is being considered, and possibly when quarantine regulations will permit some shipments will be made there. Many South African growers believe, or did believe until recently, that no oranges were produced except in South Africa during May to November. It was rather a surprise to them to learn that California now produces over half of the crop during those months.

Before South Africa can become a serious competitor to California the quality of fruit exported will have to be improved. Until this season there has been no attempt to grade fruit for quality, the size determining the grade. This meant that fancy, choice, standard and cull all went in the same case, and if of a certain size, were known as "Fancy," "Choice," etc. At a meeting called in Johannesburg in February and at which the writer was present and took an active part, the following new regulations were drawn up and will be enforced this year.

"Maturity—No oranges which have not attained 70 per cent yellow or orange color shall be exported.

"Grades—There shall be two grades of oranges, to be known as 'Fancy'

and 'Choice' 'Fancy' fruit shall be that which is practically free from all but slight blemish and from injury by insect, disease, or hail, and shall have a reasonably thin skin, this depending somewhat upon the variety. 'Choice' fruit shall be in all respects similar to 'Fancy' but not of such good quality or as free from blemish, injury by insects, disease, or hail, and shall have a reasonably thin skin, this depending somewhat upon the variety.

"Inferior fruit in any respect, usually known as 'culls' such as any injured or punctured by insects, e. g., by moths, wasps, flies, etc., damaged by caterpillars (rispers) curculio, thrips, scale or any other insects; diseased owing to the presence of anthracnose, melanose, stem-end rot, or any diseases that attack oranges: having hail marks, leaf-brush, thorn pricks, sand and earth marks, or being deformed and longitudinally or latitudinally split; any rendered uninvit-

ing or of an unappetizing appearance from any cause whatsoever, shall not be exported.

"Size—The size shall not determine the grade.

"Marking of Boxes—All boxes shall bear the grade of their respective contents on the left hand top corner of the box, beneath the variety name.

"Minimum Weight—The minimum weight shall not be less than 75 lbs. (per packed box) at railway station."

This is the first step in standardization, and while it will result in some confusion at first, will eventually bring about desired results. When one realizes that practically all of the fruit is packed on the individual farms the difficulties in the way of obtaining a uniform pack may be appreciated. Add to this the fact that unskilled labor must be used, and the situation seems more hopeless. Strict inspection will be given all fruit at the various docks, and if a grower has a consignment

refused he is going to find a method of preparing a better pack. Only by such methods can the South African fruit establish itself as a permanent competitor in the citrus markets of the world.

CONTROL OF GRAPE MILDEW

(Continued from Page 671.)

be found that the cost of application is very low and the quantity of sulphur used almost nil. A second sulphuring following the first should be made about blooming time. Whether or not it should be made during the bloom is still a question upon which authorities are not in entire agreement. It is probable that except for certain varieties it is better to stay out of the vineyard with the sulphur machine during the blooming period. However, application should be made either just before or just after blooming. If the weather conditions are favorable to the development of mildew, that is, if there are continued stretches of hot, humid weather, then a third application should be made about two weeks after the second one. From then on the vineyard should be carefully watched for the first indication of the disease and an application of sulphur be made as soon as its appearance is noted.

How To Apply Sulphur

There are many methods of getting sulphur on grape vines for the control of mildew, but there is only one way of really properly applying it. In the past some of the common ways were the use of burlap or "gunne" sacks used as shakers, then too, there were shaker cans. In some cases the sulphur is simply thrown on the vines by hand. None of these methods can really be called a proper "application" because it does not distribute the sulphur over every leaf of every vine in the vineyard. Such methods of application will not control mildew, particularly in years when this disease is serious. These methods are also costly because more sulphur is used than is really needed and in the long run, the only method that should be used is that of the hand blower or the power sulphuring machine. With such machines the sulphur can be directed by the operator at the center of the vine and sufficient air pressure put behind it that it is very thoroughly distributed throughout the entire vine. We will not here discuss the relative value of the knapsack hand machines and the power machines. That is something which every one must decide for himself. The power blowers, of course, are particularly applicable to conditions found on large vineyards, and the investment is usually too great for the small grower.

INSECTARY FOR ORANGE COUNTY

The talked of insectary for Orange County is assured, according to citrus men who are backing the plan. In discussing the matter C. C. Chapman of Fullerton said:

"I understand that plans have almost been completed and that the committee having the matter in charge probably will be in a position to make a definite announcement within the near future.

"Although I am not prepared to say just what site the building will occupy, I think it is pretty generally understood that it will be in Anaheim and that the structure will be completed by midsummer.

"The insectary will be financed, I am told, by the citrus industry, rather than by the county, although, of course, Horticultural Commissioner A. A. Brock will have active charge of the plant and the county no doubt will contribute its full share toward its upkeep.

"I think it has virtually been decided to finance the insectary by levying a nominal assessment, probably a quarter of a cent per packed box, on citrus shipments made by the various exchanges, the packing houses and private shippers.

"There was, I believe, some talk of leasing a desirable building from one of the exchanges in Anaheim and establishing the insectary in this building. I am not sure whether this will be done, or whether a lot will be secured and a new building will be erected. However, a decision may be expected soon, and the work will then go forward very rapidly.

"The insectary will be a great thing for Orange County, and will aid very materially in eliminating our pests, including the mealy bug, which is making inroads in our citrus groves. There has been developed an enemy of the mealy bug which is very effective. This will be used in profusion."

ARIZONA NEEDS CITRUS TREES

From the Yuma Sun: "A shortage of young citrus fruit trees in Arizona, especially in the Yuma district, induced Don C. Mote, state entomologist, to go to California to see what could be done, if anything, in lifting the quarantine against such stock. He will investigate reported eradication of citrus fruit diseases by means of the vacuum fumigation, a method said to have solved the problem and which leaves the trees free from scale and other disorders which led to the Arizona quarantine against outside trees.

"The horticultural commission held a meeting to determine if it will be wise to raise the quarantine on citrus fruit trees from California. A request that this be done came from Yuma people, Senator A. J. Eddy coming to Phoenix to represent them. Yuma people wish to plant citrus fruit trees on the Yuma mesa, said to be one of the best citrus growing regions of the world.

There is a scarcity of good young trees suitable for planting on the mesa. It was reported, that the California stock has been fumigated and placed in condition, should the quarantine be lifted."

MARKET FOR AMERICAN FRUIT IN EUROPE

A shortage of dried fruits in the United Kingdom, together with the rise in exchange and the drop in freight rates, should stiffen prices until the new crop reaches the English market in October, according to a report to the department of commerce from Vice Consul Howard Donovan at London. Sales of California raisins would be larger if they arrived in time for the Christmas trade and if they were packed, like the Spanish product, in seven pound tins, faced and scalded, giving them the golden brown color which attracts buyers. Smyrna Sultanias, offered at lower prices than California seedless raisins, are furnishing competition difficult to meet. The amount of dried currants and raisins entered for consumption was appreciably larger in 1921 than in the previous year. Stocks of California and Oregon plums and prunes, and of dried apricots, pears and peaches in London bonded warehouses at the end of the year considerably exceeded those of 1919 and 1920.

The oranges, mandarins and bananas seen in the best shops of France are not of a quality to attract the notice of an American tourist, writes Vice Consul J. Lee Murphy from Nantes. Grapefruit is practically unknown. If American shippers can meet the market with the adverse exchange rate and the long haul freight charges they may be able to do some business on a consignment basis with regular buyers.

During 1921 the United States furnished practically all the imports of dried apples and pears into The Netherlands, the department of commerce is informed by Consul General George E. Anderson, Rotterdam, who says there is a steady demand for these products. American exporters also sold 53 per cent of the canned fruit and 25 per cent of the preserved fruit purchased by The Netherlands last year. The fall in value of the German mark in 1921 enabled Hamburg jobbers to sell American dried prunes and apricots in the Dutch market at prices lower than those obtaining in the United States.

PRUNE AND APRICOT GROWERS CONFERENCE

A conference of prune and apricot growers is suggested for the week of the annual fruit show at the state university at Berkeley the coming fall, the association and university people to cooperate in planning for the meet.

NEW "Z" ENGINE

Those who want a thoroughly dependable engine at a comparatively small investment will select the new "Z." It is built to the same high standards as other "Z" Engines, and fully guaranteed. It delivers more than rated horse power; operates on gasoline alone; has simple high-tension battery ignition; hit-and-miss governor; new type, safety flywheels; quiet-running, spiral-cut gears. Wonderfully simple—no complicated parts. Control lever gives six speed changes. Starts easily, runs steadily, requires little attendance, carburetor requires no adjusting. The high quality and low price are due to scientific study and large production facilities. One of the greatest values in years. Over 300,000 "Z" Engines in use. See your dealer. Or write us.

Look at your wheat
before harvest

Has it long, full heads of sound grain?
Is the straw stiff enough to stand?
Will it yield as much as you hoped?
Is the clover or grass stand in it good?
If not, think over the matter of using a
fertilizer that will help you.

For six years wheat fertilizers have
contained little or no Potash.
Potash prices are now much lower.
Enough German Potash has now come
forward, so that those who wish can buy
wheat fertilizers with

4 TO 6% POTASH

Go at once to your dealer and tell him what you want and insist that he get it for you when the fertilizer salesman makes his first call.

42 Broadway New York

Tanks, Well Casing, Water Pipe

American Steel Pipe Tank Co. P.E. Bldg., Los Angeles

See the NEW Holt Steel Harvesters— Models 30 and 32—in operation this season

Entirely new and unlike any other harvesters ever before offered. Indestructible, last a lifetime, oil once a day, economical. Great grain savers.

Make a thorough investigation of these wonderful new machines

You can't buy a Model 30 or 32 "Caterpillar" Harvester for 1922 delivery—the entire production was sold out within a few weeks after these models were first announced. But you *can*—and by all means *should*—make an early and careful investigation of these newest achievements in grain harvesting equipment, and place your order without delay for next year's delivery.

See these harvesters in actual field service. Note the indestructibility of the all-steel body. Note how the roller bearings and light weight insure minimum draft. Observe the ease of operating and oiling. See how perfectly the harvesters handle the most adverse conditions of grain. Above all, notice how perfectly all the grain is saved and how well it is cleaned. Observe what a remarkable saving of time and money is effected.

We urge you to see for yourself. We ask you to be the judge. Learn *now* how you can reduce your harvesting expense and increase your grain profits in 1923. Fill out and mail the coupon without delay.

The Models 30 and 32 Harvesters

The Model 30 and the Model 32 are alike in their features of light weight, light draft, long life, all steel body and minimum power and labor requirements. Both maintain the Holt standard of saving all the grain and cleaning it exceptionally well. The chief point of difference between the two machines is in size, the Model 32 handling a 12-foot cut, having 20-inch cylinder and 31-inch separator and requiring 6 to 10 horses or equivalent tractor power to pull it, while the Model 30 cuts 16 or 20 feet, has 26-inch cylinder and 36-inch separator and requires 14 to 16 horsepower to pull it. Both machines are offered in level land and sidehill models; with equipment for sacking grain or delivering to wagons and with horse or tractor hitch.

Mail the Coupon Below

There will probably be a Model 30 or 32 at work near you this season. Fill out the coupon and mail it at once, checking the information you desire.

Highest Efficiency Must Go With the Right Soil and Climatic Conditions

THE peach growers, especially canning growers of California, asked all of California to unite in celebrating the worth of the peach and giving a recognition of its importance in California horticulture. The state accepted the invitation and the visitors gathered from all points. True cooperative spirit was manifested, especially by adjoining counties, and they entered fully into the celebration. Across the Feather lies Yuba, and Yuba, not to be outdone, called attention to its rich acres and to their prosperity. Commissioner Harney gave out through the columns of the Marysville Appeal a report of peach growing conditions in the county and referred to the fact that there were still 10,000 acres of land perfectly adapted to peach growing yet to be planted. He made the suggestion that in 1925 that county should be producing 120,000 tons of peaches which he figures out would aggregate six millions of dollars. Then came Harry Stabler, commissioner of Sutter County, with a bit of old Sutter's peach planting history. He carried peach planting history back to the days of General Sutter. Mr. Stabler said:

"General John A. Sutter, soon after the discovery of gold, left Sutter Fort at Sacramento and built a home on Hock Farm on the Feather River, five miles south of Yuba City. Here he planted a peach orchard, the first peach orchard in Sutter County.

"About 1860 John Briggs, P. L. Bunce, Dr. Chandler and Dr. Teagarden planted peach orchards in Sutter County. A. F. Abbott and Joseph Phillips planted 55 acres of cling peaches in 1883 about nine miles south of Yuba City. This orchard was extended in a few years to 425 acres, and in this orchard the famous Phillips cling, a chance seedling, was found in 1888.

"B. F. Walton, one of Sutter County's most progressive citizens, organized a cooperative association in 1883 and built a fruit canning factory in Yuba City. The building of this plant, the Sutter Canning and Packing Company, stimulated the planting of cling peaches so that now we have 10,500 acres of bearing and young trees with a crop estimated this year at 50,000 tons. There is one cannery in Yuba City and one now building in Marysville. These two plants will can approximately 10,000 tons, leaving 40,000 tons to be shipped to canneries in other parts of the state. Last year 21 canneries drew supplies of cling peaches from Sutter County.

"Joseph Philips imported some trees of a cling peach from Augusta, Georgia, about 1885. This was known as the Tuskeana; the name being gradually changed to Tuscan. This cling, now grown in cling peach districts all over the state, was first grown in California, in Sutter County. The Walton, the Johnson and the Hauss clings, popular mid-summer varieties, ripening after the Tuscan and before the Phillips, originated in the orchards of L. A. Walton, J. Sander Johnson and Ferdinand Hauss.

"A promising new mid summer variety, the Paloro, originating at Gridley, Butte County, was first grown here by M. J. Newkom who has eight acres in full bearing. This peach is highly valued as it carries exceptionally well to distant canneries and its production record is notable. At two years of age Mr. Newkom's trees produced three tons per acre, nine tons per acre at eight years, and 15 tons per acre at four years of age.

"Sutter County orchards are noted not only for the quality of the fruit but for the extremely heavy tonnage per acre. Miss Elaine Wilbur's orchard of cling peaches is now famous throughout the country. For two years she has won the first prize in the annual peach contests for quality, ton-

nage and condition of orchard on Tuscan and Phillips peaches. Her orchard when five years old had a record of 20 tons, 242 pounds per acre on a 13 1/2-acre plot, which stands unchallenged. In F. S. Walton's orchard of Phillips clings there is one acre of particularly fine trees which has produced 26 tons. L. A. Walton has trees of Phillips clings which regularly produce, 1,000 pounds per tree.

"Sutter County fruit growers have faith in cling peaches. This season 2,486 acres of clings were planted. A full crop four years hence will mean a production of 100,000 tons of cling peaches for Sutter County."

The neighborliness and cooperative spirit of the Yuba County people was also shown by the editor of the Marysville Appeal who asked for expressions from other Californians as to California grown peaches. One of these came to the editor of the Cultivator and the response was used by the Appeal:

"Fine words of praise for the achievements of Sutter County peach growers are contained in a congratulatory message from C. B. Messenger, editor of the California Cultivator. Messenger has written the following to The Appeal:

"Editor Marysville Appeal: I appreciate the opportunity of sending greetings and congratulations to peach growers of Sutter County through your columns. Congratulations are certainly due because of the magnificent work already done in competing with each other in the effort to secure greater efficiency—individual and community efficiency.

"In all worth while community building men and women must function as individuals before they can function effectively with their neighbors in general upbuilding. From reports I have received regarding some of you peach growers it appears they are growing larger and better peaches and greater tonnage. Without knowing the circumstances I am going to assume that this greater quantity of finer quality is not secured through a series of happy accidents but because of serious and hard work—hard work with the hands, harder with the head.

"O, of course I know you are boasting—and with reason—of your soil, your water and your climate. But don't forget: toil goes with soil in peach production.

"Many years ago I heard music—the most wonderful in all my life. The violinist was totally blind. He played a rare old violin said to have cost \$25,000. That bit of wood and string became a part of his very soul, and perfect harmonies inspired unnumbered thousands. The matchless quality of the instrument would have availed nothing in my hands. Had I made the utmost effort I could have produced only horrible discord.

"Should I come to Sutter or Yuba and assume that your natural conditions are so perfect that they would pour wealth into my lap whether I functioned or not, I would probably have another 'assume' coming. I could perhaps produce only discord amongst the peach trees.

"The wonderful quality and beauty of a perfect peach has little in common with soil. It does have much in common with human beings who have functioned effectively.

"Folks of Sutter: Your peaches are not so much the result of nature's laboratory making your soil over into a luscious fruit, as they are—you."

SOUTHERN CALIFORNIA CITRUS INSTITUTE

The Southern California citrus institute will be held at Pomona on Friday, July 14, followed by the fifth annual pest control school on Saturday, July 15. The institute will consider frost protection. Among the speakers will be Howard F. Pressey, manager of Rancho Sespe; J. E. Adamson, manager Pomona Valley Protective Association, on "Ten Years of Frost Protection in the Pomona Valley"; W. R. Schoonover, citrus extension specialist, University of California, on "New Ideas in Orchard Heating Technique". The orchard heater committee of the Fruit Growers' Supply Company will make report.

LOOK AHEAD TO THRESHING TIME

Four farmers, all good friends, Henry Becker, Joe Sedlacek, and Peter and Arthur Anderson, of Springfield, Nebraska, went in together to buy a Goodyear Klingtite Belt in July of 1920. They threshed all their wheat that season, the crop of several other farms—more than 350 acres of wheat and oats—repeated the performance last year, and used the belt in corn-shredding and silo-filling after threshing.

Goodyear Klingtite Belts are all-weather belts. They are not

affected by heat, cold or damp. Their Goodyear ply construction gives them long life. They need no breaking in.

Your local dealer has Goodyear Klingtite Belts. They are made in endless type for threshing, silo-filling, feed-grinding, wood-cutting, and other heavy duty, and in suitable lengths for lighter drives, such as cream-separating, electric light generating, water-pumping, etc. For further information about them, write to Goodyear, Akron, Ohio, or Los Angeles, Cal.

Sell Your Potatoes for SPOT CASH F.O.B. Shipping Point

Don't wait for your money. Distant buyers readily pay the highest market prices, f.o.b. shipping point, for guaranteed Boggs machine-graded potatoes. For they know, without seeing the potatoes, that they will receive absolutely uniform Government sizes.

Boggs Potato Grader

The Standard Grader

also saves labor. It will equal the manual labor of from three to five men. And it will not bruise or injure the potatoes.

Can be installed in field, warehouse, car or cellar. Operated by hand, motor or gasoline engine.

Made in sizes to handle 75 to 700 bushels per hour. Six models, \$40.00 and up.

Let us send you our interesting booklet. What's your address?

BOGGS MANUFACTURING CORPORATION

34 Main St., Atlanta, Steuben Co., New York

Factories: Atlanta, New York—Detroit, Minnesota

THE BOGGS POTATO GRADER

is the Standard Grader adopted by all middle western and eastern potato growing sections. Write or call for prices, booklet or other information.

Pacific Coast Representative

INTERESTING PROPOSITION FOR DEALERS

AVOCADO SEEDLINGS

For orchard and nursery planting. Grown from selected seed from hardy Mexican stock, in open beds and untouched by frost. All first-class stocky plants, 12 to 24 inches in height. Can be taken out with small balls of earth or open root as preferred.

Price \$25 per hundred while they last. Address THE R. M. TEAGUE NURSERIES, SAN DIMAS, CALIFORNIA, or Mr. James Stewart, La Habra, California.

When Writing Advertisers Please Mention the Cultivator.

For Economical Transportation

The World's Lowest Priced Light Delivery and Farm Car

\$525 *f. o. b.
Flint,
Mich.*

Complete with Body, as illustrated

The Greatest Dollar Value in the Commercial Car Market

Every farm needs this car to carry milk, garden truck, feed and all moderate loads.

Every country merchant needs it to enlarge his trading territory and give better service to customers.

Costs no more to buy and keep than a team but does the work of two teams and saves one driver.

With two extra seats makes a fine bus or jitney for livery, hotel or school uses.

Can be had with special paneled body at very reasonable cost.

Chevrolet Invites Comparison Because Comparisons Sell Chevrolet

Consider What Chevrolet Equipment Means:

Standard Rear Axle Construction. The new Superior Chevrolet has the strong, quiet Spiral Bevel Gear Axle that "stands the gaff" without breaking

Standard Transmission—three speeds forward and one reverse.

Standard Braking System—foot service brake, hand emergency brake.

Standard Electrical System: Starter, storage battery, Remy ignition, electric lights front and rear, on battery circuit.

Standard Cooling System—pump circulation, large, honeycomb radiator and fan. This means a cool, efficient engine, saving gasoline and oil and ensuring driving comfort.

Standard Instrument Board, containing speedometer, ammeter, oil pressure gauge, lighting and starting switch, and choke pull.

Standard Type of Carburetor, with exhaust heater—one reason why you get most miles per gallon of gasoline with a Chevrolet.

Powerful, Valve-in-Head Motor. The same type as used in successful cars selling at much higher prices.

Demountable Rims—extra rim on side. No trouble to change tires on a Chevrolet.

Full Weather Protection—Waterproof curtains let down on sides and rear, fully protecting driver and load against rain or snow. Flexible windows in curtains.

Many Other Advantages which will be noticed on inspection, comparison and demonstration.

Enforcing Mediterranean Fruit Fly and Melon Fly Quarantine in the Hawaiian Islands

By H. F. Willard before Quarantine Conference at Sacramento

HE five quarantine regulations now in effect between the Hawaiian Islands and other parts of the United States are:

Quarantine No. 13. Prohibits or regulates the importation of fruits or vegetables in the natural or raw state, on account of the Mediterranean fruit and melon fly.

Quarantine No. 16. Prohibits the importation of living canes, cuttings or parts of sugar cane, on account of certain insects and fungus diseases.

Quarantine No. 30. Prohibits the importation of all varieties of sweet potatoes and yams, on account of the sweet potato weevil, *Cylas formicarius*, and the sweet potato scarabee, *Euclyptus batatae*.

Quarantine No. 32. Prohibits the importation of any species or variety of banana plants, on account of two injurious weevils, *Rhabdocnemus obscurus* and *Metamasius hemipterus*.

Quarantine No. 47. Regulates the importation of cotton, cotton seed and cotton seed products, on account of the pink boll worm *Platyedra gossypiella*.

The Mediterranean fruit fly was discovered in Hawaii in 1910. Finding itself in an almost ideal climate for reproduction at all times of the year, and in a place where there were no natural enemies, its increase and spread was extremely rapid. In Honolulu alone there are between 70 and 75 varieties of host fruits in which it breeds, over half of which are considered preferred hosts that are usually heavily infested. There is no edible fruit known to the writer, that is grown in Hawaii, excepting the pineapple, that does not serve as a host for this pest. It was soon realized

by the Hawaiian and federal governments that the Mediterranean fruit fly was a pest of prime importance and that all efforts possible should be made to prevent its spread to other parts of the United States. To date this has been successfully accomplished by efforts along two lines, i.e. the enforcement of Quarantine No. 13, and by decreasing the numbers of the fly in Hawaii by control measures.

It will be of interest to know what is being done in Hawaii to enforce Quarantine No. 13 to protect the mainland United States from the introduction of the Mediterranean fruit fly and melon fly. This quarantine requires that all fruits or vegetables, moving from Hawaii to other parts of the United States shall be under the strict supervision of representatives of the federal horticultural board. It requires that fruits or vegetables to be shipped must be grown under conditions which are approved by these agents, that the packing material be likewise approved, and that the packing houses meet certain requirements. Fields where such fruits or vegetables are grown, as well as sources of packing material, are inspected often enough to insure their freedom from contamination by fruit fly or melon fly larvae when they are leaving host fruits which might be growing too near. Growers are required to destroy all host fruits growing near their fields before they become ripe enough to become infested and to immediately remove from their packing houses all overripe or damaged fruits that are removed during the process of packing.

The only fruits or vegetables allowed to be shipped at present are: Bananas, pineapples, coconuts, taro, lotus root, and ginger root. Extensive

investigations by the federal bureau of entomology have proven that non-cooking varieties of bananas, when packed green and shipped as required by the regulations of the federal horticultural board, are not a menace as carriers of the Mediterranean fruit fly. Prematurely ripened fruits are removed from bunches by inspectors in the course of their duties. Several thousands of these fruits which have been removed from bunches growing in fields where adult fruit flies were present in large numbers have been brought to the laboratory and placed in breeding jars; and no fruit flies were bred out. After the bunches have been selected in the field, harvested and cleaned, they are inspected and an inspection tag issued for each bunch to be shipped. They must be thoroughly cleaned of all dirt and debris which might be lodged between the hands, and the bunches must be free from fruits with breaks in the skin or that have begun to ripen.

The Mediterranean fruit fly or the melon fly cannot breed or survive in a green or ripe pineapple. Many unsuccessful attempts have been made to breed these flies from pineapples under both field and laboratory conditions. Hundreds of larvae of all stages have been placed within both ripe and green pineapples, and within three days they were all killed. Consequently the inspection of this fruit consists of supervision over the packing material used, the fields where the fruit is grown, and the packing sheds.

Coconuts, taro, lotus root, and ginger root, are inspected to see that they are free from soil and that proper packing material and clean containers are used.

Several methods of control have been tried in Hawaii. The unusual abundance and variety of fruits producing flies made an extensive campaign in the destruction of host fruits a failure. The use of poison bait or spray, proved impracticable for the same reason. The only control measure, that has met with any degree

of success, has been the use of natural enemies.

In 1913 and 1914 the Hawaiian board of agriculture successfully established three parasites from Africa and one from Australia, all of which attack the fly in the larval state. Since their introduction the federal bureau of entomology has made almost daily records of the amount of control exerted over the fruit fly by each of these four species. These records, excepting those for the last three years, have been published, and they show the following results: In 1915, 37.9 per cent of the fruit flies developing in and about Honolulu were parasitized and destroyed; in 1916, 33.2; 1917, 47.5; 1918, 58.8; 1919, 38.2; 1920, 51.9 and 1921, 56.4 per cent. These percentages were obtained from a total of 438,719 larvae, or an average of 62,647 larvae per year. An average of the parasitism records for the past four years, 1918 to 1921, inclusive, shows that the parasite destroyed an average of 51.3 per cent of the flies developing in all host fruits. While these beneficial insects have probably reached their maximum ability to control the fruit fly in Hawaii, the fact that they decrease the number of adults by over one-half makes them of considerable value as a control measure and decreases to some extent the danger of spreading the fly to other parts of the country.

It is the opinion of those familiar with fruit fly conditions in Hawaii that there is no danger of introducing the fruit fly from there into the mainland United States through commercial shipments as they are now handled. The danger is with the scrupulous person who deliberately tries to smuggle in quarantined fruits or the tourist who, not realizing the damage that might result, endeavors to bring in some odd or rare fruit to show his friends. Under present quarantine regulations all fruits or vegetables can be taken aboard ship in Hawaii, as ship's stores, or by passengers or crew, provided they are consumed or destroyed before the ship reaches the three mile limit of the coast of the mainland. This condition increases the chance of contraband fruits being aboard ship at the time of docking and adds to the duties of the inspectors in preventing such fruits being landed. The only way this problem can be met, is by the maintenance of a force of inspectors large enough to thoroughly examine all persons, baggage or freight leaving the ship at any time during its stay at the port of entry. Violators of the quarantine should be vigorously prosecuted, and when convicted receive a penalty large enough to serve as a warning to others in the future.

CITRUS CANCER AGAIN APPEARS

Right on the heels of the splendid fight and Herculean efforts on the part of the Florida Plant Board to clean up the statewide infestation of citrus canker, comes the report that after a lapse of several months, a new outbreak of the dreaded citrus disease, involving 75 acres has been found at Fort Lauderdale, Florida.

It is not altogether speculative to assume what would result in California should this dread plant leprosy be accidentally introduced.

What a lesson for California to study! In 1921 the value of California produced citrus fruits easily exceeded \$80,000,000. Safe to say, a large part of the citrus industry would pay the toll of negligence. As in Florida, the industry might be retarded for years. The actual control work in Florida, added to the value of orchards and nurseries burned to the ground in an effort to exterminate this disease, cost Florida over \$13,000,000, and the havoc wrought will be reflected for years to come.

California should not wait for an invasion of citrus canker or fruit flies or any other costly plant pest, for the Florida lesson has taught the penalty to be expected, and California's previous well-being, the value of immunity.

Now is the time to aid the bureau of plant quarantine inspection, by reinforcing our guards at every inland and maritime port of entry.

BANNER STRAWBERRY

A mysterious ailment, not known to be a disease, is killing Banner strawberries in the San Fernando Valley; no other varieties being affected. L. C. Holmes, field crop specialist of the Los Angeles farm advisor's office is investigating the trouble, but thus far can find nothing wrong. In some spots there is some alkali present but as the strawberry is quite tolerant of alkali it would not seem likely to destroy the plants. It may be that this Banner stock came from generations of plants grown in a non-alkaline soil. All strawberries came in whole or part from *Fragaria Chiloensis*, a wild species. This will grow in slightly acid soils and thrives best where no trace of alkali is shown by analysis. Mr. Holmes has sent samples of the soils to the state university for examination and the Banner growers

in the state of California to co-operate with the general public and take from these violators their liberty. Fines do no good whatever; they just go on from day to day and year to year and continually and intentionally violate."

POTATO GROWERS FIELD DAY

The nematode as it affects potatoes will be discussed by Prof. E. O. Essig, entomologist of the college of agriculture, at the Potato Growers Field Day at Van Nuys high school, Los Angeles County, the morning of June 27.

In the afternoon potato grading will be demonstrated in the field by H. H. Warner, standardization expert of the state department of agriculture.

Vucaipa reports hordes of visitors during Cherry Week, June 12-18.

Berry growers of Whatcom County Washington, have organized a receiving station at Bellingham.

GENERAL ADVICE AS TO FUMIGATION

At the close of an exhaustive paper read at a citrus institute at Pomona, Mr. Woglum offered the following 12 significant pointers:

Trees should be taped, not guessed, and dosed according to schedule.

Black scale should be in the immature condition when fumigated.

Use heavy dosages. Certainly not less than 88 per cent schedule; 100 per cent as soon as the trees will stand this strength.

Fumigate as early in the season as the scale is in condition.

Where "off hatch" is present double fumigation is advocated. The first treatment should be early in the season; the second probably two or three months later, or as soon as eggs are all hatched.

Avoid having a heavy cover crop about trees while being fumigated.

Avoid winter fumigation, particularly at cold temperatures, if possible.

Where winter treatment is necessary practice daylight work.

Caution operator to avoid nozzle of pump coming close to tree trunk.

Results at temperatures below 50 degrees Fahrenheit average poorer than at higher temperatures.

Fruit injury increases with high dosages. A slight loss from pits is less expensive than a heavy loss from scale infested trees.

Do not fumigate trees that have been sprayed with Bordeaux mixture within a year; painting high up on trunks and branches is also conducive to injury from fumigation with hydrocyanic acid gas.

Each grower to keep records of individual tree dosages, also of temperature.

"Barley crops are now being harvested," writes Secretary J. F. Fouch, of the Williams chamber of commerce, "and we are getting the largest yield that has been harvested in many years in Colusa County, some yields being as high as 40 bags.

Never before could you get so much tire worth for \$10.90

CAR-OWNERS who bought a 30 x 3 1/2 "Usco" for \$10.90 last Fall have discovered this by now—

Nobody before ever got so much tire value in the neighborhood of ten dollars.

They never had to question the quality—with the makers of U.S. Royal Cords behind it.

They couldn't help admiring the price—spontaneously made to meet the new economy times.

Today a number of other 30 x 3 1/2 tires have come into the popular \$10.90 price range originally established by "Usco."

So it might be well to remem-

ber just what the "Usco" Tire is in case you are in the habit of comparing.

In "Usco" you get responsible quality.

\$10.90 is today's price. But the quality was fixed long ago—the same "Usco" performance tire users have been buying and using and buying again for years. A tire that would be high value at more than \$10.90.

At \$10.90 it is unapproached.

United States Tires are Good Tires

anxiously await the outcome, for no other berry known quite fills in the market niche of the Banner.

STAND BY STANDARDIZATION

A daily war is being waged by the state department of agriculture to secure due observance of the state laws and secure for the consumer an honest exchange for his investment.

At this time of the year the strawberry occupies the limelight. In one of the southern counties an officer of the division of weights and measures on May 24 confiscated 1737 boxes of strawberries that averaged only 10 instead of 12 ounces as prescribed by law. In a large bay city during the past ten days officials have secured evidence of violation from 39 different parties, the cases to be tried at a later date.

Commenting on these flagrant violations, Chas. F. Hayden, assistant chief of the division of weights and measures says: "I only wish it would be possible for some judge some place

For a cool, clean kitchen burn PEARL OIL

Pearl Oil, burned in a good oil cook-stove, is an economical as well as a clean and convenient fuel.

You are rid of the drudgery of feeding and cleaning out a range and your kitchen is cool and comfortable. You work with a clean, intense cooking heat concentrated directly under the burner where it is needed.

To be sure of best results in your stove, use Pearl Oil. It burns cleanly—no smoke or odor

WHAT WE BROUGHT

We brought nothing into the world, they declare.

But I hold that that statement's untrue. We brought nothing with us to spend or to wear

And hunger was all that we knew, But somehow or other it oft seems to me That all of us brought, when we came, The men and the women that some day we'd be

And the seeds of our worth and our fame.

We brought what God gave us—two hands and two eyes

And a mind that could learn right and wrong,

The power to be kindly and gentle and wise;

Some brought here the glad gift of song.

Some brought with them smiles that should light up the way

For the weary and sad and distressed, Some came here with courage to serve day by day,

Some came here with love for the best.

Some came to the world bringing laughter and mirth,

Some brought with them patience and skill,

No one empty-handed came down to the earth

And I'm sure that none ever will.

Some brought with them kindness and courage and cheer,

Some came with good deeds to be wrought;

No babe ever came from the Infinite here But something of splendor he brought.

—Edgar A. Guest

THE SCOOP THAT FAILED

By H. Irving Hancock, in Forward

REPORTERS are usually pictured as carrying notebooks and writing in them. What the real news hunter really carries is a tightly folded "wad" of copy paper on which he scribbles the fewest notes possible, relying on his memory for the rest.

John Preston shoved such a wad of paper into a hip pocket, thrust his short pencil into an upper vest pocket, took a look around at the dingy, untidy room in the five-room flat out in the Inwood district of the city, nodded twice at two policemen who stood guard at the door, then started for the door.

The new quarters of the Marks gang had been discovered and raided, its members being charged with a series of low, annoying crimes in the great city. A detective had at last located the headquarters of the gang out in Inwood and had hurried to the nearest station house for a squad of policemen to aid him in the raid. Four of the gang were under close guard in an inner room. Tim Marks, leader of the captured ruffians, was in this outer room near the door that opened into the ground-floor flat. Preston had been questioning him, but with poor results.

"Say, how did you ever come to find this place, anyway?" glared Marks, addressing the policemen in the doorway.

"Maybe this reporter lad tipped us off," grinned one of the officers.

"Then he ought to have his neck broke," declared Marks hotly.

"Got everything, Preston?" inquired the other policeman.

"Yes, I think so, thank you. Let me see."

Out came the wad of paper again, and the young reporter glanced through his notes.

"All the members of the gang caught except Chuck Adams?" Preston half queried.

"That's right," nodded the officer.

"Can you describe Chuck to me?"

About five feet five in height," answered the officer. "Broad shouldered, rather squat-looking, very dark, large mouth, and a curved scar under his left eye. He is almost always scowling."

"Say, Reporter," bellowed Tim Marks as Preston stepped through the doorway, "if it was you who tipped off the police about this nest, then I wish I had my hands to myself for about a minute. You'd always mind your business after that."

Out in the hallway young Preston had to step through a thin crowd of fellow tenants in this dilapidated flat. They stared dully at the reporter as he made his way through the groups.

Outside Jack turned to the left, intending to board a trolley car that should take him to the Journal office. To do so he had to pass a little alleyway. Out of the darkness of this al-

ley there darted at him a man who did not look very prepossessing.

"I heard it!" cried the other, in a thick, low voice. "So you led the cops here and helped nab the gang, did you? I'll!"

Whatever the threat intended, the other did not finish it, but instead made a swift rush at the young reporter. Preston, however, was not easily flurried, nor had he wasted his time in college gym or in the boxing class. Like a flash he dodged, then his left fist shot out, catching the stranger on the point of the jaw and sending him to the ground. The fellow lay still, and Preston bent over him curiously, studying his general appearance. Then, suddenly, the reporter bent lower, gathered up the form in his arms, and started back into the house.

"Anyone you know?" he inquired of the two policemen.

"Chuck Adams!" gasped both of the blue-coated ones. "How?"

Hastily Preston related what had passed. Marks looking on in glowering silence.

"And now I must hurry back to the office," wound up the reporter, starting once more for the door. This time there was no interruption. He reached the main thoroughfare through which the street car ran, and within twenty minutes entered the editorial rooms of the Journal.

Preston, with one year of college finished, was putting in his summer vacation as a substitute reporter. At first he had found the work dull, but ever since a memorable night on which the town had practically broken loose, in a news sense, he had liked the life better and had won respect for his talents. Telford, an older and more experienced reporter, and Mr. Momford, the night assistant city editor, had done much to advance the young man in newspaper work.

When Preston returned, however, on this summer evening, to report, it was not Momford whom he found in the city editor's room. Momford was away on a fortnight's vacation. Ellis, one of the older reporters, was taking the absent man's place.

News of the raid had been telephoned to Ellis by a friend in the department, and he had hurried Preston out on the story.

"Much of a story, Preston?" inquired Ellis.

"As big as anything in that line," replied Preston, and hastily narrated what had happened.

"So a Journal man captured Chuck Adams?" exclaimed Ellis delightedly. "Play that up for all it's worth, lad, and get the story in as fast as you can. By the way, were there any other reporters there?"

"Not a single one."

"Good! Then, as I had hoped, the Journal is to have a scoop on that story. We need a few scoops. Be sure you don't breathe a word of this story to Parker of the News when you meet him. Understand?"

Preston gazed curiously for a few moments at his temporary chief. He wasn't quite sure whether the order was just or despicable.

A newspaper "scoop" or "beat" is a news story that a newspaper enjoys to the exclusion of the other newspapers in the same city. It is every newspaper man's ambition to obtain a "scoop" if he can do so honorably. There are, however, a good many "ifs" and "buts" to be considered. There were three morning papers in this city. One of them, the Herald, preferred to go it alone in all local news matters. The Journal and the News, while going it alone in most matters, had "combinations" on police news, information from City Hall, and in court news. A "combination" meant that they shared the news with each other. Thus Preston, who was at present assigned to cover night police news, met Parker of the Morning News, at midnight every night to exchange information. In the city proper Preston covered half the police stations, Parker taking the rest. This enabled each paper to obtain its police news with half the expense otherwise involved.

Strictly speaking, this combination covered only the city proper. Inwood was an outlying district, not strictly

included in the terms of the agreement. Few items of interest came from Inwood, and as a rule the News and the Journal men passed to each other the occasional news stories that Inwood produced. It will be understood that there are many problems and delicate shadings of the obligations of honor in the conduct of such combinations. When a reporter is in doubt, it is held that the orders of his own office binding, that the newspaper employing him, and not the reporter himself, is judge of what does or does not belong to the combination. "You understand the orders?" insisted Ellis, looking up from his desk to survey the young reporter from under his eye shade.

"Yes, sir," replied Preston a bit stiffly. Then he went out into the city room, seated himself at his desk, opened up the top to bring the typewriter into use, and began to write his story.

This finished, he turned the copy over to Ellis, remarking:

"It's growing late. I'll have to hustle to finish my rounds before midnight."

Ellis, already deep in the reading of the manuscript story, did not answer. Jack Preston hurried out, going quickly from police station to police station, collecting the usual small items dealing with accidents, fires, and the like. At just two minutes before midnight he entered the reporters' room at police headquarters, to find Parker awaiting him. Parker was a man of about thirty, a dependable fellow, a hard worker, a man with a wife and three children.

"I have only two little items," was Parker's greeting. He proceeded to give them, while Preston made hasty notes. Then he gave out his own garnered news.

"It makes me feel like a thief not to tell Parker about the Inwood business," Preston thought bitterly to himself. "His city editor will tell him he was scooped on that story. As short a time as I've been in the business, I know that it's no joke for a reporter to find himself scooped. Reporters have lost their jobs for that little thing. I wish Ellis hadn't given me such an order."

(Continued Next Week.)

HOUSEHOLD QUERIES

Devonshire Cream

Could you kindly tell me what is "Devonshire or clotted cream," where it gets its name and how it is made?—Subscriber, Palms.

This is made by letting milk stand 24 hours, setting pans on back of stove, letting milk bubble but not break through cream. Skim and let chill. This will keep for some time as it is in effect pasteurized. It is named from Devonshire, England, a noted dairying section.

Candying Fruits

I have received many helpful suggestions from the different departments of your valuable paper and have enjoyed trying some of the recipes in the household department. Some very delicious candied figs, much enjoyed by Eastern friends as well as by ourselves were made after a recipe published in your department. This year we would like to glaze or candy the various fruits as they ripen if we can get the necessary directions. Can you give in the Cultivator the recipes for loquats, blackberries, cherries, apricots, peaches, plums, prunes, quinces, oranges and apples? It certainly would be appreciated by myself and many others.—Subscribers, Wilmar Station.

Following are directions for candying all fruits mentioned except oranges, given by W. V. Cruess in charge fruit products laboratory of the state university. We have asked Mr. Cruess to tell us how to handle the oranges, and his instructions will be given later in this department:

Small crab apples, apricots, plums, cherries and ripe but firm figs are used whole after puncturing in numerous places with a wooden toothpick. Peaches and pears are peeled and cut in half. The peels of citrus fruits are

used without the pulp. Peeled and cut fruits do not require puncturing.

After preparing as above, the fruit is cooked gently. This requires from three to five minutes for most fruits. Hard fruits require longer. Citrus peels may require 30 minutes or longer. Too much cooking will spoil the shape and texture. Too little will result in slow penetration of the sugar, dark color and toughness.

Make a syrup of 25 degrees Balling, about one part sugar to three of water. A little more sugar for very sweet fruits. Heat the syrup to boiling and pour over the cooked fruit placed in an earthenware pot while still hot.

A Balling saccharometer is convenient when working on a large scale, but is not necessary for small quantities. Half the sugar in the first syrup may be replaced with Karo or other liquid glucose. This prevents the

hardening of the finished fruit by crystallization and makes it more translucent.

Keep submerged in syrup. Remove the syrup every 24 hours, increase five degrees Balling by the addition of about one-quarter the amount of sugar used originally, boil, and pour back on the fruit. When the syrup reads 68 degrees Balling (as thick as honey) it is dense enough.

Leave in the last thick syrup until it has penetrated the fruit (three to four days) and then place on a wire screen to drain a few days until the outside of the fruit ceases to be sticky. The fruit will drain more quickly if placed in the sun or other warm place.

The finished fruit may be packed in candy or cardboard boxes lined with paraffine paper, or in open jars. In air-tight containers they may mold; some ventilation is necessary.

RECIPES AND SUGGESTIONS

By Ramona Cordero

Hamburger Patties with Tomato Sauce

One pound round meat, 1 small onion, 1 spray parsley. Grind together in meat grinder. $\frac{1}{2}$ cup bread crumbs, 1 egg, dash of pepper and salt. Mix well and form in round patties. Fry in butter. Sauce: 2 cups cooked tomatoes, 1 tablespoon green pepper, 2 tablespoons butter. Cook 20 minutes and pour over patties. Serve at once.

Spring Salad

One cup cooked peas, 1 cup cooked string beans, $\frac{1}{2}$ cup cooked carrots, (sliced), $\frac{1}{2}$ cup mayonnaise, 1 teaspoon chopped onion. Mix with mayonnaise and let stand two hours. Serve on lettuce leaves and garnish with pimento cheese rolled into small carrots, putting a small leaf of parsley in for top.

Cherry Salad

Stone 1 quart ripe cherries, arrange

Summer~Winter Town~Country Big House~Little House

FOR oil stove economy the year 'round—cooler kitchens in summer and comfortable kitchens in winter—use this big 5-burner New Perfection. With a perfect baking New Perfection Oven, it makes easier work of harvest cooking.

Your neighbors will tell you about the many advantages of the famous New Perfection. Its quick-heating, clean-cooking Blue Chimney burner, which has made it the favorite of four million women the world over. Lights at the touch of a match, ready for use instantly, and does not blacken pots or pans.

Made in 1-to 5-burner models. Ask the New Perfection dealer about the one for your home. Also ask to see his Aladdin Utensils.

NEW PERFECTION OIL COOK STOVES & RANGES

“Watch me,”
said the strong swimmer,
“I’m not afraid.”

So he matched his strength against the swirl of the rapids, and laughed at the danger, and kept repeating the stunt, until—

It was the day the life-savers had been waiting for—that day the call for help came.

It’s an easy matter to smile at coffee warnings when you’re going strong.

But a good many strong swimmers won’t risk the rapids, and a good many coffee drinkers are beginning to think of the caffeine in coffee.

Coffee can disturb nerves and digestion, and often it does.

There’s a safe and satisfying course for everybody in the selection of a table drink.

Postum has charm without harm. It’s the safe drink for all, and probably, therefore, it’s the better drink for you. Thousands have found it better, and fully satisfying, for them.

Your grocer has both forms of Postum: Instant Postum (in tins) made instantly in the cup by the addition of boiling water. Postum Cereal (in packages of larger bulk, for those who prefer to make the drink while the meal is being prepared) made by boiling for fully 20 minutes.

“There’s a Reason” for Postum

Made by Postum Cereal Co., Inc., Battle Creek, Mich.

Your appreciation of the California Cultivator can be shown best by writing to and buying from Cultivator advertisers.

on bed of lettuce leaves and serve with the following dressing: Squeeze the juice of 2 oranges into a bowl, add ½ cup powdered sugar, egg well beaten, ½ teaspoon salt, 2 tablespoons lemon juice, 2 tablespoons cream. Cook mixture in a double boiler, stirring until thick. Cool and serve with salad.

Cherry Tapioca

One cup tapioca, 2 egg whites, 1½ cups sugar, 3 cups water, 1 teaspoon butter, 1 cup stoned cherries. Cook tapioca till clear in water. (Soak tapioca in cold water over night and add more water if needed. Cook cherries in one cup sugar till tender. There should be one cup juice boiled from fruit: Add cherries and juice to tapioca. Stir together and add whites of eggs beaten stiff.

Banana Pie

Two large bananas, 2 egg yolks, 2 lemons, ¾ cup sugar, 1 pint hot water, 3 tablespoons corn starch dissolved in a little cold water. Cook till thick. Slice bananas, squeeze juice of lemons over sliced bananas and stir lightly. Line a pie pan with pastry. Put a layer of custard, a layer of bananas and cover with the rest of custard. Bake till crust is brown. Beat egg whites stiff, add 3 tablespoons sugar. Stir and cover top of pie. Brown in quick oven.

Jem Cakes

Two eggs, ½ cup sugar, ¼ cup but-

ter, ½ cup New Orleans molasses, ½ cup milk, 1¾ cup flour, 1 teaspoon cinnamon, ½ teaspoon cloves, ½ teaspoon nutmeg, ½ teaspoon soda, 1½ teaspoon baking powder, ½ cup walnuts, ¼ cup raisins. Cream butter and sugar, then add beaten egg yolks. Dissolve soda in 1 tablespoon of hot water and pour in molasses, beat till it raises in cup. Stir into mixture then add milk, flour and spices. Beat ten minutes. Add raisins and walnuts, stir well. Add lastly the baking powder. Bake in jem pans.

Chocolate Cake

One cup butter, 2 cups sugar, yolks five eggs, 1 cup milk, 3½ cups flour, 2 heaping teaspoons baking powder. Cream butter and sugar together till white and creamy looking. Beat egg yolks, add to butter and sugar, stir well, add milk, then flour, beat altogether till free from lumps. Add baking powder and the whites of two eggs beaten stiff. Bake in three layers.

Filling.—5 tablespoons grated chocolate with enough milk to moisten, 1 cup sugar, 1 egg well beaten. Cook till thick, take from fire, add vanilla and beat till mixture looks thick enough to spread well on cake.

Cake Hints

Cake always shrinks from sides of pan when done.

When making cake with fruit always stir baking powder in last, as this keeps the fruit from going to

the bottom. Raisins need never be rolled in flour when this is done.

To make thick frosting pin a thick piece of paper around cake, letting paper extend about an inch above top of cake. Do not remove paper till icing is set.

To keep icing soft, add a pinch of baking soda to the whites before beating them.

The longer you beat your cake or ginger bread the lighter it will be.

SUGAR DOUGHNUT CANNING

Could you supply me with a recipe for sugar doughnuts. Not the solid doughnut but the spongy kind. In bakeries they call them sugar doughnuts.—Subscriber, Marysville.

Here is a recipe sent to the Cultivator household department by Mrs. F. A. Paugh of Glendale:

One cake of Fleischman's yeast, 1½ cups milk scalded and cooled, 1 tablespoon sugar, 4½ cups sifted flour, ½ cup sugar, 3 tablespoons butter, ¼ teaspoon mace, 1 egg, ¼ teaspoon salt.

Dissolve yeast and sugar in lukewarm liquid, add 1½ cups flour and beat well. Cover and let rise in warm place till bubbles burst on top. Add butter and sugar creamed, mace, egg well beaten, remainder flour to make moderately soft dough, and salt. Knead lightly. Place in well greased bowl. Cover and allow to rise again in warm place about 1½ hours. When light turn on floured board, roll to about one-third inch thickness. Cut with small doughnut cutter, cover and let rise again on floured board or paper in warm place until light—about 45 minutes. Drop in deep fat with side uppermost which has been next to board. While still hot roll in powdered or granulated sugar.

Canning in Pressure Cooker

I wish you would ask someone to write on canning fruit more in detail in Pressure Cooker. The articles I have read are too indefinite. I would like to know just how to do it with full directions?—Reader, Morganhill.

The Cultivator has asked W. V. Cruess of the state university, author of "Home and Farm Food Preservation," for an article on this subject, which will appear in an early issue. Meanwhile we give in this department table showing time for blanching and sterilizing various vegetables, fruits, soups and meats, not only in pressure cooker (last column) but in steam pressure canner, water seal canner and wash boiler canner. This is a valuable time card to paste in the back of your best recipe book.

SPREADING THE GOSPEL OF CALIFORNIA FRUIT FOODS

The California Prune and Apricot Growers Association maintains a complete domestic science laboratory at 74 New Montgomery Street, San Francisco, in charge of Mrs. Belle De Graf whose name is familiar to Cultivator readers. "Jams, Jellies and Preserves," in our household department of June 3, was written by her. Mrs. De Graf is always ready to give demonstration in use and preparation of prunes and apricots to women's clubs and domestic science classes.

The Cultivator will soon give in this department a number of recipes for hot weather desserts, written by Mrs. De Graf and appearing in the June Sunsweet Standard, the Prune and Apricot Growers journal.

DANGER AHEAD

Speaking of white mule, two rustic sports were uncertainly flivvering their way home from the county seat. "Bill," said Henry, "I wancha to be very careful. Fir' hing y' know you'll have us in a ditch."

"Me?" said Bill in astonishment, "why, I thought you was drivin'."

"ESSAY ON ANATOMY"

"Anatomy is a human body. It is divided into three parts, the haid, the ches and the stummick. The haid holdes the skull and the brains if they is any, the ches holdes the liver and lites, and the stummick holdes the vowels, which is a e l o u and sometimes w and y."

You Can Make Maraschino Cherries at Home

By W. V. Cruess, University of California

1. Place the cherries in barrels that are paraffined on the inside. Do not stem the cherries.

2. Prepare a sulphurous acid solution containing two tenths of one per cent of free sulphur dioxide, using six per cent sulphur from your druggist for the purpose. This would be roughly, a dilution of one gallon of the six per cent solution to 25 gallons of water.

3. The barrels are then filled and sealed tightly. Use enough of the diluted solution to cover the cherries and fill the barrels completely. They are stored for at least three weeks in a cool place.

4. The cherries may then be removed, stemmed and pitted. In pitting the cherries use a pitter which does not lacerate the flesh badly.

5. Boil the cherries in many

changes of water until they are free from sulphur taste and odor and are tender. Use at least six or seven changes of water.

6. Prepare a syrup of about 25 per cent sugar, colored with equal proportions of the permissible food colors Ponceau-3R and Amaranth. These can be obtained from any wholesale confectioner supply company or chemical supply company in San Francisco or Los Angeles. Do not use too much color. Heat the cherries in this solution to boiling and set aside 24 hours to cool.

7. Use a hydrometer to test syrup. Heat sugar and dissolve in the syrup and bring the Balling degree to 35. Again heat to boiling and set aside 24 hours.

8. On the two succeeding days bring the Balling degree to 45 and 50 respectively. If the cherries have stood in the 50 degree syrup for 24

hours, add a small amount of bitter almond oil to give the desired flavor. Do not use too much of the oil. Pack the cherries into glass jars and pasteurize in water at 185 degrees for 40 minutes. Or heat them to boiling and pack them boiling hot in the jars and seal at once without further heating. Cans have also been used as containers for Maraschino cherries. I would not advise their use until you have experimented with them.

WILD GROWTH

I do not want my mind to be
An even hedge, clipped orderly,
But rather may it gaily grow
Just anywhere it wants to go.

*And if the wind has kissed the sky
And vagrant breezes flutter by,
Why then, my gypsy thoughts must sing,
And ever go a-wandering.

I do not want my mind to show
Prim blossoms planted in a row.
The dream of all my nomad hours
Would 'prisoned be in beds of flowers.

So let my mind a garden be
Whose every path is wild and free,
That golden fancies may arise
Like clouds of yellow butterflies.
—Sunset Magazine.

An Electric Range

Gives Instant Control
of Heat in Summer

ELECTRIC POWER, carried in the lines that spread web-like over the state, makes more pleasant kitchens possible through the use of ELECTRIC RANGES. No fuel to carry, no fires to build and poke, no dirt, and *instant* regulation of the amount of heat are some of the advantages of using electricity for cooking.

Think how pleasant it is on summer days to turn a switch and have the "fire" out *instantly*. Another turn of the switch and the heat is *instantly* on.

The cost of electric power used by electric ranges in P G and E territory averages only \$60 per year per stove. Look over the nearest dealer's supply of electric ranges, and ask the P G and E man for more information.

HOUSEWIVES in the farming districts served by the P G and E can have kitchens that are as COMFORTABLE IN SUMMER as the kitchens of their city sisters.

Ranchers Now Cook With Gas!

Coleman Cookers

Coleman Cookers bring the advantage of City gas to the Country home.

They burn with a clear, hot, blue blaze. No smoke, no soot, no odor, no greasy wicks.

They make their gas from motor gasoline contained in an air tight tank.

They are safe, simple and economical. They operate under pressure and cannot be filled while lighted.

Made in a variety of sizes and styles for homes, hotels, restaurants, camping, etc.

A complete system for lighting and cooking with large outside tank can be installed at low cost.

Ask your Hardware Dealer about them, or write us for Circular No. 85 giving particulars and prices.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Gray Sediment in Babcock Test

Answering questions as to grayish sediment appearing in process of making Babcock test C. L. Roadhouse, professor of dairy industry at the state university writes:

"The gray substance appearing below the fat column or in the fat column is probably particles of curd which have not been completely dissolved by the acid. This is caused by either using weak acid, insufficient

mixing, or using milk or acid that is too cold; and white foam appearing on the surface of the butter fat column may be caused by using hard water."

Dodder on Alfalfa

I enclose specimen of plants which are proving pests in my alfalfa field. I cannot find any roots; they appear to live directly off the alfalfa, and kill it. Last year I had but few patches but this year it is causing a heavy loss of alfalfa. I thought of letting it dry and burning it. What is it and what should I do?—Subscriber, Paso Robles.

The plant sent is dodder, or love vine. It starts from a seed in the soil and if no support were found would behave itself. When it finds a suitable host plant it fastens on to it, the lower stem withers and dies and the plant is thereafter a parasite. The treatment you propose is good since you must burn the seeds or your field will be infested next year. Where very bad there is no alternative but to plow and begin anew.

Tomatoes Not Setting

I have some fine tomato plants that appear perfectly healthy and vigorous but fail to set fruit. They bloom profusely but blossoms drop off. Can you tell me what is wrong?—Subscriber, Charter Oak.

This condition is generally due to unfavorable weather—heavy or cold fogs—such as have been common of late. Too much water when blossoms are forming frequently produces drop. Too much nitrogen in soil, especially the liberal application of stable manure the present season, is likewise a cause. Warm sunny weather, not too hot, as at present prevails, should overcome the trouble.

Golden Beetle

Last week I saw what at first I took to be a lady bird, but it was of a golden hue, the color and luster of the brightest gold. As it moved about its coat changed to all the colors of brilliant pearl and fire opal.—W. B. P., Los Angeles.

This is doubtless the Golden Tortoise Beetle, *Coptocycla bicolor*, sometimes a pest on sweet potato plants. Though not abundant anywhere it is distributed throughout California, being more common in the southern part. It also infests other morning glory species beside the sweet potato. The metallic luster fades at death of insect.

Horticultural Statistics

Where can I get information, statistical or otherwise, regarding seeds, plants, herbs, roots etc., imported from France and Belgium and exported from the United States to these countries? How can I secure a list of nurserymen seedmen and florists in the Western states? With thanks in advance.—Subscriber, Newcastle.

The Federal Horticultural Board, Washington D. C., can no doubt give you the statistics. A list of California nurserymen etc., is obtainable from the secretary of the California Association of Nurserymen, C. K. Grady, care of Mc Rorie-Mac Laren, San Francisco. He can also give you name and address of secretary of Pacific Coast Nurserymen's Association. The larger trade papers issue directories, which are for sale, containing the full list for this country and Canada. Write Florists Exchange, New York.

Sulphuring Grapes

We have several vines of Thompson Seedless Grapes, one year old and

very thrifty. Please inform me when and how often we must sulphur them and oblige.—Subscriber, Anaheim.

This question is treated fully by Mr. Howard on another page of this issue. See "Control of Grape Mildew."

Growing Smilax

Please tell how to grow smilax successfully. Should the cluster of bulbs be separated and if so at what time of the year?—Subscriber, Corning.

Smilax in California is grown by professionals in lath houses; by amateurs on the shady side of a house or other building, but always in the shade. A deep rich friable soil and plenty of water is needed. A soil one-fourth well rotted stable manure is not too rich. Rows a foot apart and plants six inches apart in the row. Wires are strung near the ground and also overhead usually at eight feet high. Common twine is stretched between top and bottom wires, one for each plant of smilax. Some use green string. Buy mature dormant roots or young plants in pot unless you prefer to grow from seeds. Old bulbs are generally separated every year, in early spring.

Ornamentals for Hot Dry Climate

Please give the names of some deciduous hardy vines, climbers suitable for a hot dry climate. Name some shrubs suitable for hot and dry climate. I would like shrubs that bloom, either evergreen or deciduous.—Subscriber, Corning.

Grapes are best deciduous climbers for hot climate, but wistaria does well from coast to desert, and the finest of all is *Tecoma grandiflora*, from China, largest of all trumpet flowers. Japan ivy, or *ampelopsis*, is fine for summer foliage. For blue shrub or half climber nothing surpasses plumbago. In shrubs use Spanish broom (*Spartium junceum*) *leptospermum*, any *genista* or any bottle brush. Shrubs for hot regions are many.

Climbing Roses

I would like names of climbing roses that are everblooming in white, yellow and bright pink?—Subscriber, Corning.

In roses all thrive best in damp climates but any variety will do for Corning as all best known varieties, with very few exceptions, do well in the Sacramento and San Joaquin valleys. Climbing Kaiserin Augusta Victoria is a good white; there is no good yellow, but Climbing Caroline Testout is a strong bright pink. You cannot have "everblooming" roses during hot summers. Allow plants to rest until August or September then feed and water heavily for fall blooms. You will also get a good spring crop.

Oleanders Die

I am trying to train two young oleanders to form trees by keeping off suckers, but each year the main stem dies to the ground. In the spring they come up in clusters and bloom profusely but die down again in the winter.—Subscriber, Visalia.

We believe this is a clear case of freezing in winter. Young oleanders are tender. Old plants will endure without harm several degrees more of cold. We would advise winter protection of the young trees for at least two or three years.

Driving Rabbits from Vineyard

If your correspondent who asks for means of controlling rabbit damage to young vineyard, will get a sack of fishmeal fertilizer and put a tablespoonful at each vine on the ground,

and preferably on the windward side so that the scent will blow over the vine, the rabbits will avoid that vineyard. The cost will be 50 cents per acre for meal and about the same for labor. The meal will be effective until cultivated under when it must be replaced with fresh meal. Protect clothes and auto from the meal as it is as offensive to man's nostrils as to the rabbit's. This remedy has proven the most effective of many that I have tried.—W. H. Shafer, Selma.

Old Plaster on Land

Would like to know if lime mortar taken from brick walls would injure or benefit soil. How thick should it be spread? On what kind of soil is it best—sandy or 'dobe'?—Subscriber.

If the old plaster is pulverized it might make an excellent addition to heavy 'dobe' or sour soil, while on light sandy soil it might be objectionable. Of course, we are assuming that the plaster was made of lime and sand. If of the ordinary modern plaster or cement it would be worse than useless on any soil. The quantity would vary greatly according to soil conditions, anywhere from a ton to several tons per acre.

Purchasing Homestead

I have lived on a homestead about two years and am unable to stay longer. Can I buy same from state and get patent?—Subscriber, Barstow.

Provided you are a citizen of the United States you may commute the entry after having lived continuously on same for 14 months, and have at least one-sixteenth of the area under cultivation by paying \$1.25 or \$2.50 per acre to the U. S. government. You will have to write to the U. S. Land Office, 508-16 Federal Building, Los Angeles, regarding the payment necessary to your particular case.

Frogs and Mosquitoes

I wish to have a pond in my garden but am up against it for the following reasons: If I put black bass in the pond I get rid of the frogs which make a terrible noise during the night, but the bass eat the gold fish and do not eat the mosquitoes; If I put in only gold fish I get rid of mosquitoes but not frogs. Can I have a pond without frogs or mosquitoes?—Subscriber, Santa Barbara.

Large bass will not bother with mosquito nymphs except they are very hungry, but little ones will. If bass are bred in pond there will be no mosquitoes or frogs, but some natural conditions, such as soil, rocks and plants in water would be needed to induce bass to breed.

Rose Rust

Am sending portion of a rose bush which please examine and suggest some remedy. Trouble seems to be spreading to all my roses.—Subscriber San Jose.

This is a bad case of rose rust, a fungus (*Phragmidium*) hard to control. To protect this and other roses from an extension of the disease, spray with one ounce of potassium sulphide to three gallons of water and stir into this two or three ounces of atomic sulphur. Do not let fallen leaves escape, but burn them; also any parts of bushes you prune off.

Russian Thistle Law

Is there not a law against allowing Russian thistle to grow? It is becoming a great pest in my neighborhood. Please let me know through Cultivator who to write to about it.—Subscriber, Torrance.

There is a law against allowing

Save at the Fountain Head

PUMPS

No. 3 of a Series of Letters from Satisfied Users of

Victory Tree Spray

Azusa, California.
March, 1922.

"I am confident you will be interested and pleased to learn the benefits I have derived in using Victory Tree Spray in my grove during the past two seasons.

"The following is a summary of the results:
"Dates of application—First weeks in July, 1920 and 1921.
"Maximum kill in Black Scale and other parasites that feed on trees.
"Complete destruction of Red Spider. Elimination of Black Smut.
"Cleaning of tree trunks and limbs of green moss.
"Stimulation of tree growth. No burned or broken trees.
"No injury to all beneficial parasites. Firm lasting condition of fruit.
"Results obtained for less than half the cost of fumigation."

Signed,

CONWELL SMITH,

Russian thistle to grow but as it is not a noxious weed in all parts of the state the law is enforced only when the weed becomes a menace to agriculture. Write to H. J. Ryan, Horticultural Commissioner, Hall of Records, Los Angeles. We have reported the presence of the weed in your neighborhood and the commissioner states a field inspector will visit that section.

Largest Loquats

What variety of loquat has the largest fruit? Is it possible to graft other varieties on to a tree of the Japanese variety with smaller fruit?—Subscriber, Orangevale.

The largest fruits we have seen were from the Thales ranch at Placentia, Orange County. They were called "Gold Nugget." Nearly as large are the Champagne and the Tanaka. Other named varieties of large size are Advance, Thales, Early Red, and Victor. Loquats are budded in practically the same way as citrus trees, though a few growers whip-graft them. Seedling loquats or cuttings are best stock, though some use the quince.

Sulphuring Grapes

Why are grapes sulphured and when is the proper time to sulphur them?—Subscriber, Gilroy.

See complete treatment of this subject on another page of this issue.

Moss on Citrus Trees

What should I do for moss on citrus trees?—Subscriber, Escondido.

Orchardists seldom do anything for it, but a spraying of the tree with a light Bordeaux mixture, such as is used for red spider, will no doubt eliminate the mossy growth.

Brown Rot or Bacteriosis

Would like to know what to do for canker on apricot trees.—Subscriber, Lindsay.

The "canker" is no doubt brown rot, or bacteriosis. As the treatment for the two is much the same we refer our correspondent to the last paragraph of "Deciduous Fruit Troubles," page 595, issue of June 3, which we are sending by mail.

Probably Alkali

Can you tell me what is wrong with my black walnut trees. They came out as usual and now seem to be turning black and new growth is coming out between the other limbs.—Subscriber, Manteca.

The symptoms described point to the presence of alkali in the soil. The die-back may have been caused by alkaline water and as the water lowers or dries away the new growth comes out. Are the trees not in low land, possibly in a beet growing district? If not we would be pleased to hear from you again.

Red Spider?

Am sending leaf from Wickson plum set out two years ago. On the old wood the leaves curl up each year. They do not dry up or fall off but simply curl up. The tree is very vigorous, apparently healthy, and fruits heavily.—Subscriber, Pasadena.

The two leaves sent show no evidence of a leaf curling insect. The grayish color suggests red spider may have been present though none were found. If present a daily spraying of the young tree with water would, in a few days get rid of all red spider. However, the trouble with leaves sent is not a serious stage of anything injurious.

Tonic for Dairy Cows

What do you think of feeding tonic

to heavy milking stock?—Subscriber, Sacramento.

If the cows are getting pasture or alfalfa hay or silage or green feed of any kind they do not need a tonic. If none of these are available soaked beet pulp will provide all that is required. Medicine and tonics should be avoided unless the animal is sick and then they should be given only under direction of a veterinarian.

Sore Udder

My goat has sores on her udder, little scab like patches. I put salve on them but they never quite disappear. Would burning with caustic be good for them?—Subscriber, Redlands.

Caustic is too severe for such a tender place. If you bathe the sores before and after milking with a warm boric acid solution, (½ teaspoon boric acid to one cup warm water) and then anoint with castor oil or white vaseline I believe you can soon cure the sores. Do not hurry the bathing. Hold the cloth or cotton wet with the

boric solution on the sores till each is thoroughly soaked, then, after milking, massage well with the oil or vaseline.

Peaches on One Year Trees

Is it best to pull all peaches off one year trees, or will a few left on hurt the tree? Trees are eight or nine feet high and quite thrifty.—Subscriber.

It will be best for the trees to pull all fruit off but would do no particular harm to leave just a few, say not more than a half dozen, if you want to test their quality.

Etching on Milk Bottles

What is the proper method of etching by acid on milk bottles? By answering this query you will greatly oblige.—An "Old Subscriber, Madera."

Etching on milk bottles is done with a sand blast. A stencil is made which protects all the bottle except the lettering desired. This can be done only in a properly equipped plant and the charge is about \$2.50 a gross.

TRIBUTE TO POWELL

At the close of the great "South African Citrus Congress," at Johannesburg, April 19, Sir Percy Fitzpatrick, said: "I have been asked, and I am sure it will meet with the approval of everybody, to propose a vote of condolence with the family and friends, and the citrus growers of California, on the death of a man who has done more for our industry than any other man, and that is the late Harold Powell. You have spoken of him as the author of the Bible of citrus. Well it is not an exaggeration. I had the great privilege of meeting him many times personally, and I have never been more impressed by any man at all, as a statesman in business with a broad human outlook, with sympathy for everything and everybody, unswerving in his purpose, and high in principle. I have never seen a better leader in my life of industrial affairs than Harold Powell."

The meeting then rose and stood in silence for a few moments.

ESSEX COACH \$1345

Its owners like it—the best test of all

A Few of the Many Who Praise It

"This little Coach is a revelation. Handles easier, runs smoother than any car I ever owned. I don't think I will ever want to drive a big car again."

F. CODA,
Jenks & Muir Mfg. Co., Detroit

"We are highly pleased with the Essex Coach. We like, especially, its simplicity; ease in operation, gas mileage, and price. I do not know of a car where you get as much for the money invested."

FRED E. BODIE,
Lincoln, Nebraska

"After owning various multi-cylinder cars, I was a bit skeptical whether I could be satisfied with the four-cylinder Essex Coach. Have had ample opportunity to test its worth, and must admit everything is on the favorable side of the ledger. Economical in upkeep, satisfactory gas and oil mileage, and power and speed plenty. In short a 'delight' from every standpoint."

F. O. HANSON,
253 W. Utica St., Buffalo, N.Y.

Driving an Essex is so free of fuss and effort that every owner praises that remarkable difference. The hours they spend in their cars, above all, are comfortable hours. Controls are easy and natural. One is hardly conscious the hand directs them. Gears shift as easily as lifting a fork at table. Light-steering as a bicycle. Light pressure operates brakes and clutch.

And so reliable that thousands go out from the salesroom and serve for thousands of miles without returning for even a minor adjustment. That, too, is an experience not common to motor car owners.

Drive the Essex. It is altogether different from any car you have ever driven. It will delight—and tempt you. Any dealer will be glad to arrange such a ride.

ESSEX MOTORS—DETROIT, MICHIGAN

TYPE IS AN IMPORTANT FACTOR IN PORK PRODUCTION

By Prof. E. H. Hughes, University of California

TYPE in swine means that thing which makes one breed different from another. The things that make a Poland China hog different from a Duroc-Jersey are the color and markings, distinctive characters about the head and certain other minor differences. Generally speaking the present day conformations of our lard type of swine are not far different. In the major breeds the producers are developing hogs with strong backs, deep, smooth sides, standing on straight, strong legs. They have found that a hog carrying plenty of length, depth and constitution, with quality, is an economical one from the productive standpoint and in addition meets the demand of the packer. The packer, of course, tries to meet the demands of the consuming public. The Market Hog

The ideal market hog is one weighing from 160 to 200 pounds, with a medium amount of fat, deep, smooth side and sizable ham. It is desirable that such a hog shall dress out a high per cent and when hung in the cooler the meat shall be firm. To produce such hogs economically it is necessary to save sows with plenty of scale, length, quality and refinement. These sows should not only farrow large litters, but should be able to raise these litters well. A sow that produces two litters of pigs a year regularly is the kind of a sow that makes money for the producer.

A few years ago the type was dif-

ferent from the present day hog. The finished hog was short and thick and carried a surplus of fat. In the past the consuming public demanded such a hog, because the demand for lard was large and it was thought such a hog was more economical to produce. At the present time, with the longer, deeper bodied animals, and with the use of alfalfa forage and the feeds at hand, it is no doubt more economical to produce the present day hog. It is significant to note in our present day livestock shows the similarity in the conformation of our various lard breeds. We find the Hampshire, the Berkshire, the Poland China, the Duroc and Chester White breeders developing hogs whose bodies and general conformation are very similar.

There are, of course, minor differences, such as color, head characters, etc., but they are all producing hogs that meet the requirements of a good market hog.

INJECTING HOGS IN FLANK TO SAVE MEAT

Complaints from packers indicate that there are still many veterinarians and farmers who persist in immunizing hogs against cholera by making injections in the ham or shoulder, a practice that often results in infection and the formation of deep abscesses in the hams and shoulders where the serum and virus were injected. The United States department of agriculture has long advised against using these parts as points of injection, and the department veterinarians are instructed to avoid the possibility of such injury by selecting some other place.

The ham has been favored as a place

for making the injections because they can be made more rapidly and easily at this point, but they can be made with equal success in less valuable parts, such as the flank or axillary space, where there is loose connective tissue that readily absorbs the serum. In making an axillary injection the front legs should be spread apart so as to stretch the superficial muscles between the legs, and the needle should be directed so as to avoid the muscles of the shoulder.

It is desirable to make the injections at a point that will make drainage easy should an abscess form. Serum should never be injected into a mass of fatty tissue as it is not sufficiently absorptive. Although the serous membrane lining in the abdominal cavity takes up serum rapidly, abdominal injections are not recommended because of the danger of puncturing the internal organs with the needle or of carrying infection into the cavity.

Small pigs and shoters up to 80 pounds in weight may be held up by the hind legs, with the forefeet resting on the ground, and the injection made into the loose tissue of the flank. A pig so held is in a good position for the taking of temperature, cleansing the area of operation, and making the injection.

INCREASED MILK PRODUCTION THROUGH BETTER SIRE

A gain of 17 per cent in milk production and 20 per cent in butterfat production in daughters over their dams because of the use of a pure bred bull is the striking result obtained in the New Windsor, Maryland, cow testing association which has a bull association as a subsidiary. The

records of 21 cows were compared with the records of their 21 daughters after the latter had become mature cows. The average production of the dams for one year was 5,560 pounds milk and 219 pounds butterfat. The daughters averaged 6,523 pounds milk and 263 pounds butterfat, a gain over the mothers of 963 pounds milk and 44 pounds fat. In the association every one of the daughters sired by one of the three association bulls was better than her dam. One of the bulls produced an average improvement in his daughters of 1,414 pounds milk and 62 pounds butterfat.

The worth of the pure bred sire as an improver of the productive capacity of dairy cows has been measured in a number of localities where there are both cow testing and bull associations. The United States department of agriculture has collected figures from a number of the communities, but in the past it has been difficult to keep tab on the improvement that bulls have made in herds. The plan of the dairy division now is to get such figures, as far as possible, on cows owned by members in all of the 158 bull associations in the United States.

CALVES OR TWO YEAR OLDS?

At the Western Stock Show at Denver, Colorado, in January a load of calves won the grand championship in the feeder division. They were last spring's calves, weighing 590 pounds, and sold for ten cents per pound, \$59 per head, a little above the average price paid for two year olds on that market. These were Shorthorn calves bred and exhibited by Weiss Bros., Elizabeth, Colorado, who have attracted the attention of cattle feeders for several years by the quality of the calves and yearlings which they have been sending to the Denver market and exhibiting at the Western Stock Show.

The important point is that these under year calves, possessing the quality, the result of good breeding, should command a price comparable with cattle of indifferent breeding maintained at the growers' expense for one or two years longer period. These calves made money because they were well bred and of the type that appeals to buyers. Many an older load selling for the same amount per head would lose plenty of money for the grower.

This load of calves sold to the western feeding firm in Iowa, Peter Hopley & Son. The cut backs from the same lot, 32 head, sold for \$8 per hundredweight, which is also considerably above the prevailing range of prices for feeders on the several markets. Here is an evidence of the actual value of good breeding. Hundreds of such evidences are passed unnoticed at the market places yearly, yet in every one there is a lesson that should be learned by the cattle grower.

FEEDING OF DAIRY CATTLE

"The Feeding of Dairy Cattle" by Andrew C. McCandlish, M. S. A., professor of dairy husbandry, Iowa state college of agriculture, published by John Wiley and Sons, Inc., New York, at \$2.50 postpaid.

There have been many other books on feeds, but so far as we know this is the first to give the entire book to the discussion of feeding of dairy cattle. It is a book of nearly 300 pages of fine paper with 30 chapters and an appendix. The book touches upon fundamental principles of dairying, dealing first with the individual cow, breeding, selection, and then with the importance of feeding, beginning with the young stock and discussing the necessity of individual feeding. Then comes the chemistry of feeding, constituents of feeds, digestion and absorption, utilization of nutrients, influence of nutrition on production, feeding standards, balance, a good ration, silage, soiling crops and other feeds, feeding practice, preparation of cow for production, feeding for records, calf raising, and in fact, discussion of practically every problem which will ever confront the dairyman who is in search of information as to feeds. The author says in the preface:

"The art and science of feeding dairy cattle has ever been changing, and during the last two decades greater improvements have been brought about in this branch of agriculture by practical feeders and investigators

It's So Easy

to keep dirt and disease out of your buildings — to make them light, clean, sanitary and healthful, and therefore profit-producing quarters for your livestock and poultry — if you will use

CARBOLA

The Disinfecting White Paint

a white paint in powder form, with which a very powerful disinfectant is combined. Just mix it with water and it is ready to use — no waiting or straining. It can be applied either with a brush or with a spray pump to wood, brick, stone, cement, plasterboard or over whitewash. It doesn't blister, flake or peel off, has no disagreeable odor to taint milk or food products and one gallon — a pound of powder — covers 200 square feet. It is harmless to the smallest chick or to stock that licks a painted surface.

Used Instead of Whitewash and Disinfectants in

Poultry Houses
Rabbit Hutches
Outbuildings

Stables
Cellars
Factories

Hog Pens
Dairies
Garages

Warehouses
Creameries
Dog Kennels

by thousands of dairy and poultry farms, by leading agricultural colleges and experiment stations. It makes work easier to do and gives better results. You never will regret giving Carbola a trial — money back if not satisfied.

Your Hardware, Feed, Drug or Paint Dealer has Carbola or can get it. If not, order direct. Prompt shipment by parcel post or express.

10 lb. (10 gals.) \$1.50. 20 lb. (20 gals.) \$3.00 50 lb. (50 gals.) \$6.25.

than ever before. The importance of the dairy cow as an economic factor is now recognized. This is primarily due to the fact that with little waste of energy she converts the roughages and other feeds grown on the farm into products suitable for human consumption.

"In making this presentation of the feeding problem the aim has been to render the work broad enough to be of aid to the student. For this purpose the earlier sections contain a brief resume of material which belongs to the field of nutrition rather than to that of feeding. It is hoped that this will render it possible for the student to link up his work on feeding dairy cattle with the training he has previously received in nutrition. At the same time it is hoped that the man interested in feeding, but with little foundation in nutrition, may obtain some information of value from the earlier part of the work. To put it briefly, the main object in view has been to review in a non-technical manner the main principles on which the feeding of dairy cattle is founded and then discuss the problems of practical feeding."

CARE IN HANDLING LIVESTOCK

An appeal made some months ago for greater care on the part of shippers and transportation companies in the handling of livestock in transit has resulted in a material saving. For example, a report from the Indianapolis Union Railway on the dead hogs received at the Indianapolis market shows that, although receipts increased 39,600 head, or three per cent, the number of dead hogs received decreased 532 head, or 25.7 per cent, as compared with the corresponding period in 1920. If we wish to reduce still further the loss from improper handling of livestock, or even to hold the loss down to its present proportions, new material must be developed and new plans made, and the interest which has been aroused among various organizations and individuals must not be allowed to lag. To that end a call is issued for a meeting to be held in the Saddle and Sirloin Club Rooms, Union Stock Yards, Chicago, December 14.

MILK PRICES

Are dairymen in general justified in their complaint against the low prices being paid for milk? A study of the report contained in the Market Reporter of September 24, 1921, issued by the United States department of agriculture, showing September prices from a representative group of cities in each state, tends to raise a question regarding this matter. It requires approximately eight pounds of grain, ten pounds of hay, and 30 pounds of silage to produce 25 pounds of milk from a thousand pound cow. In other words, 32 pounds of grain, 40 pounds of hay, and 120 pounds of silage are required to produce 100 pounds of milk. Figuring grain at \$40 per ton, hay at \$20 and silage at \$5 this amount of grain will cost near 64 cents, the hay 40, and the silage 30, a total of \$1.34 representing feed cost for 100 pounds of milk.

The old formula in figuring dairy profits states that one-half the market value of milk is represented by feed, one-fourth by labor and one-fourth by general overhead costs. On this basis milk should now be selling for at least \$2.68 per 100 pounds, in order to encourage its production. Government reports show that the price received throughout the United States during September, 1921, by specified zones is: New England states, \$3.44; North Atlantic states, \$3.23; South Atlantic states, \$3.54; Southern states, \$2.68; East Central states, \$2.33; Central states, \$2.36; Western states, \$2.54.

From this it may be concluded that for an early fall month milk is bringing a very fair return considering its cost. Although not highly profitable it certainly is not so seriously out of line as to cause dairymen to become discouraged and forsake the business.

Such facts should stimulate the forward looking dairyman to renewed action, to begin the rebuilding of his herd, the growing of his calves, and the establishing of his cropping system in accordance with the needs of a well balanced dairy farm.

VALUE OF PUREBRED BULL

The advantage of using purebred bulls is well illustrated in the herd of Dan Casement, Manhattan, Kansas. Mr. Casement has used registered Hereford bulls for many years. In 1920 his grade cow herd consisted of 100 head of that year's calf crop. 44 were bulls which were steered and two carloads selected and fed as yearlings for exhibit at the 1921 International. One load was fed for the short fed specials, in which class quality and condition count 50 per cent gains 25 per cent and economy of gains 25 per cent. Mr. Casement's load gained 3.27 pounds daily at the cost of \$10.79 per hundredweight, which was the cheapest gain of the show, and when the premiums were awarded they won championship over all breeds. The other carload stood fifth in the corn belt section for yearlings and second in the best bred carload of Herefords in the show. This is a new feature of the awards in which special prizes are offered by the Institute of American Meat Packers. The load averaged 1175 pounds and sold for 15½ cents.

This notable achievement was due to the fact that nothing but good type purebred Hereford bulls were used in the grading up of the herd and demonstrates most clearly the value of registered sires.

GROWING DEMAND FOR LIGHT CATTLE

For the past several years there has been a decided change in the market demands for cattle. This change has developed from the point where heavy steers were selling at a premium on our main markets to a decided preference today for light cattle. During the past year yearling steers have as a rule outsold older and heavier cattle with the latter often being a drug on the market.

A write-up in a late issue of one of the market papers is also significant in this connection. The article was featuring the sale of some choice heavy steers which sold for \$9.25 per hundredweight. In commenting on this sale the writer said, "Had they weighed 300 pounds less they probably would have realized \$10 per hundred-

weight. Some of the buyers would not look at them on account of their great weight."

These market reports reflect the increasing demand of the consumer for small cuts of beef. For this reason and the fact that land values are gradually increasing the tendency will be more and more toward the production of high quality cattle that will finish out easily and economically at an age that will show a profit to the breeder and feeder.

The Oregon Grower says that an easy way to clean up the prune juice on the drier floor is to sprinkle lye over the floor and cover it with wet sawdust. Let this lie a few days and then sweep it up.

As a rule it does not pay to operate a large gas engine on a small job. Besides the wear and tear on engine and machinery, the fuel cost is too great.

When you install a kerosene engine, follow the instructions of the maker as to starting and operating.

SIMPLEX

the Scientifically Correct SILO

Some Simplex Features

1. Continuous, one-piece staves
2. Crisell tangent top insures true circle
3. Interlocking, diagonal cable bracing
4. Hinged, refrigerator-type doors

GOVERNMENT and State agricultural authorities agree that a silo is the most economical way of preserving feed. They also state that the properly constructed silo must be air-tight; the walls strong, rigid, and in a true circle, with the inner surface smooth and perpendicular.

The Simplex Silo is air-tight, because it is made of one-piece staves. There are no end joints to admit air.

The clear Oregon Pine (Douglas Fir), from which the staves are cut, gives the inner walls of the Simplex Silo a permanent smoothness. The Crisell Tangent Top keeps the walls perpendicular and in a true circle.

The patent Interlocking Anchorage System binds the Simplex Silo to its base in a rigid, inseparable unit that defies inside pressure or high winds.

Because of these qualifications, agricultural experts have pronounced the Simplex Silo "scientifically correct." With a Papec Ensilage Cutter to prepare the ensilage to fill a Simplex, you will be completely equipped to economically preserve feed.

Tear out the coupon and mail it. We will send you full information regarding Simplex Silos and Papec Cutters.

Infection

would have been prevented if B-K had been used shortly after this cow dropped that beautiful calf. When cows do not clean properly after calving, it indicates a germ infection which is likely to run through the entire herd and result in abortion and failure to "get with calf." The afterbirth should be removed at once, without force, and the cow flushed out with a powerful antiseptic.
B-K is scientifically correct for this work. It quickly dissolves the adhesions and allmy matter and brings the afterbirth, kills the germs and foul odors, stops the discharge and straining. B-K is non-poisonous, healing and soothing.
If your dealer does not have B-K send us his name. Get a gallon—the standard farm package.

State Champion Cows of California

CALIFORNIA is a state where development takes place rapidly, but in no other line is the progress so noticeable, as in the dairy cow. We are publishing herewith a list of the state leaders in the different divisions of the various breeds. In the Holsteins the list is almost entirely different from one compiled a year ago, showing that there has been very great activity within that breed. Several of these state records are also world's records, and it is hoped that within a few years most of the world's records will be held in this state. With its plentiful supply of good feed, green alfalfa and pasture available most of the year, and a much more even climate than elsewhere, there is every reason to think that they will. California cattle are equal to those of any other state in quality and are rapidly taking first place in performance. Breeding is on the highest possible plane and the results are very gratifying. They will be even more so within the next year or two.

National Holstein Convention Accomplishes Much
By R. A. Condee, Delegate from California

THE 37th Annual Convention of the Holstein-Friesian Association of America which was held in Kansas City, June 5 to 10, will go down in history as one of the most peaceful and constructive conventions ever held by the association. It demonstrated very forcibly the efficacy of the delegate system over the proxy system which was formerly in vogue, in eliminating politics and in getting things done.
By re-electing Frank O. Lowden of Illinois as president, it placed the stamp of approval on the conduct of the business during the past year and it ended the old fight over the constitution which has been before the association for the past decade. The Hackney amendment to the constitution brought this matter before the convention, and the vote was entirely in favor of its adoption. The Hackney amendment changed the constitution so that the secretary, treasurer and the superintendent of Advanced Registry are elected by the board of directors and are responsible to the board for their actions, thus placing them under control of the board.
Increased Transfer Fees
The matter of transfer fees was also a very live question and a compromise was finally effected which provides for a fee of \$1.50 to members and \$3 to non-members, providing transfers are made within 90 days after date of sale. If the transfer is not applied for within the 90 days the fee shall be doubled in both cases. The money provided by the increase in fees is to be used for extension work in ways and places designated by the board of directors. This will provide a considerable fund to be used in boosting Holsteins.
New Features in Judging
Another interesting feature of the convention was the meeting of the National Committee on Judging and Classifications which is made up of such men as W. S. Moscrip, R. E. Hager, Ward Stevens, T. E. Elder, Axel Hansen, H. H. Kildee, W. H. Standish and A. C. Oosterhuis. It is the duty of this committee to supervise Holstein judging and it is working on the best manner in which to place the ideal Holstein type before students of animal husbandry and prospective judges. The following recommendations were also adopted by the committee:—
That the discredits on the present score card be disregarded until a more satisfactory score card can be developed.
That all A. R. O. records be filed with the secretary of the fair and that the secretaries of the fairs use greater care in checking the records and ages of the various classes.
That 305 day cows are eligible to compete against 365 day cows.
That the classifications for calves under six months of age be eliminated.
That no prizes be awarded unless merited.
New Board of Directors
The officers elected for the coming

year were Frank O. Lowden of Illinois, president; John M. Kelly, Wisconsin, vice-president; W. S. Moscrip Minnesota; W. G. Davidson and John A. Bell of Pennsylvania; H. W. Norton Jr. of Michigan; E. B. Armstrong of New York; G. E. Fox of Illinois and T. E. Elder of Massachusetts as board of directors.

This new board elected F. L. Houghton of Vermont, secretary; Wing R. Smith of New York, treasurer, and Malcolm H. Gardner of Wisconsin, superintendent of advanced registry.

National Sale

Buyers from the surrounding states of Kansas, Missouri and Oklahoma took most of the 175 head of Holsteins which were assembled from nearly all the states of the Union. The average was \$470 and the top was \$3,200 which was paid for a 40 pound cow.

Excellent Exhibits

Educational exhibits by the universities of the near by states combined with the entire exhibit of the department of agriculture at the last National Dairy Show gave the delegates and the interested Holstein men who were there a great variety and fund of information in regard to breeding and dairying.

Livestock News Notes

F. S. Barron & Son of Tipton are making some nice A. R. O. records with their Holstein's. Dorothy Netherland Rowena 2d made 29.54 pounds butter from 655 pounds milk in seven days and a junior two year old daughter of King Korndyke Pontiac 20th made 16.51 pounds butter from 510.6 pounds milk in the same time after dropping twin heifers sired by Sir Aaggie Mead. Five of the seven nearest dams of these calves average over 1100 pounds butter for a year.

Forty cows in the Tulare County testing association averaged over 50 pounds butter fat for the month of May. Fourteen of these belong to Sargent Bros. who recently purchased the great bull, King Korndyke Pontiac 20th, for \$8,000. The high cow of the association made 2595 pounds milk and 98.3 pounds fat. She is in the herd of F. S. Borrer and Son at Tipton.

The report of the cow testing association in Stanislaus County for May shows that 1224 cows produced an average of 822 pounds milk and 30.7 pounds butter fat for the month. The high cow was a registered Holstein, Pleasant View Johanna Aaggie, owned by E. W. Lodney of Salida. Although 11½ years old she produced 2917 pounds milk and 105.3 pounds fat for the month. The high herd was that of Z. H. Richards of Denair whose Jerseys averaged 912 pounds milk and 55.1 pounds butter fat.

Report of the Southern L. A. County cow testing association for May shows that Earl Graham's cows averaged 79.9 pounds butter fat for the herd of 12 pure bred Holsteins. S. W. Bockerna's herd of grades averaged 51.4 pounds per cow. A number of other members herds averaged over 40 pounds fat per cow.

The members of the Southwestern Ayrshire Breeders Association recently voted to change the name to "The California Ayrshire Club" and make residence in California a requirement for membership. The old officers will govern the new club until the next general meeting which will be held at one of the fall shows.

Vic Bello, the veteran Ayrshire showman who gained his early experience at Willowmoor Farm and was later with Bailey McFarland's Steybrae herd, is now with R. H. Trumbull at Novato.

The Le Baron Estate Co. at Valley Ford is very much pleased with the new Ayrshire bull Royal Champion just received from Middlesex Farms in the East. He is a flashy, outstanding animal and will make a record on the fair circuit wherever he competes. With this bull as a starter Herdsman Jack A. Glass will have no difficulty in making up a prize winning herd as the Le Baron farm owns many cows of merit.

The senior member of the firm of Agee Brothers, the well known Holstein men of Rivera, is the lucky owner of a farm at Santa Fe Springs on which the General Petroleum Company has brought in an oil well which is flowing 4,000 barrels a day.

TUBERCULOSIS FREE ACCREDITING

That progressive California cattle breeders recognize the opportunities and benefits to be derived from the federal and state tuberculosis free accredited herd movement is evidenced by the rapidity with which such owners are forwarding applications to join this movement. In fact, application to have herds placed on the accredited herd list are being received so rapidly that it is difficult for the federal and state departments to keep pace with the demand, due to lack of available help to make the required tuberculin tests. The work, however, is being inaugurated as rapidly as possible.

It is interesting to know that less than 90 days have elapsed since Dr. John R. Mohler, chief of the United States bureau of animal industry, returned the signed agreement from Washington, D. C., wherein the state and federal governments formally accepted the conditions agreed upon.

Accredited herd work will be conducted jointly by the state and the officials of the United States bureau of animal industry. Dr. W. M. MacKellar, inspector in charge of the bureau of animal industry of the federal

Three of a Kind

department of agriculture, and the division of animal industry, California department of agriculture, will have charge of the work.

Twenty-six applications for accreditation of herds are already on file. Approximately 3700 purebred or high grade cattle are included and the names of many of California's most prominent breeders appear on the application. Of these herds already enrolled the majority are of the dairy type although several prominent Hereford and Shorthorn herds are included.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Cow in Heat

I have a six year old cow that comes in heat every week or two and is in heat half the time. I have bred her four times but she fails to get with calf. Please tell me through the Cultivator what to do for her.—Subscriber, Riverside.

The symptoms indicate that something is wrong with some part of the genital organs. Usually it turns out to be something in connection with one of the ovaries. Probably there is a tumor or cyst on one of the ovaries or somewhere along the line of the genital organs. To operate and remove the cause might remedy the whole trouble but the result might be bad and you might lose the cow. It is not worth the effort. Fatten her for the butcher and get another cow.

Scab on Udder

Our cow has been fresh a little over six weeks and when we began milking her we noticed a small scabby place high up on the udder. We began dressing it with carbolated vaseline and later washed it with strong dip, dried it and greased it, but it seems to be spreading. It is not a raw sore and does not seem to be painful but a sort of scab which spreads. It does not affect the flow of milk as that is increasing and the cow is sleek and fat. Please tell us the cause and cure?—Subscriber, Ceres.

It is due to a mite in the skin. Get your druggist to prepare this ointment: One ounce tincture of iodine, 20 grains iodine crystals and one ounce lard oil. Mix. Scrape scales off and apply ointment with a small swab once a day. It is not serious but will not heal without some attention.

CHANGES IN 1921 YEAR BOOK

Are we growing too much corn? What is the outlook for price of wheat?

What is relation of cotton to other Southern crops?

What changes should be made in beef production to meet demands?

Farmers will be helped to answer these and other questions for themselves by a series of economic discussions in the 1921 Yearbook of the department of agriculture which will be sent to the printer shortly. The

costs.

The report of the secretary will show the progress of agriculture during 1921 with particular emphasis on the economic phases. It will contain a brief statement of the work of the department and a discussion of the agricultural crisis through which we passed last year.

The free distribution of the Yearbook is made chiefly by members of congress. The department of agriculture has a limited number for members of its staff and principal cooperators.

Three hundred million acres of strictly forest land, unsuitable for agricultural purposes, in the United States are productive of brush alone today because fires have killed all young trees and tree seed left after the former forests were logged.

Wipe Out Every Rat and Mouse

Amazing New Discovery Quickly Kills Them All. Not a Poison

Rats, Mice, Gophers—in fact, all Rodents can now be wiped out easily and quickly. Imperial Virus will do it. This new discovery is a fluid, true Virus. Entirely harmless to humans, poultry, stock, pets, etc.

Infects Rodents only. Greedily eaten on bait. Sets up burning fever. The pests die outside hunting air and water. Imperial Virus is put up in sealed bottles, thus insuring full strength and potency. Only safe, sanitary method to overcome these pests. Protect your Poultry, especially Baby Chicks and Egg Hatches.

You Can Get Yours Free

Here's how! Send \$1.00 today (currency, M. O. Checks, etc.) and we will send you by return mail, postpaid, two regular, full sized (double strength) \$1.00 bottles of Imperial Virus. Use one to rid your place of these pests, and sell the other to a neighbor, thus getting yours free. Special inducements to represent us.

If more convenient, send no money, just your name and address to Imperial Laboratories, Dept. 470, 2110 Grand Ave., Kansas City, Mo. Pay postman \$1.00 and few cents postage when two bottles arrive. Guaranteed to do the work to your entire satisfaction within 30 days or your \$1.00 will be cheerfully refunded.

THE POMONA Duplex Plunger Deep Well Pumps

are solving the pumping problems for many users during the period of low water levels. They will lift the water to the surface, and, if desired, deliver it to high elevations above ground and at lower power cost than any other system of pumping water.

Pomona Manufacturing Co.
POMONA, CAL.
Manufacturers of the
POMONA Irrigation Gates and Valves

book will be different from those of preceding years. The reason for the change in the material is that people in the department feel that the great problems confronting farmers today and for the years to come are economic in character and should be treated as such.

In the past about one-half of the Yearbook has been devoted to magazine articles on numerous agricultural subjects. The other half has included, in general, statistical material presented in rather a formal manner.

In the 1921 book the space heretofore given to magazine articles will contain worked out studies on the economic situation with respect to four of our major crops; corn, beef cattle, wheat, and cotton. The articles deal with these crops from the standpoint of production, marketing, and distribution and show their relative importance, both as separate industries and to agriculture in general. They have been prepared in concise and understandable form and are well illustrated with charts, graphs, and photos. Much of the statistical material will appear in digest form and supplemented by the inclusion of production data and new statistics on marketing and production. Another special feature of the book will be a graphic summary of American agriculture as interpreted from the census figures of 1920. In other respects the 1921 book will contain material of former years.

In making these changes in the presentation of material in the Yearbook department people point out that farmers must give continued attention to production problems but that more thought must be directed towards cheaper production and more improved methods of marketing and distribution so that the prices the farmer receives for his products shall be more fairly related to production

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When queries are wished in Cultivator address query to 317 Central Ave., Los Angeles.

Trespassing Cow

A cow trespasses in my orchard and damages trees. The owner refuses to pay for the damage. What can be done?—Subscriber, Santa Cruz.

If the place is entirely enclosed by a substantial fence or other enclosure action may be brought against the owner of the cow and attachment issued against the cow or other property of the owner, to secure the payment of any judgment which may thereafter be rendered in the case. The complaint must be filed, setting forth the facts in the case thereafter brought on for trial, when the evidence will be produced and judgment rendered. If the property is not fenced then it would probably be impossible to recover any damages, but that would depend entirely upon the particular county in which you are located.

Employee Injured

An employee in a vineyard was injured by lifting a plow. Is the employer under obligation to pay the doctor's bill and wages for the time the employee was injured?—Subscriber, Lodi.

Employees engaged in household, domestic service, farm, dairy, agricultural, viticultural or horticultural labor, or in stock or poultry raising, are excluded from the operation of the workman's compensation act, and there consequently would be no liability

under that act. Under the fact stated there would be no liability for negligence upon the part of the owner and consequently the employee would doubtless be obliged to pay his own doctor bill and stand for his own loss of time.

Misunderstanding as to Wages

When a farmer requests an employment agency to secure help at certain wages and the employment agency secures the help but misinforms the employee as to the amount of wages and when the employee comes to work nothing is said between him and the farmer as to the amount of wages, can the employee collect the amount stated by the employment agency?—Subscriber, Lodi.

The farmer when he appointed the employment agency to secure his help, thereby appointed such employment agency as his agent, and the employment agency as such agent made the contract with the employee. In the absence of any contrary agreement between the employer and the employee, the employer undoubtedly could be held for the amount of wages represented by the employment agency, his agent. His only remedy would be to bring action against the agency for breach of its contract with him and recover the difference between the amount he informed them that he would pay and the amount that he was required to pay, by reason of their contract.

Power Company Damages Trees

County supervisors by ordinance allowed use of certain number of feet on each side of public roads to the adjacent farmers in planting fruit trees. The owners stand in three different positions, those who deeded

land for the road and received payment therefor, those who donated land, those who still own land and are paying taxes on it. The county has improved the road. The road after being improved by the county is taken over by the state highway commission. Has this commission the right to allow the power companies to cut and disfigure these trees to give clearance to their wires?—Subscriber, Lodi.

As to the first two classes there is no difference. Their land has actually passed to the county. The third class owns the land. The real difference is as follows: The first two classes use the land of the county by sufferance, the third is using his own land, and he owns not only the land but all which is growing thereon. To determine whether a contract has been made concerning these trees between the county by the passage of its ordinance and the adjacent farmers by their acceptance of the terms of the ordinance it would be necessary to examine the ordinance itself. This undoubtedly would cover the terms of the contract. As to the third class, however, it would seem that there could be no question but that they would be entitled to receive compensation for any damage which has been caused by reason of the cutting of the trees or taking of any of the property for the use of the power company. That constitutes an act of eminent domain and the constitution provides that no property can be taken or damaged by the state or any of its agencies invested with the power of eminent domain, unless compensation be first paid. If under the ordinance the farmers of the first two classes have any title to the trees they would likewise be en-

titled to compensation; otherwise, not. The highway commission has undoubtedly right and authority over all state highways and can acquire whatsoever property and grant whatsoever rights it may deem best concerning such highways which is consistent with other provisions of law. If the property and these trees have been taken by the power company the owners of the trees whoever they may be, either the farmers or the county, would undoubtedly have the right to require payment of the power company for any damage caused.

Claim of Wife to Property

Prior to marriage the husband owned property. The wife deserts him. Can she get any of this property?—Subscriber, Inglewood.

The wife has no right to this separate property other than as the court may award to her maintenance. The court may require payment of the amount ordered for the support of the wife as well as her costs and attorney's fees out of the separate property of the husband, that is, in case there is no community property.

Homestead

Land is homesteaded, the husband dies and leaves widow and children. Are the children entitled to a share of the income? Can the widow deal with the property as she wishes and would a second husband of the widow have any share in the property?—Subscriber, Fresno.

On the death of the husband the property becomes the sole property of the widow and she is entitled to transfer it in the same manner as any other separate property. The children have no interest in it. Upon her death in case she leaves no will and has subsequently married leaving children, this property would be separate property and one-third would go to the surviving husband and the other two-thirds be divided among the children.

Division of Estate

A man dies and leaves no will. There is a widow but no children, and there are several brothers and sisters. To how much of the estate is the wife entitled?—Subscriber, Covina.

As to all portions of the estate which were community property the wife would be entitled to receive first her one-half of the community property. As to the remaining one-half that is considered separate property she would be entitled to one-half thereof, and the other one-half would go to the brothers and sisters and to the children of any deceased brothers and sisters. If it is all separate property the division would be the same except the wife would not have the one-half of the community property.

Charge For Irrigation Water

A man runs his ditch through my land. I keep the ditch clear but he demands \$20 a year for the irrigation water which I use. Is he entitled to do this?—Subscriber, Weaverville.

If the man is entitled to run the ditch through your land he is of course entitled to all of the water which the ditch carries unless there is some agreement to the contrary. If he chooses to let you have any of the water he can do so at such price as he sees fit, except, of course, that he thereby renders himself liable to the jurisdiction of the public utilities commission of the state to fix a just rate, as he has constituted himself a public utility.

Forced Payment of Note

Can a debtor require the owner of a

The Sign of Water Service

Ask the farmer who has bought a pump and he will tell you that even more important than the pump is the correctness of its installation and the field service rendered during its life.

The Byron Jackson Iron Works, the oldest established and largest pump manufacturer in the West, has attained its dominating position not only through the dependable type or pumps built, but also through this highly important field service.

Through its three factories, devoted exclusively to the production of pumps, its branch offices and service car organization you are assured attention that can only be rendered by such an institution.

BYRON JACKSON IRON WORKS-INC

Wherever water is to be lifted

Sharon Building - SAN FRANCISCO

Factory: WEST BERKELEY, CAL.

Branch Factories: LOS ANGELES; VISALIA, CAL.

Branch Offices: SALT LAKE CITY; PORTLAND, ORE.

note to accept payment of it before maturity date of the note by refusing to pay interest?—Subscriber, Brawley.

Many notes are so drawn that the owner of the note may at his option declare the whole due and payable, upon the failure of payment of any instalment of interest, but that provision is almost universally at the option of the holder. The debtor is by no means entitled to advance the maturity date as in that way he would be entitled to advance the date upon which the statute of limitations is run and thus avoid payment entirely.

Contract to Sell Water

A neighbor wishes to put turnout in pipe line which crosses his land and buy water from me at the customary price. Would it be well to have a contract, and if so should it be in writing?—Subscriber, Pomona.

By thus making a sale of water the owner subjects himself to the jurisdiction of the water commission and may render himself liable to continue the performance of the contract. However, this is rather a legal liability than a present practical proposition. If a proper contract is drawn—and it should by all means be in writing and carefully prepared—any liability might easily be taken care of. If care is not taken this use of water might constitute an easement on the land and be very troublesome, even to the point of binding the land for all further time, in the hands of future owners.

Validity of Deed

If a deed is acknowledged before a notary and placed in safekeeping, but not recorded, is that deed legal in case of death of the maker?—Subscriber, Olive Hill.

The essential thing as to legality of a deed is not the acknowledgment before the notary and not the recording, but is the delivery of the deed. If the deed is delivered to the grantee during the lifetime of the party or is delivered to an agent of the grantee to deliver to the grantee upon death, and entire dominion of the property passes from grantor during his lifetime, then the deed is valid. But if the grantor places the deed in his own safe deposit box, even though properly acknowledged, in the absence of any delivery the deed is void.

Deed to Subdivision

Several years ago I purchased a lot of which I now hold the title deed. I wish to subdivide this into two lots and wish to know how I can execute a separate deed for each division?—Subscriber, Los Angeles.

There is no new deed necessary. If you wish to sell some portion of the lot you merely make a deed to the described portion. If you wish to deliver a certificate of title to that you may have a continuation certificate for that portion.

Deed by Insane Person

Several years ago a party was declared insane. While he was being held for appearance before the lunacy commission, at the request of a party he signed a blank deed before various witnesses, agreeing that the deed could be later filled out with the description of the property. It was the understanding that the deed would not be put on record as long as he lived and would be returned to him in case he became cured. The deed was filled out, acknowledged before a notary and thereafter recorded and the grantee of the deed has received and used all income from property and held its possession. The insane person has a wife and other relatives. Is this deed void and if so what could be done? Who owns the property?

The deed is undoubtedly invalid: First, by reason of the mental condition of the party; second, by reason of the fact that the deed was filled

out after he signed the blank, third, by reason of the fact that there was never any delivery made. The notary public who acknowledged the deed would certainly be liable on his bond for his act, for all damage caused. The best method to take would be to have a guardian of the estate of the insane party appointed, and this guardian would then be entitled to bring suit to recover the property, together with an accounting for all receipts therefrom. The disposition of the property would then be under the jurisdiction of the probate court, and the monies would either be turned over for the care of the insane person or his wife, or other proper disposition made.

Brakeman Injured

A brakeman employed on a railroad, while climbing off a boxcar, fell and broke his leg. Is he entitled to anything under the compensation act? Would this likewise apply to a rancher employing help?—Subscriber, San Bernardino.

If the brakeman was employed upon interstate traffic the matter would fall under the federal employers liability act. Under such act it is provided that an action shall be brought against the railroad to recover damages, which shall be tried before a jury. The defense of contributory negligence and assumption of risk of employment is excluded under this act. If the injury occurred upon intra state traffic or railroad it would fall under the state workman's compensation act and the party undoubtedly would be awarded compensation for the time during which he was injured, together with necessary medical assistance. The state compensation insurance act expressly excludes farm labor from its operation.

FARMERS PROFIT BY POTATO GRADING LAW

The Wisconsin law regarding the grading of potatoes has fully demonstrated its value. L. D. Foster, assistant director of the department of markets, recently outlined the Wisconsin grading system to New Jersey marketing officials and stated that Wisconsin machine graded potatoes brought from 15 to 20 cents more per 100 weight than the ungraded "spuds" of other states.

The Wisconsin compulsory grading system started in September 1921, since which time 16,000 cars of potatoes were shipped from which it was estimated that the farmers of the state received \$112,000 more than they would have received if they had not been subject to grading enforced by the state of Wisconsin.

The Wisconsin farmers have adopted as a standard the Boggs grader.

UNIVERSAL COTTON STANDARDS URGED

Adoption of a single set of cotton standards for American cotton in international commerce was urged by Nat C. Murray of the United States department of agriculture, at the congress of the International Federation of Master Cotton Spinners and Manufacturers Associations at Stockholm, Sweden, June 14.

The department has fostered this idea for a number of years, and it is thought that a new and powerful influence can be brought to bear by presenting the matter to spinners rather than to cotton merchants.

DODDER IN ALFALFA

Dodder, or love vine, is a serious menace to the growth of alfalfa in South Africa and government officials have given much time to experiments for control of this pest. A leading authority recommends the following:

Spraying with a saturated solution of salt.

This will destroy the dodder plant but not the seed if already mature; therefore a second spraying will be necessary either later in the season or next season.

For permanent and absolute destruction the use of a five per cent solution of arsenite of soda has in every case proved absolutely effective but spraying with this solution will also destroy the alfalfa unless the area sprayed is well irrigated within 24 hours after spraying, in which case,

most if not all the alfalfa will be saved.

The cost of spraying with a five per cent solution of arsenite of soda is small, especially if one is able to save the alfalfa in addition to killing this weed.

A pure lubricating oil

"Zerolene oils are pure. The Standard Oil Company has always considered the removal of all detrimental properties and compounds as essential in making Zerolene."

— Board of Lubrication Engineers.

Zerolene in a good truck or tractor keeps your working equipment on the job—hour by hour—day after day—without a stop for the breakdowns of incorrect lubrication.

Because of its purity, Zerolene eliminates engine trouble. It gives perfect lubrication, and when it works into the combustion chamber, as any oil will do, it burns clean. Zerolene deposits a minimum of carbon, of a soft and flaky nature, most of which is blown out harmlessly with the exhaust.

Stability — Oiliness

The ideal motor oil, besides having purity, must be stable to resist engine heat. It must cling evenly to bearing surfaces, and must also flow freely and permit the development of maximum engine power and speed.

Zerolene is refined from crudes carefully selected for stability and oiliness, and our exclusive high vacuum refining process retains these qualities in their highest form.

Consult the Zerolene Correct Lubrication Chart for the correct grade for your tractor, truck or automobile.

THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

SHEEP

HAMPSHIRE DOWNS

STRALOCH FARM
Two and one-half miles west of Davis, Calif. on Highway. C. Harold Hopkins, Woodland, California.

MAY REPORT SOUTHERN CALIFORNIA EGG LAYING CONTEST

Egg production for the whole flock held up well, surpassing April by a small fraction. The birds consumed on an average 3.38 pounds grain, 3.66 pounds mash and 2.39 pounds green feed and gave an egg production of 70.8 per cent for the month. The ration to be used in next year's contest has been decided upon by the directors that entrants for the next contest may accustom their birds to it before bringing them in if they care to do so. The grain mixture will consist of 40 per cent cleaned barley, 20 per cent wheat, 20 per cent cracked corn and 20 per cent milo maize. The mash mixture will be made up of 35 per cent bran, 20 per cent "Red Dog" flour, 20 per cent corn meal, 5 per cent soy bean meal, 5 per cent linseed meal, 10 per cent meat scrap, 5 per cent dehydrated skim milk and in addition 2½ per cent fine charcoal and ½ per cent fine salt.

CONCRETE ON THE FARM

The Portland Cement Association of Chicago has issued a number of booklets or bulletins touching details in the work with cement on the farm. There are bulletins on "Concrete Basements and Foundations," "In the Dairy Barn," "On the Hog Farm," "Fence Posts," "Silos" and others along various lines. These books will be mailed for the asking by writing the association at 111 West Washington Street, Chicago, Illinois.

Citrus Markets

Los Angeles, June 21, 1922.

Lighter shipments of Valencias the past week have strengthened prices. Practically 5,000 cars are at that remain for shipment.

Lemons are meeting good demand with hot weather increasing prices. There are on hand and available within 30 days about 200,000 boxes of foreigners.

Shipments of citrus fruits to date since November 1, 1921. Southern California: Oranges, 17,896 cars; lemons, 6,888; total, 24,784. To same date last season: Oranges, 27,843; lemons, 6,896; total, 34,739.

From Central California to date this season: Oranges, 5,098; lemons, 106; total, 5,204. To same date last season: Oranges, 6,603; lemons, 185; total, 6,788.

A 2-month-old cockerel a few hours after being attacked by head and neck lice. Both baby chicks and grown fowls are killed in great numbers by this type of louse.

MINERALIZED WATER ROUTS CHICKEN LICE

A new scientific discovery makes it easy to rid poultry of lice and mites. Simply dissolve in the fowls' drinking water the harmless mineral tablets known as Paratabs. Soon after the fowls drink the mineralized water, all lice and mites leave them. Chicks that drink the water never will be troubled by vermin.

The body louse of chickens.

Paratabs do away with the bother of greasing, dusting, spraying and other unsuccessful methods of fighting lice. They are warranted to impart no odor to flesh or eggs. They cost only a trifle and are sold under a money-back guarantee. Thousands of poultry raisers are using them with complete success.

The head and neck louse of chickens.

What Users Say

Paratabs are the best thing for chickens I ever used. They clean the hens and make them lay, and I don't find any lice, mites or fleas on any of my young chicks. Paratabs are a good tonic for all chickens.—Mrs. W. A. G., Jacksonville, Fla.

Paratabs are fine. My chickens have no more lice. Before using Paratabs I had 20 loafers on the roosts, but now they are out.—A. F., Keeseville, N. Y.

I never saw anything like the work of Paratabs. It reminds me of the fairy story of the magic wand. Early this year I was getting 14 to 16 eggs a day. Then, without visible cause, the number dropped to 5 to 7 a day. I began using Paratabs as directed and in 2 or 3 days there was a difference of 1 or 2 eggs a day. On the fifth day I got 17 eggs and on the seventh I got 23. I heartily recommend Paratabs.—Mrs. E. H., Centralia, Ill.

I received the Paratabs all right and my hens seem to be laying better already.—Mrs. W. S. C., Monticello, Ark.

I am giving Paratabs water to my chickens and am having better luck this year than ever before. I haven't had a little chick to be a bit sick. It is the greatest medicine we ever used for young chickens.—Mrs. M. N., Pulaski, Ky.

Send No Money

LET US TAKE ALL THE RISK

Anyone can try Paratabs without risking a penny. We are so confident this new scientific discovery will free your flock of lice and mites that, to introduce Paratabs, we will send two full \$1 packages—enough for 200 gallons of water—for only \$1. BUT SEND NO MONEY. On delivery, pay the postman \$1 and postage, and if your flock is not free from lice and mites in 10 days, your money will be refunded without question. Don't let vermin kill your fowls and steal your profits. Write for the Paratabs today.

More Eggs—More Money

By J. H. Barber, General Manager Poultry Producers of Central California

DURING the past year there has developed among commercial poultrymen a considerable amount of interest in better producing stock, that is, hens which will produce more eggs than the ordinary average, which on the Pacific Coast here is about ten dozen eggs per hen per year. Every poultryman well knows that it takes a certain number of eggs to pay for the feed and overhead expense per hen, the exact number depending mainly on the price of feed since the overhead remains substantially the same. It is the eggs produced above this number that make the profit, if any, in the business.

With the ordinary average yearly production of ten dozen per hen produced in the ordinary way, that is, the majority of them in the spring months when the price is low, the careful poultryman can make a living out of his flock and in most years a small interest on his investment. If through disease in the flock he loses many hens or their production of eggs is reduced, he will be apt to run behind. If, on the other hand, he could increase the production per hen above the ten dozen average, he would be able to make an additional and sure profit, because it costs approximately the same to feed a hen whether she produces ten dozen eggs or only five dozen eggs, or on the other hand, 15 dozen.

No doubt a considerable part of the interest in better producing stock has been stimulated by the egg laying contests which have been held in various districts the last two or three years. At these contests the egg production records of individual hens have run all the way from 150 to 300 eggs per hen. Naturally, the thoughtful poultryman, observing these records so much in excess of the production of his own flock, is apt to wonder why he cannot have some of this high production stock himself. A few years ago the commercial poultryman would have laughed at anyone who asked him to pay more than \$1 for a cockerel for breeding purposes, and \$2 was an extreme outside figure. Last fall we had the spectacle of an auction of cockerels at Petaluma where the highest priced bird brought over \$160, and the average price paid was, if I remember correctly, somewhere around \$50.

The accredited hatchery plan put into effect last year was a long step in the direction of better producing stock. There is no doubt that the comparatively low production of many of our commercial poultry farms has been due to the purchase of their chicks from hatcheries which have bought their eggs from all kinds of sources without any effort at selection. Under the new plan the accredited hatcheries are securing eggs from only approved flocks which, as time goes on, will have more and more production pedigree behind them if the plan is carried out as contemplated. In buying chicks from these accredited hatcheries the poultryman will be assured of getting stock that with ordinary good care will produce better than the average. He may even go farther and obtain through the hatchery stock from the flock of a particular breeder whose stock he has satisfied himself is above the ordinary and is being handled in a scientific way. If he cares to go farther he can himself have his hens culled so as to select the best producers and then he can mate them to cockerels with production pedigree behind them. These he can purchase from some breeder with whose methods he is familiar and in whom he has confidence. He can then produce his own hatching eggs, which he can have custom hatched at one of the hatcheries if he does not care to undertake the hatching himself. In a very few years he can by these means very materially increase the production per hen of his flock, and thus add considerably to the profits of his business.

If, in addition to paying more attention to the breeding of his stock, he will install electric lights in his laying houses so as to increase his egg production in the fall and winter, and

will acquaint himself with the proper management of hens on which electric lights are used, he can obtain additional income by securing more eggs in the fall and winter when they are high priced and fewer in the spring when they are low priced.

The future of the poultry industry as a commercial proposition seems to us now to rest very largely on the two points touched on above; that is, higher producing stock and higher relative egg production in the fall and winter months.

If it be asked why we are mentioning these things at this time, it is for two reasons: First, because right now it is possible to obtain pedigreed cockerels two or three months old at very reasonable prices, and second, because during the summer is the time to have the electric light installation put in so as to be ready to turn on the lights in the fall.

Poultry Queries

Conducted by Jean A. Koethen

Culling Pullets

Is it a general practice to cull February pullets in June, and would you advise it?—Subscriber, Ontario.

Pullets that lag behind the rest in development should be removed from the flock as soon as it is evident they are likely to remain undersized. Weakly pullets should also be removed as soon as their condition is apparent. For the rest, I believe it is customary to cull when the pullets are put in the laying house, which time for February pullets would be in July or August.

How Much Grain?

Authorities I have read agree that a quart of grain to 15 laying hens is the proper amount, but I find nothing regarding the proper grain ration for pullets while on the growing mash. Equal amounts of grain and mash leave them unsatisfied after the night feeding of grain.—Subscriber, Ontario.

Not all authorities agree on a quart of grain for 15 laying hens. Professor Dougherty would make it considerably less during the heavy laying season in order that they may eat more mash. With growing pullets, however, the case is quite different. They have to grow and to lay on a little surplus fat, and so they must have all the grain they will eat. Give them all you think they will eat, then, if it is eaten up clean, a little more to make sure there is something for them to begin on in the morning.

Infertile Eggs

Will eggs laid by hens that are not with a male keep better than others?—Subscriber.

Indeed they will. All market eggs should be fertile, and for eggs that are put down in waterglass this rule is imperative. There is nothing to be gained by keeping a rooster with hens if fertility is not required, and everything to be lost. "Rots" are eggs in which a germ has commenced to develop, and then, lacking proper heat, has died, and a rotten egg is a dead loss.

Double Yolks

What is the cause of frequent double yolks in pullet eggs?—Subscriber, Ontario.

I have never heard or read any really satisfactory explanation of double yolks. The Maine Station's "Poultry Diseases and their Treat-

Rid Hens and Chicks of Lice and Mites

A Few Drops of Wonderful New Remedy In Drinking Water Does It—No Dusting, Spraying or Greasing

Any poultry raiser can easily and quickly clean out Lice and Mites by using a new Remedy recently discovered by a Kansas City chemist and called Imperial Lice and Mite Remedy.

All that is necessary is to occasionally put a few drops of this amazing remedy in the fowl's drinking water. It renders them immune from the attack of all blood-sucking parasites, as these pests positively will not stay on a fowl taking this remedy.

It also acts as a splendid Tonic and Blood Purifier, as well as increasing egg production and growth, for with these pests eliminated, hens lay better and young stock grows faster. It is positively guaranteed not to affect the meat or eggs.

The manufacturers of Imperial Lice and Mite Remedy are anxious to get it quickly introduced among poultry raisers everywhere, and make this Special Introductory Offer. Send no money, just your name and address to the Imperial Laboratories, Room 638, 2110 Grand Ave., Kansas City, Mo., and they will send you a regular full sized \$1.00 bottle and will also send you free a big full sized (double strength) \$1.00 package of Imperial White Diarrhoea Remedy, the standard, time-tested remedy. Pay the postman only \$1 and a few cents postage when both packages are delivered. Any time within 30 days, if you are not satisfied with results, just say so and your money will be cheerfully refunded.

Baby Chicks

We incubate 250,000 eggs every three weeks; the largest and finest equipped electric hatchery in the Southwest. All popular breeds: Rhode Island Reds, Barred Rocks, Black Minorcas, Anconas, etc. Also our famous Oregon-Corvallis White Leghorns. Order now for immediate or future delivery of Baby Chicks, Pekin, Muscovy or Indian Runner Ducklings, Mammoth Bronze baby turkeys. All kinds of pullets supplied—anytime. Incubators and brooders. Careful attention to every order, large or small. Send today for prices.

ment" says: "They result from a disturbance of the time relations of ovulation of such nature that two yolks get into the oviduct at nearly the same time and become surrounded by common layers of albumen." I think you will generally find that double yolks are laid only by certain hens and not by all.

Broilers and Fryers

Which is the best breed to raise for broilers and fryers, R. I. Reds, Barred Rocks, Langshans or Brahmas? What will they weigh at two months?—Subscriber, Turlock.

Barred Rocks and R. I. Reds are equally satisfactory. One man who is making quite a success with market poultry keeps both breeds and crosses them, but the cross is little better, if any, than either of the pure breeds. The important thing is to produce a strain that will grow very rapidly and be above the average weight when grown. Langshans and Brahmas are fine roasters but do not grow as rapidly as Rocks and Reds. Either of these breed ought to weigh two pounds at ten weeks if they are from a heavy strain and well cared for.

Ration For Turkeys

What is the proper ration for turkeys three months old? I had 35 and had wonderful success till recently. Have lost five now and all in the same way. They walk slowly, hump up and in a day or so are gone.—Subscriber, Alhambra.

That is the tragedy of turkey raising. You think your turkeys are safe, and all at once they begin to drop off. The answer is always the same—overfeeding, perhaps recently, perhaps several weeks back. Turkeys three months old are usually past the critical time, but perhaps you have been feeding corn or some other feed which they ought not to have. Bran and grain which may be either wheat or rolled barley, are the usual ration for turkeys this age, but it is well to give chopped onion mixed with rolled oats occasionally if the birds are not on alfalfa. Keep sour milk before them as much as possible and keep them hungry.

Inflamed Combs

Some of my hens have inflamed and swollen combs. Can you suggest treatment?—Subscriber, Banning.

I wonder if chicken-pox is in your flock. If it is those swollen combs have by this time developed warty nodules, red or grayish red in color or perhaps a yellowish crust. You may be able to control the disease by isolating the sick hens and giving all sulphur in their mash, about one pound of sulphur to 50 pounds mash. If this does not control it, write Poultry Division, University of California, Berkeley in regard to vaccination. If the disease is not chicken-pox, anointing the sore combs with carbolated vaseline will probably heal them.

Extensive or Intensive?

I have a two acre place and chicken house 120 by 22, with four runs 30 by 60, and about 900 hens. I am thinking of fencing the whole place and letting them run instead of raising green feed. I have plenty of water for irrigation and could irrigate occasionally. Some say they will do better on less feed than if they were confined.—Subscriber, Redlands.

If you had an alfalfa field so large that the hens could never eat it up this plan might do very well, but it will not work on two acres. Your hens will eat up every green thing and there will be nothing to irrigate. No, better confine them and have a nice patch of alfalfa which you can run through the clover cutter every day and give them all the fresh green they want. In addition to this, since you have so much yard room, you can confine the hens in two runs while you raise rape or barley in the other two, and then let them in to eat it off. It will not last long, but will be a fair substitute for range.

For Sticktights

Please publish a spray for sand fleas or sticktights on chickens.—Subscriber, Modesto.

The best remedy for sticktights is carbolated vaseline. Anoint the head and any other affected parts once or twice a day till the pests die and drop off. The vaseline smothers them, and they cannot live.

Turkeys on Shares

A friend and I are raising turkeys on shares. We have each six hens, in all 12 hens and a gobbler. I take all the care of them, furnish range and everything except feed. What would you consider a fair division of the proceeds?—A Reader, Torrance.

It is difficult to see how you can arrive at a fair division without reducing everything to dollars and cents.

What are the hens worth? To whom does the gobbler belong? Who pays for the feed? What would the range be worth if it were put to other uses? How much time do you put in and what is it worth? If I were you, I would rather buy his hens and go it alone than try to figure out an equitable division.

Guinea Fowl

Can you not give us an article on the Guinea fowl, telling us how to distinguish between male and female; time for eggs to hatch, markets, etc.?—Steady Subscriber, Orange.

An article will appear in due time. Perhaps your immediate need will be satisfied if I say time of incubation is 30 days and the young are fed in the same way as young turkeys, though they are more easily raised. Hatching should not be too early because the little ones are very sensitive to cold.

The Guinea is a great forager and is more profitable where it can have wild range. Eggs are more safely hatched under chicken hens, but Guineas are excellent mothers when they are allowed to hatch and rear their young. The cock is distinguished from the hen by his more compact shape, by the deeper and richer color on his neck, his wider wattles and a slight difference in the call, that of the hen being only "Come back, come back." Guineas are in season in January, February and March and their eggs find ready sale in March and April. I remember reading several years ago that an effort was being made to put Guineas on the market in California as "wild" game, but have heard no more of it. There seems to be little market for the birds except as fancy stock. They mate in pairs.

Canker

Some of my hens have a yellowish white substance on side of mouth and on tongue. What is the cause and what can I do for it?—Subscriber, Mountain View.

This growth, when not connected with roup or chicken pox, is called canker and is due either to an injury to the membrane or to indigestion. The sores may be removed by swabbing with undiluted creolin or with hydrogen peroxide diluted half and half with water.

Canker in Squabs

Some of my squabs are dying from a canker like growth in their throats. I feed a regular commercial chicken scratch feed, which for a time contained cracked corn. I wash the water pans every day and spray after the squabs are out.—Subscriber, Redlands.

Alice Macleod in "Pigeon Raising," says: "Some pigeon raisers think canker comes from close confinement and lack of exercise, but I believe it comes from inbreeding, and, likely from improper food and water." She recommends for pigeon feeding Chevalier barley, Egyptian corn, Canadian peas and red wheat, with some whole Indian corn in winter, and hemp and millet seeds occasionally for young stock intended for breeders. Most feed stores keep a mixture of grains specially for pigeons. You might try swabbing the canker out of their mouths with dilute hydrogen peroxide, but it may not work with such young creatures.

DEMONSTRATIONS OF POULTRY CULLING IN LOS ANGELES COUNTY

June 26, 10 a.m., La Canada; 2 p.m., San Fernando. June 27, 10 a.m., Van Nuys; 2:45 p.m., Baldwin Park. June 28, 10 a.m., Lomita. June 29, 10 a.m., Pasadena; 2 p.m., Downey. Science Discovers Greatest Lice Killer

Changes Old Methods. No Dusting or Spraying. Birds Delouse Themselves. Gives Lasting Relief.

A recent discovery promises to revolutionize all the methods accepted up to now for keeping poultry free from lice and mites. This wonderful lice killer keeps the birds always lice free without the poultry raiser doing any work. It is the simplest, easiest, surest and best method ever discovered.

Hick's Lice Kill, which is the name of this sensational lice killer, is added to the drinking water. The medicine taken into the system of the bird comes out through the pores and every louse or mite dies or leaves the body. It does not injure the hatchability or flavor of the eggs or meat; is harmless to chicks and does not affect the plumage. A few days treatment at the start and then a little in the drinking water each month.

A Trial Costs You Nothing

So confident is Mr. Hick that Hick's Lice Kill will kill every louse or mite, that he is making a special guaranteed offer of two regular full sized, double strength, \$1.00 bottles and a regular \$1.00 package of Hick's Egg-Lay Tablets all for \$1.00. Use one bottle yourself and sell the other at one dollar, thus getting your own free. Send \$1.00 today (currency, money order, check, etc.) to Chas. M. Hick & Co., Dept. 1556, 1018 S. Wabash Ave., Chicago, Ill. If you prefer, send no money, just your name and address, and pay postman \$1.00 and postage on delivery. If after two weeks' trial you are not absolutely satisfied, write Mr. Hick and your money will be refunded.

KEEPING FARM ACCOUNTS

In spite of the fact, or perhaps because of it, that relatively few farmers will worry about income taxes this year, there has been a growing interest in farm accounts. From every state come detailed reports of work done in this line. In Kansas 49 counties report the distribution of 1846 farm account books by request of interested farmers. Not all of the account keeping that was done was under direct supervision of extension specialists in farm management, but 21 of the county agents employed co-operatively by the United States de-

partment of agriculture and the state agricultural college lent assistance to farmers. Accounts were interpreted and summarized for 285 farmers. In 36 counties 24,186 farm inventories were distributed, and in nine counties 44 farmers made changes in their business as a result of keeping accounts.

Specialists working with the farm management extension department have obtained facts and figures on various crops, classes of livestock, and other particulars on 21 different farms in two counties. One of these men visited the farms on his list at intervals similar to those of a cow tester.

Some of the results noted in connection with this work in Kansas are as follows:

The net cost of producing an acre of alfalfa in 1920 amounted to \$23.17. This is the average obtained on a yield of 2.08 tons per acre on 21 farms on which there was a total of 386.5 acres of alfalfa.

The net cost per acre on corn was \$28.26, or 64 cents per bushel. Twenty farms, including 903.68 acres, furnished this average. Oats averaged 36.7 bushels per acre, grown on 16 farms which had a total acreage of 289.5 acres. The cost was \$27.88 per acre, or 75 cents a bushel. Wheat

cost \$34.22 per acre, or \$1.77 per bushel to produce on 18 farms, planted with 894 acres of wheat averaging 19.3 bushels per acre. The net cost of 100 pounds of pork amounted to \$13.08. The average cost of keeping one work horse for the year amounted to \$159.36. This was found by averaging 140 horses on 22 different farms.

These were the figures for a particular locality. Those applying to other localities could be worked out by following similar methods of averaging if the farmers in any given district have kept their cost accounts in such a way that they can be utilized.

FUMIGATION

with Hydrocyanic Acid Gas

The Most Effective and Economical Method of Scale Control

When Ordering Liquid Hydrocyanic Acid Gas
Always Ask For

“HYDRO-CY”

96---98% Strength Guaranteed

Also Insist on

The “HYDRO-CY” Pump

Different in Principle From All Other Makes

Light, Portable, Simple But Substantial, Accurate, Safe, Dependable

“The Service is Built into the Pump”

ACCURACY: The most essential factor for the successful operation of any machine which must measure a predetermined charge. During the past season it was not an uncommon practice to check the operation of the pump, on every throw during the night's work. Such practice, although not essential, is recommended as it insures the grower that the trees are getting the required dosage and it gives the fumigator confidence that his work has been done right.

SAFETY: A machine for handling a poisonous liquid of the nature of hydrocyanic acid must be safe. This pump **DOES NOT LEAK** because the liquid is never under pressure except below the piston when it is being ejected. There are no Stuffing boxes below the liquid level. With the air pump eliminated there is never any liquid under air pressure, thus providing greater safety for the operator.

SIMPLICITY: The number of parts which enter into its construction have been reduced to a minimum. All working parts are easily accessible. The wing nut type of construction eliminates the necessity of tools. Our service men can completely inspect and test a machine in a very few minutes.

DEPENDABILITY: A feature which the Fumigator and Grower alike appreciate. A night's work lost means valuable time wasted, a disappointed grower, discontented crews, and profits smashed. A machine which is dependable is a big asset to the success of the fumigating work. During the past season not a single night's work was lost by the users of the “HYDRO-CY” Pump.

LIGHTNESS: The standard machine of 3 gallons capacity weighs only 18 pounds empty and 35 pounds when filled. A light handy machine means less fatigue to the operator, thus resulting in more and better work and contented workmen. An operator who is always fresh is worth two who are tired out before the night is over.

SERVICE: Our service men averaged one inspection a week during the past season on all the machines in service. Correct calibration

is part of this service. Such service adequately maintained, insures both grower and fumigator that the pump is properly functioning at all times. These pumps are part of our regular service. No rental charge is made to users of our product—“HYDRO-CY.” Our own trucks, manned by skilled drivers deliver the material to you, when and where you want it. Salesmen with an intimate manufacturing knowledge of our products are ever ready to assist you in your problems.

OUR COMPANY HAS GROWN ON THE MERITS OF ITS SERVICE
